There can be no indefinite subject in transitive verbs. Instead, **passives** are used. They are usually marked by /-l-o/ on the middle stem (sometimes /-o/, and sometimes /-wa/ after /-i/), /-o/ being a post-consonant allomorph of /-wa/. In other words, the existence of the process is marked (by |-wa|, see 6.3.1), but at the same time related to an entity, so there is a reorientation (marked by /-l-/):

- (77)
- Ni-nōca-lo.*

SBJ.1.SG-call-PASS

'I am called, someone calls me.'

*N-itta-lo* or *N-itt-o.*

SBJ.1.SG-see-PASS

SBJ.1.SG-see-VR<sub>1</sub>

'I am seen, people see me.'

Ditransitive verbs (see 3.1.4) can be put into the passive. Only an object place overtly marked in the active form can be transformed into a subject; and a 'dropped' prefix does not reappear:

- (78) (a)
- Ti-ča-mak-o.*

SBJ.2.SG-OBJ.INDEF.NHUM-give-PASS

'You are given something.' (cf. 24 b)

(b) *Ti-mak-o naka-č.*

SBJ.2.SG-give-PASS meat-ABSL

'You are given meat.' (cf. 26 b) (not \**ti-k-mak-o*)

Impersonal forms can be taken from transitive verb stems with an indefinite prefix (*ne-* if reflexive):

- (79)
- Tē-nōca-lo.*

OBJ.INDEF.HUM-call-PASS

'People are called.'

*ča-kʷa-lo.*

OBJ.INDEF.NHUM-eat-PASS

'People eat.'

*Ne-pōwa-lo.*

IMPR.REFL-count-IMPR

'People are arrogant (lit. count themselves.)'

### 6.3.3. Passive and impersonal potentials

A passive potential (3.2.3) refers to a passive ability or necessity (80). An impersonal potential refers to an instrument, or more generally to a condition that brings about the process (81):

- (80)
- kʷa-lō-ni*

eat-PASS-POT

'edible'

*itta-lō-ni* or *itt-ō-ni*

see-PASS-POT

see-PASS-POT

'visible'

- (81)
- kočt-wa-ni*

sleep-IMPR-POT

'soporific (by which people sleep)'

*ča-tta-lō-ni* (or *ča-tt-ō-ni*)

OBJ.INDEF.NHUM-see-IMPR-POT

'device with which to see (e.g. magnifying glass)'

### 6.3.4. Causatives

**Causative** verbs indicate that the process is caused by an external agent. This adds one argument place to the verb. The 'new' agent appears as the subject and the 'old' subject is demoted to the status of an object. These verbs are marked by */-tia/* or */-tia/* on intransitive stems, */-l-tia/* or */-tia/* on transitive stems (with some fluctuations):

- (82) (a)
- Ni-k-kočt-tia.*

SBJ.1.SG-OBJ.3.SG-sleep-CAUS

'I make him sleep.'

(b) *Ni-mic-ča-kʷa-ltia.*

SBJ.1.SG-OBJ.2.SG-OBJ.INDEF.NHUM-

eat-CAUS

'I make you eat.'

(c) *Ni-mic-kʷa-ltia in*SBJ.1.SG-OBJ.2.SG-eat-CAUS DET<sub>1</sub>*naka-č.*

meat-ABSL

'I make you eat the meat.' (cf. (26 b))

Undoubtedly, */-tia/* is the same suffix as the denominative seen in 6.2.1. Thus (82 a) can mean 'I provide him with the process of sleeping', and there is a striking ambiguity in (82 b) ('I give him food, *ča-kʷa-l-li* 'OBJ. INDEF.NHUM-eat-OBJNR-ABSL', cf. (68 a)). Verbs of perception have both a */-l-tia/* (or */-tia/*) and a */-tia/* causatives. The former refers to an action on a person, the second to an action on an object (Launey 2002):

- (83) (a)
- Ni-k-itta-ltia in*

SBJ.1.SG-OBJ.3.SG-see-CAUS DET<sub>1</sub>*tōnatiw.*

sun

'I take him (e.g. out) to see the sun.'

(b) *Ni-k-itti-tia in*SBJ.1.SG-OBJ.3.SG-see-CAUS DET<sub>1</sub>*āma-č.*

book-ABSL

'I show him the book.'

If the causative applies to a reflexive form, the reflexive prefix is */-ne-/*; if the reflexive is 'external' to the basic form, it appears as definite:

- (84) (a)
- Ni-kin-ne-časočča-ltia.*

SBJ.1.SG-OBJ.3.PL-IMPR.REFL-love-

CAUS

'I act in such a way that they love each other.' (*mo-časočča-?* 'OBJ.REFL.2/3-love-PL')(b) *Ni-no-tē-itti-tia.*

SBJ.1.SG-OBJ.REFL.1.SG-OBJ.INDEF.

HUM-see-CAUS  
'I show myself (to someone).'

Causatives can be put into the passive:

- (85) (a) *Ni-kočī-tī-lo.*  
SBJ.1.SG-sleep-CAUS-PASS  
'Someone puts me to sleep.'
- (b) *Ni-kʷa-ltī-lo naka-č.*  
SBJ.1.SG-eat-CAUS-PASS meat-ABSL  
'Someone gives me some meat to eat.'

Intransitive inanimate-subject verbs (cf. 76) have no 'real' causative. They usually occur in pairs with a transitive counterpart, which may alter in various ways the final syllable; these pairs were called 'thematic verbs' by Whorf (1946) and extensively studied by Canger (1980):

- (86) (a) *Ni-k-wāca.*  
SBJ.1.SG-OBJ.3.SG-dry:CAUS  
'I dry it up.' (cf. *wāki* in (76))
- (b) *Ni-k-kotōna.*  
SBJ.1.SG-OBJ.3.SG-cut:CAUS  
'I cut it (e.g. thread).' (*kotōni*  
'cut:DETR')
- (c) *Ni-k-poloa.*  
SBJ.1.SG-OBJ.3.SG-destroy:CAUS  
'I destroy it.' (*poliwi* 'destroy:DETR')

### 6.3.5. Applicatives

Here again, one argument place is added. But this argument is a 'dative' one (with a benefactive or a detrimental meaning). It is marked in some verbs by */-ia/*, but in most cases by */-lia/* (probably analyzable as */-l-ia/*: once again we find */-l-/*), which can cause some minor alterations on the stem (87). Very few intransitive stems have a corresponding applicative, see however (88). If the applicative comes from a reflexive form, the reflexive prefix is indefinite (89 a); but if there is an 'external' coreference between subject and dative, it is definite (89 b). Applicatives can be put into the passive (90):

- (87) (a) *Ni-mic-čā-kōwi-lia.*  
SBJ.1.SG-OBJ.2.SG-OBJ.INDEF.NHUM-  
buy-APPL  
'I buy (*kōwa*) something for (or:  
from) you.' (also *ni-mic-čā-kōw-ia*  
'SBJ.1.SG-OBJ.2.SG-OBJ.INDEF.NHUM-  
buy-APPL')
- (b) *Ni-mic-kʷī-lia.*  
SBJ.1.SG-OBJ.2.SG-take-APPL  
'I take (*kʷi*) it from you.'

- (88) *Ni-k-čōki-lia.*  
SBJ.1.SG-OBJ.3.SG-weep-APPL  
'I bemoan it (lit. I weep for it).'
- (89) (a) *Tī-m-ināya.*  
SBJ.2.SG-OBJ.REFL.2/3-hide  
'You hide (lit. you hide yourself).'  
*Tī-k-ne-ināyi-lia.*  
SBJ.2.SG-OBJ.3.SG-IMPR.REFL-hide-  
APPL  
'You hide from him.'
- (b) *Ni-k-no-kʷī-lia.*  
SBJ.1.SG-OBJ.3.SG-OBJ.REFL.1.SG-take-  
APPL  
'I take it for myself.' (cf. (87 b))
- (90) *Tī-čā-kōwī-lī-lo.*  
SBJ.2.SG-OBJ.INDEF.NHUM-buy-APPL-PASS  
'Someone buys something for you.' (cf.  
(87 a))

### 6.3.6. Honorific verbs

They are formed by splitting the subject place (the second place being marked by a reflexive). Usually (with some exceptions) intransitive verbs use the causative as honorific, while transitive verbs use the applicative (91 a–b); this can lead to 'hyper-applicative' verbs with up to 4 prefixes (91 c). The construction cannot be used with reflexive forms: a suffix */-cinoa/* is added to the short stem (cf. 3.1.2 and (92)):

- (91) (a) *Mo-kočī-tia.*  
OBJ.REFL.2/3-sleep-CAUS  
'He (hon.) is asleep.'
- b) *Ki-mo-tti-lia.*  
OBJ.3.SG-OBJ.REFL.2/3-see-APPL  
'He (hon.) sees it.'
- (c) *Tī-k-mo-ne-ināyī-lī-lia.*  
SBJ.2.SG-OBJ.3.SG-OBJ.REFL.2/3-  
IMPR.REFL-hide-APPL-APPL  
'You (hon.) hide from him.' (cf.  
(89 a))
- (92) *Mo-kokoʔ-cinoa.*  
OBJ.REFL.2/3-ill-HON  
'He (hon.) is ill.'

## 7. Composition

### 7.1. Noun + noun

**Compound nouns** are very common in Nahuatl. Normally the second is the main noun, and the first occurs only as a stem with no absolute suffix. The semantic relation can involve one of the following: double member-

ship (an entity which is both N1 and N2), comparison, material, location, instrument, possessor, agent (Launey 1999):

- (93) *siwā-pil-li*  
woman-noble-ABSL  
'noble woman'  
*āyo-tōč-čī*  
tortoise-rabbit-ABSL  
'armadillo'  
*picō-naka-č*  
pork-meat-ABSL  
'pork meat'  
*kʷaw-kimič-in*  
wood-mouse-ABSL  
'mouse (of the) woods'  
*tē-yakān-kā-kal-li*  
OBJ.INDEF.HUM-guide-PART-house-ABSL  
'house of the leader' (cf. (65 b)), etc.

## 7.2. Noun + verb

This is traditionally called **incorporation**, and can involve either **saturation** or **modification**. In **saturating incorporation**, the noun stem refers to a generic object. Consequently, the compound verb is intransitive, while the verb stem is transitive:

- (94) *Šōči-namaka*.  
flower-sell  
'He sells flowers.'  
*ča-kʷa-l-čīwa*.  
OBJ.INDEF.NHUM-eat-OBJNR-prepare  
'He prepares food.'  
*Naka-kʷa*.  
meat-eat  
'He eats meat.'

In **modifying incorporation**, the argument pattern of the verb stem is not affected since the noun stem does not refer to an object. The semantic relation can be:

- (a) adverbial: the noun refers to an instrument, or to any kind of circumstance in which the process occurs (95 a);
- (b) predicative or comparative: the noun can be predicated, at least metaphorically, of the subject or the object (95 b);
- (c) possessive: the noun is possessed by the transitive object or by the intransitive subject (95 c);
- (d) agentive: always in the passive, the noun referring to the agent (95 d).

- (95) (a) *Ki-te-wīteki*.  
OBJ.3.SG-stone-hit  
'He hits him (with a) stone.'

*Ki-čān-kotōna*.  
OBJ.3.SG-tooth-cut  
'He tears it (with his) teeth.'

*Ki-čāl-tōka*.  
OBJ.3.SG-earth-bury  
'He buries it (in the) earth.'

- (b) *Okič-miki*.  
man-die  
'He dies (like a) man.'

*Ki-tēkʷ-čālia*.  
OBJ.3.SG-lord-install  
'He installs him (as a) lord.'

- (c) *Ni-k-keč-kotōna*.  
SBJ.1.SG-OBJ.3.SG-throat-cut  
'I cut his throat (lit. I cut him (by the) throat).'

*Yōl-miki*.  
heart-die  
'He faints (lit. he dies (by the) heart).'

- (d) *Kōwā-kʷa-lo*.  
snake-eat-PASS  
'He is bitten (lit. 'eaten') (by a) snake.'

## 7.3. Verb + verb

### 7.3.1. The /-t(i)-/ auxiliaries

About 15 intransitive and 4 transitive verbs (the latter being very uncommon) can occur as aspectual or modal auxiliaries. The morphological pattern is: Main verb (in the short stem) + /-ti-/ (/t/- before /V/) + auxiliary:

- (96) (a) *Koč-ti-ka?*. (*ka?*, see 3.2.5)

sleep-AUX-be  
'He is asleep.'

- (b) *Čōka-ti-w*. (-*w*, see 3.2.5)  
cry-AUX-go  
'He goes along crying.'

- (c) *Čōka-ti-nemi*.  
cry-AUX-move  
'He keeps crying all the time.'

- (d) *Ki-kʷi-ti-weci*.  
OBJ.3.SG-take-AUX-fall  
'He takes (*kʷi*) it suddenly.'

### 7.3.2. Other auxiliaries

Only one is common: *neki* 'to want', which can be used as transitive with an object clause, but also as an auxiliary, the main verb being in the future:

- (97)
- Ni-koči-s-neki.*

SBJ.1.SG-sleep-FUT-want:AUX  
'I want to sleep.'/'I am about to sleep.'

### 1. General facts on Quechua

The Quechua family consists of a number of closely related linguistic varieties, alternatively referred to as ‘dialects’ or ‘languages’ according to the viewpoint of the observer. If taken as a unity, Quechua is the largest American Indian language presently spoken with an estimated total number of speakers

of 8,354,125 (Cerrón-Palomino 1987: 76). The Quechua linguistic area covers large sectors of the Bolivian, Ecuadorean, and Peruvian Andes, including some smaller regions in the Amazonian lowlands of these countries (Adelaar 2004). In addition, speakers of Quechua are found in Northwestern Argentina, in Southern Colombia and, to a very limited extent, in Northern Chile. The genetic affiliation of Quechua is uncertain. The numerous lexical, phonological, and typological similarities between Quechua and the neighbouring Aymaran languages can be attributed to intensive borrowing at the proto-language stage, followed by a state of permanent or intermittent contact which has lasted until the present day.

A modern assessment of the Quechua dialect situation was provided for in the 1960s. Broadly spoken, a subdivision of the Quechua dialects into two main groups exists. A Central Peruvian group, referred to as Quechua B (Parker 1963) or Quechua I (Tóro 1964), comprises the dialects of the de-

parts of Ancash, Huánuco (cf. Weber 1989), Junín and Pasco, and that of the Cajatambo area in the department of Lima. A second group, referred to as Quechua A or Quechua II includes the dialects of all other regions. Within the Quechua A/II group a further distinction is made between (a) a northern subgroup, including the dialects of Ecuador and Colombia, the Peruvian dialects of Amazonas, Loreto and San Martín, and the extinct dialect of the Peruvian Central coast, and (b) a southern subgroup, comprising the dialects of Southern Peru, Bolivia, and Argentina. In addition, the Quechua of Cajamarca and Lambayeque in Northern Peru and several dialects located in the high valleys of the department of Lima in Central Peru are said to constitute a third subgroup within Quechua A/II. Its members occupy intermediate positions between the two dialect branches and have been the object of conflicting classifications. One of them, the dialect of Pacaraos, spoken in the upper reaches of the Chancay valley near Lima, shares essential elements of its morphology with Quechua B/I (Adelaar 1984: 45).

The distinctive elements that separate the two main groups of Quechua dialects are essentially morphological and lexical. Considerable phonological variety is found within each of the two subdivisions, although morphological differences are important as well, in particular, within the Quechua B/I group. The general morphosyntactic structure of the Quechua dialects is remarkably similar. The Ecuadorean and Colombian varieties (cf. Cole 1982; Levinsohn 1976; Muysken 1977) constitute an exception because they have lost part of the original morphological complexity.

## 2. Typological features

Quechua is the epitome of an agglutinating language. It combines considerable morphological complexity with almost perfect regularity. Morphology occupies a central position in almost all descriptions of Quechua dialects. It is a consequence of the fact that a majority of the syntactic phenomena involve the use of one or more morphological markers. A systematic treatment of these markers in connection with their syntactic applications provides a straightforward guideline for the organization of a reference grammar. The one morphological device which is dominant in

Quechua is suffixation. There are no prefixes at all. Infixes do not occur either. However, in the Quechua B/I dialects productive affixes are sometimes inserted within petrified root-suffix combinations; e.g. Tarma Quechua *ša-ya:-mu-n* [ʃa'ja:muŋ] 'come-PROG-HIT-3.SBJ (he is coming)'. In this verb-form, the progressive aspect affix *-ya:-* precedes the suffix *-mu-* (HITHER), which is obligatorily present in the lexical base *ša-mu-* 'come' (the root *ša-* does not occur without *-mu-*). Vowel modification is a morphophonemic process which affects suffixes occurring in strings. It is found in Quechua B/I and in southern Quechua A/II. The most common type of vowel modification affects verbal suffixes with a final back vowel *-u-* [u, ɔ]. This back vowel is changed to *-a-* before a small set of suffixes, which do not constitute a phonological class but have the property of triggering vowel modification. In Quechua B/I dialects, this sort of vowel modification can operate between non-contiguous suffixes, skipping intervening suffixes which do not meet the condition for being modified. In the dialects in question, the rule of vowel modification often extends to verb roots ending in a back vowel when the final element in the root is a suffix from a historical point of view. An example is the verb root *miku-* 'eat', which at an early stage of development of the language absorbed the reflexive suffix *-ku-* (now meaningless); e.g. Tarma Quechua *mika-ya:-či-n* [mika'ja:tʃin] 'eat-PROG-CAUS-3.SBJ (he is making him eat)', where *-či-* is the triggering suffix and *-ya:-* an intervening neutral one. In the Quechua B/I dialects, which have vowel length as a distinctive element, length variation affects suffixes occurring in strings under somewhat similar conditions. Additionally, the morpheme that expresses a first person subject or possessor consists in lengthening the final vowel of the base (which is stressed in word-final position); e.g. *miku-:* [mi'ku:] 'eat-1.SBJ (I eat)'. Contrastive stress plays a role in Pacaraos Quechua. If it occurs word-finally, stress is normally a result of elision; e.g. Pacaraos Quechua *akšu-k'* [ak'ʃuk], from *akšu-kta* [ak'ʃukta] 'potato-ACC'. In Pacaraos Quechua stress is also part of the shape of the 1st person subject and possessor morpheme whenever it is word-final; e.g. *miku-'* [mi'ku] 'eat-1.SBJ (I eat)'. Stress associated with the Pacaraos Quechua 1st person morpheme is not a result of elision.

Suffixes can have different allomorphs according to the phonological context in which

they occur. The suffix *-m(i)* is a validator denoting first-hand knowledge. In most dialects, it has the shape *-m* when added to a base ending in a (short) vowel; when the base has a final consonant (or a long vowel in those dialects that distinguish length), the suffix in question appears as *-mi*; e.g. Quechua A/II Ayacucho Quechua (cf. Parker 1969) *wasi-m* ['wasim] 'house-KNWL.VAL (it is a house)'; *wasi-n-mi* [wa'simmi] 'house-POSS.3-KNWL.VAL (it is his house)'. However, when *-m(i)* is followed by one of the rare suffixes with an initial vowel, its shape is *-m-* even after a consonant; e.g. Ayacucho Quechua *-iki* in *pay-m-iki* [pa'i'miki] 'he-KNWL.VAL-OF.COURSE (it's him of course)'. With the exception of a few phonologically divergent dialects (Quechua A/II Amazonas, for instance; cf. Taylor 1975), Quechua does not allow sequences of more than two consonants, which furthermore can only occur in word-medial position (*V*: being treated as *VC*). For the same reason, nominal suffixes take a binding element *-ni-* when added to a consonantal base; e.g. Ayacucho Quechua *yawar-ni-n* [ja'warnin] 'blood-BIND-POSS.3 (his blood)'. In some dialects, historical changes in the phonological domain have created a distance between different allomorphs of a suffix; in Quechua A/II Cuzco (cf. Cusihuamán Gutiérrez 1976), the genitive case suffix is *-q* after vowels and *-pa* after consonants; e.g. *nuqa-q* [nɔqax] 'I-GEN (mine)', *qam-pa* ['qampa] 'you-GEN (yours)'. This allomorphy reflects an earlier *-pl-/pa* alternation still found in Quechua B/I Huanca (Huancayo Quechua; cf. Cerrón-Palomino 1976); e.g. *ya?pa-p* ['ja?ap] 'I-GEN (mine)', *am-pa* ['ampa] 'you-GEN (yours)'. Most other Quechua dialects have lost the short form and only use *-pa*.

As a rule, there is a one-to-one correspondence between form and meaning for each suffix. However, **portmanteau** suffixes do occur in the personal reference system of the verbs. An example from Quechua B/I is the suffix *-q* which indicates a 1st person subject acting upon a 2nd person object; e.g. Ancash Quechua *wiya-q* ['wijaq, 'wijaq] 'hear-1.SBJ&2.OBJ (I hear you)'. Also in the personal reference system, some suffixes can have a different function from their usual one when they occur in a particular combination; e.g. Ayacucho Quechua *riku-wa-n* [ri'kuwan] 'see-1.OBJ-3.SBJ (he sees me)', *riku-nčik* [ri'kuntšik] 'see-1+2.SBJ (we see him/it)', *riku-wa-nčik* [ri'ku'wantšik] 'see-3.SBJ&1+2.OBJ (he sees us)'. As the example shows, the meaning of the

suffix combination *-wa-nčik* cannot be predicted from that of the elements that make up the combination. On the other hand, it is definitely not possible to analyze *-wa-nčik* as one suffix, because the second element varies according to tense and mood (future tense *-wa-sun* [wasun], potential mood *-wa-čwan* [watʃwaŋ]). Another exception to the one-to-one relation between form and meaning is the fact that several suffixes can be used to convey one meaning. Tarma Quechua has three suffixes indicating plurality of a subject (or, occasionally, an object) in verbs; the choice is determined by the presence or absence of other suffixes in the verb form; e.g. *puri-ba:ku-n* [puri'ba:kun] 'walk-PL-3.SBJ (they walk)', *puri-rga-ya-n* [purir'gajan] 'walk-PL-PROG-3.SBJ (they are walking)', *puri-ra:ri-n* [puri'ra:rin] 'walk-PFV-PL-3.SBJ (they walked)'. The two last examples also show a different relative order of the pluralizers and the suffixes denoting progressive and perfective aspect. In these combinations, the affix order is rigid, and any deviation from it would be rejected by the speakers of Tarma Quechua.

Another morphological device frequently found in Quechua is root reduplication. It applies both to nouns and to verbs, but it remains restricted to expressive use. The reduplicated root can either be bare, or be accompanied by a suffix. In reduplicated verbs the second root is conjugated like any other verb whereas the first root remains invariable; e.g. Tarma Quechua *kaša kaša* [kaʃa'kaʃa] 'place full of thorny plants' (*kaša* 'thorny plant'); *tinka-y tinka-r* [tiŋka'i'tiŋkar] 'as with a snap of the finger' (*tinka-* 'to snap with the finger'). In the latter example, *-r* is a verbal subordinator; the element *-y* accompanies the first root in this particular type of reduplication which conveys the general meaning 'to act as if'.

Compounding is not a common process in Quechua. It is limited to certain expressions containing a substantive as their nucleus. In accordance with the general word order rules of the language, a modifier precedes its head also in compounds. Occasionally, combinations of co-ordinated substantives occur. As a rule, both constituents of a compound fully preserve their phonological characteristics (including word-stress). Therefore, the compositional character of the expressions at issue is questionable. Compound-like expressions are often place names (e.g. *aya-kuču* [aja'kutʃu] 'Ayacucho, corner of corpses').

### 3. Word-classes

Quechua morphology provides unambiguous criteria for a subdivision of the lexicon into verbs, nouns, particles, and interjections. The noun class can be further subdivided into substantives, adjectives, pronouns (demonstrative, interrogative, personal, indefinite), and numerals. The existence of a separate subclass of adverbs is doubtful because most adverbs are regularly derived from adjectives or verbs. In addition, the particles have an adverbial function. Some Quechua dialects have one or more postpositions (historically substantives), which play a role similar to that of the case suffixes except that they have the shape of a phonological word. Minor classes of interrogatives (*what? to do what? to say what?*) and deictics (*thus, to do so*) stand at right angles to the main word-class division.

The word-class division in Quechua rests upon the existence of three clearly distinct sets of suffixes. One of these sets is characteristic of the verb class, whereas a second one belongs to the noun class (and to a variable degree to each of its subclasses). Several verbal suffixes take care of the transposition of verbs to the noun-class, and there are nominal suffixes that verbalize nouns. The third set of suffixes has been known by different names, such as **independent suffixes**, **sentential suffixes**, **class-free suffixes**, or **enclitics**. It is closely linked to the organization of the sentence. Independent suffixes occur with verbs, nouns, and particles. The latter can take no other suffixes. With verbs and nouns, the verbal and nominal suffixes (if any) must be added first before independent suffixes can be attached. Interjections do not normally take any suffixes at all.

There are formal restrictions which set the verb class apart from the other classes. Verb roots always end in a vowel; they do not occur by themselves and must at the least be followed by one suffix that closes the verb form. Verbal suffixes must also end in a vowel except those that can occupy the closing position in a verb; e.g. in Ayacucho Quechua *l'amka-n* [ɿamkaŋ] 'work-3.SBJ (he works)', the suffix *-n* need not end in a vowel because it closes the verb form. All the intervening suffixes must end in a vowel, *-CV-* or *-CCV-* being the preferred shape for these suffixes; e.g. Ayacucho Quechua *l'amka-mu-n* [ɿam'kamun] 'work-THERE-3.SBJ (he works over there)', *l'amka-čka-n* [ɿam'katʃkan]

'work-PROG-3.SBJ (he is working)'. In contrast to verb roots, noun roots can end in a consonant, and they can be used by themselves without a suffix. Non-permitted consonant sequences are avoided by inserting the binding element *-ni-* (see 2 for examples). The small closed subclass of the independent pronouns is exceptional in that some of its members must be followed by a personal reference marker; e.g. Pacaraos Quechua *rapqa-yki* [rap'χaiki] 'both-poss.2 (both of you)'.

Unlike nominal and verbal suffixes, the independent suffixes never begin with a consonant cluster. In most dialects, the three validator suffixes, Ayacucho and Tarma Quechua *-m(-)/-mi* [m(i)] (first-hand knowledge), Ayacucho Quechua *-s(-)/-si* [s(i)], Tarma Quechua *-š(-)/-ši* [ʃ(i)] (hearsay), and Ayacucho Quechua *-č(-)/-ča* [tʃ(a)], Tarma Quechua *-č(-)/-či* [tʃ(i)] (conjecture) have different allomorphs according to whether there is an adjacent vowel or not. Independent suffixes can also begin with a vowel (see 2 for examples).

### 4. Personal reference

The Quechua personal reference system is a common component of both verbal and nominal morphology. It is essentially a four-term system based on the inclusion or non-inclusion of the speaker and the addressee. With substantives, personal reference markers identify a possessor; with verbs, they identify the subject and a human object, which can either be direct or indirect according to the meaning of the verb. As a rule, third person objects are not marked. The nominal possessor markers and the verbal subject markers are either identical (in Quechua B/I and Pacaraos Quechua) or partly similar (in Quechua A/II); e.g. the following paradigms of Tarma and Ayacucho Quechua *wata-* 'to tie', and Tarma Quechua *wayi*, Ayacucho Quechua *wasi* 'house': Tarma Quechua '1.SBJ' *wata-* [wa'ta:], '2.SBJ' *-nki* [wa'taŋki], '3.SBJ' *-n* ['watan], '1+2.SBJ' *-nči(k)* [wa'tantʃi(k)], Ayacucho Quechua '1.SBJ' *wata-ni* [wa'tani], '2.SBJ' *-nki* [wa'taŋki], '3.SBJ' *-n* ['watan], '1+2.SBJ' *-nčik* [wa'tantʃik]; Tarma Quechua 'POSS.1' *wayi-* [wa'ji:], 'POSS.2' *-gi* [wa'jigi], 'POSS.3' *-n* ['wajin], 'POSS.1+2' *-nči(k)* [wa'jintʃi(k)], Ayacucho Quechua 'POSS.1' *wasi-y* ['wasii], 'POSS.2' *-ki* [wa'siki], 'POSS.3' *-n* ['wasin], 'POSS.1+2' *wasi-nčik* [wa'sintʃik]. The verbal paradigm exemplified here is the unmarked (present) tense paradigm.

Personal reference suffixes may vary according to tense and mood. These variations are minor except for the future and the imperative paradigms, which have portmanteau suffixes indicating both tense/mood and person of subject. Nevertheless, the forms for '2.SBJ' future and '2.SBJ' present are identical, and the same holds for '1+2.SBJ' future and '1+2.SBJ' imperative. The future endings for Ayacucho Quechua are '1.SBJ' -*saq* [saχ], '2.SBJ' -*nki* [ŋki], '3.SBJ' -*nqa* [χa], '1+2.SBJ' -*sun* [suŋ], the imperative endings are '2.SBJ' -*y* [i], '3.SBJ' -*čun* [tʃuŋ], '1+2.SBJ' -*sun* [suŋ].

Except for marginal cases in the Quechua B/I dialects, person of object can only be indicated in combination with person of subject. The ending for '1.SBJ&2.OBJ' is a portmanteau suffix, -*q* [q, χ, x] in most of Quechua B/I, -*yki* [iki] in Quechua A/II. Apart from '1.SBJ&2.OBJ', combinations of suffixes, rather than portmanteau suffixes are used. For Ayacucho Quechua the combinations are '2.SBJ&1.OBJ' -*wa-nki* [waŋki], '3.SBJ&1.OBJ' -*wa-n* [waŋ], '3.SBJ&2.OBJ' -*sunki* [suŋki], and '3.SBJ&1+2.OBJ' -*wa-nčik* [wantʃik]. The first suffix remains unaltered, whereas the second one varies according to tense and mood; e.g. Ayacucho Quechua *yanapa-wa-y* [jana'pawai] 'help-1.OBJ-2.SBJ.IMP (help me!)'. The two suffixes need not be adjacent. They can be separated by other suffixes, e.g. Ayacucho Quechua *yanapa-wa-ptiki* [janapawap'tiki] 'help-1.OBJ-DS-2.SBJ (if you should help me)'. The suffix combinations referring to subject and object are also used with nominalized verbs. If only the subject is indicated, it is not always possible to distinguish the endings in question from the nominal possessor endings; e.g. Ayacucho Quechua *puñu-na-yki* [puñu'nałki] 'sleep-FUT.NR-2.SBJ (that you will sleep, you will have to sleep)', but also 'sleep-FUT.NR-POSS.2 (your means of sleeping, your bed)'.

The Ecuadorean-Colombian branch of Quechua A/II has a three-term rather than a four-term system of personal reference, the original 1st + 2nd person forms having taken the place of the 1st person plural. The morphological indication of the person of a possessor is no longer possible, and the possibilities of encoding person of object in the verb form are much reduced.

## 5. Pluralization

The suffixes which are used for personal reference can be accompanied by plural markers. Quechua dialects differ in their ways of indi-

cating the plurality of subject, object, and possessor. On the other hand, virtually all dialects share the pluralization of nouns and nominalized verbs by means of the suffix -*kuna*; e.g. Ayacucho Quechua *wasi-kuna* [wasi'kuna] 'house-PL (houses)', *pay-kuna* [paɪ'kuna] 'he/she-PL (they)'. Pluralization does not automatically apply to all plural entities. The emphasis is on the plurality of individual items.

The Quechua B/I dialects and Pacaraos Quechua indicate plurality of the subject by means of suffixes that precede the tense, mood, and person affixes; e.g. Pacaraos Quechua *ka-ri-rqa-yki* [karir'xałki] 'be-PL-PAST-2.SBJ (you people were)'. According to the dialect, there may be a single pluralizing suffix or several, as in Tarma Quechua (see 2). Portmanteau suffixes combining plural marking with another category occur as well; e.g. Pacaraos Quechua *ri-rka:ča-n* [rir'ka:t-ʂan] 'go-PL.PROG-3.SBJ (they are going)'. In a few contexts, the plural marker indicates plurality of object, rather than of subject; e.g. Tarma Quechua *čay-la-ta-m ni-ba:ku-x lapa-y-ta* [tʃař'latam ni'ba:kɔx la'paňta] 'that-ONLY-ACC-KNWL.VAL say-PL-1.SBJ&2.OBJ all-POSS.2-ACC (I say that to all of you)'. Plurality of possessor cannot be indicated by morphological means. The semantic difference between 1st person plus plural and 1st + 2nd person is that between an **exclusive** and an **inclusive** first person plural.

In most Quechua A/II dialects, plural of subject, object, and possessor is indicated by means of suffixes which follow the personal reference suffixes. Both the former and the latter can occur word-finally. The northern Quechua A/II dialects use -*kuna* [kuna] (Ecuadorian Highland Quechua), -*sapa* [sapa] (San Martín Quechua) (from \**sapa* 'each'), and -*žapa* [(d)ʒapa] (Cajamarca Quechua) (from \**l'apa* 'all'). The southern Quechua A/II dialects have developed an interesting system based on two pluralizers, one for second person (Ayacucho Quechua -*čik*, Cuzco Quechua -*čis*) and one for first and third person (-*ku*). The availability of these two markers allows number indication for either the subject or the object; e.g. *riku-wa-nki-ku* [rikuwaŋ'kiku] 'see-1.OBJ-2.SBJ-1.PL (you see us)', *riku-wa-nki-čik* [rikuwaŋ'kitʃik] 'see-1.OBJ-2.SBJ-2.PL (you people see me/us)'. Most dialects do not allow subject and object to be marked for plural simultaneously.

## 6. Tense and mood

All Quechua dialects distinguish several tenses in the verb system. The future tense exhibits a special conjugation (see 4) and refers to any activity after the moment of speaking. Past tense is indicated by a suffix *-rqa-* (Ancash, Ayacucho, Pacaraos, and Puno Quechua), *-rka-* (Ecuadorian Quechua) or *-ra-* (Ayacucho, Cuzco, and Tarma Quechua), followed by the personal endings of the unmarked (present) tense with slight allomorphic variation; e.g. Ayacucho Quechua *mikur(q)a-Ø* [mi'kur(χ)a] 'eat-PAST-3.SBJ (he ate)'. In Ayacucho Quechua, the allomorph for third person in the past tense is *-Ø*, not *-n*.

Many Quechua dialects distinguish a second past tense referring to an event of which the speaker or the protagonist in a narrative had not been aware of until the moment in focus (**sudden discovery tense**; cf. Adelaar 1977: 94–98). This tense is indicated by reflexes of *\*-ña(q)*, in Quechua B/I, or by the suffix *-sqa* [sχa, sqa] in Ayacucho and Cuzco Quechua; e.g. Quechua B/I San Pedro de Casas *čar-qas ka-ku-na-Ø alqu* ['tʃa:χa ka'kuna 'alχo] 'that-TOP be-CUST-SUDD-3.SBJ dog (that man had been a dog all along, so it turned out)'. Quechua B/I Ancash has a recent past tense formed with the affix *-rqu-*; e.g. *wiayarrqu-n* [wi'jarqoŋ] (Parker 1976: 109) 'hear-RECPST-3.SBJ (he has just heard)'.

Along with the synthetic tenses, compound tenses occur. As a rule, they consist of a nominalized verb form and the verb *ka-* [ka] 'to be'. Common to almost all dialects is the **habitual past**, which consists formally of 'to be' and the active nominalizer in *-q* [q, χ] (-x [x] in Ecuadorian and Tarma Quechua). As the 3rd person subject form of the verb 'to be' is normally suppressed, the pluralizing affix can be added directly to the nominalizer in Ayacucho Quechua; *rima-q-ku* [ri'maxku] 'speak-ACT.NR:HABIT-3.SBJ.PL (they used to speak)'. Some Northern and Central Peruvian dialects have additional compound tenses. These tenses have active meaning regardless of the semantic characteristics of the nominalized form underlying them. Pacaraos Quechua, for instance, has a **perfect tense** which indicates past experience or relevance to the present. It is formed on the basis of the participle in *-šqa* [ʃχa], which is normally passive when the verb base is transitive; e.g. *miku-šqa-m ka-'y* [mi'kusχam 'kai] 'eat-STAT.NR-KNWL.VAL be-1.SBJ (I have eaten it once, or: I have eaten, don't worry about feeding me)'.

Along with the indicative mood which may be considered to comprise the (mutually exclusive) tense categories treated so far, all Quechua dialects have an imperative mood (see 4) and a **potential mood** (also called **optative** or **conditional**). The latter is characterized by the presence of a suffix *-man*, which is added after the personal reference affixes of the unmarked tense with slight allomorphic variation. Many dialects have a special ending for 1st + 2nd potential, which may (or must) replace the expected suffix combination; e.g. Ayacucho Quechua *wañu-nčik-man* [wajnun'sčikman], *wañu-čwan* [wa'nutčwan] 'die-1+2.SBJ-POT (we could die)'. By adding the third person past tense form of the verb 'to be' a past potential is formed. It refers to a possibility in the past which did not materialize; e.g. Ayacucho Quechua *wañu-čwan kar(q)a-o* [wa'nutčwan] 'kar(χ)a] 'We could have died'.

## 7. Nominalization

Nominalization plays a central role both in Quechua morphology and in syntax. The nominalizing suffixes are mutually exclusive with the tense and mood suffixes and with the subordinating suffixes (see 8). They combine with personal reference markers (subject, object, and possessor) and with case affixes in the formation of different types of subordinate clauses. Most Quechua dialects have at least four nominalizers. Ayacucho Quechua, for instance, has an **infinitive** in *-y* [i] (*miku-y* ['mikuɪ] 'to eat'), an **active nominalizer** in *-q* [χ] (*miku-q* ['mikox] 'one who eats'), a **stative nominalizer** in *-sqa* [sχa] (*miku-sqa* [mi'kusχa] 'something eaten'), and a **future nominalizer** in *-na* [na] (*miku-na* [mi'kuna] 'something to be eaten, future eating'). In Ecuadorian Quechua the infinitive in *-y* has been replaced in most of its uses by *-na* (e.g. *miku-na* [mi'kuna] 'to eat'). As a rule, the infinitive refers to the activity denoted by the verb itself, the active nominalizer is co-referential with the subject of the underlying verb, and the stative and future nominalizers can refer to an object or to the fact that an event occurs. The difference between the stative and future nominalizers corresponds to that between accomplished and non-accomplished events. The future nominalizer, in particular, can also refer to place or means. Person of subject and person of object markers can co-occur with the stative and fu-

ture nominalizers. All nominalizers can take case markers.

A nominalizer *-nqa-* [ŋχ] (Tarma Quechua *-nxas-* [ŋχa]) is found in some of the Quechua B/I dialects and in Pacaraos Quechua. It is roughly equivalent to the stative nominalizer but must be combined with personal reference; e.g. Tarma Quechua *wa:ka pišta-nxa:* ['wa:ka pištan'xa:] 'cow slaughter-NR-1.SBJ (the cow I slaughtered), *wa:ka pišta-ša* [wa:ka piʃ'taʃa] 'cow slaughter-STAT.NR (the cow which was slaughtered)'.

## 8. Subordination

Along with the possibility of using nominalized verb forms for clause subordination, all Quechua dialects have a specific set of verbal subordinators. Subordinating affixes indicate that the verb in which they occur is subordinate to some other verb, and they identify the subject of a subordinate clause as the same or different in relation to the subject of the matrix clause (**switch-reference**). The **different subjects subordinator** is *-pti-* [pti] in most of Quechua B/I and in Ayacucho Quechua (*-qtis-* [χti] in Cuzco Quechua). It is obligatorily accompanied by personal reference markers including the object markers when relevant; e.g. Ayacucho Quechua *muna-su-pti-ki* [munasup'tiki] 'want-3.SBJ&2.OBJ-DS-2 (because she wants you)'. The **same subject subordinator** is *-r* [r, t] in most of Quechua B/I (-*l* [l] in Huancayo Quechua), it is *-špa* [ʃpa] or *-spa* [spa] in Quechua A/II and in Pacaraos Quechua. Ayacucho Quechua allows the redundant use of personal reference markers in combination with *-spa*. It has an additional marker for same subject and simultaneousness *-stin* [stiŋ], which is found in several Quechua B/I dialects as well.

The semantic relation between two clauses connected by a subordinator remains weakly specified. The context and the addition of independent or aspectual affixes are needed in order to distinguish between causal, concessive, conditional, and temporal clauses, all of which can contain a subordinator.

An interesting expansion of the switch-reference phenomenon is found in Ecuador. In Ecuadorean Highland Quechua (Imbabura Quechua), no person markers can be added to the different subjects affix *-(x)pi* [(x)pi], which remains distinct from its same subject counterpart *-špa* [ʃpa]. On the other hand,

purpose clauses are also marked for switch-reference, same subject being indicated by *-ngapax* [ŋgapax] (< \**nqa-paq*) and different subjects by the former 3rd person imperative suffix *-čun* [tʃun] (Cole 1982: 63 f.; Muysken 1977: 69–75).

## 9. Other verbal affixes

The verbal affixes which find their locus between the verb root on one hand, and the tense, mood, and person endings on the other, constitute the area in which Quechua morphology exhibits its greatest dialectal variety. These affixes are commonly referred to as **modal suffixes** or **(verbal) derivational suffixes**. Some affixes have the property of changing the syntactic valence of the verb base, whereas others introduce more or less important modifications to its meaning. In still other cases, the presence of a verbal affix serves a pragmatic purpose which often remains elusive. Characteristically, a single suffix may combine several of such uses according to the context in which it occurs. Idiomatic combinations of a verb root with a particular suffix are frequent. However, although some verbal affixes tend to participate in such combinations, others never do. Only the former can be considered to be truly derivational.

Combinations of affixes are frequent. The resulting sequences do not necessarily have the meaning that one would expect on the basis of the semantics of the affixes of which they consist.

Broadly speaking, the order in which the verbal affixes occur is fixed. For some parts of the affix inventory, however, the order of co-occurrence cannot be established easily. The semantic domain of an affix need not extend to the preceding base exclusively, it may also involve elements which follow the affix in question; e.g. in Tarma Quechua *maxa-čima-n* [maxa'čimaj] 'beat-CAUS-1.OBJ-3.SBJ (he makes me beat someone, he causes me to be beaten by someone)', ambiguity arises from the fact that the order *-či-ma-* is compulsory regardless of the hierarchy of the semantic elements involved in the combination. Nevertheless, affix order is relevant in the interplay of the causative suffix *-či-* with the reflexive *-ku-* and the reciprocal *-naku-*; Tarma Quechua *maxa-či-naku-n* [maxatʃi'nakun] 'they make each other beat', *maxa-naka-či-n* [maxana'katsin] 'he makes them beat each

other' (*-naku-* is modified to *-naka-* before *-či-*; cf. 2).

Verbal affixes that occur in most Quechua dialects (here given in their Ayacucho Quechua form) are *-či-* [tʃi] 'causation, permission'; *-ku-* [ku] 'reflexive, characteristic behaviour'; *-l'a-* [ka] 'just, only, politeness'; *-mu-* [mu] 'motion towards the speaker, non-motion over there'; *-naya-* [naja] (Quechua B/I *-na(:*)- [na(:)] 'physical need (used in an impersonal construction)'; *-pa-* [pa] 'repetition, action directed towards a non-characteristic object'; *-pu-* [pu] 'on behalf of a person marked as the object' (Cuzco Quechua also: 'return to former location'); *-raya-* [raja] (Quechua B/I *-ra(:*)- [ra(:)] 'continuous event or state'; *-ri-* [ri] 'inchoative, temporary change of state'; *-(y)kača-* [(i)kača] (Quechua B/I *-(y)kača(:*)- [(i)kača(:)]); *-ysi-[isi]* (Quechua B/I *-wši-* [üʃi]) 'to accompany or help with an action'. Equally widespread are the pseudo-sequences *-naku-* [naku] 'reciprocal' and *-paku-* [paku] 'taking advantage of the situation'. Many Quechua B/I dialects also have a suffix *-ka(:*)- [ka(:)] for 'potential passive or non-controlled action'. Ecuadorian Quechua and 16th century varieties of Quechua A/II have a passivizer *-ytuku-[ítuku]*. Most Quechua dialects lack a genuine passivizing element.

Aspect suffixes usually include a progressive aspect marker, Ayacucho Quechua *-čka-* [tʃka] (Cuzco Quechua *-sya-* [ʃa], Bolivian Quechua *-sa-* [sa]). In Quechua B/I the progressive marker is *-yka(:*)- [ika(:)] (Ancash and Pacaraos Quechua) or *-ya(:*)- [ja(:)] (Huancayo and Tarma Quechua). Ecuadorian Quechua has reflexes of *-ku-* [ku, xu] for progressive. Some of the Quechua B/I dialects have developed more elaborate aspect systems, involving a perfective aspect marker as well (Pacaraos Quechua *-rqu-* [r̥ʃ], Tarma Quechua *-ru-* [ru], Huancayo Quechua *-?l(u)-* [?(lu)], *-?l(u)-* [?(lu)], Eastern Ancash Quechua *-ski-* [ski]).

A set of four **directional** suffixes can be reconstructed for Quechua B/I. Only two of them, *-rku-* [rku] 'upwards' and *-rpu-* [rpu] 'downwards', have preserved their original meaning productively. The other two directional suffixes, *\*-rqu-* 'outwards' and *\*-yku-* 'inwards', occur both in Quechua B/I and in Quechua A/II, but are limited to petrified root-suffix combinations (e.g. Ayacucho Quechua *yayku-* [jaiku] 'to go in', Ancash Quechua *yarqu-* [jarqɔ] 'to go out'). As productive suffixes, they have survived with a

wide array of different meanings and uses; e.g. the reflexes of *\*-rqu-* indicate urgency (Ayacucho and Cuzco Quechua), recent past (Ancash Quechua), and perfective aspect (Huancayo, Pacaraos, and Tarma Quechua).

## 10. Case and other nominal affixes

Nominal suffixes include personal reference (cf. 4), number (cf. 5), and case markers. Other affixes are verbalizers (Ayacucho Quechua *-ča-* [tʃa] 'to make', *-ya-* [ja] 'to become') and suffixes indicating possession (Ayacucho Quechua *-yuq* [ʃɔχ] 'owner of', *-sapa* [sapa] 'rich in') and inclusion *-ntin* [ntin] 'including'. A very frequent suffix is *-l'a* [ka]. It indicates restriction ('just, only') or politeness (see 9 for its verbal counterpart). A diminutive suffix *-ča* [tʃa] is common in southern Quechua A/II.

The number of case suffixes is limited. The spatial relations conveyed by the case suffixes are 'location without a direction' (locative *-pi* [pi] in Quechua A/II, *-čaw* [tʃaú] or reflexes of *\*-čaw* in Pacaraos Quechua and Quechua B/I), 'direction towards' (allative *-man* [man]), 'direction away from' (ablative *-manta* [manta] in Quechua A/II, *-pita* [pita] in Quechua B/I, *-piq(ta)* or reflexes of *\*-piq(ta)* are found in Pacaraos Quechua [pɛχ(ta)], in Huancayo Quechua [pi?(ta), pi:(ta)]), and 'until, up to' (limitative *-kama* [kama]). The concept 'through' is indicated in different ways. Quechua B/I dialects often use the genitive case marker *-pa*; in Ayacucho Quechua and other Quechua A/II dialects the combination *-n-ta* 'POSS.3-ACC' obtains. As in other Amerindian languages, spatial relations can be specified more explicitly by means of syntactic constructions involving nouns referring to parts of the body.

Least well defined in its semantics is the accusative case marker *-ta* [ta] (historically, in Huancayo and Pacaraos Quechua *-(k)ta* [(k)ta]). It indicates a direct object or a deliberately selected fixed goal. It is also used in Quechua A/II dialects for marking adjectives that are used adverbially.

The genitive case marker is *-pa* [pa] in most dialects, whereas some (Cuzco and Huancayo Quechua) preserve reflexes of the historical alternation *-pl-pa*. Possessive constructions are formed by marking the possessor noun for genitive case and the possessed noun for person of possessor; e.g. Tarma Quechua *atux-ba nawi-n* [a'tɔxbə 'nawin]

'fox-GEN eye-POSS.3 (the fox's eyes)'. The benefactive case marker *-paq* [paq, pay] is formally akin to the genitive suffix. Although the two are kept apart in most dialects, Ecuadorian Quechua and the 16th century Lengua General use reflexes of *-paq*, along with *-pa*, for the genitive.

The last important case marker to be mentioned here is *-wan* [waŋ]. It denotes instrumental and comitative case, and it is also used as a noun co-ordinator.

Further case markers are *-rayku* [raiku] 'for the sake of' and *-pura* [pura] 'among'.

Combinations of case markers are mainly those involving genitive *-pa* and instrumental *-wan*; e.g. Ayacucho Quechua *ñuqa-pa-ta* [nɔχa'pata] 'I-GEN-ACC (affecting mine, to my place)', *ñuqa-ta-wan* [nɔχa'tawan] 'I-ACC-INSTR (and to me, to me as well)'. Case markers must follow the person and number markers on the noun. They are added to the last noun in a noun phrase, which need not be the head noun; e.g. Tarma Quechua *rigabaku-ra-o ača išgi-mu-x-ta* [zigaba:'kura 'atʃa išgi'moxta] 'see-PL-PAST-3.SBJ star fall-HIT-ACT.NR-ACC (they saw a star falling down)'.

## 11. Independent suffixes

The independent suffixes belong to the domain of morphology inasmuch they form a phonological unit with the word to which they are affixed. Their regular locus is at the end of a sentence constituent (that is, at the end of a noun phrase, at the end of a subordinate clause, or after any word which is not part of one of these entities). Among the independent suffixes are the **validators**, which indicate **data source** (see 2 and 3 for the formal characteristics of these suffixes and an inventory). The independent suffix *-ču* [tsu] marks both yes-no questions and negative sentences. In the latter case it must be accompanied by a negation particle; e.g. Tarma Quechua *mana-m muna-n-ču* ['manam mu'nantsu] 'not-KNWL.VAL want-3.SBJ-NEG (he does not want it)'. The Ancash and Huancayo Quechua dialects keep the two functions apart formally as well (Ancash Quechua has interrogative *-ku* [ku] and negative *-cu* [tsu]).

Other independent suffixes are the topic marker *-qa* [qa, χa], *-pas* [pas] or *-pis* [pis] 'also' (in Quechua B/I also *-si* [si]), *-raq* [raq, ray] 'still, first' and *-taq* [taq, tax] 'and, on the other hand'. Ayacucho Quechua and several other dialects also have *-ña* [na] 'already' (-na

[na] in Ancash Quechua). Most independent suffixes have a special meaning when added to interrogative pronouns (or verbs).

## 12. Contact phenomena

The Quechua language has a rich history of contact situations both of early and recent date. At least two mixed languages that are presently in use combine Quechua morphology with the lexicon of another language. These are the Media Lengua of the Ecuadorian Highlands (Muysken 1979) and the language of the Callahuaya herb doctors of the Charazani area in Bolivia. The lexical basis of the Media Lengua is Spanish, whereas a dialect of the extinct Puquina language provided most of the lexicon for Callahuaya; e.g. Media Lengua *inki-da azi-ngi* [in'kida a'zingi] (Muysken 1979:44), Ecuadorian Highland Quechua (Salcedo) *ima-da ura-ngi* [i'mada u'rangi] 'what-ACC do-2.SBJ (what do you do?)', Spanish *en qué* 'in what', *hacer* 'to do'; Callahuaya (Girault 1989:140) *nisi seka-ku-y-man*, Cuzco Quechua *nuqa yača-ku-y-man* ['nɔqa jača'ku'man] 'I learn-REFL-1.SBJ-POT (I could learn it)'.

The morphological parallelism which exists between Quechua and the Aymaran languages must be attributed to long-standing contacts. Most Quechua suffixes have Aymaran counterparts, which are similar in meaning and use, although in the majority of cases there is no formal resemblance. The four-person system, the sudden discovery tense and data source, which are now so characteristic of Quechua, may have been copied from Aymaran at an early moment.

Aymara verbal suffixes without a counterpart in Quechua A/II were borrowed by Quechua dialects of the Puno and Arequipa region. Within certain limits, these suffixes maintain the phonological and morphophonemic characteristics which they had in Aymara, such as the presence of ejectives and aspirated consonants and the elimination of a preceding vowel; e.g. *tiy-t<sup>h</sup>api-či-n* [tiit<sup>h</sup>a'pitʃiŋ] 'stay-TOGETHER-CAUS-3.SBJ (he allows them to stay together)'. In this example, the Aymara suffix *-t<sup>h</sup>api-* has no counterpart in other Quechua dialects. It causes the loss of the final vowel of the root *tiya-* 'sit, stay', a frequent phenomenon in Aymara but highly exotic from a Quechua point of view.

### 13. Illustrative texts

The following text fragments exemplify a Quechua A/II dialect (Ayacucho) and a Quechua B/I dialect (Tarma).

- (1) Ayacucho Quechua (from Meneses et al. 1974: 117):

#### Explanatory notes:

- (1) *-sqa-* indicates both narrative past and sudden discovery tense;
- (2) the combination *-na-.kama* (future nominalizer + limitative case) is interpreted as 'while, as long as, until';
- (3) *-ñ-a-taq* means 'but, on the other hand' (contrast with preceding sentence);
- (4) after another case suffix *-kama* means 'exclusively, each time' (here: 'all along, always further');
- (5) the combination *-na-.paq* (future nominalizer + benefactive case) refers to a purpose ('in order to');
- (6) the meaning of the (former) directional suffix *-yku-* (glossed 'intensive') is 'carefully, thoroughly, well';
- (7) the sole function of the demonstrative pronoun *čay* is to carry the independent suffix *-raq* 'still, first'; the expression *čay-l'a-raq* is to be translated as 'only just then, not before';
- (8) the literal meaning of *wiqi ñawi-ntin* is 'including tearful eyes'.

'One day a little boy called Tomás went to the mountains herding lambs and his little cow. But, while he was playing in the mountains, the cow had gone all the way down the ravine and disappeared. The boy was not aware of this. When he went to look for her in order to drive her home, she was not there. Only then did he follow her footprints with tears in his eyes, crying.'

- (2) Tarma Quechua (from Adelaar 1977: 362–365):

#### Explanatory notes:

- (1) the suffix *-rgu-* (originally a directional) is used in combination with the subordinator *-r* for indicating an immediate succession of events (glossed ‘sequential’);
- (2) the combination *xita-yu-* (from \**hita-* ‘to throw’ and the directional suffix \**-yku-*) means ‘to lie down’; the final vowel in *xita-ya-* has been lowered under the influence of the pluralizing suffix *-ri-*;
- (3) the suffix *-(ga)sga* (from \**-(ka)ska*) means ‘somewhat more’;
- (4) *-tbi-* is a local variant of the switch-reference marker *-pti-*;
- (5) the combination *yača-ka(:)-* (from *yača-* ‘to learn’ and *-ka(:)-* ‘non-control’) has the meaning ‘to get used to’; its verbal complement (*miku-y-ta*) is marked for infinitive + accusative case;
- (6) note the co-occurrence of perfective aspect and habitual past in *wina-ru-x.*

‘After giving birth, they would dig a pit in the ground. After digging that pit in the ground, they would lay woollen pelts in it. Their children used to be kept in that pit, while rolling about. Every twenty-four hours they would be suckled. Later on, when they were growing a little bigger ..., as soon as they had got used to eating ..., when they were big already, they would be put in a larger pit.’

8. References

### 1. Introduction

Yagua is a VSO language of northeastern Peru spoken by some 3,000 people along the Napo, Amazon, and Yavarí rivers and their tributaries. Dialect differences are largely limited to phonetics and phonology, with very few morphological and syntactic differences. Due to extensive migrations (Chaumeil 1981), differences likely cannot be keyed to geographical areas. Yaguas will sometimes try to pass themselves off as *Mestizos* due to long-standing downgrading of the indigenous groups. Except when integrated into *Mestizo* villages, the Yagua live in villages of from one to 20 families (cf. P. Powlison 1985 for ethnographic information, which supersedes Fejos 1943). As of the early 1980's, Thomas Payne (p.c.) estimated that 75% of women and 25% of men were monolingual in Yagua. Spanish proficiency varies; we have observed a few instances of probable semilingualism stemming from the desire of Yagua-speaking

parents to have their children speak only Spanish.

Yagua is the only remaining Peba-Yaguan language. Previously there were at least two others: Yameo (Espinosa Pérez 1955) and Peba (Rivet 1911). Data on these other languages are not extensive, limited largely to word lists, some simple constructions, and short translated examples. All data on Yagua in this article are from fieldwork done by Thomas Payne and myself, and from a superb text collection compiled by Paul Powlison.

The practical Yagua orthography used here has the standard phonetic values with the following exceptions. Orthographic *j* = /h/, *v* = /w/, *c* and *qu* = /k/. There is a phonemic nasal-oral contrast for vowels. Nasal vowels are indicated by a hook below the letter, except that in order to reduce the number of diacritics which must be written, a different strategy is adopted following nasal consonants: orthographic *b* and *d* represent orally-released allophones of /m/ and /n/; vowels are phonemically nasal after *m* and *n*, and phonemically oral after *b* and *d*. Yagua has either a pitch-accent or tone system, which has never been properly analyzed. In this work I endeavor to indicate phonetic high pitch by the acute accent, and low by no marking over the vowel. Further details on phonology and

phonological processes are found in E. Powlison (1971), P. Powlison (1962), D. Payne (1990 a), T. Payne (1983), and Payne & Payne (1990). (Throughout the running text of this chapter, paradigms of Yagua morphemes are indicated in small capital letters, while individual members of a paradigm are glossed in single quotes.)

## 2. Morphological typology

Yagua is almost exclusively **suffixing**. Just one old **prefix** formative *va-* occurs in a number of abstract nouns: *vánuquh* ‘heat’, *vándú* ‘clearness’ (cf. Payne & Payne 1990: 449–451), and possibly also in the nouns *vánu* ‘male, man’, *váturá* ‘woman without children’. Set I **proclitics** indicate subjects of verbs, objects of postpositions, and possessors of nouns. Otherwise there are absolutely no prefixes.

Yagua is **polysynthetic** in the sense that the average verb in running text consists of three to four morphemes, though an attempt to establish position classes yields approximately thirteen positions in the verb. There is some verb compounding with serial-like semantics. Some suffixes most certainly derive from old roots and one could argue that there is both verb and noun compounding. Productive noun incorporation does not occur.

It is **agglutinative** in that within a word it is possible to tell where one morpheme ends and the next begins. However, there is some nasal spreading and vowels and the glide /y/ can affect vowels in contiguous morphemes. P. Powlison (1962) has also described a **metathesis** process between morpheme-final /y/ and any immediately following consonant. However, when the following consonant is coronal, one could argue that palatalization occurs rather than metathesis. Also, /y/ plus /w/ result in the bilabial fricative [β]. When it is phrase-final, /y/ is almost inaudible; it is not that it is voiceless, but there is hardly any closure to the point where a nonnative speaker may completely miss the /y/. It clearly surfaces, however, if any morpheme follows.

## 3. Word classes

Nouns and verbs are the major word classes in Yagua. There are a few adverbs and probably not more than one to three adjectives. There are a multitude of postpositions, but

most transparently derive from nouns. There is also a pronoun or clitic class.

The **pronoun/clitic** class divides into three subclasses depending on whether the form is prefical (Set I), suffixed (Set II), or free. Across all three sets the forms are segmentally identical with just two exceptions (pitch or tone may also vary among the three sets). For example, *ráy* is the free 1<sup>st</sup> person singular pronoun used in emphatic contrastive contexts. *Ray-* is the bound Set I proclitic which occurs on verbs and auxiliaries to indicate subject, on postpositions, and on nouns to indicate possessor. The **enclitic** *-ráy* indicates objects of transitive verbs. The enclitic attaches to whatever immediately precedes the lexical object. When there is no lexical object noun phrase, the same enclitic most neutrally attaches to the end of the sentence. Only for animate 3<sup>rd</sup> person singular is there segmental variation: the free and enclitic 3.SG animate (hereafter just ‘3.SG’) forms are *níil* /-níi/, while the proclitic form is *sa-*; the proclitic coreferential form is *jíiy-* and the enclitic form is *-yu*.

Semantically, the pronouns/clitics distinguish 1<sup>st</sup>, 2<sup>nd</sup>, 3<sup>rd</sup> animate, 3<sup>rd</sup> inanimate, and coreferential persons; **singular**, **dual** and **plural** for all **animate** persons; and **inclusive** and **exclusive** for 1<sup>st</sup> person dual and plural. The **coreferential** forms do not occur with first and second persons. The dual forms indicate semantic duality, but the 2<sup>nd</sup> and 3<sup>rd</sup> person forms are also used for singular females who have given birth (which can be specified as singular by the numeral *tíquii* ‘one’).

Diachronically the proclitics are on their way to reanalysis as inflectional agreement in that whenever a lexical noun phrase follows the head of the phrase (whether it be a verb, possessed noun, or adposition), a coreferential Set I form must be prefixed to the head. For example, all the following occur: *vánu rooríy* ‘the man’s house’, *sa-rooríy* ‘his/her house’, *sa-rooríy vánu* ‘the man’s house’, but \**rooríy vánu* (cf. T. Payne 1993; D. Payne 1986 a; and Everett 1989 for discussion of alternative orders). *Rooríy* can be translated as ‘house’, but it most centrally refers to a (traditional) home thatched with palm to the ground and now modernly to the roof of a house thatched with palm fronds.

- (1) (a) *raryooríy*  
*ray-rooríy*  
1.SG-house  
‘my house’

- (b) *vüyüyooríy*

3.PL-manioc.beer  
'their (more than 2 people's) manioc beer'
- (d) *ra-buyqa*  
INAN-manioc.beer  
'it's manioc beer'
- (e) *sanááyqa jibuyaq*  
*sa-nááyqa jíy-buyqa*  
3.SG-stomp COREF-manioc.beer  
'She/he stomps her/his own manioc beer.'

**Nouns** cannot take the large range of verbal suffixes, but can take Set I proclitics to indicate possession. Further, noun phrases can be suffixed with postpositions as in *Tomásaroorí-mu* 'at Tom's house'. Compound nouns function as a single word phonologically

(shown by /y/ metathesis and vowel assimilations). This is most certainly the process whereby bound CLASSIFIERS have arisen (cf. 4).

**Adjectives** cannot take verbal suffixes or Set I proclitics marking possession. They can directly modify nouns but not verbs. They cannot function as a subject or object phrase syntactically, or as the object of a postposition. By these criteria the only clear adjective found in Yagua to-date is *jáámu* 'big' and perhaps *jápuu* 'small'. *Pásiy* 'small' has some nominal properties in that it can directly take postpositions. *Sámiy* 'good, well' can without further affixation modify nouns and verbs, and thus it has more adverbial properties. Other semantic concepts that would be expressed by syntactic adjectives in English are usually expressed by abstract nouns in Yagua, or else by suffixing CLASSIFIERS to the noun, which modify the noun by adding features of size, shape, function, constituting material, etc. Most postpositions derive from nouns and can be compounded, as in *sa-jutunuváá-ramurya-mu-siy* '3.SG-neck-end-LOC-ABL (from the end of his neck)'.

**Adverbs** do not take Set I clitics or verbal suffixes, but without further affixation can modify verbs. They include *sámiy* 'good, well', *munátya* 'first', *mítya* 'just', *jááriy* 'really'.

Morphologically, **verbs** are the most complex word class in Yagua, and with addition of a Set I proclitic to indicate the subject of the clause readily function as the sole element of a clause.

#### 4. Morphology of nouns

A noun root or stem can take suffixes in the following linear order: CLASSIFIER<sup>n</sup>, CONDITION SIZE QUANTITY. All except perhaps the QUANTITY suffix would be considered derivational. More than one CLASSIFIER can occur, as in:

- (4) *roorijyúdaypoóquñmíy*  
*rooriy-ju-day-poo-quñ-miy*  
house-CL.opening-CL.patch-CONDITION.rotting-SIZE.big-QUANTITY.PL  
'the several tall and rotting house doors'

Nouns with so many suffixes are infrequent, but they are completely natural.

##### 4.1. Inflectional morphology on nouns

If the Set I proclitics are viewed as inflectional, then Yagua nouns can be said to inflect for possessor. But Yagua nouns do not

have any obligatory inflections. They can optionally take QUANTITY suffixes such as *-juy* ‘dual’, *-miy* ‘plural’, *-vay* ‘plural’, *-ju* ‘heap of’, *-súma* ‘very’ which indicates augmentation as in *vánda-quíi-súma* ‘heat-SIZE.big-QUANTITY.very (light that extends a lot (e.g., from the sun))’. Dual suffixes are most frequently employed to indicate the status of a female who has given birth, rather than literal dual number. At least dual affixes can be considered inflectional, not because number must be specified (it need not be), but because they reflect lexically-specified features of the noun which are also reflected elsewhere in the clause (D. Payne 1990 a), just as masculine or feminine gender is an inherent lexical feature of nouns in Spanish. This can be seen from the behavior of CLASSIFIERS. This lexical number feature is also reflected in the clause by any clitic or pronoun element that refers to the referent.

Numerals and demonstratives must be inflected with CLASSIFIERS in order to be complete word forms. Once so inflected, they are syntactically nominal and can either occur with another noun, or can function almost pronominally as the only element in a noun phrase.

There are over 40 classifiers (D. Payne 1986 b; Powlison & Powlison 1958; cf. Art. 97). Animate CLASSIFIERS distinguish singular, dual, and plural number: *-nu*, *-nuuy*, *-vay*, respectively. Inanimate ones distinguish features such as 1, 2 and 3-dimensional shape, square vs. round, flexible vs. rigid, function, arrangement, and a number of unique items. The general CLASSIFIER *-ra* most often refers to inanimates, but can be used for animates as in *dee-ra* ‘DIM-CL (little one)’. Synchronously one could argue that CLASSIFIERS are infixated to the numerals ‘one’ through ‘four’ and numerals formed on the basis of them, and suffixed to other numerals. However, ‘two’ and ‘three’ transparently end in the dual and plural suffixes *-juy* and *-miy*.

Inflected demonstratives can also take the QUANTITY suffixes: *ru-nu-juy dapúuy-nuuy* ‘that-CL.ANIM.SG-DU hunt-CL.ANIM.DU (those two hunters)’. The demonstrative *ru* is inflected with *-nu* singular, reflecting the lexically specified number of the lexeme HUNTER. The dual CLASSIFIER *-nuuy* on *dapúuy* is not required as an inflection, but serves to derive a noun from a verb root (cf. 4.2). Similarly, *tá-nuuy-quH* ‘one-CL.ANIM.DU-one’ mixes the dual CLASSIFIER with the semantically singular

numeral ‘one’, as for example when the dual lexeme *váturuy* ‘woman who has borne children’ is being counted.

#### 4.2. Derivational morphology on nouns

Nouns can contain either an inherently nominal root (see (1), (3)), or in some restricted cases be prefixed with the formative *va-*. Or they can productively be derived from verb roots by adding a CLASSIFIER (see (2)), the infinitive *-janul-jada* (homophonous with the distant past tense suffix) as in *ramuchoonu* from *ramuchu-janu* ‘swallow-INF’, or one of several other suffixes (Payne & Payne 1990).

CLASSIFIERS also occur on stems that are already nominal in order to derive particular senses, as in *rooriy-ju-day* ‘house-CL.opening-CL.patch (door)’.

Yagua CLASSIFIERS thus cannot be specified as exclusively inflectional or derivational (D. Payne 1985 a; 1990 a). Rather, there is one set of some 40 forms that in some contexts functions inflectionally, but in other contexts functions derivationally. Inflection and derivation are thus best viewed as functions, and not as features inherent to particular morphemes (cf. Art. 38).

CONDITION and SIZE suffixes surely derive from lexical roots and have possibly developed historically from processes of incorporation, though incorporation of nouns into verbs is not synchronically viable. For example, the CONDITION affix *-poo* ‘rotting’ in (4) corresponds to the verb *poo* ‘rot’. The diminutive SIZE suffix *-dee* is found as an apparent root in the nouns *deenu* ‘boy’ and *deetu* ‘girl’ where *-nu* would appear to be the animate singular CLASSIFIER, but *-tu* does not function as a classifier (i.e., it does not inflect numerals and demonstratives). However, the form *dee* alone does not function as a noun.

### 5. Morphology of verbs

Although the verb is the most complex word class in Yagua, the ‘internal syntax’ of Yagua verbs is still not as complex as that of Mai-puran Arawakan, Panoan, or Athabaskan verbs (D. Payne 1985 c). Somewhere between 10 and 13 position classes could roughly be posited, but a strict position class approach is impossible. Further, although grammatical, it is quite uncommon for more than four affixes to occur on a verb. Morpho-semantically, a first approximation of affix order is:

- (5) ROOT-TRANSITIVITY-LOCATION-BOUNDED.MOVEMENT-COMPLETIVE-ITERATION-IMPERFECTIVITY-MODAL-TENSE

### 5.1. Postbases

A strict position class approach is impossible because of the behavior of **postbase** suffixes such as *-tániy* ‘causative’, *-rúy* ‘potential/desiderative’, the UNBOUNDED MOVEMENT suffix *-nayqa* ‘going all over’, and possibly the ‘completive’ *-muuy*. Postbases create new layers of structure, and do not constitute a single paradigm. Certain other suffixes and postbases themselves can have scope over (i) an inner structural layer established just by a root or stem, (ii) over a layer created by a postbase, or (iii) over both. Linear order in such cases generally depends on semantics. When there are differences in interpretation, the suffix to the right has wider scope:

- (6) *Saquivúchurúmyuuyanu.*

*sa-quivúy-su-rúy-muuy-janu*  
3.SG-deceive-TRR<sub>1</sub>-POT-COMPL-PAST<sub>3</sub>  
'She/he stopped wanting to deceive (someone) long ago.'

- (7) *Suumiiryútyánimyuuryúñii.*

*sa-jimiyi-rúy-tániy-muuy-rúy-níi*  
3.SG-eat-POT-CAUS-COMPL-POT-3.SG  
'She/he thinks that she/he should finish making her/him eat everything.' (lit. 'She/he wants to finish making her/him want to eat.') [Thus she/he will eat everything.]

It is thus impossible to account for affix order by fixed position classes. Rather, the following overall structure is likely (D. Payne 1990 b):

- (8) [[[STEM]-STEM.SUFFIX]-POSTBASE-POSTBASE.SUFFIX]-CLAUSAL.SCOPE.SUFFIX]

In (8), the stem suffixes and the posbase suffixes are comprised by the same paradigms, while suffixes within the verb stem (TRANSITIVITY suffixes discussed in 5.3) and those which have clausal scope, such as TENSE, are distinct.

*-Rúy* is related to the verb root *nirúy* ‘desire’. The suffix ranges in meaning from ‘desire to’, ‘want to’, ‘be able to’, ‘can’, and possibly ‘think’. Although it does not have a fixed position, it must precede IMPERFECTIVITY and preferably precedes UNBOUNDED MOVEMENT suffixes:

- (9) *Suumiiryútyítiiy.*

*sa-jimiyi-rúy-títiy*  
3.SG-eat-POT-GOING.DIRECTLY  
'She/he wants to eat going along.'

- (10) *?Suumiityítyiiryúy.*

Depending on placement of *-tániy*, scope of causation may change. The verb root plus suffixes to the left of *-tániy* are predicated of the causee. In general, *-tániy* plus suffixes to its right are predicated of the causer:

- (11) *Suumnaatyánñii Mario.*

*sa-júnaay-tániy-níi*  
3.SG-cry-CAUS-3.SG Mario  
'She/he makes Mario cry.'

- (12) *Suumnaamyuutyánñii Mario.*

*Sa-júnaay-muuy-tániy-níi*  
3.SG-cry-COMPL-CAUS-3.SG Mario  
'She/he makes Mario stop crying.'

- (13) *Suumnaatyánimyuunñii Mario.*

*sa-júnaay-tániy-muuy-níi*  
3.SG-cry-CAUS-COMPL-3.SG Mario  
'She/he stops making Mario cry.'

In (14) *-naayqa* has scope over both causing and wanting to cry and is predicated of both participants. In (15) the causee is going all over, while the causer need not be; (16) and (17) are similar.

- (14) *Suumnaaryútyáineyqaníi.*

*sa-júnaay-rúy-tániy-naayqa-níi*  
3.SG-cry-POT-CAUS-GOING.AIMLESSLY-3.SG  
'She/he makes him/her want to cry while travelling.' (Apparently both participants are travelling together.)

- (15) *Sarupiíneyqatánñii.*

*sa-rupiíy-naayqa-tániy-níi*  
3.SG-walk-GOING.AIMLESSLY-CAUS-3.SG  
'She/he makes him/her walk all over.'

- (16) *Saraqyqatáninuvñii.*

*sa-raqy-yaq-tániy-nuvñ-níi*  
3.SG-jump-DISTR-CAUS-ON.ARRIVAL.HERE-3.SG  
'She/he makes him/her dance upon arrival here.' (Whose arrival is not specified; perhaps both are arriving together.)

- (17) *Saraqyqanuvñtánñii.*

*sa-raqy-yaq-nuvñ-tániy-níi*  
3.SG-jump-DISTR-ON.ARRIVAL.HERE-CAUS-3.SG  
'She/he makes him/her come here to dance.'

The UNBOUNDED MOVEMENT suffix *-nayqa* possibly derives from *nááya* ‘to press, stomp’.

It contrasts semantically with *-tityiiy* ‘going directly’. However, *-tityiiy* is more fixed in position than *-nayqq* and thus it is less clear that *-tityiiy* should be considered a postbase.

### 5.2. Inflectional morphology

TENSE suffixes are inflectional in that either an overt TENSE suffix or zero is required on any finite verb. Zero is meaningful and thus part of the paradigm. This is not true for absence of IMPERFECTIVITY, COMPLETIVE, MOVEMENT, LOCATION, ITERATION, and suffixes of other categories. TENSE suffixes are always final (though clitics may follow TENSE).

Six distinctions in time reference are made by verb suffixes. Zero indicates non-past (present/future) and is used for the ‘historical present’ when past time is clearly set at the beginning of a text or episode. Future is differentiated from present or historical present by the irrealis auxiliary *a* (which is also used for relative future set in the past).

There are two proximate TENSES. Most neutrally *-jásiy* ‘PROX<sub>1</sub>’ indicates time earlier on the same day; *-jáy* ‘PROX<sub>2</sub>’ indicates time about one day ago. When used with the irrealis auxiliary, however, these affixes convey modal meanings in the future.

There are three past TENSES: *-siy* ‘up to a few weeks ago’, *-tiy* ‘from a few months to a year ago’, and *-jada* (dialect variant *-janu*) ‘distant’ or ‘legendary’ past time. Interpretation of the precise time indicated by each past TENSE morpheme is variable.

### 5.3. Derivational morphology on verbs

TRANSITIVITY suffixes occur within the STEM portion in (8) (D. Payne 1985 b). These change valence or the intensity of an action. Occasionally they derive verbs from nouns. With the exception of the ‘instrumental’ applicative *-ta*, they are highly restricted in terms of what verb roots they may co-occur and are idiosyncratic in meaning. The suffix *-vay* ‘intensity’ can derive a verb with a Theme role. Compare: *sa-jáy* ‘3.SG-father (his/her father)’ vs. *Rd-jáy-vey* ‘INAN-mature-INTS (It grows.)’. The suffix *-su* adds an Actor role or can derive a verb from a noun by adding both Theme and Actor: *Sajáq-vyechuníi* from *sa-jáy-vay-su-níi* ‘3.SG-mature-INTS-TRR<sub>1</sub>-3.SG (He caused him to grow.)’ The suffix *-nu* is similar to *-su*: *vátajú* ‘wound (noun)’ vs. *Sa-vátajú-nu-níi* (3.SG-wound-TRR<sub>2</sub>-3.SG) ‘She/he wounds him/her.’

The applicative *-ta* corresponds to the ‘instrumental’ (or ‘comitative’) postposition *-ta*:

- (18) *Sijchitiñíi*      *quiivá* *quiichitya*.  
*sa-jichitiy-níi*      *quiichity-ta*  
 3.SG-poke-3.SG fish knife-INST  
 ‘She/he pokes the fish with the knife.’
- (19) *Sijchitityara*      *jumurutágníi*.  
*sa-jichitiy-ta-ra*      *jumuru-táqá-níi*  
 3.SG-poke-INST-3.NAN clear-NR.INSTR-3.SG  
 ‘She/he pokes with the machete him/her.’ (i.e., ‘She/he pokes him/her with the ground-clearing instrument.’)

The suffix *-niy* also increases transitivity and probably corresponds to the postposition *-niy* ‘in’. The iterative *-tiy* is perhaps also part of this paradigm. It is lexically restricted and occurs with certain roots indicating action done with some type of motion; compare *jiitya* ‘remove (for some purpose)’ and *jiitya-tiy* ‘take all apart’. (Other ITERATIVE suffixes are productive and occur further out in the verb structure.)

The only detransitivizing suffix is the lexically restricted anti-causative *-y* (perhaps also with middle semantics). Compare *Sa-mutamaa Hilario-ra rooriy-jú* ‘3.SG-open-PF Hilario-INAN house-CL.opening (Hilario has opened the door.)’ vs. *Ra-múta-y-maa rooriy-jú* ‘INAN-open-ACAUS-PF house-CL.opening (The door has opened/has been opened.)’.

Following TRANSITIVITY suffixes come affixes that can operate on stem and postbase layers. These are highly productive and semantically predictable. They are not required and their absence does not imply a meaningful distinction within a paradigm.

As in many South American languages, **location** and **movement** are important semantic features of Yagua. LOCATION suffixes indicate that the action of the verb was done at a stationary place. These are *-ja* ‘across from’, *-imu* ‘down’ (usually downstream), and *-sa* ‘up’ (usually upstream) as in *Suyníuchusaníi* from *sa-juniúy-su-sa-níi* ‘3.SG-look-TRR<sub>1</sub>-UPWARDS-3.SG (He cared for him upriver.)’.

Two general types of movement are conveyed by verbal suffixes. A movement trajectory can be bound at its inception, its termination, or it may be punctuated, by another event. Such movement is referred to as **bounded**. Movement which is true throughout an event and which imparts imperfectivity is **unbounded**.

There are four BOUNDED MOVEMENT suffixes: *-nuvh* indicates the action is done upon arrival at the locative deictic center; *-nuvee* indicates it is done upon arrival at a location away from the deictic center. These suffixes

are related to verb roots *v̥y* or *viy* ‘arrive here’ and *veey* ‘arrive there’. The suffix *-siy* indicates the action is done upon departure from a location. This is etymologically related to the ablative postposition *-siy*. Both the postposition and the suffix may be related to the verb *siy* ‘run’ or *maasiy* ‘go out’. As a suffix, *-siy* bounds the inception of some movement relative to the action of the verb root. The suffix *-rij* indicates that an event is done while enroute to some destination. Thus, the event can bound both the termination of one part of a movement trajectory, and its resumed inception: *Sa-suuta-rij* ‘3.SG-wash-ENROUTE (She/he washed enroute.)’.

Productive ITERATIVE affixes include *-jayqa* ‘iterative’ and *-jaa* ‘iterative movement to some other location’. These do not co-occur with the proximate TENSES, though they may occur with more remote past TENSES as in *Rameeyjeyyqqisy* from *ray-maay-jayqa-siy* ‘1.SG-sleep-ITER-PAST<sub>1</sub> (A few weeks ago I slept various times.)’. Other ITERATIVE suffixes include *-saniy* ‘group action carried out by individuals successively’. Finally, *-jadapúúryii* is close to a semelfactive but also conveys the idea of ‘suddenly’. It does not (easily) occur with roots which have an inherent durative aspect such as *jimiy* ‘eat’ or *rupiy* ‘walk’ (and such collocations are unacceptable to some speakers).

The ‘distributive’ *-yaa* is problematic under a position class approach. It may occur contiguous to the root, forming well-lexicalized verb stems, as in (20). But it need not; in (21) *-yaa* occurs twice. The first instance may be lexicalized as part of how one expresses ‘tap foot’. The second instance follows the second position clitic *-numaa* ‘now’ which is not a verbal suffix per se.

- (20) *Sarááyatániñuvnii*.  
*sa-rááy-yaa-tániy-nuy-nii*  
 3.SG-jump-DISTR-CAUS-ON.ARRIVAL.HERE-  
 3.SG  
 ‘She/he makes him/her dance upon arrival here.’

- (21) *Ríjeniyqanumaayaa*.  
*ray-jíjeniy-yaa-numaa-yaa*  
 1.SG-tap.foot-DISTR-now-DISTR  
 ‘I am tapping my foot now (iteratively).’

With the exception of *-yaa*, ITERATIVITY suffixes most neutrally precede IMPERFECTIVITY, and follow bounded movement.

- (22) *Rachuutajayqanúúyada*.  
*ray-suuta-jayqa-núúy-jada*  
 1.SG-wash-ITER-IPFV-PAST<sub>3</sub>  
 ‘I used to wash all the time.’

- (23) *Samaachajqasara*.  
*sa-maay-sa-jaa-sara*  
 3.SG-sleep-UPWARDS-ITER.MOVEMENT-HABIT  
 ‘She/he always goes up (river) to sleep.’

- (24) *Naada-suuta-rij-jayqa*.  
*3.DU-wash-ENROUTE-ITER*  
 ‘They two always stop enroute to wash.’

The IMPERFECTIVITY paradigm includes *-jancha* or *-janumucha* ‘continuative’ and *-núúiy* ‘imperfective’. The gnomic habitual *-sara* (cf. (23)) cannot occur with TENSE or other IMPERFECTIVITY suffixes. Thus, its paradigmatic status is ambiguous. Here I treat it as part of the IMPERFECTIVITY paradigm. (The second position clitics *-numaa* ‘now’ and *-maa* ‘perfect’ are clearly aspectual, but are not verbal suffixes. Collocation of the IMPERFECTIVE *-núúiy* and the distant past tense *-janul-jada* is extremely likely, so much so that *-núúyanu* (from *-núúy* plus *-janu*; variant *-núúiyada*) could be a nearly-lexicalized suffix complex.

Suffixes which are not part of the IMPERFECTIVITY paradigm may have inherent aspect. In particular, ITERATIVE and UNBOUNDED MOVEMENT suffixes have imperfective meanings. COMPLETIVE and BOUNDED MOVEMENT suffixes are more perfective.

The COMPLETIVE *-muuy* is as close to a grammaticalized PERFECTIVE as can be found in Yagua. However, it puts heavy emphasis on the termination of an action and thus is not a true perfective. Semantically *-muuy* is most closely opposed to *-núúiy* ‘imperfective’. Positionally the two are distinct and *-muuy* shares some positional properties with postbases. For some speakers (but not all) *-muuy* may co-occur with and precede the HABITUAL *-sara*. For apparently all speakers it may co-occur with the CONTINUOUS *-janchal-janumucha*, either before or after it. However, it occurs after BOUNDED MOVEMENT suffixes as in (25), and preferably before UNBOUNDED MOVEMENT suffixes.

- (25) *Naada-suuta-rij-muuy*.  
*3.DU-wash-ENROUTE-COMPL*  
 ‘They two finished washing enroute.’

The COMPLETIVE also occurs before some ITERATIVITY suffixes such as *-jadapúúryii*. The latter most neutrally occur close to the verb root.

- (26) *Rachiúmyuuyadapúryijra.*  
*ray-súiy-muuy-jadapúryijj-ra*  
 1.SG-bite-COMPL-ONE.MOVEMENT-INAN  
 'I finished biting all at once (and there isn't any food left).'

In contrast to BOUNDED MOVEMENT, *-títyiiy* 'action done while going directly to some destination' and *-nayqqa* 'action done while going aimlessly all over' do not put a bound on the inception or termination of any movement trajectory. Rather, the movement is presented as simultaneous with the action of the main verb root. Alternatively, the point(s) at which the action was done relative to the movement are not of concern:

- (27) *Sa-suuta-títyiiy*  
 3.SG-wash-GOING.DIRECTLY  
*sa-rooriy-mút-ju.*  
 3.SG-house-LOC-TOWARD  
 'She/he<sub>i</sub> washed while going along directly to his/her<sub>j</sub> house.'
- (28) *Sa-suuta-nayqqa.*  
 3.SG-wash-GOING.AIMLESSLY  
 'She/he washed while going all over aimlessly.'

Unlike the BOUNDED *-rií*, UNBOUNDED MOVEMENT suffixes do not imply that the movement was necessarily interrupted while the action was performed. With certain roots such as 'wash' it is pragmatically assumed that the actor stopped to perform the action at some place along a river or stream. But with a root like 'eat' stopping is unnecessary.

*-Nayqqa* may vary in position relative to BOUNDED MOVEMENT suffixes, though differences in semantic scope are extremely subtle. In (29) there may be only one general area of locative reference, while (30) may indicate several. Lack of clarity in semantic scope is likely due to the imperfectivity inherent in *-nayqqa*: an imperfective action is somehow distributed either in time or space; the distributivity may be the dominant semantic feature, and not the spatial vs. temporal domain.

- (29) *Sa-suuta-nuvq-nayqqa.*  
 3.SG-wash-ON.ARRIVAL.HERE-GOING.AIM-  
 LESSLY  
 'She/he washes here, over here, over  
 here, whenever arriving here.'
- (30) *Sa-suuta-nayqqa-nuvq.*  
 3.SG-wash-GOING.AIMLESSLY-ON.ARRI-  
 VAL.HERE  
 'She/he came to every place to wash.'

UNBOUNDED MOVEMENT suffixes must precede IMPERFECTIVITY suffixes:

- (31) *Sasuutatítyiñúyada.*  
*sa-suuta-títyiiy-núuy-jada*  
 3.SG-wash-GOING.DIRECTLY-IPFV-PAST<sub>3</sub>  
 'She/he always goes along washing.'

Verbal suffixes which convey MOOD include *-vqqa* 'action achieved' and *-táqta* 'debitive'. Relative position and morphological properties of these suffixes need further study; *-vqqa*, at least, may precede the gnomic habitual *-sara*. It almost always occurs in negative contexts to indicate 'action not achieved':

- (32) *Dantya-múy yqqa*  
 thus-NEG 2.SG.IRR  
*játa-yqqa-vqqa-sara* *marya-day.*  
 move-DISTR-ACHIEVE-HABIT day-DAY  
 'Neither will you move (to another place) during the day.'

- (33) *Saaníduutyatáqtiíyu.*  
*sááda-jíduuty-a-táqta-iyu*  
 2.DU-prepare-DEB-REFL  
 'You two had better get yourselves ready.'

## 6. Illustrative text

Following are two short portions from an oral story *Mucatyu Munatyí* told by Manungo Díaz, who was roughly 60 years old at the time of telling. Though the story was clearly well known to the speaker, on the occasion on which this version was narrated the initial portion did not appear to be well planned. The narrator backs up and fills in bits of essential information for his audience, namely that the brother of a toucan had been swallowed by the snake. This fact is important to the entire story because later the deer (who cannot jump like the squirrel) will find himself inside the snake alongside a toucan.

This story without morpheme analysis, but with a full Spanish translation, has been printed for Yagua readers in Díaz & Peña (1982, eds.). Just a few clauses from the beginning, and from a bit later in the story, are given here. For reasons of space, for the most part the text is written representing essentially underlying forms of morphemes so that the morphology will be transparent, rather than the way Yagua is practically written

(which makes clean morpheme divisions impossible). The form here thus does not show /yl/-metathesis and operation of other rules that affect vowels. However, some derived words have essentially been lexicalized and these are not necessarily broken into underlying forms. For example, *munáátyij* ‘ancestor’ and *tááryij* ‘other’ contain roots *munáátya* and *táárya* plus an animate singular nominalizer *-i*. *Jíjta* is a second position element which, among other functions, occurs on most main events (D. Payne 1992).

### 1. Introduction

#### 1.1. The language and its speakers

Tagalog, a Meso-Philippine language belonging to the Western Malayo-Polynesian branch of the Austronesian family, is one of the major languages of the Republic of the Philippines (Constantino 1971: 112–118). In the 1990s, it was the native language of around 15 million speakers. Most Tagalog speakers live in the central parts of the island of Luzon, in particular in the provinces Batangas, Bulacan, Laguna, and Marinduque. But Tagalog is also widely spoken in the surrounding provinces (including the capital, Manila), and there are many settlements of

Tagalog speakers throughout the Philippine islands, especially on Mindoro and Mindanao (cf. McFarland 1983: 29, 80). Furthermore, Tagalog is widely spoken as a second language. In 1937 it was selected as the basis for the national language Filipino (formerly called Pilipino).

Since the beginning of Spanish colonisation in 1565 the Tagalog area has always been the center of political power in the Philippines, and Tagalog has thus been strongly influenced by the colonial languages, first Spanish and then American English (from 1898 to 1946). This influence, however, has been largely on the lexicon and the phonology, but not on the morphosyntax. For example, the Manila slang, called Taglish, mainly consists of English roots, but the morphology is exclusively Tagalog. Examples include *lipstick-an* 'to put lipstick on', *i-give up* 'to give sth. up', and *mag-on* 'to start dating' (cf. Cubar 1984; the affixes are explained in 4.1). As for morphosyntax, it is not unlikely that there has been some normative influence by colonial institutions and practices

because the Spanish started using Tagalog very early on as a missionary language, writing grammars and preparing catechisms in Tagalog (a *Doctrina Christiana*, dated 1593, is the oldest preserved Tagalog document). The continuing normative influence exerted by the Manila based educated classes is shown by the fact that Tagalog exhibits surprisingly little dialectal diversity (McFarland 1983: 80). Only the dialect spoken on the small island of Marinduque exhibits lexical and morphological idiosyncrasies that have caught the attention of linguists (Lopez 1970; Soberano 1980).

The most influential of the Spanish grammars is the one written by Totanes (1865) which has served as the basis for many analyses of Tagalog (e.g. Humboldt 1838; Müller 1882: 87–163; Marre 1901). The last and most comprehensive Tagalog grammar cast in a traditional framework is Blake (1925). Bloomfield's texts and grammar (1917) are the first attempt to present Tagalog in its own terms and a very fine and early piece of modern structuralist analysis. In addition to Bloomfield and Blake, further comprehensive statements of Tagalog morphology can be found in Lopez (1937), Schachter & Otanes (1972), and Wolff et al. (1991). A review of linguistic work on Tagalog is given in Constantino (1971: 118–145) and Reid (1981). The present article is based primarily on Bloomfield's data and analysis.

## 1.2. Phonology and orthography

The segmental phonology of Tagalog is relatively simple (except for problems concerning the treatment of loans for which see Matsuda French 1988: 1–17). The graphemes used in the standard orthography directly reflect phonemes and basically have their IPA values. The only exception is the use of the digraph <ng> for the velar nasal [ŋ]. The use of this digraph may be slightly confusing, since it is also used for the NP-marker [naŋ], in this case written as a separate word which in turn is not to be confused with -ng = [ŋ], the bound allomorph of the linker *na*. A genuine problem with the standard orthography is the fact that glottal stops are not written. Glottal stops regularly occur before initial vowels and intervocally, i.e., <tao> 'person' is [tá?o], <aral> 'study' is [?áral] and <magaaral> 'will study' is [mag?á?áral]. As the last example shows, base-initial glottals

are not dropped when prefixes are added. Although the phonemic status of these initial and intervocalic glottals is far from clear much recent writing on infixation in Tagalog assumes without any discussion that they are non-phonemic (e.g. Crowhurst 1998: 590 who misrepresents her older sources with regard to this point). Word-finally, the problem is further confounded by the fact that here final vowels (optionally followed by [h]) contrast with glottal stops. Thus, <baga> 'glowing charcoal' is [bágah], but <baga> 'lungs' is [bágá?]. Deviating from standard orthography a final glottal stop will be marked in this article by '>'.

Stress is also unmarked in standard orthography. Its analysis is somewhat controversial. Some authors (e.g. Schachter & Otanes 1972: 15–18; Wolff et al. 1991: 12) consider vowel length the primary phenomenon, while others consider vowel length an epiphenomenon of stress (cf. Bloomfield 1917: 141f.; Matsuda French 1988: 63f.). In this article, the latter view has been adopted, but since stress assignment in Tagalog is not fully understood, all remarks pertaining to this phenomenon must be regarded with caution. Stress clearly is phonemic in Tagalog, compare *búkas* 'tomorrow' and *bukás* 'open', and plays an important rôle in affixation (see 3.4). Bases with stress on the penultimate syllable are called barytone bases, those with stress on the final syllable oxytone bases. Primary stress on the penultimate syllable will remain unmarked (thus *bukas* for 'tomorrow'), elsewhere it will be marked by the acute accent. The grave accent marks secondary stress.

Phonological rules of relevance to the present exposition are:

- /d/ often becomes /r/ intervocally;
- phrase-final vowels are followed by a weak glottal fricative (cf. [bagah] above);
- /u/ and /i/ in phrase-final syllables are lowered to [o] and [e], respectively;
- word-final glottal stops regularly disappear before clitics and the linker (cf. Bloomfield 1917: 136; Wolff et al. 1991: 12).

## 2. Morphosyntax and parts of speech

Tagalog distinguishes between two parts of speech (Bloomfield 1917: 146): **full words** and **function words** (or particles). Some function

words mark morphosyntactic slots, then usually being proclitics. Others are second position clitics (these are not discussed here; see Schachter & Otanes 1972: 187–193, 433–435 and Kroeger 1993: 118–123, 152–154). Full words may be extensively affixed and occur in the limited set of morphosyntactic slots provided for by the function words. There are five morphosyntactic slots for full words in a Tagalog clause, four of which are illustrated by the following example:

- (1) *i-ni-abót ng*  
 CV-RLS(UGR)-within.reach GEN  
*màng-ga-gamot sa sundalo ang itlób*,  
 AV-RDP<sub>2</sub>-medicine LOC soldier SPEC egg  
*at ang pare at siyá ay nág-hintáy*  
 and SPEC priest and 3.SG PM RLS.AV-wait  
*ng sà-sabih-in ng sundalo*.  
 GEN RDP<sub>1</sub>-say-PV GEN soldier  
 ‘The physician handed the egg to the soldier, and the priest and he waited for what the soldier would say.’

Except for the first word, all full words in this clause are preceded by a function word. The clause initial position is the predicate position, which is unmarked unless it is preceded by a topical constituent. In this case, the predicate is marked by the predicate marker *ay* ‘PM’, as in the second part of example (1). The other markers have the following functions:

*sa* is a general locative preposition marking oblique arguments and adjuncts. It is the final constituent of all of the more specific prepositions in Tagalog such as *hanggang sa* ‘until’ or *para sa* ‘for’.

*ang* is often called a topic (or a subject) marker in the literature. The notion of subject in Tagalog is highly controversial (cf. Schachter 1976; 1995; Drossard 1984: 73–78; Foley & van Valin 1984: 134–148; DeWolf 1988: 144–150; Kroeger 1993; Naylor 1995). The fact that *ang* by itself marks neither topics nor subjects is evident from clauses containing two *ang*-phrases:

- (2) *ang mga buhók lamang ang*  
 SPEC PL hair only SPEC  
*p<in>ù-putol ng patálím*  
 <RLS(UGR)>RDP<sub>1</sub>-cut GEN blade  
 ‘only the hair was cut by the blade’

In this example, the first *ang*-phrase functions as the predicate, the second as the predication base or subject (subject<sub>2</sub> in the terminology of Matthews 1981: 104–113). Subjects in this sense have to be configurationally

defined in Tagalog as the *ang*-phrase which occurs either after the predicate or before the predicate marker *ay*. But this does not yet clarify the function of *ang*.

Basically, the function of *ang* is similar to that of an article (the standard analysis in traditional Tagalog grammars, cf. Blake 1925: 205 f.). It is, however, not a definite article, but includes all kinds of referentially specific expressions (definite, specific-indefinite, generic; for details, see Adams & Mandler-Ramer 1988 and Himmelmann 1991: 8–16), and is therefore glossed as SPEC here.

*ng* [naŋ] ‘GEN’ marks genitive attributes. In the literature it is common to differentiate between *ng* marking non-topic agents, direct objects, instruments, manner, etc., but there is little empirical support for such distinctions (cf. Naylor 1980: 37–42).

The fifth morphosyntactic slot, not illustrated by examples (1) and (2), is constituted by the linker (or ligature) *na* (-*ng* after vowels, /n/ or glottal stop). This particle links the elements of a modifying construction such as *ulól na unggó* ‘foolish CONN monkey’, but also occurs in compounds such as *puno-ng-saging* ‘tree-CONN-banana’ and in complement clauses (see Gonzales 1971). The order in modifying constructions is not fixed in Tagalog, thus *unggó-*ng* ulól* is equally possible for ‘foolish monkey’. The difference between the genitive marker *ng* and the linker pertains to referentiality as shown by the following ‘minimal pair’:

- (3) (a) *bata-*ng* dalaga*  
 child-CONN young.woman  
 ‘girl’  
 (b) *bata’ *ng* dalaga*  
 child GEN young.woman  
 ‘child of the young woman’

Full words are not formally differentiated with respect to the five morphosyntactic positions just illustrated. Any full word, regardless of its affixation, may occur in any position (provided its meaning is appropriate). That is, with regard to their syntactic distribution the large class of full words cannot be further divided into classes such as nouns, verbs, and adjectives (cf. Lemaréchal 1982; 1989; Himmelmann 1991; to appear; Gil 1993; Shkarban 1995; Naylor 1995; Art. 72). For example, the words *sásabihin* in (1) and *piníputol* in (2) which are inflected for aspect and mood (see 4.2) and which are often called verbs, occur – without any further

derivation – in a *ng-* and an *ang-*phrase, respectively. Similarly, so-called nouns may occur underived in predicate position, e.g.

- (4) *Isdá' ang pág-kain niyá.*  
 fish SPEC GER-eat 3.SG.POSS  
 'His meal was fish.'

A brief look at the list of affixes in Schachter & Otanes for what they call 'nouns' (1972: 97–106), 'adjectives' (1972: 198 f.; 216–229), and 'verbs' (1972: 344–355) immediately reveals that a subclassification of full word bases on the basis of morphological evidence is also not a straightforward enterprise since basically the same set of affixes is involved in all these formations. Nevertheless, bases appear to differ in their morphological potential. A detailed study of the different morphological classes, however, still remains to be done (see Wolff 1993 and Himmelmann to appear for some preliminary suggestions).

There is no doubt that both unaffixed bases and affixed words differ in their semantics in that some denote actions, others things, yet others states, etc. A base such as *bili* clearly designates the action of buying, *bahay* the entity 'house', *bago* the quality 'new'. The distinction between these different kinds of concepts is sometimes grammatically marked by different stress patterns (cf. 3.4). It is not clear, however, whether these conceptual classes are in any way directly relevant to stating the (segmental) morphosyntactic regularities of Tagalog. Therefore, given the absence of clear-cut formal evidence for such categories, the terms for lexical categories such as noun, verb, adjective, etc. are avoided in this article and the terms action, entity, etc. are used whenever it is convenient to make reference to conceptual classes.

### 3. Formal processes

#### 3.1. Affixation

The number of affixes in Tagalog is fairly small, but each of the major three affix categories is represented: there are two suffixes (*-in* and *-an*, see 4.1), two infixes (*-in-* and *-um-*, see 4.1 and 4.2), and about a dozen prefixes. Most of these affixes can be combined with each other so that a large number of complex formations results (Bloomfield 1917: 317–319 lists some 200 formations). This number is further increased by the fact

that affixes may co-occur with other formal processes such as reduplication (see 3.3) and stress shifting (see 3.4).

**Prefixes** exhibit some word-like properties in that (with few exceptions) they (a) do not display any fusional characteristics (not even resyllabification takes place, which, however, is not surprising given the fact that all bases start with a consonant (cf. 1.2)), (b) mostly carry their own stress, and (c) may occasionally be used in isolation (cf. Bloomfield 1917: 213; Matsuda French 1988: 89 f.; Rubino 1998). Exceptions are, on the one hand, the prefixes *i-* (4.1) and *ka-* (5.1), the first of which is never stressed and both of which are sometimes fused with the base, e.g. *ka-ibigan* 'ass-like-LV (friend)' is usually pronounced [kaybigan] rather than [ka?ibigan] (Bloomfield 1917: 139 f.).

The other exception is the prefix *pang-* (and related *mang-* and *nang-*), where the prefix-final nasal regularly assimilates to, and sometimes substitutes for, the initial consonant of the base. This prefix-type is very common in western Austronesian languages and is often analysed as containing an archisegmental nasal (and then is represented as /paN-/). The assimilation and substitution regularities may be summarised as follows (for the semantics of this derivation, see 5.2):

- N is regularly deleted before base-initial nasals: *maN* + *manhid* → *mamanhid* 'get numb'.
- N never substitutes for a glottal fricative or for glides: *maN* + *hiyá'* → *mànghiyá'* 'humiliate', *maN* + *walís* → *màngwalís* 'hit with a broom', *maN* + *yari* → *màngyari* 'happen'.
- Voiceless obstruents (apart from the glottal fricative) are regularly substituted for: *maN* + *pili'* → *màmili'* 'choose (several things)', *maN* + *takot* → *mànakot* 'frighten several people', *maN* + *kabayo* → *màngabayó* 'ride on horseback', *maN* + *sakít* → *mànakít* 'cause pain'. Glottal stop is sometimes not substituted for; the factors involved are unclear. In fact, two derivations are occasionally possible from the same base. Compare [*mànjaso*] 'hunt with dogs' with [*mâj?aso*] 'ridicule people' (base *aso* 'dog').
- Voiced obstruents and the lateral are generally not substituted for: *maN* + *daya'* → *màndaya'* 'cheat people' (but *maN* + *dikit* → *mànikít* 'adhere'), *maN* + *gamót* → *mànggamót* 'practice medicine (profes-

sionally)’ *maN + laró*’ → *mànlaró*’ ‘amuse others’. For /b/ both options are common and, in a few cases, possible for the same base. Thus from *bakyá*’ ‘wooden shoe’ it is possible to derive either *màmbakyá*’ ‘hit with a wooden shoe’ or *màmakyá*’ ‘wear wooden shoes’.

In the derivation of so-called instrumental adjectives substitution is said to be optional, e.g. both *pansuklái* and *panuklái* mean ‘for use in combing’ (Schachter & Otanes 1972: 218–221; 319 f.).

**Suffixes** exhibit regular fusional tendencies in that the stem-final consonant (including the optional [h] after vowel-final bases) is regularly resyllabified with the suffix and the base-final vowel is often syncopated, e.g. *lakás + an* → *lak.sán* ‘strengthen (x)’, *bili + in* → *bil.hín* ‘buy (x)’ (cf. Matsuda French 1988: 12 f.). There are further sporadic irregularities such as *tawan-an* ‘laugh at (x)’ instead of the expected \**tawah-an*, and *tamn-án* ‘plant in (x)’ instead of the expected ?*tanim-án* or \**tanm-án* (cf. Bloomfield 1917: 214; Schachter & Otanes 1972: 375–380).

**Infixes** are always inserted after the first consonant of the base, e.g. *b<um>ili*’ '<AV> buy' from *bill*. All other formative processes precede infixation, infixes thus also occur in prefixes, e.g. *p<in>ág-tapat-án*’ '<RLS(UGR)>GER-fronting-LV (confided to (x))', and reduplicated syllables (cf. 3.3). In formations involving the infix -in- and stem-initial glides or liquids, the stem-initial consonant and the nasal of the infix are regularly metathesized, thus \**l-in-uto*’ but *ni-luto*’ ‘RLS(UGR)-cook’. With stem-initial /w/ metathesis is optional, for example, both *ni-wisik-án* and *w<in>isik-án* for ‘RLS(UGR)-sprinkle-LV/<RLS(UGR)>sprinkle-LV (sprinkle on (x))’. When co-occurring with the prefix *i-* (i.e. [?i]), -in- is infixated into the following syllable, e.g. *i-b<in>igáy*’ ‘CV-<RLS(UGR)> give’ from *bigáy*. In stems beginning with a liquid, a glide or a glottal, metathesis again regularly occurs, compare *i-ni-hatíd*’ ‘CV-RLS(UGR)-convey’ (\**ihihatid*), *i-ni-abót* [?i-ni-?abót]’ ‘CV-RLS (UGR)-within.reach’ (\**i-in-abot*).

### 3.2. Consonant alternation

A number of prefixes display regular alternation of the initial consonant (cf. de Guzman 1978: chapter 3.3): the /p/-initial form is the basic form (used as gerund (4.3) or imperative), /m/ marks non-realism and /n/ realism (cf.

4.2). Examples are *pag-/mag-/nag-*, *paN-/maN-/naN-*, *paki-/maki-/naki-*. The alternation between the two nasal forms also occurs with the stative or potentiative prefix (*ma-/na-*, cf. 5.1), but here no /pl/-initial basic form exists. Furthermore, a small number of /p/-initial bases (which probably contain a fossilised prefix) exhibits this alternation, e.g. *pakiníg makiníg nakiníg* ‘listen’, *panoód manoód na-noód* ‘watch’. This alternation probably developed from infixed formations by clipping the first (unstressed) syllable. Thus, *mag-* probably derives from \**pumag-* and *nag-* from \**pinag-*. Note, however, that *pinag-* is still a productive formative, i.e. the RLS (UGR) form of *pag*-derived stems (cf. 5.2).

### 3.3. Reduplication

There are three kinds of **reduplication** processes in Tagalog. In two of these processes the first consonant and vowel of the base are copied (CV-reduplication). The two processes differ with regard to the fact that in one the reduplicated syllable is assigned stress (RDP<sub>1</sub>), and in the other it is not (RDP<sub>2</sub>): *mang-gàgamót* ‘will practice medicine’ vs. *màng-ga-gamot* (or *mànggagamót*) ‘one who makes cures, physician’. If a base starts with a consonant cluster, only the first consonant is copied, cf. *trabaho* ‘work’ → *mag-tà-trabaho* ‘will work’.

The third process consists in copying the first two syllables of the base (RDP<sub>3</sub>). In the case of disyllabic bases, the complete base is copied, e.g. *lakad* ‘walk’ → *mag-lakàd-lakád* (RDP<sub>3</sub> with stress shift) ‘do a little walking’, *mura* ‘cheap’ → *mura-mura* ‘rather cheap’. In the case of bases containing more than two syllables, the second syllable is copied only up to its peak, which is then assigned secondary stress, viz. *tahimik* ‘peaceful’ → *tahi-tahimik* ‘rather peaceful’, *baluktód* ‘crooked’ → *balù-baluktód* ‘variously bent’. RDP<sub>2</sub> and RDP<sub>3</sub> generally apply to bases only, while RDP<sub>1</sub> freely applies to prefixes as well (see below).

Each type of reduplication may occur only once in a derivation but different types may be combined with each other, as will be seen shortly.

Tagalog reduplication phenomena have figured prominently in the discussion of the status of reduplication (cf. Art. 57) as well as the related issues concerning the boundaries between morphology and phonology and the internal structure of the morphological component (cf. Marantz 1982: 438 f., 451 f., 473–479; Carrier-Duncan 1984; Matsuda French

1988: 19–61). The argument is concerned with the interrelation of (regular) affixation and reduplication. The Tagalog evidence, however, seems inconclusive in this regard. The following is a (partial) list of the relevant phenomena:

- Formations involving nasal substitution (cf. 3.1) suggest that allomorphy rules precede reduplication, e.g. *maN + RDP<sub>1</sub> + putol* → *mamūmutol* ‘will cut (a lot)’.
- Infixation, on the other hand, seems to follow reduplication (cf. Matsuda French 1988: 38), i.e., *pumūputol* ‘cut’ seems to be derived from *pūputol*, otherwise one would expect \**pūpumutol*.
- In formations involving polysyllabic prefixes or a combination of prefixes, it is usually the second syllable of the prefix that is reduplicated (by RDP<sub>1</sub>, receiving word level stress, cf. Matsuda French 1988: 44–52), viz. *mag + pa + putol* → *magpāpaputol* ‘will cause to be cut’, *maka + putol* → *makākaputol* ‘will be able to cut’, or *maka + pag + pa + putol* → *makākapāgaputol* ‘will be able to cause to be cut’. A general exception to this regularity are formations involving the prefix *i-*, which is never reduplicated and does not count in determining the second syllable, cf. *ma + i + pag + luto*’ → *maipāpagluto*’ ‘will be able to cook for (x)’ and *i + paki + pa + putol* → *ipakikipaputol* ‘will be asked to be caused to be cut’. In several instances, however, either the second syllable of the prefix or the first syllable of the base may be reduplicated, an example being *makapūputol* ‘will be able to cut’ which alternates with the form *makākaputol* just mentioned (for more examples, cf. chart in Schachter & Otanes 1972: 369). This raises the problem of where to place RDP<sub>1</sub>-reduplication in the derivation of these complex formations.
- The relation of suffixation and RDP<sub>3</sub> is also problematic. In some cases suffixation (and the related morphonological processes) clearly apply before RDP<sub>3</sub>: *tingín + an* → *tingnán* ‘look at (x)’ → *ting-nán-tingnán* ‘look at (x) a little’. In other cases, it is the other way around: *sakit* → *sakit-sakit* → *màgsakit-sakitan* ‘pretend to be sick’. If suffixation preceded RDP<sub>3</sub>, \**magsakisakitan* would be expected (trisyllabic base), cf. *mag + salitá’ + an* → *màgsalí-salitaan* ‘talk a little to each other’.
- RDP<sub>1</sub> and RDP<sub>3</sub> may co-occur. In this case either RDP<sub>3</sub> precedes RDP<sub>1</sub>, e.g. *magsà-sakit-sakitan* ‘will pretend to be sick’ and *magsàsalí-salitaan* ‘will talk a little to each other’, or they may apply simultaneously (at different locations), viz. *mag + pa + ka + ingat* → *magpápakaingatingat* ‘will be extremely careful’. Carrier-Duncan (1984: 269) claims that there are also cases where RDP<sub>2</sub> precedes RDP<sub>3</sub>: *mag + kaN + punit* → *magkámpupunit* ‘will tear spontaneously’ → *magkámpupù-pupunit* ‘will (intensively) tear spontaneously’.
- RDP<sub>1</sub> and RDP<sub>2</sub> may co-occur as well, in which case RDP<sub>2</sub> precedes RDP<sub>1</sub>. Thus from *takbó* ‘run’ *mág-ta-takbó* ‘run wild’ is derived by prefixing *mag-* and RDP<sub>2</sub>. From the latter the imperfective aspect *mag-tà-ta-takbó* is derived by RDP<sub>1</sub>.

### 3.4. Stress shift

Both primary and secondary **stress assignment** in Tagalog may be connected with a variation in meaning and this assignment is at least partially independent of segmental processes (cf., for example, the difference between RDP<sub>1</sub> and RDP<sub>2</sub> mentioned in 3.3). The data, however, are not clear, since most sources (apart from Bloomfield 1917 and Wolff et al. 1991) do not mark stress consistently (cf. 1.2). Two examples are given to illustrate the possibilities and complexities involved.

There is a substantial number of bases which differ only with respect to stress and which are clearly semantically related (unlike the pair *bukas* ‘tomorrow’/*bukás* ‘open’ mentioned in 1.2). Examples include *abot* ‘overtake’ vs. *abót* ‘within reach, reach for, pass’, *alam* ‘knowledge’ vs. *alám* ‘known’, *buhay* ‘live, life’ vs. *buháy* ‘alive’, *bunot* ‘pull out’ vs. *bunót* ‘pull out a lot/repeatedly’, *isip* ‘think, thought’ vs. *isíp* ‘think hard/with deliberation’, *lakad* ‘walk’ vs. *lakád* ‘on foot, barefooted’, *tulog* ‘sleep’ vs. *tulóg* ‘asleep’ (cf. Bloomfield 1917: 215 f.). Wolfenden (1961: 12) characterises the meaning shifts involved as (a) accomplishment (resultative) or (b) intensification. While resultative pairs are widely attested, it is unclear whether the much more sporadic pairs not belonging to this type can all be subsumed under ‘intensification’ as the handful examples just given should make clear.

The complex interaction of stress assignment and affixation is illustrated by the suffix

*-an* (cf. Bloomfield 1917: 250–262). If this suffix marks locative voice (cf. 4.1), primary stress usually shifts one syllable to the right (i.e. to the ultimate or penultimate syllable of the derived word). Examples are *táwag* ‘call’ → *tawágán* ‘call (x)’, *gupít* ‘cut (with scissors)’ → *gupítán* ‘cut the hair of (x)’, *bílì* ‘buy’ → *bilhán* ‘buy from (x)’, *sáma* ‘go along, accompany’ → *samáhan* ‘accompany (x)’. If *-an* derives expressions denoting either a collective action or the place where something (an entity or an action) is located, stress in oxytone bases remains on the same syllable as in the underived word: *iyák* ‘cry, weep’ → *iyákan* ‘a crying of many’, ‘buy’ → *bilhán* ‘place where to buy, market’, *aklát* ‘book’ → *aklátan* ‘library’, *litsón* ‘a roast pig’ → *litsúnan* ‘place to roast pigs or a barbecue (= roast-pig party)’. For barytone bases there are two possibilities: either stress shifts one syllable to the right (to the penultimate syllable of the derived word), which is often accompanied by secondary stress on the first syllable of the derived word, e.g. *sámáhan* ‘a going together of many, company’, or it is shifted to the ultimate syllable of the derived word (i.e., the suffix is stressed), e.g. *básá* ‘read’ → *basahán* ‘a reading-room, library’ (vs. *basáhan* ‘read sth. to (x)’), *lábán* ‘contrary, fight’ → *labanán* ‘a fighting of many, battle, war’ (vs. *labánan* ‘fight/oppose (x)’). Stress shift to the penultimate syllable of the derived word is used (with very few exceptions) for collective action expressions, while stress shift to the suffix is more commonly (though by no means exclusively) used for ‘place where’ derivations. Note that these are only regularities; differences in meaning are not always accompanied by formal differences, e.g. *dílo* ‘end’ → *dulíhan* ‘terminate (x)’ (locative voice), but also ‘end part, back yard’ (‘place where’; cf. Bloomfield (1917: 261) who lists a number of words which formally appear to be locative voice derivations, but the meaning of which does not fit this categorisation).

#### 4. Voice, aspect, and mood

Tagalog and the other Philippine languages are most famous for a phenomenon variously called voice, orientation, case marking on the verb (cf. Blake 1906; Ramos 1974), or ‘focus’, a term introduced in the late 1950s to underscore the exceptional nature of the phenomenon (cf. Llamzon 1973: 168). The last term is widely used to refer to the pragmatic

phenomenon of highlighting new or contrastive information. ‘Focus’-affixes in Philippine languages do not have such a highlighting function. The participant ‘focussed’ on by these affixes is usually given information and often remains unexpressed. Therefore, this term is avoided here. Instead, **voice** is chosen because it is the least misleading term (see 4.1).

The literature on voice in Tagalog is fairly extensive (see – in addition to the general reference works mentioned in 1.1 – Müller 1882: 136–142; Marre 1901: 574–582; Blake 1906; Scheerer 1924; Capell 1964; Llamzon 1973; 1976: 89; Wolfenden 1961: 14–16; Ramos 1971: 21–23, 56–69; 1974: 19–40; Foley 1976: 105–113; McFarland 1976: 16–24; de Guzman 1978: chapter 3; Drossard 1984: 34–51; Himmelmann 1987: 92–125; DeWolf 1988; Shibatani 1988). Since voice marking is formally tied to aspectual and modal distinctions, these three categories will be treated together in one section.

##### 4.1. Voice

Tagalog predicate expressions usually display a voice affix that indicates the semantic rôle of one of the participants involved in the state of affairs denoted by the predicate. There are four such affixes, as illustrated by the following examples:

- (5) *t<um>angó’ ang unggó’*  
     <AV>nod SPEC monkey  
     ‘the monkey nodded in assent’
- (6) *dikdik-in siyá sa lusóng*  
     crush-PV 3.SG LOC mortar  
     ‘(that) he (i.e., the turtle) be crushed in a mortar’
- (7) *hulug-an mo akó!*  
     drop-LV 2.SG.POSS 1.SG  
     ‘drop me (some)!’
- (8) *kung i-tà-tanim niyá ang*  
     if CV-RDP<sub>1</sub>-plant 3.SG.POSS SPEC  
     *kaniyá-ng ka-parté*  
     DAT.3.SG-CONN ASS-part  
     ‘if he would plant his part (for him)’

As briefly shown in 2, the NP-markers *ang* and *ng* in Tagalog do not signal semantic rôles. Rather, the voice affixes indicate the semantic rôle of the participant which appears in the *ang*-phrase (*siyá* in (6) and *akó* in (7) are *ang*-forms of the pronoun). Thus, the infix *-um-* in (5) indicates that it is the monkey who does the nodding, and in (6) the suffix

*-in* indicates that the turtle is going to be the undergoer of the crushing (rather than the actor), etc.

Before discussing some of the more remarkable features of this voice marking system in more detail, it should be noted that the **actor voice** marking infix *-um-* does not only occur in clauses with a subject which is in full control of an action. It is also used for subjects which are involved in a process, as in *p<um>ulá* ‘become red’ or *l<um>ù-lutang* ‘be floating’. Furthermore, it occurs in subject-less expressions for natural events such as *um-ulán* ‘rain’ or *l<um>indól* ‘earthquake’.

In addition to *-um-*, the prefix *mag-* (realis *nag-*) also marks actor voice, cf. *nag-là-laró* ‘*silá* ‘RLS.AV-RDP<sub>1</sub>-play 3.PL (they are playing)’. Following de Guzman (1978: chapter 3), this prefix is analysed here as involving the prefix *pag-* used in gerund formation (see 4.3), actor voice (and mood) being signalled by consonant alternation (cf. 3.2). The difference between the two actor voice affixes is further commented upon in 5.2.

One of the remarkable features of voice marking in Tagalog, which sets it apart from voice marking systems in many other languages, is the fact that both actor as well as **undergoer voices** involve overt morphological marking, while in languages such as English only undergoer orientation (passive) is explicitly marked. In other words, actor voice and undergoer voice are equally marked in Tagalog (at least in morphological terms).

Another peculiarity is the fact that there is not only one affix for undergoer orientation. Instead, three different ways in which the undergoer may be involved in a given state of affairs are distinguished:

- *-in* (**patient voice**) indicates a directly affected undergoer, such as the turtle in (6), the hair in (2), or *ító* in *inum-in mo ító* ‘drink-PV 2.SG.POSS PROX (drink this)’.
- *-an* (**locative voice**) is used for recipients (see (7)), addressees, beneficiaries, and the location where an action takes place, e.g.:

(9)	<i>ni-lakar-an</i>	<i>ko</i>	<i>ang</i>
	RLS(UGR)-walk-LV	1.SG.POSS	SPEC
	<i>ma-bató-ng</i>	<i>kalye</i>	
	STAT-stone-CONN	street	

‘I walked on a stony road’

More generally, it is used for indirect undergoers, i.e. undergoers which are not

directly affected by the action denoted by the predicate, as in *inum-án mo ító* ‘drink-LV 2.SG.POSS PROX (drink from/some of this)’ or *buks-án mo ang pintó* ‘open-LV 2.SG.POSS SPEC door (open the door)’.

- *i-* (**conveyance voice**) indicates an undergoer that is moved (a displaced theme), such as the egg in (1) or one half of the banana tree in (8). It is also used for the instrumental rôle, instruments thus being conceived of as moving undergoers:

(10)	<i>Ang iták ay i-p&lt;in&gt;utol</i>		
	SPEC	bolo	PM CV-<RLS(UGR)>cut
	<i>ko</i>	<i>ng</i>	<i>saging</i> .
	1.SG.POSS	GEN	banana

‘I cut bananas with the bolo.’

Furthermore, *i-* may also indicate the beneficiary of an action with a few bases (e.g. *i-bilí* ‘buy for (x)’), a usage not easily accounted for by any of the analyses proposed for this prefix (cf. Himmelmann 1987: 103–22, 139 f.).

A third cross-linguistically remarkable feature of the voice affixes is that they may be applied to all kinds of bases without any further derivation. That is, the above affixes cannot only be attached to bases denoting actions but also to ones denoting things (e.g. *bató* ‘stone’ → *batuh-in* ‘throw stones at (x)’), masses (e.g. *tubig* ‘water’ → *tubig-an* ‘add water to (x)’), states (e.g. *bago* ‘new’ → *baguh-in* ‘change (x)’ or *i-bago* ‘move (x) to another position’), or animate beings (e.g. *langgám* ‘ant’ → *langgam-in* ‘be infested with ants’). Of course, the derivational possibilities depend on the semantic compatibility of base and affix, and thus are more restricted with regard to, for example, expressions for human beings than for action expressions.

It is common to treat voice with respect to action expressions as inflection, and voice with regard to non-action expressions as derivation. There is, however, no formal evidence to support this distinction. On the contrary, the analysis of voice as inflection leads to extremely complex systems of ‘verb’ classes in Tagalog. That there is little clear-cut evidence for such classifications is shown by the fact that the proposed classifications differ extremely. Blake (1925), for example, proposes 17 classes, de Guzman (1978) about 80 (cf. Himmelmann 1987: 69, 129–145). The main empirical observation here is that there is no simple classification for action expressions

with regard to their voice marking. In particular, there are no productive inflectional paradigms for voice, as suggested by the commonly used ‘paradigmatic’ examples in the literature. Instead, derivations from all kinds bases are only partially predictable on the basis of their semantics and exhibit a large number of idiosyncrasies, which again suggests derivation rather than inflection. See McFarland (1976) and Ramos & Bautista (1986) for instructive surveys of those derivations which are actually attested for a given action base (see also Art. 38).

With regard to the three features just mentioned, Tagalog voice marking has much in common with nominalising morphology in other languages. Like much of the morphology used for deriving nouns (or, in many languages, participles) from verbs, the voice affixes change the orientation of a given base in such a way that it may be used to refer to one of the participants involved in the state of affairs denoted by the base (cf. Lehmann 1984: 151 f., who introduces the term **orientation** for analysing nominalisation strategies). In this view, *-um-* is an actor orienting infix which derives from a base such as *tangó* ‘nod, nodding in assent’ a word *tumangó* which could be glossed as ‘one who nods, nodder’. This expression no longer directly denotes the action of nodding, but rather the participant who nods. That is, in the Tagalog clause (5) *tumangó ang unggó* both *tumangó* and *uggó* refer to the same entity. Imitating the equational structure of this clause it could be rendered as ‘nodd-er in assent (was) the monkey’. Similarly, example (6) is ‘he (be) crush-ee in the mortar’, example (7) ‘I (be) the place of your dropping/your droppery’, and example (8) ‘if his plant-ee (would be) his part’ (cf. DeWolf 1988: 157 f.). Note, however, that Tagalog voice affixes are not nominalising in a morphosyntactic sense, since they do not change the syntactic category of the base (both base and derived word are full words which can be used in any of the five major morphosyntactic slots discussed in 2). That is, the similarity of Tagalog voice affixes and noun or participle-forming morphology is primarily a semantic one.

With regard to this semantic similarity, it should be noted that the voice marking formatives do not only occur in expressions which denote actions, processes or states (or, more precisely, a participant involved therein). Most of the voice marking affixes also occur in formations which clearly denote

entities. The major possibilities pertaining to locative *-an* are mentioned in 3.4. Actor voice marking *mag-* (plus RDP<sub>2</sub>) occurs in formations denoting professionals, thus from *nakaw* ‘steal’ *mág-na-nakaw* ‘thief’ may be derived. This form differs only with respect to stress from the action denoting formation *mag-ná-nakaw* ‘will steal’ (cf. 3.3 and Bloomfield 1917: 242 f.; Schachter & Otanes 1972: 103). Furthermore, *mag-* is used together with kinship terms to indicate two (with RDP<sub>2</sub> several) persons between which the relation designated by the base holds: *mág-iná* ‘mother and child’ (< *iná* ‘mother’), *mág-pípinsan* ‘several cousins’ (cf. Bloomfield 1917: 242; Schachter & Otanes 1972: 102). The suffix *-in* may denote entities undergoing the action denoted by the base, e.g. *aral* ‘study’ → *aralin* ‘lesson’. Again, it is stress that (often) differentiates action and thing, compare *aralin* with *aralin* ‘study (x)’. Other examples are *kumpuni* ‘repair’ → *kùmpunihin* ‘things to repair’ vs. *kumpunihin* ‘repair (x)’; *kain* ‘eat’ → *kanin* ‘boiled rice’ or ‘eat (x)’ (no difference whatsoever, compare also *kakanín* ‘sweets’); *inóm* ‘drink’ → *inumín* ‘drinking water’ or ‘drink (x)’, cf. also *inumin* ‘beverage’ (cf. Bloomfield 1917: 247; Schachter & Otanes 1972: 99 f.). There are no derivations with *-um-* or *i-* which denote entities in a similar way.

#### 4.2. Aspect and mood

Voice marked forms occur in two aspects (perfective and imperfective) and two moods (realis and non-realis). **Imperfective** aspect is indicated by RDP<sub>1</sub> (**perfective** aspect is unmarked), **realis** mood is indicated by the infix *-in-* or consonant alternation (/m/ → /n/, cf. 3.2), **non-realis** again being unmarked. These formations are illustrated in Tab. 136.1 with the paradigms for the base *bili* ‘buy’, one of the few bases which occurs with all voice affixes. A number of different analyses and terminologies have been proposed for these forms (see Werlen in Bader et al. 1994: 95–100 and Kroeger 1993: 15–18 for overviews). The terminology used here reflects the formal make-up of the paradigms but it is not quite felicitous in all instances with regard to the function of the forms.

Aspect-mood formation is highly regular both formally and semantically and thus clearly is an instance of inflection. It exists for every voice-marked form and is also found for other affix combinations, e.g. *maki-*, *makiki-*, *naki-*, *nakiki-* (see 5.2). With

	AV ('buy')	AV ('sell')	PV	LV	CV
NON.RLS/PFV	<i>b&lt;um&gt;ilí</i>	<i>màg-bilí</i>	<i>bilh-ín</i>	<i>bilh-án</i>	<i>i-bilí</i>
NON.RLS/IPFV	<i>bilí</i>	<i>mag-bilí</i>	<i>bìlh-ín</i>	<i>bìlh-án</i>	<i>i-bilí</i>
RLS/PFV	<i>b&lt;um&gt;ilí</i>	<i>nàg-bilí</i>	<i>b-in-ilí</i>	<i>b-in-ilh-án</i>	<i>i-b-in-ilí</i>
RLS/IPFV	<i>b&lt;um&gt;ibilí</i>	<i>nag-bilí</i>	<i>b-in-ibilí</i>	<i>b-in-ibilh-án</i>	<i>i-b-in-ibilí</i>

Tab. 136.1: Aspect-mood paradigms for *bilí* 'buy'

a few exceptions not dealt with here, the contexts of use for each form are the same regardless of the meaning of the base. Thus, NON.RLS/PFV (also called *basic form*; cf. Schachter & Otanes 1972: 66 f.) is used in hypothetical and complement clauses and in commands (cf. (6) and (7)), NON.RLS/IPFV (Schachter & Otanes' *contemplated aspect*) is used for future events (cf. (8)), RLS/PFV (Schachter & Otanes' *perfective aspect*) and RLS/IPFV (Schachter & Otanes' *imperfective aspect*) for past and present events, respectively (see illustrative text in 6).

In addition, there is a recent perfective formation (with prefix *ka-* + RDP<sub>1</sub>) which involves no voice marking and does not allow for subjects (*ang*-phrases). Hence, all participant expressions are either genitive or locative marked:

- (11) *Ka-là-laró ko pa*  
RECENT.PFV-RDP<sub>1</sub>-play 1.SG.POSS still  
*lamang sa bata*.  
only LOC child  
'I have just finished playing with the child.'

As may be immediately observable there are some asymmetries in the paradigms in Tab. 136.1. Strictly speaking, the realis patient voice forms do not have a marker for voice and, similarly, there is also no marker for actor voice in the NON.RLS/IPFV form of the *um*-paradigm. These asymmetries are probably relevant for unravelling the diachronic development of the voice marking system. Their relevance for the synchronic analysis of the system is still in need of further exploration (see Himmelmann 1987: 157–171; Blake 1988: 79 f. for some discussion). In this regard it may be noted that although most action expressions in Tagalog are voice and hence also aspect-mood marked, it is possible to use bases denoting actions without further affixation. In such uses action bases may be semantically undergoer oriented (often with a resultative connotation). For example, in (11) *an-*

*táy* could be replaced with the patient voice form *inantáy*.

- (12) *Antáy ko ang sagót mo.*  
wait 1.SG.POSS SPEC answer 2.SG.POSS  
'I wait for/expect your answer.'

But unaffixed bases may also occur in imperatives with actor orientation, e.g. *hintáy ka* 'you wait' (which could also be rendered with *mag-hintáy ka*), and for denoting a state of affairs without orientation:

- (13) *Iyák ang sagót niyá sa akin.*  
cry SPEC answer 3.SG.POSS LOC DAT.1.SG  
'His answer to me was crying/to cry.'

In this last usage, unaffixed bases are similar to gerunds, to which we now turn.

#### 4.3. Gerunds

For bases denoting a state of affairs it is possible to derive a form which is neither voice marked nor aspectually and modally inflected. This is done by prefixing *pag-* to the base according to the following correspondence rules which hold between actor voice and gerundial forms (cf. Schachter & Otanes 1972: 160):

ACTOR VOICE	GERUND
<i>-um-</i>	<i>pag-</i>
<i>mag-</i>	<i>pag-RDP<sub>2</sub></i>
<i>mang-</i>	<i>paN-RDP<sub>2</sub></i>

Tab. 136.2: Gerund formation

**Gerunds** are further derivable from stative expressions (cf. 5.1, prefix *ma-* is substituted by *pagka-*) and joint action expressions (cf. 5.2, prefix *maki-* replaced by *pakiki-*). In general, gerunds may not be used in predicate position, since they are not oriented towards one of the participants of the state of affairs denoted. Only in a clause such as *pág-lu-luto ng pagkain ang trabaho niyá* 'GER-RDP<sub>2</sub>-cook GEN food SPEC work 3.SG.POSS (his job is

cooking food)' may a gerund be used predicatively (*pagkain* – which may also mean ‘eating’ – is a semantically specialised gerund from *kain* ‘eat’). Gerunds are most commonly used in noun phrases, e.g. *nág-umpisáng pág-si-sigáw* ‘RLS.AV-begin GEN GER-RDP<sub>2</sub>-shout ((the turtle) began shouting/to shout)’ and *nàng-galing sa pág-su-sugál niyá* ‘RLS.AV-come.from LOC GER-RDP<sub>2</sub>-gamble 3.SG.POSS ((this) is due to his gambling)’, or in subordinate clauses (usually with a temporal meaning) *pág-balik ni Gabby sa Pilipinas* ... ‘GER-return GEN.PN Gabby LOC Philippines (when Gabby returned to the Philippines ...)’. As shown by the preceding examples, all participants involved in the state of affairs denoted by a gerund have to be expressed in genitive or locative phrases.

A special perfective form of the gerund indicates that the event took place before that of the main clause. It involves the prefix *ka-* (which may be optionally reduplicated) following the general gerund formatives mentioned above (cf. Schachter & Otanes 1972: 161). Compare *pág-punta* ‘going’ with *pág-(ka)-ka-punta* ‘having gone’. Gerunds may become the basis for further derivations involving voice, aspect, and mood (see 5.2).

Formations with *paN-* without reduplication regularly denote instruments used in the state of affairs denoted by the base, e.g. *pámutol* ‘cutting instrument’ (< *putol* ‘cut’), *pànghampás* ‘a whip’ (< *hampás* ‘whip’), *pàngkapé* ‘means for buying coffee’, etc. (cf. Bloomfield 1917: 224 f.).

## 5. Actor involvement

Although much less widely discussed, Tagalog morphology concerning the way an actor is involved in a given state of affairs is even more elaborate than the voice morphology. The basic split here is that between dynamic and stative or potentive formations (for statives see also Drossard 1984: 64–72). The **dynamic** forms are morphologically unmarked

and have been dealt with in 4. That is, an action expression marked for voice (and aspect and mood) generally implies a volitional actor who is in full control of the action (the major exception being some expressions for processes marked with *-um-* briefly mentioned in 4.1).

### 5.1. Stative and potutive

States of affairs which do not involve a controlling actor are expressed by a related but different set of formations. Two different scenarios have to be distinguished here. On the one hand, the state of affairs may be such that it excludes the involvement of an actor for principled conceptual reasons. This is typically the case for **stative** expressions such as ‘be hungry’, ‘be angry’, ‘be adrift’, and the like. On the other hand, the state of affairs may be such that in principle it allows for controlling actors but in the specific instance at hand the conceptually possible controlling actor is not in full control of the event. This is the case when someone happens to do something without having the intention to do it. Formations expressing this second possibility are called **potutive**.

A completely regular correspondence exists between dynamic and potutive formations. That is, for each dynamic form there is a corresponding potutive form. The major potutive formatives are *maka-* for actor voice and *ma-* for the undergoer voices. For details compare Tab. 136.1 with Tab. 136.3.

The typical use of potutive forms is for involuntary actions:

- (14) *Biglá niyá-ng*  
 sudden 3.SG.POSS-CONN  
*nà-bigkás iyón:*  
 RLS.POT.PV-enunciation DIST  
 ‘(Terrified) she suddenly exclaimed  
 this: ...’

This includes actions done accidentally, i.e. the actor may be in control of the action but did not really intend its outcome:

	AV(‘buy’)	AV(‘sell’)	PV	LV	CV

RLS/IPFV	<i>na-gàgalit</i>	<i>kina-gàgalit-an</i>	<i>i-kina-gàgalit</i>	<i>naka-gàgalit</i>

Tab. 136.4: Voice and aspect/mood paradigms for stative bases (base *galit* ‘anger’)

- (15) *Na-i-luto ko na.*  
 RLS.POT-CV-cooked 1.SG.POSS now  
 ‘I happen to have cooked it already  
 (by mistake).’

It also includes perceptions over which the actor (= experiencer) has no control as in:

- (16) *doón ay nà-kita nilá*  
 DIST.LOC PM RLS.POT.PV-see 3.PL.POSS  
*ang isá-ng ma-lakí-ng higante*  
 SPEC one-CONN STAT-size-CONN giant  
 ‘there they saw a great giant ...’

In a second, somewhat different use potentiative forms express the ability of an actor to perform the action in question:

- (17) *kung inyóng*  
*kung inyó-ng*  
 if 2.PL.DAT-CONN  
*mapagtisán iyán*  
*ma-pag-tiis-an iyán*  
 POT-GER-suffer-LV that  
 ‘if you are able to endure this ...’

- (18) *at hindí makabaríl sa kanyá.*  
 at hindí maka-baríl sa kanyá  
 and NEG POT.AV-gun LOC 3.SG.DAT  
 ‘(The man got bitten by the ants) and  
 wasn’t able to shoot at him.’

Turning now to stative expressions, these also come in four different voices, two of which are formally identical to the potentiative voice forms. Because of the formal similarities, the same labels have been chosen here for glossing these stative voices. However, their syntax and semantics differ quite clearly from the potentiative formations so that the labels are not really indicative of their functions.

In the basic voice form for statives, which is simply called *stative* here, the subject is a theme, i.e. an entity which is in, or currently is undergoing, a given state. The forms are identical to the patient voice forms of the potentiative paradigm, i.e. base plus prefix *ma*. The forms of the stative actor voice are morphologically identical to the potentiative actor

voice forms, i.e. base plus *maka*. The stative locative and conveyance voices are marked by the prefix *ka*- to which the basic voice affixes *-an* and *i-*, respectively, are added. See Tab. 136.4 for an overview of the forms.

The only really productive formation is the basic stative formation. Almost every Tagalog content word base can be prefixed with *ma*- and then expresses a state:

- (19) *na-galit siyá*  
 RLS.STAT-anger 3.SG  
 ‘she was/got angry’

With bases such as *basag* ‘crack, break’, which allow both a state and an action reading, the form *nabasag* is ambiguous: It can mean ‘be in a broken state’ (stative) or ‘happen to break/able to break’ (potentiative patient voice). In context, these readings are generally distinguished by the presence of an overt actor expression in the potentiative use (*nabasag niyá* ‘s/he happened to break it/was able to break it’).

The stative locative voice is common with bases expressing emotions. The subject expresses the person or thing at which the emotion is directed:

- (20) *kinagalitan siyá ng*  
*in-ka-galit-an siyá ng*  
 RLS(UGR)-STAT-anger-LV 3.SG GEN  
*Nanay nanay*  
 mother mother  
 ‘mother was angry with him/her’

Frequently, stative locative voice derivations take on some more specialised meanings. Thus, *kagalitan* also means ‘to reprove, to scold, to rebuke’. In addition, stative locative voice derivations are possible with a (relatively small) number of stative expressions which do not pertain to emotions. They then denote the place at which a given state occurs (e.g. *ka-matay-an* ‘place where someone died’, *ka-hulug-an* ‘place where someone falls’).

The stative conveyance voice is also most common with bases expressing emotions. Stative conveyance voice formations always have the connotation of causation, that is, the subject specifies the reason for the emotion:

- (21) *ikinagalít niyá akó*  
*i-in-ka-galit niyá akó*  
 CV-RLS(UGR)-STAT-anger 3.SG.POSS 1.SG  
 'she got angry at me (I was the reason for her being angry)'

The stative conveyance voice is found with a somewhat broader range of bases than the stative locative voice. These include *ikabasá* 'get wet on account of', *ikabagsák* 'fall on account of', *ikatawa* 'laugh on account of', *ikaiyák* 'cry on account of', etc.

The stative actor voice is very similar in meaning to the stative conveyance voice since it also specifies the cause for a given state. But the two formations differ in their grammar and productivity. In the stative conveyance voice construction (as in the stative locative voice construction), the theme argument (i.e. the one who experiences an emotion in the case of emotions) is grammatically coded as a genitive argument. In the stative actor voice construction it is a locative argument:

- (22) *lahát ng kanyáng sabihin*  
*lahát ng kanyá-ng sabi-in*  
 all GEN 3.SG.DAT-CONN statement-PV  
*ay nakagàgalit sa*  
*ay naka-RDP<sub>1</sub>-galit sa*  
 PM RLS.STAT.AV-RDP<sub>1</sub>-anger LOC  
*akin*  
*akin*  
 1.SG.DAT  
 'everything he says irritates me'

The subject expression in the stative actor voice construction usually refers to an inanimate cause (some state of affairs or a thing). With regard to productivity, the stative actor voice forms are the least common of all stative formations and whenever they occur they often take on somewhat specialised meanings (thus *makagalit* is 'irritate, antagonise, give offence' rather than a plain 'make angry'). Furthermore, the stative actor voice derivations are often conventionalised in one of the four aspect/mood forms, for example, *naka-àawa* 'arousing pity, pitiable' (<*awa*' 'mercy, compassion'), *nakàka-lító* (or *naka-lilitó*

'confusing' (< *litó* 'confused, at a loss'), or *nakàka-gandá* (or *naka-gàgandá*) 'beautifying' (< *gandá* 'beauty').

## 5.2. Further modes of actor involvement

The following prefixes mark further modes of actor involvement:

- *pa-* is a **causative** prefix and compatible with all voice affixes (see McFarland 1984 for ample exemplification and discussion). Actor voice is used when the causer is the subject, patient voice when the causee is the subject, e.g. *p<in>a-talim niyá itó* '<RLS(UGR)>CAUS-sharp 3.SG.POSS PROX (he made this sharp)' and *pa-patul-in mo si Huán ng kugon* 'CAUS-cut-PV 2.SG.POSS PN Juan GEN species.of. grass (have Juan cut the cugon-weeds)'. Patient voice in non-causative constructions becomes conveyance voice in causative ones. Compare the following two examples:

- (23) *Nànakaw-in ba natin*  
*RDP<sub>1</sub>-nakaw-in ba natin*  
*RDP<sub>1</sub>-stealing-PV INT 1.PI.POSS*  
*ang bangkáy ni Andrea?*  
*ang bangkáy ni Andrea*  
 SPEC corpse GEN.PN Andrea  
 'Will we steal Andrea's corpse?'

- (24) *Ipanànakaw ba ulí'*  
*i-pa-RDP<sub>1</sub>-nakaw ba ulí'*  
*CV-CAUS-RDP<sub>1</sub>-stealing INT again*  
*sa atín ang bangkáy*  
*sa atín ang bangkáy*  
 LOC 1.PI.DAT SPEC corpse  
*ni Andrea?*  
*ni Andrea*  
 GEN.PN Andrea  
 'Is (he) asking us to steal Andrea's corpse again?'

- *paki-* indicates that the actor joins an ongoing action (**sociative**). It may also be used to make a polite request or to indicate that something is done as a favour. Next to actor voice *maki-*, all undergoer voices are possible, for example:

- (25) *i-p<in>àki-hulog ni*  
*CV-<RLS(UGR)>SOCIAT-fall GEN.PN*  
*Pedro ang aking sulat*  
 Pedro SPEC DAT.1.SG.CONN letter  
 'Pedro mailed my letter (along with his)'

- *si-* only co-occurs with *mag-* and indicates **plurality** of (individual) actors, e.g. *nàg-si-ilag silá sa bayan* ‘RLS.AV-PL-flee 3.PL LOC town (they all fled from the town’).

Further differences in the conceptualisation of an action are indicated by the prefixes *pag-* and *paN-*. As illustrated in 4.3, these prefixes are used to derive gerunds. Such gerunds, which do not have an inherent orientation, are also compatible with voice affixes. Thus, contrasting sets such as the following occur: *p-um-utol* ‘cut’, *mág-putol* ‘cut several things’, *màmutol* ‘cut selectively or in quantity’. Similar contrasts involving undergoer voices are rare (an example is *tapakan* ‘step on’ vs. *pág-tapakan* ‘step on repeatedly’). The use of voice marked *paN*-derivatives is not very common and generally indicates intensive, distributive or repeated action, e.g. *bumilí* ‘buy’ vs. *nàmili* ‘shop’, *humampás* ‘hit with a whip’ vs. *màngampás* ‘whip people, go whipping’.

The major contrast is the one between *-um-* and *mag-* (cf. Blake 1925: 248 f.; Lopez 1937: 46–49; Pittman 1966; Schachter & Otanes 1972: 292 f.; Drossard 1984: 87–92; Himmelmann 1987: 185–188). Often *mag*- indicates the greater frequency or intensity of an action, cf. *bumasa* ‘read’ vs. *magbasa* ‘to read a lot/study’. A similar formation, i.e. the prefixing of *mag-* plus RDP<sub>2</sub>, is possible in principle for any base to indicate intensive or repeated action (cf. Schachter & Otanes (1972: 337 f.); Bloomfield (1917: 237–239) specifies stress shifts which may also occur). *mag-* and *-um-* may even co-occur to indicate a high degree of intensity, cf. *mág-um-aral* ‘study diligently’ or *mag-s-um-igáw* ‘shout (long and very loud)’. In other instances, the contrast seems to pertain to transitivity: *t<um>ayó’ kami* ‘<AV>stand.upright 1.PE (we stood up)’ vs. *nag-tayó’ kami ng bahay* ‘RLS.AV-stand.upright 1.PE GEN house (we erected a house)’. Note that in the corresponding undergoer voices no *pag-* appears: *i-t<in>ayó’ niyá ang bahay* ‘CV-<RLS(UGR)> stand.upright 3.SG.POSS SPEC house (he erected the house)’. In this type of example, the base denotes some kind of position or motion, and the *um*-form denotes an actor who moves himself, the *mag*-form an actor who moves something. A similar contrast exists with respect to bases denoting qualities,

e.g. *um-init* ‘become/get hot’ vs. *mag-init* ‘make hot, heat’. Much quoted, but unique is the contrast between *bumilí* ‘buy’ and *mág-bilí* ‘sell’.

Apart from such contrasting sets there are also several bases which only allow voice marking for *pag*-derived stems. For example, from *bawal* ‘prohibited’ neither \**bumawal* nor \**ibawal* may be derived, but only *magbawal* and *ipagbawal*. These bases do not display a common semantic or phonological feature. Other examples are *bilín* ‘order, instruction’, *kanuló* ‘betrayal’, *lingkód* ‘servant’, etc. (cf. McFarland 1976 Appendix II; Himmelmann 1987: 151). Another group of bases – which again does not exhibit a common denominator – allows actor orientation only with *mag-*, while undergoer orientation is possible without prior derivation. For example, from *luto* ‘cook’ \**lumuto* may not be derived but only *magluto*, while the undergoer voice form is simply *iluto*’ or *lulu’in*. Other bases belonging to this group are *dasál* ‘prayer’, *hugas* ‘wash’, *punas* ‘wipe off’, *libíng* ‘burial’, *bayad* ‘payment’, *kahoy* ‘wood’, *hubád* ‘naked’, etc. (cf. Himmelmann 1987: 179 f.).

Bloomfield's (1917) translation:

“Once upon a time, when the turtle was swimming in the river, he saw a banana-tree adrift and being carried along by the current. He dragged it to the beach, but was not able to carry it up to the solid ground. Therefore he called his friend, the monkey, and offered him a half of the banana-tree, if he would plant his part for him. The monkey agreed, and they divided the banana-tree at the middle, half-way from either end. The monkey took the half which had leaves, because he thought it would grow better than the half which had none.

When a few days had passed, the monkey's tree died, while that of the turtle grew until it bore fruit. The bananas grew ripe, but the turtle could not climb for them. Therefore he called his friend, the monkey, and offered him some of the fruits of the banana, if he would climb the tree. The monkey climbed up and ate for all he was worth.

Said the turtle: ‘Throw me some.’

But the monkey answered: ‘Though sweet the skins, I'd throw you none.’

The turtle got angry and scattered spines round the foot of the tree. When the monkey jumped down, he landed on the spines. He suspected the turtle and looked for him, in order to punish him. He found the turtle behind a stump.

Said he to the turtle: ‘I am going to punish you. Choose between the two: shall I Bray you in a mortar or drown you in the river?’

The clever turtle began to shout and begged the monkey, if it were possible, to Bray him in a mortar.

But the monkey answered: ‘I shall give you the punishment you don't want.’

And he threw the turtle into the river.

When the turtle arrived in the water, he set up a shout and said to the monkey: ‘Thank you, friend! This is my home.’” (Bloomfield 1917: 16)

### 1. Introduction

The Diyari language was traditionally spoken in the far north of South Australia, to the east of Lake Eyre along the lower reaches of Cooper Creek – a mostly dry watercourse that runs from western Queensland into Lake Eyre. This is one of the driest and hottest regions of Australia with an average annual rainfall of about 100 mm (or 4 inches) and summer temperatures regularly reaching 45

degrees. However, the whole of the area was exploited by the Diyari and is covered with placenames and mythological sites.

The neighbours of the Diyari were the Thirrari and Arabana (west), Kuyani and Adnyamathanha (south), Yandruwandha and Yawarrawarrga (east), and the Ngamini and Wangkangurru (north). The Diyari language is closely genetically related to Thirrari and Ngamini, and more distantly to Yandruwandha and Yawarrawarrga. Austin (1990) shows that these languages form a sub-group with Pitta-Pitta (western Queensland) and Wangkumarra (western New South Wales). The more distant genetic connections of this subgroup have yet to be worked out in detail (see Bowern 1998; 2001); however, it is clear that they all belong to the Pama-Nyungan family which occupies the southern seven-eighths of the Australian continent (Dixon 1980; Blake 1988; Bowern & Koch 2004).

When first contacted by white settlers in the 1860's the Diyari probably numbered over 1000; today there is no-one alive who can speak the language fluently. Mr. Ben Murray (traditional name *parlku-nguyuthangkayiwarna*) was born in 1891 and was the very last speaker of the Thirrari language. His life history, including a series of stories told by him in Diyari and Thirrari, appears in Austin et al. 1988 (cf. also Murray & Austin 1981; 1986).

Unlike many Australian Aboriginal languages, Diyari has a long history of use as a written language. In 1869 German Lutheran pastors established a mission among the Diyari at Lake Killalpaninna on Cooper Creek; the mission and associated sheep station flourished until its closure by the South Australian government in 1914. The missionaries studied the Diyari language and used it in their work and their daily lives, including preaching in Diyari and teaching it in the mission school. They prepared primers, school books, dictionaries and grammars of Diyari, and translated a large number of Christian works into the language, including hymns and the Old and New Testaments.

One of the most remarkable missionaries was the Rev. J.G. Reuther who not only translated the New Testament into Diyari, but also compiled a 14 volume manuscript on Diyari language, culture, mythology and history that includes a grammatical description (employing traditional Latin-based categories), and a massive four volume dictionary (Reuther 1981).

Recent research on Diyari began in the 1970's when tape recordings and notes were made by Luise Hercus, David Trefry and Peter Austin. Austin (1978) is a reference grammar of Diyari (revised and published as Austin 1981). Austin is preparing a dictionary and collection of stories told by the last speakers, and a study of Diyari literacy based on letters written by native speakers.

## 2. Morphological type

Like all Pama-Nyungan languages, Diyari is entirely suffixing with a highly agglutinative word structure. Morpheme shape is generally invariant or else conditioned by phonological (and rarely morphological) factors. Word order is relatively free, though less so than in many other Australian languages. Diyari is also consistently **dependent marking** (Nichols 1986) with grammatical functions coded on dependents only. Approximately half the Pama-Nyungan languages have bound pronominal agreement suffixes attached to the finite verb, to a sentence-level auxiliary element, or else to the first constituent of a main clause, and hence show **double marking**. Bound pronominals are lacking from Diyari and its neighbours (see bound pronoun distribution maps in Blake 1977, Dixon 1980).

Case affixes are attached to the last element of a noun phrase only, unless the constituents are separated by other material. Diyari is thus a **phrase marking** language (Blake 1987: 78; Dench & Evans 1988), not **word marking** like many other Pama-Nyungan languages.

Diyari shows **Suffixaufnahme** (Austin 1995; Plank 1990), i.e. double marking of case in possessive constructions, where the genitive case-marked element may take the case marker assigned to the phrase. This occurs when the possessor follows the possessee.

Words in Diyari must begin with one and only one consonant and must end in a vowel. Intervocalic consonant clusters are limited (Austin 1981: 26) and no vowel sequences are permitted. Bound morphemes may begin with consonant clusters, but must end in a vowel. The transcription adopted here follows Australianist conventions: *th, nh, lh* are lamino-dental stop, nasal and lateral respectively; *j, ny, ly* are lamino-palatal; *rd, rt, rn, rl* are apico-domal (retroflex). There are three r-sounds: a post-alveolar continuant *r*, a tap *rr*, and a trill *rrh*.

Morphophonemics is relatively limited and is discussed in the relevant sections below (cf. 4.2.2). Reduplication (involving copying of the first CV(C)CV of the stem) occurs with both nominals and verbs, coding ‘diminutive’ with nominals and ‘iterative’ with verbs (cf. illustrative text, (8)).

### 3. Parts of speech

Seven word classes may be set up for Diyari:

- (a) **nominals** – words which inflect for case according to their relationship to the predicate or to other nominals in the clause. This category covers entity concepts (‘nouns’), property concepts (‘adjectives’), certain temporal and spatial locationals, and personal names. Adjectives and nouns have the same inflectional behaviour, but can be distinguished as subclasses of nominals on syntactic grounds (Austin 1981: 33 f.).
- (b) **pronouns** – inflect for case and are specified for person (1st, 2nd, 3rd) and number (singular, dual, plural). In the first person non-singular there is an inclusive-exclusive contrast; there is also a set of special relationship pronouns with a defective paradigm.
- (c) **verbs** – obligatorily inflect for tense/mood or dependent clause categories. There are main and auxiliary verbs, the latter occurring after main verbs and marking tense/aspect.
- (d) **predicate determiners** – closed class with two members that are inflected for deixis and adverbially modify predicates.
- (e) **particles** – modal elements that cannot take inflectional or word-forming affixes.
- (f) **co-ordinators** – phrasal and clausal conjunctions and disjunctions that allow no affixation.
- (g) **interjections** – comprise a whole utterance by themselves and are uninflected (see Austin 1981: 37).

Diyari has a set of post-inflectional affixes that can attach to words of any class (except co-ordinators and interjections). These code various pragmatic (information status) categories (see (9)).

### 4. Nominal morphology

Nominal words minimally consist of a root which may be inflected for case (4.2). One or more derivational suffixes may be attached

to roots to form stems; some of these derive nominals (4.1.1), while others cause a change in category (4.1.2). On morpho-syntactic grounds nominals can be divided into: adjectives, common nouns, proper nouns (personal and place names), and location nominals. Case is realised differently according to nominal sub-class.

#### 4.1. Word formation

There are eleven derivational suffixes that may attach to nominal roots to form stems. Eight of these derive nominal stems (4.1.1); the other three derive verbs (4.1.2).

##### 4.1.1. Non-category changing

Affixes deriving nominals are:

- (a) *-kanyji* ‘EXCESS’ derives a stem meaning ‘animate being excessively concerned with or possessed of’ qualities denoted by the root, e.g. *yapa-kanyji* ‘fear-EXCESS (fearful one)’, *parla-kanyji* ‘sexual.desire-EXCESS (sex maniac)’.
- (b) *-yija* ‘HABIT’ produces ‘animate being habitually associated with’ the root nominal, e.g. *kupula-yija* ‘alcohol-HABIT (drunkard)’, *nhaka-yija* ‘there-HABIT (one from there)’.
- (c) *-lha* ‘CHAR’ added to a locational noun or a common noun referring to a geographical feature it forms ‘entity which inhabits, grows or is found in’ a place, e.g. *pantu-lha* ‘salt.lake-CHAR (salt lake dweller)’, *marda-lha* ‘hill-CHAR (hill dweller)’. With temporal location nominals it indicates characteristic time association, e.g. *warru-lha* ‘long.ago-CHAR (old, ancient)’.
- (d) *-wurlu* ‘DU’ derives a dual stem from a common noun or adjective root, e.g. *kanku-wurlu* ‘boy-DU (two boys)’, *kapi-wurlu* ‘egg-DU (two eggs, testicles)’. Number is not an obligatorily marked category in Diyari; unmarked common nouns may be interpreted as singular, dual or plural according to context. Dual and plural derived stems inflect like pronouns (see 5).
- (e) *-wara* ‘PL’ derives a plural stem from a common noun or adjective root, e.g. *kanku-wara* ‘boy-PL (boys)’, *pirta-wara* ‘tree-PL (trees)’.
- (f) *-nithu* ‘PROPR’ meaning ‘with’ or ‘having’ is suffixed to common noun or adjective roots to produce stems that can serve as

- adnominal modifiers, e.g. *nganka-nthu* ‘beard-PROPR (bearded)’, *nhuwa-nthu* ‘spouse-PROPR (married)’ (Austin 1981: 42, 140–145). Most Australian languages have a complementary suffix, the PRIVATE indicating ‘lacking, without’, Diyari has an adjective *pani* ‘none’ to express this concept, e.g. *ngapa pani* ‘water without (waterless)’ (cf. Austin 1981: 43 f.).
- (g) *-mara* ‘KINPROPR’ can be added to common nouns or adjectives with two effects: as a synonymous alternative to *-nthu* ‘PROPR’, or suffixed to a kinship term to derive a collective noun stem where *A-mara* means ‘group of people one of whom is called A by the others’, e.g. *nhuwa-mara* ‘spouse-KINPROPR (man and wife/wives)’, *kaku-mara* ‘elder.sister-KINPROPR (group of sisters)’. Australian languages typically have one or more affixes that attach to kinship terms to derive such collective nouns, often called **dyadic** or **triadic kin terms** (Heath et al. 1982), and sometimes with different functions in address and reference (Dench 1982).
  - (h) *-nja* ‘NUMBER’ added to numeral adjectives to mean ‘just so many in number’, e.g. *parrkulu-nja* ‘three-NUMBER (just three)’.

Nominal stems may be composed of two of these affixes with (a) or (b) or (c) followed by (d) or (e) or (f) or (g) (affix (h) has never been observed in combination), e.g. *kupula-yijawara* ‘alcohol-HABIT-PL (drunkards)’, *yapakanyji-mara* ‘fear-EXCESS-KINPROPR (with a fearful one)’. Other combinations and longer affix sequences are avoided by speakers.

#### 4.1.2. Category changing

Three affixes may be added to nominal roots to derive verb roots. Two derive intransitive roots and one transitive verbs:

- (a) *-rri* ~ *-ri* ‘INCH’ derives inchoative intransitive verbs meaning ‘become’ (Austin 1981: 164–167). The allomorphs are phonologically conditioned: *-ri* is added to roots containing an intervocalic apical consonant or cluster, *-rri* is used elsewhere, e.g. *wardu-ri* ‘short-INCH (become short)’, *pandrra-ri* ‘cooked-INCH (become cooked, cook)’, *ngumu-rri* ‘good-INCH (become good)’, *thungka-rri* ‘rotten-INCH (become rotten)’ (cf. illustrative text, (6), (7), (19)).

- (b) *-nga* ‘PRODUCT’ derives an intransitive verb meaning ‘to produce ...’ when added to nouns referring to sounds, e.g. *karta-nga* ‘crack-PRODUCT (to crackle, snap)’, *kandrru-nga* ‘snore-PRODUCT (to snore)’. There is also the form *thupu-nga* ‘smoke-PRODUCT (to smoke, give off smoke)’.
- (c) *-nganka* ‘CAUS<sub>3</sub>’ derives a transitive verb meaning ‘to cause to be ...’, e.g. *mukanganka* ‘sleep-CAUS<sub>3</sub> (to put to sleep)’, *kirrhi-nganka* ‘clever-CAUS<sub>3</sub> (to teach)’ (cf. illustrative text, (2), (8)). This affix is homophonous with the main verb *nganka* ‘to make, cause’.

#### 4.2. Inflection

Nominals and pronouns inflect for case with only the last of a sequence of nominals in a noun phrase bearing the case marker, the others being unmarked. Case inflection, as in most Pama-Nyungan languages, is of the ‘split-ergative’ type (cf. Art. 102; Silverstein 1976; Dixon 1979); the distinction between intransitive subject (**nominative**), transitive subject (**ergative**), and transitive object (**accusative**) is not overtly marked for all nominal types. There is formal syncretism conditioned by animacy of the nominal or pronoun referent (cf. Blake 1987: 20–23). In Diyari there are three paradigms:

- (a) singular common nouns and male personal names syncretise nominative and accusative (giving an ergative-absolutive pattern);
- (b) non-singular first and second person pronouns (see 5) syncretise ergative and nominative (giving a nominative-accusative pattern);
- (c) all others have three separate forms for the three cases, i.e. female personal names, non-singular common nouns (derived by the affixes *-wurlu* and *-wara*, cf. 4.1.1), singular first and second person pronouns, and all third person pronouns (see 5).

There are four other case categories: ablative, allative, locative and dative. All nominals have a separate ablative case form but the others are subject to syncretism: for singular common nouns allative and dative fall together, all other non-locational nominals have a single form for locative and allative. Case allomorphy is described in the following sections.

#### 4.2.1. Location nominals

**Location nominals** have the unmarked stem as their **locative** case form. They include temporal locationals, e.g. *warru* ‘long ago’, *thangkuparna* ‘tomorrow’, and spatial locationals. The latter consist of the cardinal directional terms (*thinankarra* ‘north’, *kunankarri* ‘south’, *yantakarra* ‘west’, *thirrhiwa* ‘east’) and the roots *nhaka* ‘there’ and *nhingki* ‘here’. The root *nhingki* obligatorily selects a deictic marker of relative distance from the speaker (-*rda* ‘VICIN’, -*ya* ‘NEAR’, -*parrha* ‘THERE’, -*wa* ‘DISTANT’) before being suffixed for case. The case affixes are allative -*nhi* for *nhaka* and *nhingki*, -*ya* for other locationals, and ablative -*ndrru*, e.g. *thangkuparna* ‘tomorrow(LOC)’, *nhaka* ‘there(LOC)’, *warru-ndrru* ‘long.ago-ABL’, *thinankarra-ya* ‘north-ALL’, *nhingki-rda-nhi* ‘here-VICIN-ALL’.

#### 4.2.2. Personal names, common nouns, and adjectives

Seven cases are distinguished for personal names, common nouns and adjectives, with some formal syncretism (4.2). There are two morphophonological rules that affect inflected forms (Austin 1981: 28 f.):

- (a) in tri-syllables ending in *i* or *u* the final vowel is neutralised to *a* when a suffix is added;
- (b) final *u* of -*wurlu* ‘DU’ becomes *a* when followed by a suffix.

The cases are:

- (a) **Nominative** codes intransitive subject function. Allomorphs are -*ni* added to female personal names, -*nha* added to male personal names; all others use the bare stem form.
- (b) **Ergative** codes transitive subject and instrumental functions. There are three allomorphs:
  - *ndrru* added to female personal names;
  - *li* added to male personal names, non-singular common nouns, singular common nouns ending in *a*, and singular common nouns of three syllables ending in *u* or *i* (optionally for tri-syllables ending in *i*);
  - *yali* added to singular common nouns of two, four or five syllables ending in *u* or *i* (and optionally for tri-syllables ending in *i*).

Words exemplifying these allomorphs are given in Tab. 137.1 (see also illustrative

text). Note that most Pama-Nyungan languages have ergative allomorphs -*ngku* and/or -*lu* (often the former is used with disyllables and the latter with longer stems; see Dixon 1980, Blake 1987). Diyari and its neighbours show no evidence of these.

- (c) **Accusative** codes transitive object function. Singular common nouns and male personal names syncretise this case with the nominative, all others add -*nha*. Accusative is commonly -*nha* or -*nya* throughout Australia (Dixon 1980).
- (d) **Locative** codes functions including location in time or space, accompaniment, object of comparison and complement of certain intransitive verbs (Austin 1981: 123–130). Allomorphs are:
  - *nhangu* added to female personal names;
  - *ngu* added to male personal names and non-singular common nouns;
  - *nhi* added to singular common nouns.

Most Pama-Nyungan languages show locative allomorphs identical to ergative except in having final *a* instead of *u* (e.g. -*ngka* and/or -*la*). Diyari and its neighbours lack this parallelism.

- (e) **Allative** codes location in time or space towards which motion or an action is directed. It is formally the same as LOCATIVE for female and male personal names and non-singular common nouns, and is -*ya* for singular common nouns.
- (f) **Dative** codes purpose, benefactive and genitive (alienable possession) functions. The realisation is the same as allative for singular common nouns, -*nhangka* for female personal names, and -*rni* for male personal names and non-singular common nouns. Most Pama-Nyungan languages have a dative case form -*ku*; this is lacking in Diyari and its relatives, though found in Arabana and Wangkangurru to the west.
- (g) **Ablative** codes source location from which motion or an action proceeds and indirect cause. The suffixes are: -*ngundrru* added to male and female personal names and to non-singular common nouns, -*ndrru* added to singular common nouns.

Tab. 137.1 sets out examples of these allomorphs.

stem	ergative	nominative	accusative	locative	allative	ablative	dative
person-DU	<i>karnawu-rlali</i>	<i>karnawurlu</i>	<i>karnawurla-nha</i>	<i>karnawu-rlangu</i>	<i>karnawu-rlangu</i>	<i>karnawu-rlangundru</i>	<i>karnawu-rlarni</i>
person-PL	<i>karnawara-li</i>	<i>karnawara</i>	<i>karnawara-nha</i>	<i>karnawa-rangu</i>	<i>karnawa-rangu</i>	<i>karnawara-ngundru</i>	<i>karnawa-rarni</i>
woman's name	<i>jirimiri-rrindru</i>	<i>jirimirrini</i>	<i>jirimirrinha</i>	<i>jirimirri-nhangu</i>	<i>jirimirri-nhangu</i>	<i>jirimirri-ngundru</i>	<i>jirimirri-nhangka</i>

long ago				<i>warru</i>	<i>warrya</i>	<i>warrundru</i>	
there				<i>nhaka</i>	<i>nhakanhi</i>	<i>nhakandru</i>	

Tab. 137.1: Case paradigms

## 5. Pronoun morphology

Pronouns inflect for case and distinguish three persons (1st, 2nd, 3rd) and three numbers (singular, dual, plural). There are two types of pronouns: regular personal pronouns and special relationship pronouns.

Special relationship pronouns are a marginal set with a defective paradigm – they occur only in the dual absolute (intransitive subject and transitive object functions) and are clearly borrowed from Wangkangurru. They code same or different (matrilineal) moiety membership. Special pronouns reflecting kinship are found in many Australian languages (Heath et al. 1982, eds.).

For regular personal pronouns there is an inclusive-exclusive contrast in the first person non-singular (present in about half the languages of Australia, cf. Dixon 1980), and a feminine/non-feminine natural sex based gender contrast in the third person singular. Third person pronouns have demonstrative functions: they co-occur with nouns in noun

phrases (cf. illustrative text, (12), (19)) and may take the deictic suffixes attached to spatial location nominals (4.2.1). Tab. 137.3 sets out the pronoun paradigm.

Dative pronouns are used to indicate alienable possession in Diyari. Body-part possession is coded by apposition of the possessor and the possesum, both being marked for case (cf. two instances in illustrative text, (11)). Dative pronouns may precede the head (cf. illustrative text, (3), (11), (13)) or follow it, in which circumstance they bear the case marker of the noun phrase as a whole, the head remaining unmarked (a type of Suffixaufnahme; Austin 1981: 62). An example is illustrative text, (9) (note the shift of final *i* to *a*, as with tri-syllabic nominals).

## 6. Verb morphology

Verbs in Diyari inflect for tense, mood or dependent clause categories. They sub-classify into **main verbs** and **auxiliary verbs**; the latter are optional, code tense/aspect and do not undergo word formation processes. Main verbs are strictly sub-categorised into intransitive (taking a nominative subject), transitive (taking ergative and accusative) and di-transitive (taking ergative and two accusative). Most Australian languages have several morphologically conditioned verb conjugations (Dixon 1980: 382 ff.); in Diyari and its neighbours all verbs inflect in a single paradigm.

person	same moiety	different moiety
first	<i>ngalantha</i>	<i>ngalilakiya</i>
second	<i>ampalantha</i>	<i>ampalakiya</i>
third	<i>pulalantha</i>	<i>pulalakiya</i>

Tab. 137.2: Special relationship pronouns

person	ergative	nominative	accusative	dative	locative	ablative
1:SG	<i>ngathu</i>	<i>nganhi</i>	<i>nganha</i>	<i>ngakarni</i>	<i>ngakangu</i>	<i>ngakangundrru</i>
2:SG	<i>yundrru</i>	<i>yini</i>	<i>yinantha</i>	<i>yingkarni</i>	<i>yingkangu</i>	<i>yingkangundrru</i>
3:SG:F	<i>nhandrru</i>	<i>nhani</i>	<i>nhanha</i>	<i>nhangkarni</i>	<i>nhangkangu</i>	<i>nhangkangundrru</i>
3:SG:NF	<i>nhulu</i>	<i>nhawu</i>	<i>nhinha</i>	<i>nhungkarni</i>	<i>nhungkangu</i>	<i>nhungkangundrru</i>
1:DL:INCL	<i>ngaldrra</i>	<i>ngaldrra</i>	<i>ngaldranha</i>	<i>ngaldrrarni</i>	<i>ngaldrrangu</i>	<i>ngaldrrangundrru</i>
1:DL:EXCL	<i>ngali</i>	<i>ngali</i>	<i>ngalinha</i>	<i>ngalirni</i>	<i>ngalingu</i>	<i>ngalingundrru</i>
2:DL	<i>yula</i>	<i>yula</i>	<i>yulanha</i>	<i>yularni</i>	<i>yulangu</i>	<i>yulangundrru</i>
3:DL	<i>pulali</i>	<i>pula</i>	<i>pulanha</i>	<i>pularni</i>	<i>pulangu</i>	<i>pulangundrru</i>
1:PL:INCL	<i>ngayana</i>	<i>ngayana</i>	<i>ngayananha</i>	<i>ngayanarni</i>	<i>ngayanangu</i>	<i>ngayanangundrru</i>
1:PL:EXCL	<i>ngayani</i>	<i>ngayani</i>	<i>ngayaninha</i>	<i>ngayanirni</i>	<i>ngayaningu</i>	<i>ngayaningundrru</i>
2:PL	<i>yurra</i>	<i>yurra</i>	<i>yurranha</i>	<i>yurrarni</i>	<i>yurrangu</i>	<i>yurrangundrru</i>

Tab. 137.3: Pronouns

### 6.1. Word formation

Verb stems may be derived by the addition of suffixes to roots. Some suffixes change category, deriving nouns (6.1.2), while others derive verbs (6.1.1). Among the latter, some affixation changes transitivity, some does not.

#### 6.1.1. Non-category changing

There are eight affixes which may be added to verb roots to derive verb stems; five of these affect **transitivity** and three do not. Main verbs can be sub-classified into ten morpho-syntactic groups according to their co-occurrence with these five affixes. The classification is set out in Tab. 137.4.

### Intransitive

class	<i>-lka-</i>	<i>-ipa</i>	<i>-ma-</i>	example
1A	+	—	—	<i>wapa-</i> ‘to go’
1B	+	+	—	<i>tharrka-</i> ‘to stand’
1C	—	+	—	<i>purnka-</i> ‘to grow’
1D	—	—	—	<i>yatha-</i> ‘to speak’
1E	—	—	+	<i>pali-</i> ‘to die’

### Transitive

class	<i>-tharrhi-</i>	example
2A	reflexive	<i>nandrra-</i> ‘to hit’
2B	anti-passive1	<i>karlka-</i> ‘to await’
2C	anti-passive2	<i>thayi-</i> ‘to eat’
2D	passive	<i>thinthia-</i> ‘to lose’
2E	none	<i>yurlka-</i> ‘to swallow’

Tab. 137.4: Verb classes

The affixes and their functions are as follows. Firstly, those which affect transitivity:

- (a) *-lka* ‘APPL’ added to class 1 A or 1 B intransitive roots derives an applied transitive stem indicating accompaniment, e.g. *wapa-lka-* ‘go-APPL (to go with, take)’, *tharrka-lka-* ‘stand-APPL (to stand with)’.
- (b) *-ipa* ‘CAUS<sub>1</sub>’ added to 1 B or 1 C roots derives a causative transitive stem (with replacement of the root-final vowel with *i*), e.g. *tharrkipa-* ‘stand:CAUS<sub>1</sub> (to stand (it) up)’, *thurraripa-* ‘lie:CAUS<sub>1</sub> (to lay (it) down)’. This affix also has a benefactive function (see (f)).
- (c) *-ma* ‘CAUS<sub>2</sub>’ added to 1 E roots derives a causative transitive stem, e.g. *pali-ma-* ‘die-CAUS<sub>2</sub> (to kill)’.
- (d) *-tharrhi* has a number of functions according to the transitive verb sub-class:
  - with 2 A or di-transitive roots it derives an intransitive reflexive stem, e.g. *nandrra-tharrhi-* ‘hit-REFL (to hit oneself)’;
  - with a 2 B root it derives an intransitive anti-passive activity stem, e.g. *karlka-tharrhi-* ‘await-APASS (to wait for)’;
  - with a 2 C root it derives an intransitive anti-passive unspecified object activity stem, e.g. *thapa-tharrhi-* ‘drink-APASS (to have a drink)’;
  - with a 2 D root it derives an intransitive passive process stem, e.g. *thintha-tharrhi-* ‘lose-PASS (to get lost)’.

This affix also has an aspectual function where there is no change in transitivity. It can be added to a reduplicated root of

- any class to derive a durative stem (iterative or continuous according to the root semantics), e.g. *ngara-ngara-tharrhi-* ‘RDP-hear-DUR (to listen)’, *yatha-yatha-tharrhi-* ‘RDP-speak-DUR (to gossip)’.
- (e) *-mali* ‘REC’ added to a transitive or ditransitive root derives an intransitive stem with reciprocal meaning, e.g. *nandrра-mali-* ‘hit-REC (to hit one another)’.

Affixes not affecting transitivity are:

- (f) *-yirrpа* ‘BEN’ attaches to a transitive or ditransitive root producing a stem indicating altruistic action done for the benefit or someone other than the subject, e.g. *pardaka-yirrpа-* ‘carry-BEN (to carry for someone)’. The transitiviser *-ipa-* is a synonymous alternative, e.g. *pardakipa-* ‘carry:BEN (to carry for someone)’.
- (g) *-ingа* ‘PROL’ may be added to roots of any transitivity to derive a stem indicating relative motion of the subject with respect to some other referent (this affix changes root-final vowel to *i*), e.g. *mаnинга-* ‘take-PROL (to take going past)’, *thar-ingа-* ‘go.up-PROL (to go up past)’ (cf. illustrative text, (20)).
- (h) *-nthi* ‘CONSEC’ added to roots of any class derives a stem meaning action done as a consequence of some other action, e.g. *wapa-nthi-* ‘go-CONSEC (to go afterwards)’.

Complex words composed of roots plus two or three derivational suffixes have been attested. The general order is transitiviser plus benefactive plus de-transitiviser, e.g. *yakkalkipa-mali-* ‘ask:BEN-REC (to interrogate one another)’, *wapa-wapa-lka-tharrhi-* ‘RDP-go-APPL-DUR (to be taking)’, *parni-mа-yirrpа-mali-* ‘smell-CAUS<sub>2</sub>-BEN-REC (to smell one another)’.

### 6.1.2. Category changing

Noun stems may be derived from verbs by:

- (a) suffixing *-ni* to the verb stem (which may be preceded by its object if transitive) to derive an instrumental nominal, e.g. *pawa daka-ni* ‘seed grinder’, *warlpardaka-tharrhi-ni* ‘cover-REFL-NR (cover, blanket)’;
- (b) suffixing *-yija* ‘HABIT’ (cf. 4.1.1) to the participial inflected stem (6.2.1) to derive an agentive nominal, e.g. *yindrrа-rna-yija* ‘cry-PART-HABIT (crier)’.

## 6.2. Inflection

Main verb inflections divide into those added to **main clause verbs** (finite, marking tense/mood, and non-finite (6.2.1)), and those added to **dependent clause verbs**. The latter code interclausal reference and linkage categories (6.2.2).

### 6.2.1. Main clause

There are four finite tense/mood inflections and two non-finite inflections:

- (a) *-yi* ‘PRES’ marks non-past tense and imperfective aspect, including present tense, immediate future, and generic statement. It is common in narrative texts for actions in sequence in the main story line (see illustrative text).
- (b) *-ya* ‘PAST’ marks past tense and perfective aspect, situations completed at the moment of speaking.
- (c) *-ya* ‘IMP’ marks imperative mood for verbs ending in *i* and *u*; verbs ending in *a* use the bare stem for imperative (see illustrative text, (6), (18)). Following ‘IMP’ a subject number marker may be optionally suffixed: *-lu* ‘DU’ or *-ni* ‘PL’ (see illustrative text, (6)). Optionally an emphatic *-mayi* may be added (cf. illustrative text examples).
- (d) *-yathimayi* ‘OPT’ marks a situation the speaker feels ought to hold.

Non-finite inflections are added when the main verb is followed by an auxiliary (6.3).

- (e) *-rna* ‘PART’ is the participial inflection used when most past auxiliaries follow.
- (f) *-lha* ‘FUT’ is the future inflection when the future (and one exceptional past) auxiliary follows.

### 6.2.2. Dependent clause

Verbs in dependent clauses take non-finite inflections that are portmanteau morphs coding type of clause linkage (including relative tense) and cross-clausal referential (non-) identity of subjects (switch-reference). There are four clause types; three distinguish same-subject and different-subject reference. The categories are (see also Austin 1981: 187–229):

- (a) **implicated clauses** – these code relative future tense and are typically purposive. The inflections are *-lha* ‘IMPLSS’ for same-subject (see illustrative text, (8), (11), (15), (18)) and *-rnanthu* ‘IMPLDS’ for dif-

- ferent-subject (see illustrative text, (6), (9), (10), (17)). Note that 'IMPLSS' is homophonous with 'FUT' and 'IMPLDS' consists of 'PART' plus 'PROPR'.
- (b) **relative clauses** – these code relative past tense and imperfective aspect. They have both adnominal and adverbial semantic functions. The inflections are *-rna* 'RELSS' for same-subject (cf. illustrative text, (8)), and *-rnanhi* 'RELDs' for different subject (cf. illustrative text, (19)). Note that 'RELSS' is homophonous with 'PART' and 'RELDs' consists of 'PART' plus 'LOC'.
- (c) **sequential clauses** – these code relative past tense and perfective aspect. They have both adnominal and adverbial semantic functions. The inflections are *-rnandrru* 'SEQSS' for same-subject, and *-ni(ngurra)* 'SEQDS' for different-subject. Note that 'SEQSS' consists of 'PART' plus 'ABL' and 'SEQDS' is homophonous with 'NR', optionally followed by *ngurra* which is 'ABL' in neighbouring languages.
- (d) **lest clauses** – express an undesirable state of affairs and are typically used in admonitives. There is no switch-reference and just one suffix *-yathi* (cf. optative in 6.2.1).

### 6.3. Auxiliary verbs

Main verbs may be optionally followed by an auxiliary verb, marking tense (and in one case, aspect). There are five past tense auxiliaries coding relative temporal distance from the present, and one future. Habitual aspect is also marked by auxiliary. Each auxiliary is homophonous with a main verb, and places requirements on the inflection it takes and the non-finite inflection assigned to the main verb which precedes it. These are set out in Tab. 137.5.

auxiliary	homophonous root	function	non-finite inflection	auxiliary inflection
<i>wanthi-</i>	to search	distant past	PART	PRES
<i>wapa-</i>	to go	habitual	PART	PRES
<i>wapa-</i>	to go	intermediate past	PART	PAST
<i>parrha-</i>	to lie	recent past	PART	PAST
<i>wirrh-i-</i>	to enter	yesterday past	FUT	PRES
<i>warra-</i>	to throw	immediate past	PART	PRES
<i>ngana-</i>	to be	future	FUT	PRES

Tab. 137.5: Auxiliary verbs

### 7. Predicate determiner morphology

There are two adverbial predicate determiners: *yaru-* 'like that' (typically with cataphoric reference) and *yani-* 'like this' (typically with immediate context anaphoric reference). These two take the deictic suffixes added to third person pronouns and spatial location nominals (see 4.2.1). e.g. *yani-parrha* 'like.this-THERE (like this)', *yaru-ya* 'like.that-NEAR (like that)' (cf. illustrative text, (12)).

### 8. Particles

Particles are uninflected words with modal functions, having scope over a phrase or whole clause (Austin 1981: 169–177). They include: *wata* 'NEG', *pulu* 'CANNOT', *kanyji* 'CAN', *kara* 'PERHAPS', *maja* 'ALREADY', *ngampu* 'ALMOST', *windri* 'ONLY', *pinti* 'RUMOURED', and *ngarla* 'BUT'.

### 9. Post-inflectional morphology

Post-inflectional suffixes may be attached to words of any class (except co-ordinators and interjections) following their inflection. They code pragmatic functions reflecting informational status of discourse elements (Austin 1981: 177–186), and include: *-rlu* 'STILL', *-yarri* 'RESEMBLE', *-tha* 'OLD.INFORMATION', *-lha* 'NEW.INFORMATION', *-ldrра* 'CONTRAST', *-ku* 'SENSORY.EVIDENCE', *-matha* 'IDENTIFIED', and *-yina* 'TAG' (see illustrative text, (20) for *-tha*).

### 10. Illustrative text

This is an extract from the only mythological text recorded in Diyari. The full text is in Austin (1981: 236–251); this extract covers lines 28–47.

### 1. Introduction

There are about 1,000 languages spoken on New Guinea and surrounding islands; around 250 of these belong to the Austronesian family. The other 750 languages, called Non-Austronesian or Papuan languages, cannot be said to derive from one ancestral language and are organized in more than sixty language families (cf. Wurm 1982; Foley 1986).

Wambon is a Papuan language of the Awyu family of Irian Jaya, the easternmost province of Indonesia on the western half of New Guinea. It is spoken by about 4,000 people in the Upper-Digul area. The southern and western neighbours of Wambon are the Awyu languages Mandobo (Drabbe 1959), Kombai (De Vries 1993 a) and Tsakwambo; the eastern and northern neighbours are the Ok family languages Sait and Muyu.

Wambon is an oral language. About 20% of the speakers can write but they do this only in Indonesian, the national language, taught in school. Local, pidginised varieties of Indonesian, sometimes called Bazaar Malay, are used for intertribal contacts and for contacts with petty traders, government and mission personnel.

Wambon has two main dialects, Digul-Wambon and Yonggom-Wambon (Drabbe 1959). Here, we summarise the morphology of the major word classes of the Digul dialect, starting with the verb, the core of Wambon grammar. For more background information, see De Vries & Wiersma (1992).

### 2. Verbs

#### 2.1. Clause-chaining

Wambon exhibits the New Guinea type of **clause-chaining**. (This type of clause-chaining occurs especially in the grouping of 500 Pap-

uan languages called the Trans-New Guinea phylum, proposed as a genetic grouping in the work of McElhanon et al. 1975. For New Guinea clause-chaining, see Longacre 1972 and Foley 1986.) Longacre (1972: 2) describes New Guinea clause-chains as structures with an engine at the end, and a bunch of cars hooked on, preceding it. This comparison points to the essential division between the fully inflected distinctive verb forms of the last clause, the final verbs, and the less inflected dependent verb forms which occur medially in the chain.

Dependent (medial) verb forms in New Guinea clause-chains typically express **switch-reference** and **temporality**. Temporality markings indicate interclausal relations of sequence and simultaneity of events. Switch-reference markings indicate whether the following clause has the same subject or a different subject from that of the preceding clause in the chain.

The basic opposition in the verb morphology of Wambon is not between final and medial forms but between independent and dependent forms: chain-final clauses must have independent verb forms but independent forms are also frequently used chain-medially. The chain-medial use of independent verbs is switch-reference neutral. Consider the following Wambon clause-chain. (Wambon has a complex morphophonemics; see De Vries and Wiersma (1992: 8–10). Some of the processes occurring in the examples are: intervocalic voicing and fricativisation of /p/ (>/v/) and /k/(>/kh/), intervocalic voicing and lateralisation of /t/ (>/l/), and intervocalic insertion of /n/ as a transitional nasal, glossed as -Ø-):

(1) *Ap nda-khe-n-o*

<i>house</i>	<i>come-NON.1.SG.PRES-Ø-CONN<sub>1</sub></i>
<i>kit-mo-mbel-o</i>	<i>nekho-salip</i>
<i>finished-VR-SS.SEQ-CONN<sub>1</sub></i>	<i>his-wife</i>
<i>lokha-l-o</i>	<i>kap-kap</i>
<i>speak-NON.1.SG.NFUT.DS-CONN<sub>1</sub></i>	<i>man-man</i>
<i>lokha-l-o</i>	<i>lokha-l-o</i>
<i>speak-NON.1.SG.NFUT.DS-CONN<sub>1</sub></i>	<i>lap-ka-lembō</i>
<i>do-go-NON.1.PL.PAST</i>	

'Having come home he informed his wife and she informed the people and they left.'

In this clause-chain there are five verbs. Two of these are independent forms, the chain-fi-

nal *lapkalembo* and the chain-medial switch-reference neutral form *ndakheno*. The other three verbs are dependent forms which can only be used in chain-medial clauses and are inflected for switch-reference and temporality.

Chained clauses are not embedded clauses. The combination of dependency and non-embeddedness is an essential characteristic of clause-chaining (see De Vries 1993 b for clause-combining in Awyu languages). Chaining linkage contrasts with subordinate linkage in Wambon; subordinate clauses take independent verb forms and nominal inflections such as case suffixes and the topic-marking demonstrative *-eve* (see 6); they cannot take the connective *-o* which links chained clauses. Chained clauses cannot take nominal case inflections and the marker *-eve*.

## 2.2. Inflection

As for the inflection of dependent forms, there are two kinds of dependent forms in Wambon: different subject forms and same subject forms.

Same subject forms come in two types, both non-finite, temporality specific forms and temporality neutral forms.

Temporality specific forms consist of the verb stem plus an invariable temporality ending, marking either simultaneity (*-no*) or sequence (*-mbet*) relations between consecutive events. Temporality neutral same subject forms consist of just the verb stem or the verb stem plus the same subject marker *-lo*.

Different subject forms also come in two types. Depending on the tense and mood of the chain-final independent verb, future or non-future different subject forms are used. When the tense of the final verb is future or the mood intentional, the future different subject forms are used. In all other cases the non-future different subject forms are used. Since Wambon has three tenses in independent verbs (past, present, future), the non-future versus future distinction in different subject forms is a tense-neutralisation, making these forms less inflected than the independent forms.

The future/different subject forms consist of future stem plus person-number plus connective *-o*. (Wambon has tense-related suppletive verb stems). The non-future/different subject forms consist of past stem plus *-t* 'DS' plus person-number plus *-o* 'CONN<sub>1</sub>'. In the example text (see section 12) *nembelo* in chain (20) is an example of a same subject sequen-

tial form and *tamjalo* of a different subject form.

Independent verb forms are inflected with suffixes (with the exception of the imperative which is expressed by the prefix *na-*) for tense (present, past, future), number (singular and plural), person (first person versus non-first person), mood (imperative, intentional, hortative), status (counterfactual, conditional, uncertain future) and negation. The tense distinctions of Wambon are defined in terms of both the moment and the day of speaking. Present tense is used for events taking place at utterance-time or before that time on the utterance-day. In past narratives, the present tense may be used for chain-medial independent forms, in a tense-neutral fashion (see e.g. the text in 12). Past tense is used for events taking place before the utterance-day (= yesterday and the time before yesterday). Future tense is used for events after utterance-time. Completive and durative aspects are expressed by periphrastic constructions employing medial verbs or aspectual adverbs. Habitual-iterative aspect is expressed by derived (reduplicated) verbs.

Wambon independent and dependent forms take the same set of person and number endings:

(2)	SG	1:	<i>-ep</i>
		NON.1:	<i>Ø</i>
	PL	1:	<i>-ev-a</i>
		NON.1:	<i>Ø</i> (Present and FUT/DS)
			<i>-e</i> (Past and NFUT/DS)
			<i>-na</i> (Future)

The plural marker in the first person plural is *-a* and the /p/ of the first person marker is fricativised and voiced between vowels.

## 2.3. Word formation with verbalising suffixes

Adjectives can be productively turned into verbs with either *-mo* or *-ke* as verbalisers. For example:

- (3) adjective: *kok* 'ill'
- ke* verb: *koke* 'to be/become ill'
- mo* verb: *kokmo* 'to be/become ill'

There do not seem to be differences in meaning between the *-mo* derived verbs and *-ke* derived verbs of adjectival origin. Once turned into verbs, dependent same subject forms of the verbalised adjectives are used as manner adverbials. For example in (4) the verb *matetmo* is a same subject form of the

verb *matetmo* ‘to be/become good’. This verb is derived from the adjective *matet* ‘good’:

- (4) *Jakhov-e matet-mo ka-lempo?*  
they-CONN<sub>2</sub> good-vr.ss go-NON.1.PL.PAST  
'Did they travel well?'

The verb *kitmo* ‘to be finished’, a *-mo* formation based on the adjective *kit* ‘finished; ready; sufficient’, is frequently used as a periphrastic verb expressing completive aspect. See e.g. the use of this verb in (22) of the example text in 12.

Indonesian verbs are productively integrated into the Wambon lexicon with *-mo* and *-ke*. For example, the Indonesian verb *belajar* ‘to learn’ receives the form *mbelajatmo* ‘to learn’.

Although there are many noun-based *-mo* and *-ke* verbs, there is no longer a productive *-mol-ke* verbalisation of nouns. For example, the verb *takhimo* ‘to buy’ is derived from the noun *takhet* ‘kauri-shell; money’.

From verbs, habitual-iterative verbs are productively derived by reduplicating the first syllable of the verb and adding *-mo* or *-ke*. For example, from *ndat* ‘to listen’ the verb *ndatndatmo* ‘to listen repeatedly/habitually’ is derived.

### 3. Nouns

The morphology of nouns is very simple: nouns may take possessive prefixes, there is a plural formation with kinship nouns and there is derivation of nouns from verbs with the nominaliser *-mop*.

Kinship nouns have plural forms which consist of the stem plus the plural suffix *-ngguye*, for example *mbap* ‘father’ and *mbap-ngguye* ‘father-PL’. Some kinship nouns have irregular plural forms, for example *nambut* ‘my-brother.in.law’ and *na-mbul-alile* ‘my-brother.in.law-PL’.

Occasionally, reduplication is used for plural: *kap-kap* ‘man-man (people)’ (cf. (22)).

As for word formation, nouns can be (productively) derived by adding the nominalizing suffix *-mop* to the future-stem of verbs. For example, from *en-* ‘to eat’, future/past stem *ande-* the noun *ande-mop* ‘eat-NR (food)’ is derived.

### 4. Pronouns

Wambon has a basic set of personal pronominal forms, the set (5), on which emphatic, reflexive and bound possessive forms are based:

- (5) SG 1: *nuk* ‘I’  
2: *nggup* ‘you’  
3: *nekhep* ‘he/she/it’  
PL 1: *nokhop* ‘we’  
2: *nggokhop* ‘you’  
3: *jakhop* ‘they’

The emphatic forms are formed by adding *-otke* to the basic forms of (5). (In this process there occur some morphophonemic changes which we shall not discuss here):

- (6) SG 1: *novotke*  
2: *nggovotke*  
3: *nekhovotke*  
PL 1: *nokhovotke*  
2: *nggokhovotke*  
3: *jakhovotke*

Reflexive pronouns are formed by adding the reflexive suffix *-ta* to the basic forms of (5).

Possessive pronominal forms are bound forms, also based on the forms of (5), except for the first person singular form *na-* ‘my’ and the second person singular form *ngga-* ‘your’ which are special forms:

- (7) SG 1: *na-* ‘my’  
2: *ngga-* ‘your’  
3: *nekho-* ‘his/her/its’  
PL 1: *nokho-* ‘our’  
2: *nggokho-* ‘your’  
3: *jakho-* ‘their’

### 5. Adjectives

Adjectives are words which take the optional intensifier *-mbalin*. For example, *kaimo* ‘good’ and *kaimo-mbalin* ‘good-very (very good)’. Adjectives have plural forms that are rather infrequent. They are formed by reduplication of the first syllable of the adjective, for example *kowanggai* ‘big’ and *ko-kowanggai* ‘PL-big (big)’. There are no morphological superlative and comparative, these notions being expressed by periphrasis.

### 6. Demonstratives

The demonstrative *nombo* ‘this (proximity of speaker)’ contrasts with *ep* ‘that (not in proximity of speaker)’.

When used attributively as in (8), the demonstrative must take the connective *-o*, when used independently they must take *-e*, as in (9). Examples:

- (8) *ev-o lan*  
that-CONN<sub>1</sub> woman  
'that woman'

- (9) *ev-e lan*  
 that-CONN<sub>2</sub> woman  
 ‘that is a woman’

The demonstratives with *-o* may also be used as definite articles. The demonstrative forms with *-e* are also used as spatio-temporal adverbials meaning ‘here/now’ and ‘there/then’ and as markers of textual relations (topic/setting). Especially *ev-e* ‘that-CONN<sub>2</sub>’ functions as a topic marker in which case it cliticises to the setting clause or topic phrase. Consider the following example:

- (10) *Kikhuv-e*  
*Digul-CONN<sub>2</sub>*  
*nde-tkhekkel-ev-e*  
 rise-NON.1.SG.COND-that-CONN<sub>2</sub>  
*ev-e Manggelum*  
 then-CONN<sub>2</sub> Manggelum  
*ko-nok-si-v-a.*  
 go-NEG-NEG.INTENT-1-PL  
 ‘If the Digul rises, then we do not want to go to Manggelum.’

## 7. Numerals

The Wambon number system is a **body-part tally system** of a type common in New Guinea. The nouns denoting body-parts have the numbers as their secondary meanings. Thus e.g. *javet* has two meanings: ‘upper arm’ and ‘nine’. In the numeral use of the words, conventional gestures must accompany the use of the number words: the fingers are bent and the parts of the arm and head are touched with the outstretched middle finger and/or index finger (cf. Tab. 138.1):

1	<i>sanop</i>	little finger
2	<i>sanopkunip</i>	ring finger
3	<i>takhem</i>	middle finger
4	<i>hitulop</i>	index finger
5	<i>ambalop</i>	thumb
6	<i>kumuk</i>	wrist
7	<i>mben</i>	lower arm
8	<i>muyop</i>	elbow
9	<i>javet</i>	upper arm
10	<i>malin</i>	shoulder
11	<i>ngokmit</i>	neck
12	<i>silutop</i>	ear
13	<i>kelop</i>	eye
14	<i>kalit</i>	nose

Tab. 138.1: Wambon numeral corresponding body-part

The nose is the turning point, after which counting goes down again via the right-hand side of the body, by prefixing *em-* ‘the other side’ to the body-part/number words. Thus, 15: *em-kelop* ‘eye of the other side’; 16: *em-silutop* ‘ear of the other side’.

This continues down again until the little finger of the right side of the body is reached, the highest number of the system being 27: *emsanop*.

The body-part/numbers are integrated in noun phrases as numeral modifiers by adding the comitative suffix *-kup* ‘with; also’. For example:

- (11) *ap hitulop-kup*  
 house (index.finger)four-with  
 ‘four houses’

The number words *sanop* ‘little finger; one’, *sanopkunip* ‘ring finger; two’ cannot be used as numeral modifiers in noun phrases. Instead, the only two “real” numerals are used:

- (12) (a) *ap ndominuk*  
 house one  
 ‘one house’  
 (b) *ap ilumo*  
 house two  
 ‘two houses’

## 8. Adverbs

Adverbs are a very marginal word category in Wambon since *-mo* and *-ke* derived verbs express adverbial meanings of manner (see 2.3) and demonstrative forms have spatio-temporal adverbial meanings. There is a small closed class of invariable adverbs including *sonop* ‘again’, *ndo* ‘just’, *osak* ‘again; also’ and *wasi* ‘quickly; already’. These adverbs occur clause-initially but also pre-verbally. Consider the following example:

- (13) *Hitulop-e osi ka-levambo.*  
 Thursday-CONN<sub>2</sub> again go-1.PL.PAST  
 ‘On Thursday we went again.’

*Hitulop* ‘indexfinger/four’ is also used to denote the fourth day of the week. The week starts with *sanop* ‘little finger/Monday’, etc.

## 9. Nominal case suffixes

Wambon has three nominal case suffixes: *-ka*, *-sikhi* and *-kot*. The element *-ka* is suffixed to inanimate circumstantial adjuncts such as time, place and instrument:

- (14) *Kikhup-ka okima-levambo.*  
 Digul-in take.bath-1.PL.PAST  
 ‘We took a bath in the Digul.’

In (15) *-ka* (*-ngga* after morpheme-final vowels) marks an adverbial time clause:

- (15) *Nukh-e ande-lepo-ngga ev-o*  
 I-CONN<sub>2</sub> eat-1.SG.PAST-when that-CONN<sub>1</sub>  
*kav-e nde-tmbo.*  
 man-CONN<sub>2</sub> come-NON.1.SG.PAST  
 ‘When I ate, that man came.’

The suffix *-ka* forms complex locational relators with the nouns *wamip* ‘inside’, *hitop* ‘bottom’, *kuk* ‘front’, *linggit* ‘back’, *palip* ‘top’. For example:

- (16) *ap-wamip-ka*  
 house-inside-in  
 ‘in the house’

The nominal case suffix *-si(khi)* is a nominal case marker with cause, reason and purpose phrases but it marks also human “goals” such as addressed (with speech act verbs), recipient and beneficiary. Consider the following example:

- (17) *Keno-sikhi nda-khe?*  
 what-for come-NON.1.SG.PRES  
 ‘Why does he come?’

The suffix *-kot* marks cause and reason:

- (18) *Nukh-e jambolok-mo-knde-p-kot*  
 I-CONN<sub>2</sub> ill-VR-PRES-1.SG-because  
*nekhev-e nda-no-khe.*  
 he-CONN<sub>2</sub> come-NEG-NON.1.SG.PRES  
 ‘Because I am ill, he does not come.’

## 10. Connectives

An interesting aspect of Wambon morphology is the set of very frequent connectives *-a*, *-o*, and *-e* which create syntactic cohesion in various syntactic domains. In the framework of this article we cannot discuss those functions and we just give a number of examples of some of the functions. Consider (19):

- (19) *Nuk oy-a*  
 I pig-CONN<sub>3</sub>  
*temke-n-o*  
 shoot.NON.1.SG.PRES-Ø-CONN<sub>1</sub>  
*kav-e khetak-nok-nde-p.*  
 man-CONN<sub>2</sub> see-NEG-PRES-1.SG  
 ‘I do not see the man who shot the pig.’

In (19) the relative clause (*oya temke*) is linked to its syntactic head noun *kave* ‘man’

by the connective *-o*. The first nominal phrase of every relative clause receives the relative clause delineator *-a*. The connective *-e* also occurs in (19), linking the nominal phrase with *kave* as headnoun to the verb, the head of the clause. The connective *-e* may replace (but not co-occur with) the nominal case suffixes (cf. 9).

The connective *-o* is used within noun phrases to connect modifiers to the headnoun. But *-o* is also used to link chained clauses (see (20)–(22)) and to coordinate nouns.

## 11. Concluding remarks

Wambon represents the morphological type which is sometimes called the New Guinea type of clause-chaining. In this type the verbal morphology is complex, with dependent and independent forms. The dependent forms express switch-reference and temporality and are used as the non-embedded “cars” hooked to the “engine”, the chain-final verb. The morphological differentiation between independent forms and dependent verb forms is small in Wambon, compared with many other clause-chaining languages of New Guinea.

The nominal morphology is simple; nouns are not inflected, apart from a marginal plural formation with kinship nouns. Adjectives have no morphological comparative or superlative forms. The demonstrative system is a simple two-way deictic system (+/- proximate to speaker) but demonstrative forms have important secondary functions, marking definiteness, topic phrases and adverbial setting clauses. The numerals of Wambon exemplify the body-part tally system which is widespread in New Guinea.

## 12. Illustrative text

(20) ‘Savanop went to see his trap and he saw that he had trapped (a pig) and he approached and shot it but the pig attacked him. (21) Thus it (the pig) did and he (Savanop) left and went home. (22) Having come home he informed his wife and she informed the people and they left.’

This short text consists of three clause-chains, connected by means of **generic verb linkage**, linking (20) and (21), and **tail-head linkage**, linking (21) and (22) (see De Vries 1993 a: 69–75 for these common Papuan linkage types). Tail-head linkage is a recapitulative cohesion device by which the chain final clause is repeated as the chain initial clause of the next clause-chain.

The use of the verb ‘to say’ in (20) is part of the **quotative** construction which Wambon, like many other Papuan languages, employs to express purpose and intention in the form of “inner speech” (cf. De Vries 1993 a: 91–104).

The connective *-o* is used to link the chained clauses in (20)–(22). There is one clause (in (20)) having *-e* as connective clitic (*hetakhene*) signalling the nominal status of the perception clause, a strategy occurring in several Awyu languages with perception verbs which can be rendered literally as ‘(what) he saw (was that) he had trapped (a pig)’.

The verb *inandetmbo* in (20) is an example of a serial root construction in which two verb roots are juxtaposed to form one complex predicate which is the head of one clause. This **serialisation** of verb roots is a productive morpho-syntactic process in Wambon as in many other Papuan languages.

The text illustrates the central role of verbal morphology in Wambon in both event

and participant cohesion. The participants in the text, after initial introduction by nouns, are not tracked by pronouns or nouns but by agreements and switch-reference. Not surprisingly, the verb has functions in Wambon which are carried out by other word classes in other languages, like adverbs and conjunctions. Conjunctions like *kono* and *ndano* in (20) at closer inspection turn out to be verb forms: they are same subject simultaneity forms of the motion verbs *nda* ‘to come’ and *ko* ‘to go’. Such forms are used in Awyu languages as discourse relational verbs expressing speaker continuation.

2. The noun and other categories
3. Category shift
4. The morphology-phonology interface
5. The morphology-syntax interface
6. Illustrative text
7. Uncommon abbreviations
8. References

Turkana ([ŋáttürk(w)ánà]), is spoken in northwestern Kenya by approximately 270,000 people. It belongs to a cluster of closely related dialects spoken by distinct ethnicities in bordering areas of Ethiopia, Kenya, Sudan, and Uganda which are generally referred to as the Teso-Turkana group. Together with the Lotuko-Maa group and the Bari group, Teso-Turkana forms the Eastern Niloctic branch of Niloctic, one of the major subgroupings, in terms of number of languages, within the Nilo-Saharan stock. Although Turkana is used in written form in primary education in Kenya, there is minimal literacy and only a fairly recent tradition of writing. The earliest studies of the language date back to the 1920s; more recent studies include those of Heine (1980), Best (1983), Dimmendaal (1983), and Barrett (1988; 1991).

Section 1, “the verb”, addresses verb structure and a number of more general morphological properties of Turkana. Section 2, “the noun and other categories”, provides an introduction to structural features of nouns and other word-classes. Section 3, “category shift”, introduces the reader to the relational properties between categories. Finally, sections 4 and 5, “the morphology-phonology interface” and “the morphology-syntax interface”, deal with the interaction of morphology with phonology and syntax. The text in section 6 presents a brief sample of transliterated, connected Turkana speech.

### 1. The verb

Many investigators have remarked on the complexity and richness of the verb systems of Niloctic languages. For example, in their description of the Southern Niloctic language Nandi Creider & Creider (1989: 75) observe that “the complexity of the verbal word in Nandi is, for the non-Nandi staggering”.

Similar observations can be made for Turkana. There are at least three reasons for this complexity. Verb roots may be preceded by markers for negation, person (subject and/or object), and causative (in that order), and be followed by derivational suffixes, as well as aspect, number and voice markers, as shown below. Also, a number of distinct categories are involved in determining the shape of a single formative, i.e. there is a considerable degree of morphological allomorphy. In addition, there is morphophonemic alternation, due to vowel harmony, fusion of vowels, and tone rules.

Verb roots in Turkana fall into two **morphological classes**, here called class 1 and class 2. On the basis of morphophonemic alternations triggered by various prefixes added to verb roots, it can be deduced that class 2 verbs have an initial high front vowel *i* or *ɪ* (depending on vowel harmony) whereas class 1 verbs do not: e.g. class 1 *-nam* ‘eat (solids)’, class 2 *-imoj* ‘eat (fluids)’. (In the examples below, low tones are marked with ` , whereas high tones are left unmarked.) Such a verb root (or stem, i.e. a root plus derivational extension) cannot constitute a word by itself in Turkana, except as the imperative form of a verb like ‘get, fetch’ which is *ɔm* ‘get (it)!’. This situation shows iconicity in that the semantically least marked forms (presumably because of their high frequency) are also the morphologically least marked ones. Regular verbs are marked in the imperative by the prefix *ta-/tɔ-/to-* (depending on vowel harmony) for class 1, and *k-* for class 2 verbs: *ta-nam* ‘eat (solids)!', *k-imoj* ‘eat (fluids)!'. For other moods either an infinitive marker occurs or a person marker is required as an inflectional morpheme to complete a word:

- (1) (a) *aki-nam*  
INF-eat<sub>1</sub>,  
‘to eat (solids)’
- (b) *à-nam* [àŋám]  
1-eat<sub>1</sub>,:PAST  
‘I have eaten (solids)’
- (c) *ak-imoj*  
INF-eat<sub>2</sub>,  
‘to eat (fluids)’
- (d) *à-imoj* [èmój]  
1-eat<sub>2</sub>,:PAST  
‘I have eaten (fluids)’

Fusion as a morphological technique, as with the indicative mood form ‘I have eaten (fluids)’ above, complicates the segmentation of surface words into exhaustive strings of morphemes in Turkana, but this of course is a more general property of fusional (or inflecting) languages.

**Derived verbs** (stems) can be formed either by reduplicating the verb root or by expanding the root with a derivational suffix in order to express categories like habitual, ventive, itive, dative, inchoative, affective, or factitive. Each of these sememes is realized by a morpheme that has phonologically and morphologically conditioned allomorphs. For example, the form of the habitual marker is variously *-een-*, *-aan-*, *-oon-* or *-een(i)*. Roots or stems can also be preceded by a causative marker whose various allomorphs include *-ita-* and *-is-* among others. The following infinitive verb forms illustrate the causative as well as some of the derivational suffixes that can be added to the class 1 verb *-nam* and the class 2 verb *-imoj* introduced above:

(2) Causative	<i>ak-ita-nam</i> INF-CAUS-eat <sub>1</sub> , ‘to feed (solids)’
	<i>ak-is-imoj</i> INF-CAUS-eat <sub>2</sub> ‘to feed (fluids)’
Ventive	<i>a-nam-ōn(i)</i> INF-eat <sub>1</sub> -VEN ‘to wear out’
Itive	<i>a-nam-ār(i)</i> INF-eat <sub>1</sub> -IT ‘to cheat; to wear out’
Intensive	<i>ak-imoj-o-moj</i> INF-eat <sub>2</sub> -Ø-RDP ‘to rinse the mouth’
Habitual	<i>ak-imuj-een(i)</i> INF-eat-HABIT ‘to eat <sub>2</sub> regularly’
Dative	<i>ak-imoj-akin(i)</i> INF-eat <sub>2</sub> -DAT ‘to start eating’

Semantic labels such as “ventive” or “itive” refer to proto-typical meanings of movement towards or away from a deictic center, but metaphorical extensions are frequently observed, as in the examples above. Also, the abovementioned suffixation and reduplication processes are used productively (i.e. they can be applied to new forms, such as borrowings from Swahili), but their actual occurrence is sometimes precluded on semantic grounds. The ventive or itive markers, for ex-

ample, can be used in combination with the intensive (i.e. reduplicated) form of the verb *-imoj*, but not with the corresponding root form of the same verb: *ak-imojomoj-ōn(i)* (‘flush out the mouth’, or *ak-imojomuj-aär(i)* ‘1. to rinse; 2. to eat after a long time of fasting’, but not *\*ak-imoj-ōn(i)*).

The Turkana verb is conjugated using inflectional markers for the first, second, and third **person**; these precede the root or stem. **Number** suffixes are usually only found in the second and third person plural, thereby distinguishing these from the corresponding singular form. Number-marking inflections follow derivational suffixes as well as aspect markers. The form of the person and number markers depends on the phonological environment, as well as on the paradigm in which a verb occurs. For example:

- (3) (a) *i-nam-ar-it'*  
2-eat<sub>1</sub>-IT-ASPECT  
‘you (sg.) are cheating’
- (b) *i-nam-ar-it-o'*  
2-eat<sub>1</sub>-IT-ASPECT-PL  
‘you (pl.) are cheating’
- (c) *i-nam-a'*  
2-eat<sub>1</sub>-IT  
‘you (sg.) have been cheating’
- (d) *i-nam-ā-si'*  
2-eat<sub>1</sub>-IT-PL  
‘you (pl.) have been cheating’

The Turkana verbal system has the additional dimension of **object marking**. A first or second person object is marked by the prefix *k-*, which precedes the subject-marking prefix; if there is a first or second person object, but the subject is a third person, the subject prefix is absent, and the corresponding marker for first or second person object occurs in the position where the third person marker would occur otherwise. This kind of system, which is more common in Nilo-Saharan, occasionally results in formal neutralisations as well as in neutralisations of inflectional features, i.e. in syncretism:

- (4) (a) *k-à-mm-à*  
PAST-I-love-VOICE  
1. ‘I love you (sg./pl.)’
- (b) *k-à-mm-à*  
PAST-me-love-VOICE  
2. ‘(s)he loves me’

The verb forms above also illustrate the relational category of **middle voice**, which contrasts with the active and the passive (or im-

personal active) voices of Turkana. Middle and passive voice are expressed by a series of suffixes following a root or stem. Aspect markers follow the root or stem, but they precede voice and number markers. The marker for passive voice in Turkana is found in combination with transitive as well as intransitive verbs (see also Dimmendaal 1991):

- (5) (a) *ɛ-nam-i-o'*  
           3-eat<sub>1</sub>-ASPECT-VOICE  
           '(s)he/they is/are being eaten'  
 (b) *ɛ-ləs-i-o'*  
           3-go-ASPECT-VOICE  
           'one is going; people are going'

The **Aktionsart** inherent to verbs also plays an important role with aspect marking (cf. Art. 109), as shown by the following examples with the progressive aspect marker *-it*:

- (6) *à-ŋɔp-it'*  
       3:PAST-disappear-ASPECT  
       '(s)he disappeared (and reappeared)'  
 (7) *à-twàn-it'*  
       3:PAST-die-ASPECT  
       '(s)he almost died'

As opposed to **aspect** marking (and other inflectional and derivational processes described above), the expression of tense is not linked to a sequential slot in a series of segmental morphemes; the binary distinction between [+past] and [-past] tense in Turkana is expressed by tonal inflection of a verb form as a whole; in addition, the third person subject prefix varies between *a-* for [+past] and *ɛ-/e-* for [-past]. Compare:

- (8) (a) *ɛ-lòs-i'*  
       3-go-ASPECT  
       '(s)he is going'  
 (b) *à-lòs-i'*  
       3:PAST-go-ASPECT  
       '(s)he went'

With **mood** distinctions in Turkana (e.g. indicative versus subsecutive, which is used in narrating a story) it becomes even more evident that not all morphosyntactic or semantic oppositions are necessarily identifiable with a single morphological slot or position class; instead, the word as a whole may operate as the signaling unit. The second person subject prefix, for example, is *i-/i-* in the indicative and *ta-/tɔ-/to-* in the subsecutive. But the formal expression of tense or aspect also varies across moods: thus, imperfective past

indicative, *i-lòs-i* 'you went' contrasts with narrative *to-lot* 'then you went'. The indicative mood – as opposed to all other moods – constitutes the core of the paradigmatic structure; it shows the widest range of morphological distinctions expressed on the verb. The subsecutive, by contrast, lacks tense marking, and only first, but not second person objects are expressed on the verb. The indicative has also formed the basis for certain analogical realignments in the history of Teso-Turkana (Dimmendaal 1991).

## 2. The noun and other categories

As with verb roots, most nominal roots in Turkana cannot be used alone as independent words. For example, with very few exceptions, lexical nouns are inflected for **gender** by a prefix (although gender marking is absent from verbs and pronouns). A different set of gender markers is used in the singular and the plural, thus indicating gender and number at the same time. In addition, a noun stem is inflected with a plural suffix when the singular is the basic form, or with a singulative suffix when the plural is basic; alternatively, there is sometimes replacement (Dimmendaal 1983: 208–258).

singular	plural
<i>a-mok-àt</i>	<i>ŋa-møk'</i>
<i>e-com'</i>	<i>ŋi-com-in'</i>
<i>e-wùko'</i>	<i>ŋi-wuko-i'</i>
<i>i-moru'</i>	<i>ŋi-mòr(u)</i>
<i>a-tera-n(i)</i>	<i>ŋa-tera-k'</i>

Tab. 139.1: Number marking

Overt **singulative** marking – used by taking plural forms as basic (as with 'sandal, shoe' above) and inflecting the singular – is common in Turkana when a noun refers to entities which naturally occur in pairs or large numbers. This kind of number inflection is widespread in the Nilo-Saharan family (Dimmendaal 2000). Not all nouns in Turkana are overtly marked for number by one of the above suffixes. Some nouns are either inherently singular or plural (as shown by their gender prefix) and so never alternate; such nouns are typically, although not exclusively, mass nouns or collective nouns, e.g. *a-sinyon(i)* 'sand', *ŋa-kipl* 'water'. There is also a group of nouns showing alternates for number that are not marked by segmental

morphemes. In the form for ‘pebble’ above, the voicing of the final vowel in the singular is the result of tonal inflection. Word-final vowels are devoiced before a pause, unless they are followed by a floating low or high tone (Dimmendaal & Breedveld 1986). Thus, in the case of ‘pebble’ the voicing of the final vowel indicates the presence of a word-final floating tone. The floating tone and hence voicing of the final vowel is correlated with a particular tonal configuration which is one of the exponents of number inflection in Turkana.

As the examples above illustrate, the gender prefixes show syncretism between masculine and neuter in the plural. Kinship terms and names of various animals take different sets of gender prefixes: *na-* (fem.), *lò-/lo-* (masc.), preceded by *ta-* in the plural. Gender prefixes also play a role in derivation; compare *e-wìko* ‘lung’ with *lò-wìko* ‘pneumonia’, or *e-com* ‘baboon’ with *i-com* ‘young/small baboon’. Synchronously these gender prefixes do not bear any relation to definiteness or referentiality in Turkana. But their historical link with demonstratives is obvious. Compare, for example, the feminine marker *na-* with the [+near] feminine demonstrative form *na*, or the masculine marker *lò-* with the [+near] masculine demonstrative form *lo*.

There are relatively few **adjectives** in Turkana. Their number marking resembles that of nouns, since it makes use of singular and plural suffixes, as well as replacement:

singular	plural	
<i>-kitèt-et</i>	<i>-kitèt(i)</i>	‘new’
<i>-lèm(u)</i>	<i>-lemu-yèk</i>	‘hornless’
<i>-yoro-t'</i>	<i>-yoro-k'</i>	‘old (of inanimate things)’

Tab. 139.2: Adjectives

Turkana clearly avoids monomoraic words (see also 4). Thus, minor categories like adjectives, numerals, adverbs of time, place or manner and prepositions all consist of at least two moras (this often coinciding with two syllables):

- (9) numeral: *a-pey'* ‘one’  
               adverb: *inaa'* ‘over there’  
                     *mòyi'* ‘tomorrow’

There are a few exceptions to this prosodic principle, however:

(a) There are monomoraic prepositions like *a-*, *ka-*, and *ni-* which always cliticize onto the nouns they govern, however. Prepositions that do not cliticize onto the noun they modify are historically or synchronically derived from related nouns, and consequently consist of at least two moras.

(b) Ideophonic adverbs, expressing the perception or emotional reaction to size, speed, colour, etc. may be monomoraic, forming a separate prosodic constituent of their own. An example:

- (10) *iryonò                    cuc'*  
          3.be.black   IDEO  
          ‘it is black as coal’

(c) Particles expressing attitudes of the speaker towards propositions in an utterance. These attitude markers, which play an important role in discourse, are particularly frequent with illocutionary acts such as questions and imperative constructions (Dimmendaal 1996; see also the illustrative text in 6).

### 3. Category shift

Nouns in Turkana (as in most languages) may be said to typically express referents, whereas the other major word class in the language (that of verbs) typically expresses predication or events having a temporal dimension (cf. Art. 94; Art. 104). Thus, all conjugated verbs can distinguish between [+past] and [−past] tense. A comparison between stative verbs and nominal modifiers such as true adjectives (as a part of speech) in Turkana suggests that the latter typically describe inherent, permanent, and often irreversible states or property concepts that are not contingent on time. For example, ‘(being) small’ is categorized as a stative verb, whereas ‘(being) bald, without horns’ is categorized as an adjective in Turkana.

In order to modify the syntactic behaviour and semantic characteristics of such parts of speech, category shift (from noun to verb, verb to noun etc.) can be applied. Thus, nouns as well as adjectives can be changed into verbs in order to express a stative or dynamic event, via the addition of a habitual (-*aan*-) or dative (-*kin*-) verb extension:

- (11) *ɛ-mɔɪt                    ‘enemy’*  
          *ɛ-mɔɪt-aan-à            ‘it/(s)he is hostile’*

- lèm(u) ‘hornless’  
 è-lèmw-aan-à ‘it is hornless’

There are few cases in Turkana where the direction of the derivational relation cannot be determined, since both of two related forms require a morphological marker, as in *e-mur-on(i)* ‘diviner’ vs. *a-mur-òrè* ‘to divine’.

There are various processes whereby verbs can be changed into nouns in Turkana. Such nouns express various semantic roles, e.g. agent, instrument, location, or an abstract noun, as the following examples with the verb root *-nam* illustrate:

- (12) (a) *e-ka-nam-an(i)*  
          M.SG-AGNR-eat<sub>1</sub>-AGNR  
          ‘glutton; s. o. who gets dowry of cattle’
- (b) *a-nam-èt'*  
       F.SG-eat<sub>1</sub>-INSTNR  
       ‘instrument for eating; generation’
- (c) *e-nam-rr'*  
       M.SG-eat<sub>1</sub>-SG  
       ‘salary; wage’
- (d) *ŋi-nam-èn*  
       M.PL-eat<sub>1</sub>-PL  
       ‘food; eatables’

Nominalized verbs may “inherit” the verbal causative marker, derivational suffixes, or the aspect marker *-rl/-it*, but tense, voice, person marking or mood distinctions do not occur in nominalized verbs. An example:

- (13) *ŋa-k-is-icwom-aan-akin-èt'*  
       F.PL-Ø-CAUS-spear-HABIT-DAT-INTS  
       ‘mortuary ceremony (lit. cause to spear often for somebody [in order to wipe away tears of bereavement])’

(The prefix *k-* above is part of the nominalization but does not seem to have a separate function synchronically.)

Verbs are changed into **nominal modifiers**, in order to describe a property attributed to a noun (Dimmendaal 1983: 318–332). Some of these attributive (“adjectival”) verb forms, as well as adjectives can be used adverbially by prefixing *ni-/ni-*:

- (14) (a) *-lɔn-a-n(i)*  
          far-ADJR-SG  
          ‘distant (attribute)’
- (b) *ni-alɔnan(i)*  
       ADVR-distant  
       ‘distantly’

- (c) *-lèm(u)*  
       hornless  
       ‘hornless (adjective)’
- (d) *ni-lèm(u)*  
       ADVR-hornless  
       ‘blindly, without proper thinking’

A number of **prepositions** in the language can be shown to be derived from, or related to, nouns historically; these prepositions sometimes lack the nominal gender prefix found in the corresponding noun; this derivational relationship is not productive.

- (15) *kwap'* ‘under’  
       *a-kwap'* ‘land’  
       *nà-àbor'* ‘behind’  
       *a-àbor'* ‘buttocks’

There does not seem to be a productive derivational process in the language whereby adverbs are changed into verbs, or adverbs into nouns, except for a few ideophonic adverbs (expressing a sensory experience), a number of which can be changed into class 2 verbs: *butubut'* ‘sound of gurgling liquid’, and *akibutubut'* ‘to empty a bottle containing a liquid’.

Finally, there are recursive elements which suggest a derivational relation historically but which lack any function or meaning synchronically in the language. For example, the initial high front vowel of class 2 verbs (cf. 2), or intrusive elements in nouns such as *-si-/si-* are “empty morphs” synchronically, but probably were separate morphemes historically:

- (16) (a) *e-si-dbɔŋɔrɔr(i)*  
          M.SG-Ø-elbow  
          ‘elbow’
- (b) *e-si-girigir(i)*  
       M.SG-Ø-crest  
       ‘crest of baboon’

**Compounding** of roots or stems is not used as a productive type of word formation in Turkana; it is restricted to the formation of names of geographical locations, animals, or persons. The corresponding meaning of such nouns is often non-compositional (whereas vowel harmony does not apply between juxtaposed roots):

- (17) (a) *nà-morù-toŋa'*  
          ‘Namorutunga (name of a village)’
- (b) *lò-kòri-ŋaj'*  
       ‘Lokorinyang (personal name of someone owning an ox with a yellow, patched fur)’

As may be expected, absence of compounding as a productive word formation process corresponds to a large set of lexical forms, whose meaning is rendered by compounds in, for example, English. This can be illustrated with the following (stative) verbs, all related to the bovine idiom:

- (18) (a) *-lɪŋà*  
‘black headed and white bodied’
- (b) *-ŋòlè*  
‘white headed and black bodied’
- (c) *-moray'*  
‘fat-necked or fat-headed’

#### 4. The morphology-phonology interface

For several bound morphemes above, at least two allomorphs exist which differ in the quality of their vowels. This is due to a **vowel harmony** system which is based on the position of the tongue root – a common feature among African languages. In general, all vowels within a word belong to one of two sets of vowels: a set of [–Advanced Tongue Root] vowels, containing *i*, *ɛ*, *a*, *ɔ*, *ʊ*, and a set of [+Advanced Tongue Root] vowels, comprising *i*, *e*, *o*, *u*. As a corollary, vowels in bound morphemes alternate between *i* and *i*, *ɛ* and *e*, etc. For example, the neuter gender prefix is *i-* before a root with [–ATR] vowels, and *i-* before an [+ATR] root. The feminine gender prefix is always *a-*, however, and does not alternate with other vowels in prefixes or roots. In suffixes *a* alternates with *ɔ* or *o*.

A number of suffixes only occur with [+ATR] vowels; for example, the passive marker has a number of morphologically conditioned allomorphs, e.g. *-i* or *-o*, but they all contain [+ATR] vowels. These suffixes cause the preceding [–ATR] vowels to shift to [+ATR]:

- (19) *è-gyel-i-o'*  
3:PAST-buy-ASPECT-VOICE  
(s)he/it is bought; they are bought’

Because of this category shift caused by [+ATR] suffix vowels, it can be concluded that alternating affixes either contain [–ATR] vowels underlyingly which shift to their corresponding [+ATR] counterpart in the environment of an [+ATR] vowel, or that alternating affixes are unspecified for the feature [ATR] (Noske 1996; 2000).

Apart from vowel harmony, the **syllable** is the primary factor in conditioning allomorphy in Turkana. The infinitive prefix of class 1 verbs has a short allomorph *a-* and a longer form, *aki-/laki-*. The distribution of these allomorphs is governed by the number of moras in the stem. If the stem is monomoraic, the allomorph *aki-/laki-* occurs; if the verb is bimoraic the short variant *a-* is found.

- (20) (a) *aki-nam'*  
INF-eat<sub>1</sub> ‘to eat’
- (b) *a-ŋaam'*  
INF-yawn ‘to yawn’

If a derivational suffix is attached to a monomoraic verb stem, the short variant of the infinitive prefix occurs, as in *a-nam-är(I)* ‘to acquire, absorb, win’. The distribution of these allomorphs suggests that Turkana places a restriction on the minimal size of a verb stem or root: Verb stems have to be at least bimoraic. If a root is monomoraic *-ki-/ki-* is inserted to satisfy the bimoraic stem template (Noske 1991).

The **reduplicative system** is another area of morphology in which the segmental shape of a morpheme is adapted to a template. Turkana has two verb forms which are constructed by reduplicating the root: The intensive and the resultative. The intensive is formed by complete reduplication of the root:

- (21) (a) *a-pet-e-pet'*  
INF-kick-Ø-RDP  
‘to kick repeatedly’
- (b) *a-ɛn-ɛ-ɛn'*  
INF-tie-Ø-RDP  
‘to fasten’

An **epenthetic vowel** occurs between the root and the reduplicative suffix which assimilates completely to the surrounding vowels. In these examples vowel epenthesis seems to be motivated by the syllable structure constraints of Turkana. Without the epenthetic vowel the reduplicated string (\**a-petpet*) could not be syllabified. (Turkana bars obstruents in the syllable coda word-internally). However, even if the verb ends in an open syllable, an epenthetic vowel occurs between the root and the reduplicative suffix:

- (22) (a) *a-da-i-da'*  
INF-thresh-Ø-RDP ‘crumple’
- (b) *ak-ilō-i-lo'*  
INF-defeat-Ø-RDP ‘shake’

In these examples vowel epenthesis does not result from syllabification, since reduplication of an open syllable gives rise to a well-formed syllabic sequence (e.g. *a-dada'*). In addition, in the case of *ak-ilō-i-lō*, the epenthetic vowel fails to assimilate to the surrounding vowels. If assimilation took place the epenthetic vowel would be syllabified with the preceding open syllable. This shows that the epenthetic vowel is not motivated by the syllable structure constraints of Turkana, but that it is an integral part of the intensive verb form. The **intensive** consists of a bimoraic foot template which is filled by copying the root. If the root material does not suffice to fill the template, a high front vowel is inserted (Noske 1991).

The occurrence of a nominal number marker depends primarily on the syllable structure of the base form. In addition, the semantics of a noun need to be taken into consideration. An entirely different set of number markers occurs with abstract nouns than with concrete nouns. Only concrete nouns will be considered here.

The nominal number suffix *-inl-in* marks plurals. It is suffixed to nouns consisting of a monomoraic closed syllable:

- |                        |                   |
|------------------------|-------------------|
| (23) (a) <i>e-com'</i> | <i>ŋi-com-in'</i> |
| M:SG-baboon            | M:PL-baboon-PL    |
| (b) <i>e-pem'</i>      | <i>ŋi-pem-in'</i> |
| M:SG-platform          | M:PL-platform-PL  |

This suffix is also found with stems that consist of a bimoraic, closed syllable and bisyllabic stems that end in a closed syllable. Nouns with this syllable structure can also be inflected with other number markers. The occurrence of this suffix is therefore not entirely predictable. However, no noun stems consisting of a light, closed syllable have been found which form the plural with a marker other than *-inl-in*.

The suffixes *-itl-it*, *-et*, *-atl-ɔtl-ot*, and *-utl-ut* always mark the singulative.

- |                      |                     |               |
|----------------------|---------------------|---------------|
| (24) <i>ɛ-cɔk-it</i> | <i>ŋi-cɔk'</i>      | 'fruit stone' |
| <i>ɛ-kasùkow-ut'</i> | <i>ŋi-kasùkowu'</i> | 'old man'     |
| <i>a-bòŋ-et</i>      | <i>ŋa-bòŋe'</i>     | 'thousand'    |
| <i>a-war-èt</i>      | <i>ŋa-wàr</i>       | 'cow dung'    |

The most common singulative marker amongst these is *-itl-it* (which is also widespread in other Niloctic and Nilo-Saharan languages). Other suffixal forms probably came about as distinct singulative markers as a result of paradigmatic displacement. As the ex-

ample for 'old man' and 'thousand' show, the suffix vowel has assimilated to the root-final vowel. However, in many instances the base-final vowel that conditioned the vowel assimilation was lost in the uninflected form, as in the case of 'cow dung'. Consequently, *-et* must be considered as a separate singulative marker synchronically.

Turkana also has the suffixes *-a/-o/-ɔ*, and *-i/-i*, which mark both the singulative and the plural, depending on what the base form of the noun is. These suffixes do not have a constant meaning and their function can only be defined as signalling the morphologically marked category of number as such. Suffixation by way of these suffixes is in fact the most common way of marking number in Turkana. The suffix *-a/-o/-ɔ* is used if the base form is at least bimoraic and ends in a closed syllable. It is also found with nouns ending in an open syllable with a high front vowel in the nucleus. Note that in all examples the suffix has a high tone.

singular	plural	
<i>a-ŋasep'</i>	<i>ŋa-ŋàsèp-a'</i>	'placenta'
<i>e-putìr</i>	<i>ŋi-pùtìr-o'</i>	'warthog'
<i>a-lagam-a'</i>	<i>ŋa-lagam'</i>	'kind of necklace'
<i>a-kopit-o'</i>	<i>ŋa-kòpit</i>	'rope'
<i>ɛ-kɔr(i)</i>	<i>ŋi-kɔrì-a'</i>	'ratel'
<i>e-ris(i)</i>	<i>ŋi-rìsy-ò</i>	'cheetah'

Tab. 139.3: Suffixes *-a/-o*

The suffix *-i/-i* occurs if the noun stem is at least bimoraic and ends in an open syllable with any vowel other than a high, front vowel in the nucleus.

singular	plural	
<i>e-suro'</i>	<i>ŋi-suru-ì</i>	'dik-dik'
<i>a-gùlù</i>	<i>ŋa-gulu-i'</i>	'water jar'
<i>e-pòno-i</i>	<i>ŋi-pòn(o)</i>	'lip'
<i>a-làma-i</i>	<i>ŋa-làm(a)</i>	'wild cherry'

Tab. 139.4: Suffixes *-i/-i*

The two number suffixes are in complementary distribution with *-a* occurring only after a consonant and a high front vowel and *-i/-i* occurring elsewhere. They can therefore be treated as allomorphs of the same morpheme, even though they cannot be related to each other by means of phonological rules. This is a rather rare case, then, of phonologi-

cal factors governing the distribution of morphs which are themselves phonologically quite unlike (see also Carstairs 1988: 70 and Dimmendaal 1987 for a discussion). Since Turkana does not have any diphthongs, suffixation of this number marker always adds a syllable to the existing noun. The allo-morph *-a* is chosen when the noun ends in a high front vowel to create an additional syllable and not a long (or complex) vowel.

In general, Turkana nouns receive a low tone on the second mora of the stem if they are marked for number. However, tonal marking varies depending on the syllable structure of the noun and the choice of the number suffix.

### 5. The morphology-syntax interface

Turkana is a verb-initial language, i.e. the syntactic subject and object tend to follow the main verb or auxiliary verb, as in (27) of the illustrative text in 6. Alternative orders, e.g. where either the subject or the object precedes the verb, are used to express topic continuity (as in (28)) as well as other pragmatic roles. These alternative word orders are therefore highly context-sensitive. Whereas pronominal marking for subjects (and objects in the case of first and second person) on verbs is obligatory in conjugated verbs, independent subject and object pronouns again may be used for pragmatic reasons (as in (30)). From a syntactic point of view, then, there is a unidirectional relation between the (obligatory) pronominal subject or object prefix on a verb and an independent subject or object pronoun if it occurs, since the latter is superfluous from a syntactic point of view. It follows that subject and object markers on a conjugated verb in Turkana should not be called agreement markers, but, rather, cross-reference markers.

Nominal modifiers such as adjectives and numerals in Turkana take gender-sensitive **agreement** prefixes, whereas the form of demonstratives co-varies with the gender or number of the nouns they modify (cf. the examples in (36)). Indexing the different nominal modifiers through prefixes, thereby binding the modifier to a noun, constitutes a true case of agreement marking, since the marking is assigned as a reflection of the properties of the head noun.

- (25) (a) *aite' na-pus(i) na'*  
cow F-grey this:F  
'this grey cow'

- (b) *emoj' lo-pus(i) lo'*  
bull M-grey this:M  
'this grey bull'

Syntactic **subjects** (both noun phrases and independent pronouns) take **nominative** case marking when they follow the (auxiliary or main) verb. When they precede the latter, they take **absolutive** case, as do objects (or nouns or pronouns in isolation). Nominative case is formed by changing the tonal pattern of nouns and pronouns in isolation, by way of tonal displacement triggered by a low tone case marker (Dimmendaal 1983: 261–264). However, because of lexical irregularities in the nominative tone patterns of certain nominal paradigms, nominative case marking cannot or can no longer be treated as an entirely syntactic phenomenon *pur sang*.

absolutive	nominative	
<i>ŋi-tɔŋa'</i>	<i>ŋi-tòŋà</i>	'people' (cf. 27)
<i>ɛ-kasùkow-ut'</i>	<i>ɛ-kasùkow-ùt</i>	'old man'
<i>ŋa-kiṭɔ'</i>	<i>ŋa-kiṭò</i>	'firewood'
<i>kèci'</i>	<i>kèc(i)</i>	'they' (cf. 30)
<i>ŋwɔ̃n'</i>	<i>ŋwɔ̃n(i)</i>	'we (inclusive)' (cf. 32)

Tab. 139.5: Absolutive and nominative

Similarly to the nominative case, the **genitive** and **instrumental** case in Turkana are formed through tonal modification of the noun (and modifiers, if they occur).

	singular	plural
absolutive	<i>a-kiṭɔ-r'</i>	<i>ŋa-kiṭɔ</i>
instrumental	<i>a-kiṭɔ-r</i>	<i>ŋa-kiṭɔ</i>
genitive	<i>à-kiṭɔ-r</i>	<i>ŋa-kiṭɔ</i>

Tab. 139.6: Instrumental and genitive

The **locative** and **ablative** are marked by a different set of gender prefixes, together with a change in the tonal pattern of the noun. In addition, the ablative case form is preceded by a proclitic *à* for nouns, pronouns, and their modifiers, or *ka* for adverbs and demonstratives.

	singular	plural
absolutive	<i>a-kiṭɔ-r'</i>	<i>ŋa-kiṭɔ</i>
locative	<i>nà-kiṭɔ-r'</i>	<i>na-kiṭɔ</i>
ablative	<i>à na-kiṭɔ-r</i>	<i>à na-kiṭɔ</i>

Tab. 139.7: Locative and ablative

As these examples illustrate, the lexical property of gender and number, and the syntactic (relational) property of case are identified cumulatively in Turkana by way of prefixes as well as tonal inflection. Note also the typologically rare property of expressing case by means of prefixes, rather than suffixes. As argued by Nichols (1986), head-marking languages favour verb-initial structures. Turkana is no exception to this cross-linguistic tendency, but it is somewhat exceptional in that it combines head marking on the verb with dependent marking (by way of core and peripheral case marking). As argued in Dimmendaal (to appear), this property is shared with a number of other languages in the area, which form a transitional zone in this respect between strongly head-marking languages towards the south and southwest, and dependent-marking languages towards the north and north-east.

A number of nouns in Turkana have an irregular locative case form; they lack a gender prefix and display a low high tone pattern: *a-kàr(ε)* ‘well (absolutive)’, *kàrε* ‘at/ to the well’ (not \**nà-kar(ε)*).

With regard to **clause linkage** it is noted that Turkana does not use the connective ‘and’ to link up clauses or sentences; instead, the narrative mood is used with verbs to express subsecutive action (as in (30)). This feature is widespread among African languages. An additional morpho-syntactic “africanism” found in Turkana is the form and use of the complementizer ‘that’, which is based on the verb ‘to say’ (as in many African languages). Its infinitive form (*atamar(i)*) is used with complements in indirect speech, whereas the conjugated form occurs with direct speech.

A rather intricate aspect of the interaction between morpho-syntax (or categorization) and semantics is illustrated in the following examples:

- (26) (a) *à-rài` e-buw` ε-ka-naman(i)*  
3:PAST-be M.SG-hyena eater  
*ŋi-barèn à ŋi-twɔŋà*  
cattle of people  
‘a/the hyena ate the cattle of people’
- (b) *a-lómón-et (ŋési) ni-kalapatàn(i)*  
‘after it had come out’

In (26a), Turkana uses an agent noun *ekaman(i)* (derived from a verb) rather than a conjugated verb. Since eating cattle is a habit or more permanent property of the species hyena, no tense marking seems to be required

in such a proposition. The use of the corresponding noun (which lacks the verbal property of tense marking) fits in with the universal proto-typical discourse role of nouns, which describe referents or more permanent entities, while verbs tend to describe events (or temporary properties) cross-linguistically. In (26b), a derivational noun instead of a conjugated verb is used in an adverbial clause. In Turkana, perfective or completive aspect in an adverbial clause is expressed obligatorily through an instrumental or locative noun (which is marked by the suffix *-et*). That the expression of “completion of an event” does not require tense marking (as a proto-typical property of verbs) again seems to be related to the proto-typical features of nouns, which contrast with verbs in this respect.

Finally, a rather interesting aspect of the association between form and meaning (which is relevant to Turkana morphology and its interaction with syntax) is illustrated by the following examples: *ak-igaràr(i)* ‘spread (fingers or wings)’, *ak-igarar-a-òn* ‘come with hands or wings spread out’. In the second example, two semantic notions, namely motion and manner, are conflated in a single verb form, rather than being expressed in a syntactically independent way, for example, by means of a verb of motion plus a separate manner phrase. This aspect of lexical composition and lexicalization patterns, has been barely studied for either Turkana or any other African language.

## 6. Illustrative text

We illustrate some of the phenomena that were discussed in 5 by means of the following text.

- “(27) Long ago, there were people called the Turkana. (28) Those people lived in the forest. (29) Their way of gathering food was by hunting animals. (30) They used to go into the forest and kill animals there. (31) They ate the meat raw, because they did not know fire. (32) Then, a certain old man said: ‘Why for goodness sake are we eating the meat raw?’ (33) The others started laughing and said: ‘You are a fool!’ (34) ‘Where did you ever see people roasting meat?’ (35) Then that old man became silent. (36) The next morning, he called all the other people, and said: ‘Look, I brought two sticks.’ (37) Then he called for another old man and said: ‘Come, and let us get fire from these sticks’. (38) They set the sticks on fire. (39) Then the fire emerged from those sticks. (40) Then, all the people turned out happy.”

8. Zitierte Literatur
  
1. Sprachgebiet, Forschungsstand und soziolinguistische Angaben

Unter dem Namen Twi werden verschiedene Dialekte, v. a. das Akuapem und Asante, zusammengefaßt. Es bildet zusammen mit dem Fante das Akan, die in Ghana am weitesten

verbreitete Sprache. Das Akan wird im südlichen bis mittleren Ghana von ca. 45 Prozent der Bevölkerung des Landes als Muttersprache gesprochen; 70 Prozent sprechen es als Zweitsprache. Es hat eine Sprecherzahl von ca. 9 Millionen. Bei einem v. a. in älterer Literatur weiter gefaßten Akan-Begriff sind eng verwandte Völker und deren Sprachen der östlichen und zentralen Côte d'Ivoire integriert. In genetischer Hinsicht ist es dem Potou-Tano-Zweig des New Kwa der Niger-Congo-Sprachfamilie zugehörig (vgl. Stewart 1989).

Die morphologische Skizze behandelt das Akuapem-Twi, das Mitte des 19. Jahrhunderts durch Missionare schriftlich fixiert und

wissenschaftlich bearbeitet worden ist (s. Riis 1853). Für das Asante-Twi und das Fante war ebenfalls eine eigene schriftliche Form entstanden. Jahrelange Bemühungen des Akan Orthography Committee mündeten 1978 in die Schaffung einer einheitlichen Akan-Orthographie. Die Erforschung des Akan ist mit dem Namen des Missionars J. G. Christaller verbunden, dessen Hauptwerke (Grammatik 1875 und Wörterbuch 1881) zu den Pionierarbeiten der afrikanischen Linguistik im 19. Jahrhundert zählen.

## 2. Typologischer Charakter

Das Twi ist in typologischer Hinsicht als eine isolierend-agglutinierende Sprache zu charakterisieren. Silbe und Morphem sind vielfach identisch, dann einsilbig (vgl. 3); es gibt jedoch formbildende Affixe. Besonderes Merkmal der Agglutination auf nominaler Ebene sind Präfixe als Reste eines nominalen Klassensystems (vgl. Art. 98 und 4.1). Das Twi ist eine Tonsprache mit zwei distinktiven Tönen, die einerseits lexikalische, andererseits grammatische Funktion haben. Tonträger sind Vokale und Nasale. Daneben ist als Intonationsmerkmal das Downdrift-Phänomen, d. h. die stufenweise Absenkung der Hoch- und Tieftöne, wenn diesen ein oder mehrere Hoch- bzw. Tieftöne vorangehen, charakteristisch (vgl. Stewart 1965; Dolphyne 1988). Downdrift erstreckt sich über den gesamten Satz.

## 3. Silben- und Morphemstruktur

Die charakteristischen Silbenstrukturen des Akuapem-Twi, die meistens gleichzeitig auch Morphemstrukturen repräsentieren, sind /CV/, /V/ und /C/ (vgl. Dolphyne 1988). Vokale fungieren v. a. als grammatische Morpheme, wie nominale Präfixe und Tempus/Aspekt/Modus-Marker (PF -*a*, PRÄT -*è*, -*i*). Silbische Konsonanten werden durch Nasale sowie finales -*w* repräsentiert. Nasale fungieren entweder als Grammeme (Nominalpräfixe, Tempus/Aspekt/Modus-Marker, wie {OPTATIV}, oder sind finaler Bestandteil eines /CVC/-Morphems (*dàñ* ‘umdrehen’, (*ɔ-*)*kwáñ* ‘Weg’). /CV/-Strukturen haben grammatische Funktion (Pronomina, Tempus/Aspekt/Modus-Marker, Nominalpräfixe) oder repräsentieren lexikalische Morpheme (*kɔ* ‘gehen’, (*ɔ-*)*bá* ‘Kind’). Zu den häufigsten

mehrsilbigen Morphemtypen, die vorwiegend Lexeme darstellen, gehören die folgenden:

- (a) /CVC/: als CVN *nom* ‘trinken’; als CVw *tow* ‘werfen’
- (b) /CVV/: *boá* ‘helfen’, *bué* ‘öffnen’
- (c) /CVCV/: *bisá* ‘fragen’, *katá* ‘bedecken’, *srú* [*srá*] ‘besuchen’
- (d) /CVCVC/: *hyerén* ‘scheinen’, *hurúw* ‘springen’

Die Kombination von grammatischen und lexikalischen Morphemen zu einem Wort folgt dem Prinzip der morphologischen Agglutination.

Als eine für alle Akan-Dialekte typische Eigenschaft des Wortes ist die Vokalharmonie herauszustellen, die eine ausgeprägte allomorphe Variation bedingt. Die Vokalharmonie wirkt sowohl auf der nominalen Ebene (Präfix + Stammmorphem) als auch auf der Ebene des ein Wort repräsentierenden verbalen Ausdrucks (Pronomen + Tempus/Aspekt/Modus + Verb). Alle Vokale sind, durch unterschiedliche Zungenwurzelstellung bedingt, in zwei sich in ihrer Qualität unterscheidende Reihen eingeteilt:

- [i, e, æ, o, u] [+gespannt] [+ATR]
- [I, ε, a, ɔ, ɒ] [+ungespannt] [-ATR]

Lediglich [æ] repräsentiert kein Phonem. Die regressiv wirkende Vokalharmonie geht vom lexikalischen Morphem aus, dessen Vokalqualität die der vorangehenden Formative beeinflußt, so daß jedes Wort Vokale nur einer Reihe enthält; vgl. die Verbformen *ɔ-béba* [-ATR] (‘er/sie wird kommen’), *o-bé-hu* [+ATR] (‘er/sie wird sehen’) sowie die Nomina (*e-*)*dá* [-ATR] ‘Tag’ und (*e-*)*hú* [+ATR] ‘Furcht’. Über Wortgrenzen hinaus wirkt die Vokalharmonie in der Regel über eine Silbe.

## 4. Wortarten

### 4.1. Substantiv

Die Morphologie des Substantivs weist auf ein durch Präfixe geprägtes Nominalklassen-System hin, das jedoch in seiner morphologischen Ausprägung, der jeweiligen semantischen Klasseninhalten sowie der vor allem auf syntaktischer Ebene relevanten Kongruenz reduziert ist. Die Präfixe dienen zur Numerusbildung ({SINGULAR}/{PLURAL}) sowie zur nominalen Derivation (s. 5.1.1). Im wesentlichen entsprechen bei der SG/PL-Distinktion zwei {PLURAL}-Präfixen fünf singularische.

- {SINGULAR}: *ɔ-lo-*, *ɛ-le-*, *a-/æ-*, *n-/m-/lŋ-*, *o-*
- {PLURAL}: *a-/æ-*, *n-/m-/lŋ-*

Die allomorphen Vokalvarianten sind der Vokalharmonie geschuldet, die nasalen der Assimilation an den konsonantischen Anlaut des lexikalischen Morphems. Die Präfix-Entsprechungen ergeben folgende Genera (nach Danso 1983):

{SING}		{PLUR}		
<i>ɔ-lo-</i>	<i>a-/æ-</i>	<i>ɔ-héne</i>	<i>a-héne</i>	'Häuptling'
		<i>ɔ-túo</i>	<i>a-túo</i>	'Gewehr'
		<i>n-/m-</i>	<i>ɔ-bá</i>	'Kind'
<i>ɛ-le-</i>	<i>a-/æ-</i>	<i>ɛ-káw</i>	<i>a-káw</i>	'Schuld'
		<i>n-/m-</i>	<i>ɛ-dá</i>	'Tag'
		<i>ɛ-le-</i>	<i>ɛ-só</i>	'Zahn'
<i>a-/æ</i>	<i>a-/æ-</i>	<i>a-ní</i>	<i>a-ní</i>	'Auge'
		<i>n-/m-</i>	<i>a-bofrá</i>	'Kind'
<i>o-</i>	<i>a-/æ-</i>	<i>gyatá</i>	<i>a-gyatá</i>	'Löwe'
		<i>n-/m-</i>	<i>kurow</i>	'Dorf'
<i>n-/m-</i>	<i>n-/m-</i>	<i>n-hómá</i>	<i>n-hómá</i>	'Buch'

Tab. 140.1: Präfix-Entsprechungen

Den Präfixen ist nur noch selten ein bestimmter semantischer Inhalt zuzuordnen. Bei Personen tritt vorwiegend die Opposition {SINGULAR} *ɔ-lo-*, {PLURAL} *a-/æ-* oder *n-/m-* auf. Kollektiva und Flüssigkeiten nehmen meistens ein nasales Präfix an, vgl. *n-sú* 'Wasser', *n-tá* 'Speichel'. Präfixe fallen, mit Ausnahme von *a-/æ-* und *n-/m-*, im Syntagma unter regelmäßigen Bedingungen aus. Das betrifft v. a. die sog. assoziativen Konstruktionen: *mé ná* 'POSS.1.SG-Mutter (meine Mutter)' (*ɛ-ná* Mutter).

Die in begrenztem Umfang auftretenden Suffixe dienen, in Kombination mit jeweils spezifischen Präfixen, der Derivation (vgl. 5.1.1).

Da das Twi als nicht-flektierende Sprache keine Kasus kennt, werden diese durch syntaktische Mittel gekennzeichnet. Relevant für morphologische Prozesse (vgl. auch 5.2) ist die Wiedergabe des {GENITIV} durch die Aufeinanderfolge zweier Substantive in einem Possessor-Possessum-Verhältnis (s. Art. 103) ohne Verwendung eines segmentalen Morphems, jedoch einhergehend mit tonalen Veränderungen.

Zur Klasse der Substantive gehören auch die v. a. als Postposition fungierenden relationalen Nomina, die das Possessum einer solchen Substantiv-Verbindung darstellen, z. B.:

*ɛ-hó* 'Außenseite', *e-mú* 'Innenseite', *ɛ-só* 'Oberseite'. Ebenso repräsentieren Numeralia Substantive, erkennbar an ihrem nominalen Präfix, das jedoch entsprechend den in der Sprache geltenden Regeln ausfällt: *a-nán* 'vier'; *e-dú* (Plural *a-dú*) 'zehn': *a-du-a-sa* 'dreißig'; *ɔ-há* (Plural *a-há*) 'Hundert': *a-há-n-krón* 'neun Hundert'. Numeralia folgen in einer Nominalphrase den Adjektiven: *m-mofrá n-kétewá dú* 'zehn kleine Kinder'.

#### 4.2. Pronomina

Die pronominalen Formen in Subjekt- und Objektfunktion bzw. in Funktion eines Possessors stimmen in segmentaler Hinsicht im wesentlichen überein (Ausnahmen: '3.SG', '1.PL', '3.PL'). Ihre konkrete Funktion leitet sich von ihrer syntaktischen Position ab: präverbal als Subjekt, postverbal als Objekt, pränominal als Possessor. Bei den als Subjekt fungierenden Anaphorika ist die ursprüngliche Nominalklassen-Unterscheidung auf eine Opposition zwischen {BELEBT/UNBELEBT} reduziert: *ɔ-bà* '3.SG{BELEBT}-komm(HABIT) (er/sie kommt)', *ɛ-dú* '3.SG '{UNBELEBT}-ankomm(HABIT) (es kommt an)'. Subjektpronomina unterliegen der Vokalharmonie (vgl. 3). Ihre tonale Charakteristik ist vom Verbparadigma abhängig, z. B. (im Akuapem-Twi) Hochton im {HABITUALIS} (*ɔ-kò* 'er geht') und {OPTATIV} (*ɔ-n-kò* 'er möge gehen'), Tiefton im {PRÄTERITUM} (*ɔ-kò-ɛ* 'er ging'). Possessivpronomina sind, ebenso wie Nomina in assoziativen Konstruktionen, Tonveränderungen unterworfen.

#### 4.3. Adjektive

Bei Adjektiven ist zwischen ihrer attributiven und prädikativen Gebrauchsweise zu unterscheiden. Bei attributiver Funktion ergibt sich die für alle Modifikatoren eines Substantivs (mit Ausnahme des {GENITIVS}) charakteristische postnominale Stellung. Auch hier ergeben sich Tonveränderungen: Tilgung des Hochtons auf dem Nomen, hochtonige Realisierung der 1. Silbe des Adjektivs: *ɔ-nipa boné* 'sg-Mensch schlecht (schlechter Mensch)'; *ɔ-dan késé* 'sg-Haus groß (großes Haus)'. Prädikativer Gebrauch ist durch die Verbindung mit der Kopula *yε* gekennzeichnet: *ɔ-dán yε késé* 'sg-Haus KOP groß (das Haus ist groß)'. Einsilbige Adjektive sind in der Regel auf prädikativen Gebrauch beschränkt (mit Ausnahme von *pa* 'gut'); als Attribut werden sie redupliziert: *ɔ-béa yε fέ* 'sg-Frau KOP hübsch (die Frau ist hübsch)', aber: *ɔ-bea fέfέ* 'sg-Frau hübsch (die hübsche

Frau’); *a-duań ye dé* ‘SG-Essen KOP süß (das Essen schmeckt gut)’; *a-duan dédé* ‘SG-Essen süß (schmackhaftes Essen)’. Eine dreifache Wiederholung des Stammes – wobei der Vokal der 2. Silbe gelängt ist – drückt Intensität aus bzw. ergibt adverbiale Formen, vgl. folgende Formen: *dedéede* ‘(sehr) süß’, *féfíféfí* ‘(sehr) hübsch’, *pápaapa* ‘(sehr) gut’. Im Plural existieren drei Varianten. Während in der Regel die Adjektive den pluralischen Substantiven unverändert folgen, vgl. *m-mofra bóné* ‘PL-Kind schlecht (schlechte Kinder)’, nehmen einige entweder Präfix *a-* oder {NASAL}- an: *a-dán á-késé* ‘PL-Haus PL-groß (große Häuser)’; *a-dán n-kétewá* ‘PL-Haus PL-klein (kleine Häuser)’.

In der Funktion prädikativer Adjektive treten stative Verben oder auch dynamische Verben, letztere in Verbindung mit dem Perfekt-Marker *-a-*, auf, wodurch ein Zustand als Resultat einer Handlung zum Ausdruck gebracht wird.

- (a) Stative Verben: *ware* ‘lang/weit sein’: *ɔ-kwán nó ware* ‘SG-Weg DEF weit sein (der Weg ist weit)’.
- (b) Dynamische Verben: *bré* ‘müde werden’: *wɔ-a-bré* ‘3.PL-PF-müde werden (sie sind müde)’.

Auch Experiencer-Konstruktionen drücken prädiktative Adjektive aus. Als Experiencer fungiert ein Nomen oder Pronomen, das den Possessor eines Körperteil-Nomens (= Possessum) darstellt; das Verb ist mit dem perfektivischen *-a-* verbunden, vgl. *né wèrə á-hòw* ‘3.SG.POSS Herz PF-trockn (er ist ärgerlich)’.

Die Komparation von Adjektiven wird nicht durch morphologische Mittel ausgedrückt, sondern mit Hilfe einer seriellen Verbkonstruktion (vgl. 4.5.6), in der *sen* ‘übertreffen’ als zweites Verb steht: *o-n-yé n-sén wo* ‘3.SG-NEG-gut.sein NEG-übertreff 2.SG (er/sie ist nicht besser als du)’.

#### 4.4. Determinatoren

Zum Ausdruck der Determination bzw. Referentialität nominaler Ausdrücke ist im Twi zwischen vier Morphemen zu unterscheiden: Nullmorphem, *yí*, *bí* und *nó*. Ihnen sind folgende Funktionen zuzuweisen:

- (a) Nullmorphem: generisch; *a-gyinamoá* ‘Katze/Katzen’
- (b) *bí*: indefinit; *a-bofrá bí* ‘ein Kind’
- (c) *yí*: deiktisch; es bezeichnet die räumliche und zeitliche Nähe; *ɔ-dán yí* ‘dieses Haus’, *sáá béré yí* ‘zu dieser Zeit’

#### (d) *nó*: definit; *a-bofrá nó* ‘das Kind’

Die betreffenden Determinatoren stehen am Ende einer auch durch andere Modifikatoren qualifizierten Nominalphrase: *ɔ-bea fífé yí* ‘diese schöne Frau’; *yen a-dán á-késé dú nó* ‘unsere zehn großen Häuser’

#### 4.5. Verb

Am Verb selbst vollziehen sich keine morphologischen Prozesse. Nur in ganz geringem Maße sind Spuren derivativer Bildungen festzustellen (vgl. 5.1.2). Der verbale Ausdruck, im Twi ein orthographisches Wort repräsentierend, besteht aus Subjektpronomen, Formativ und Verb. Die Formativen, die mit einer Ausnahme dem Verb vorangehen, bringen die grammatischen Kategorien Tempus, Aspekt und Modus zum Ausdruck und markieren die Polarität. In vielen Fällen ist eine Interaktion lexikalischer Bedeutungen von Verben mit Tempus/Aspekt/Modus-Markern zu konstatieren, was ihre gegenseitige Inkompatibilität bedingt.

Neben den segmentalen Formativen bilden suprasegmentale Merkmale einen konstitutiven Bestandteil jeder Verbform. Bei Fehlen eines segmentalen Morphems können sie ausschließliches Unterscheidungsmerkmal von Verbformen sein, vgl. {STATIV} und {HABITUALIS}.

##### 4.5.1. Tempus- und Aspekt-Marker

###### (a) Habitualis:

Silbe	Ton			
Verb	Pron. Verb			
1-silbig	H	T	ɔ-kɔ	‘er geht’
2-silbig	T	T-H	ɔ-sómá	‘er schickt’
	H	T-T	ɔ-nwènè	‘er webt’

Tab. 140.2: Bildung des Habitualis

Diese, ohne segmentales Formativ gebildete, Form drückt in Verbindung mit dynamischen Verben einen {HABITUALIS} sowie auch generische Sachverhalte aus. Sie trägt primär aspektuellen, imperfektiven, Charakter: *ó-dí pááno* ‘3.SG-ess(HABIT) Brot (er/sie ißt Brot)’; *a-gyinamoá kyérè n-kurá* ‘sg-Katze fang(HABIT) PL-Maus (die Katze fängt Mäuse)’.

(b) **Stativ:** Der Stativ ist ebenfalls eine imperfektive Verbform, die sich formal vom {HABITUALIS} nur durch seine generelle Tiefotonigkeit unterscheidet. In ihm stehen ausschließlich stative Verben: *o-gyina hó* ‘3.SG-

steh{STAT} dort (er/sie steht dort); *ɔ-wɔ há* ‘3.SG-sein(LOKAT) hier (er/ sie ist hier)’.

(c) **Präteritum:** Die die Vergangenheit bezeichnende Verbform hat primär temporalen Charakter und ist die einzige, die durch ein Suffix markiert ist. Es existieren zwei Morphemvarianten, deren Form syntaktisch bedingt ist; sie hängt vom Vorhandensein einer dem Verb folgenden Ergänzung ab:

- bei Verb ohne Ergänzung: *-èl-i:* *me-kó-è* ‘1.SG-geh-PRÄT (ich ging)’.
- bei Verb mit Ergänzung: Längung des auslautenden Verbvokals: *me-kó-ɔ hó* ‘1.SG-geh-PRÄT dort (ich ging dorthin)’.

(d) **Futur:** Zukünftige Sachverhalte werden durch ein hochtoniges *-bé-/bé-* gekennzeichnet: *ye- bέ-dua n-nuá* ‘1.PL-FUT-pflanz PL-Baum(AKK)(wir werden Bäume pflanzen)’. Daneben kann *-bé-* modale Bedeutung haben und eine Vermutung über das erwartete Geschehen ausdrücken: *ebià ye-bé-ba* ‘vielleicht 1.PL-FUT-komm (vielleicht kommen wir)’.

(e) **Progressiv:** Die tonale Charakteristik des imperfektiven {PROGRESSIV}-Markers *-re-* hängt von der Silbenstruktur des Verbs ab: Hochton bei einsilbigen Verben (*ɔ-ré-yé a-dwíma* ‘3.SG-PROG-mach SG-Arbeit (er/sie ist beim Arbeiten)’, Tiefton bei zweisilbigen Verben (*ye-re-didí* ‘1.PL-PROG-ess RDP (wir sind beim Essen)’. Die temporale Locierung progressiver Sachverhalte ergibt sich aus dem Kontext; ein Progressiv der Vergangenheit kann jedoch auch durch die dem Subjekt vorangehende hochtonige Vergangenheitspartikel *ná* markiert werden: *ná ye-re-didí* ‘wir waren beim Essen’. *-re-* blockiert die Vokalharmonie.

(f) **Perfekt:** Ein Perfekt wird durch Funktionsmorphem *-a-* ausgedrückt, dessen Ton je nach Verbindung mit ein- oder zweisilbigen Verben variiert: *ye-á-hù* ‘1.PL-PF-seh (wir haben gesehen)’, *ye-à-bísá* ‘1.PL-PF-frag (wir haben gefragt)’.

(g) **Venitiv/Allativ:** Gehen ein in der Regel tieftöniges *bè* oder *kò* einem dynamischen Verb voran, wird eine Bewegung zum Sprecher hin (*bè*) bzw. vom Sprecher weg (*kò*) als Voraussetzung für die durchzuführende Handlung ausgedrückt. Diese Venitiv- bzw. Allativformen können mit Tempus/Aspekt/Modus-Markern verbunden sein, wobei eine

Kombination mit dem futurischen *bé* ausgeschlossen ist. Beide *be*-Marker (*bé* = Futur und *bè* = Venitiv) sind aus *ba* ‘kommen’ grammatisiert: *o-be-kyiá-à yen* ‘3.SG-VEN-begrüß-PRÄT 1.PL (er/sie kam uns begrüßen)’; *w-a-kó-hwé sini* ‘3.SG-PF-ALL-anseh Film (er ist einen Film ansehen gegangen)’. Die entsprechenden Konstruktionen stellen Verkürzungen aus seriellen Verbkonstruktionen dar (vgl. 4.5.6), in denen *ba* und *kò* als Vollverben auftreten; *ɔ-n-kó n-kó-hwéhwe* ‘3.SG-NEG-geh{HABIT} NEG-ALL-such{HABIT} (er/sie geht nicht (um zu) suchen)’. Das vor dem zweiten Verb der seriellen Konstruktion stehende Venitiv- bzw. AllativmorpheM verdeckt die aus der Sicht des Sprechers für die Durchführung der Handlung notwendige Bewegung des Kommens oder des Gehens.

(h) **Nahe Zukunft:** Die Kombination von *-re-* {PROGRESSIV} + *be* {VENITIV} ergibt eine grammatisierte spezielle Verbform, ein nahes Futur: *ye-re-be-tú kwán* ‘1.PL-PROG-ven-herauszieh Weg (wir werden gleich verreisen)’.

(i) **Konsekutiv:** Eine ebenfalls mit *-a-* gebildete Verbform (s. Perfekt in (f)) hat syntaktische Funktion, indem sie einen Konsekutiv bezeichnet: *ɔ-da a-wiá na w-a-yé ε-há a-nadwó* ‘3.SG-lieg(STAT) SG-Mittag und 3.SG-KONSEK-mach SG-Jagd SG-Nacht (er/sie schläft mittags und jagt abends)’. Konsekutives *-a-* folgt obligatorisch dem {PROGRESSIV}, {FUTUR} und {NAHEN FUTUR}. Eine finale Interpretation erscheint häufig der Semantik der Konstruktion angemessen: *brá na ye-a-hwé no* ‘komm-(IMP) und 1.PL-KONSEK-anseh 3.SG (komm, damit wir ihn betrachten)’.

#### 4.5.2. Modi

Das Twi verfügt über drei Modi. Neben den zum {INDIKATIV} (vgl. 4.5.1) gehörenden Formen sind der {IMPERATIV} und {OPTATIV} zu unterscheiden.

(a) **Imperativ:** Er tritt nur im {SINGULAR} auf und wird durch den Verbstamm repräsentiert; einsilbige Verben sind hochtonig, bei folgender Ergänzung nehmen sie Tiefton an: *kó!* ‘geh!'; *kò hó!* ‘geh dorthin!’

(b) **Optativ:** Ein stets hochtoniger, dem Verb vorangehender homogener {NASAL} bildet den {OPTATIV}; außer mit der 2.SG tritt er in allen Personen auf: *ɔ-ń-kyérε yen a-dán* ‘3.SG-OPT-zeig 1.PL PL-Haus (er/sie möge/soll uns Häuser zeigen)’. Mit Hilfe der {OPTATIV}-

Form der 2.PL wird der pluralische {IMPERATIV} ausgedrückt: *mó-m-fá* ‘2.PL-OPT-nehm (nehmt!)’.

#### 4.5.3. Negation verbaler Formen

Formales Kennzeichen jeder negativen Verbform ist ein tieftoniger homorganer {NASAL}. Das Twi verfügt über mehr affirmative als negative Formen, da eine der Negativ-Formen, die neben einer spezifischen Tonstruktur lediglich den negierenden {NASAL} als segmentales morphologisches Kennzeichen besitzt, semantisch mehreren affirmativen entspricht. Für den {HABITUALIS}, {STATIV}, {PROGRESSIV} sowie den {KONSEKUTIV} in einer seriellen Verbkonstruktion nach einem {FUTUR}, {NAHEN FUTUR} und {PROGRESSIV} ist in der Negation folgende tonale Struktur charakteristisch: {PRONOMEN} Tief (außer 2. Personen), {NASAL} Tief, 1-silb. Verb: Hoch, 2-silb. Verb: Tief-Hoch, vgl: {NEG/HABITUALIS} *ɔ-n-kó* ‘3.SG-NEG-geh (er/sie geht nicht)’; {NEG/STATIV} *ɔ-n-yé ɔ-héne* ‘3.SG-NEG-KOP (er/sie ist kein Hauptling)’; {NEG/KONSEK} in einer seriellen Verbkonstruktion *ɔ-ré-ñ-tumí n-kó* ‘3.SG-PROG-NEG-könn NEG-geh (er/sie wird nicht gehen können)’.

Einige affirmative Morpheme unterliegen bei ihrer Kombination mit dem negierenden {NASAL} einem Funktionswandel. So bezeichnet das präteritale Suffix *-el-i* bei seiner Verbindung mit dem {NASAL} ein negiertes {PERFEKT}: *m-á-hú* ‘1.SG-PF-seh (ich habe gesehen) > *mi-n- hú-i* ‘1.SG-NEG-seh-PRÄT (ich habe nicht gesehen)’. Negierender {NASAL} + perfektivisches *-a-* ergibt das negierte Präteritum: *mi-hú-i* ‘1.SG-seh-PRÄT (ich sah) > *m-a-n-hú* ‘1.SG-PF-NEG-seh (ich sah nicht)’. Das {FUTUR} wird im Akuapem-Twi mit Hilfe des {PROGRESSIV} *-re-* negiert: *ɔ-bé-fa* ‘3.SG-FUT-nehm (er/sie wird nehmen) > *ɔ-ré-m-fá* ‘3.SG-PROG-NEG-nehm (er/sie wird nicht nehmen)’.

#### 4.5.4. Genera verbi

Das Twi kennt kein grammatisiertes {PASSIV}. Als funktionales Äquivalent dient die 3.PL: *wɔ-kyér-è ɔ-wɔ* ‘3.PL-fang-PRÄT SG-Schlange (eine Schlange wurde gefangen)’. Ein Zustandspassiv kommt zum Ausdruck, wenn ein Mittelverb in seiner intransitiven Gebrauchsweise mit {PERFEKT} *-a-* verbunden ist. In diesem Fall ist das Nicht-{AGENS} Subjekt: *n-tamá nó á-suáne* ‘PL-Kleid DEF PF-reiß (die Kleider sind zerrissen)’. Vgl. dagegen: *w-á-suáne n-tamá* ‘SG-PF-zerreiß PL-Kleid (er/sie hat die Kleider zerrissen)’.

#### 4.5.5. Syntaktische Kategorie der Valenz

Bei der für das Twi gültigen grundlegenden Wortfolge SV(O) geht das Subjekt dem Verb voran. Die Position des Objekts bleibt bei intransitiven einwertigen Verben unbesetzt: *Kofi sɔré-è* ‘K. aufsteh-PRÄT (Kofi stand auf)’. Für dreiwertige Verben, deren Objekte die semantischen Rollen {RECIPIENS} und {PATIENS} tragen, wie *ma* ‘geben’, *kyéré* ‘zeigen’, *fem* ‘leihen’, gilt die Aufeinanderfolge {RECIPIENS}-{PATIENS}, wobei die Verbindung dreiwertiger Verben mit zwei Objekten Beschränkungen unterworfen ist. Nur, wenn das {PATIENS} indefiniten Charakter trägt, kann es als direktes Objekt dem indirekten {RECIPIENS} folgen: *yé-mà no n-hóma bi* ‘1.PL-geb{HABIT} 3.SG(IO) SG-Buch INDEF(wir geben ihm ein Buch)’, aber *\*yé-ma no nhoma no* ‘1.PL-geb {HABIT} 3.SG SG-Buch DEF(wir geben ihm das Buch)’. Bei definitem {PATIENS} ist eine serielle Verbkonstruktion (vgl. 4.5.6) obligatorisch, in der das direkte Objekt dem defekтивen Verb *de* ‘nehmen’ folgt und das indirekte Objekt dem handlungstragenden Verb angeschlossen ist: *yé-de n-hóma no ma no* ‘1.PL-nehm SG-Buch DEF geb(HABIT) 3.SG (wir geben ihm das Buch)’.

Ein wesentliches Charakteristikum zweien und dreiwertiger Verben im Twi ist die Tatsache, daß sie mit einer Ergänzung eine semantische Einheit, einen neuen verbalen Begriff, bilden können, z. B.: *fa so* ‘nehmen Oberseite’ = ‘besiegen’: *ɔ-fá-à wɔn so* ‘3.SG-nehm-PRÄT POSS 3.PL Oberseite (er/sie besiegte sie)’. Bei dreiwertigen Verben gibt die dem Verb unmittelbar folgende Ergänzung an, auf welche Person oder Sache sich das Geschehen bezieht. *tow... tuo* ‘werfen ... Gewehr = schießen’; *bu...fɔ* ‘beugen ... Schuld = verurteilen’: *wo-bú-ù no fɔ* ‘3.PL-beug-PRÄT 3.SG Schuld (sie verurteilten ihn)’.

#### 4.5.6. Serielle Verbkonstruktionen

Die Aneinanderreihung zweier oder mehrerer Verben ist eine in den westafrikanischen Kwasprachen charakteristische Erscheinung, vgl. auch Osam (1994). In formaler Hinsicht sind solche Konstruktionen dadurch gekennzeichnet, daß im wesentlichen die Verben mit denselben Formativen (Tempus/Aspekt/Modus-Markern, Polarität) verbunden sind und das zugrundeliegende, nicht ausgedrückte Subjekt des 2. Verbs mit dem Subjekt oder Objekt des 1. Verbs identisch ist. In funktional-semantischer Hinsicht sind die seriellen Verbkonstruktionen von formal-identischen

koordinierenden, die Aufeinanderfolge von Handlungen ausdrückenden Konstruktionen abzugrenzen.

(a) Zwei Verben nehmen eine spezifische, z. T. idiomatische Bedeutung an und bilden einen neuen Lexikoneintrag: *gye... di* ‘nehmen essen > glauben’; *sua... hu* ‘lernen sehen > beherrschen’; *mi-suá-à kásá hú-i* ‘1.SG-lern-PRÄT Sprache seh-PRÄT (ich beherrschte die Sprache)’.

(b) Die Kombination zweier Verben ist funktional-grammatisch determiniert, indem eine spezifische grammatische Funktion zum Ausdruck kommt, wie {INSTRUMENTALIS}, {BENEFAKTIV}. Dabei gibt es Beschränkungen, die die Fähigkeit der Verben betreffen, als 1. oder 2. Verb aufzutreten, z. B.:

	1. Verb	2. Verb
INSTR	<i>de</i> ‘nehmen’	Aktionsverb
BEN	Aktionsverb	<i>ma</i> ‘geben’

Tab. 140.3: Serielle Verbkonstruktionen

Z. B.: *o-wu ma no* ‘3.SG-sterb(HABIT) geb(HABIT) 3.SG (er/sie stirbt für ihn)’; *me-de sekán twá-à nám* ‘1.SG-nehm Messer schneid-PRÄT Fleisch (ich schnitt mit dem Messer Fleisch)’.

(c) Ein Verb der Konstruktion wirkt modifizierend und drückt häufig Adverbien aus: *nya* ‘erhalten’ > ‘schon’, *san* ‘zurückkehren’ > ‘wieder’. Solche Verben gehen entweder dem handlungstragenden Verb voran oder folgen ihm: *ye-á-nyá á-kò hó* ‘1.PL-PF-erhalt PF-geh dort (wir sind schon dorthin gegangen)’.

#### 4.5.7. Grammatikalisierung von Verben

Verben, die in seriellen Verbkonstruktionen auftreten, sind sehr häufig Grammatikalisierungsprozessen unterworfen. Dabei ist, aus insbesondere funktionaler, aber auch formaler Sicht, ein eindeutiger Übergang zu anderen Wortarten hin, vor allem zu Präpositionen, Konjunktionen und Adverbien, zu beobachten. Sie werden weitgehend flektiert, d. h. mit Tempus/Aspekt/Modus-Markern verbunden. Der Grammatikalisierungsprozeß ist im einzelnen jedoch unterschiedlich stark ausgeprägt, z. B.:

(a) Serielle Verbkonstruktionen zum Ausdruck eines {BENEFAKTIV}: *wu* ‘sterben’ ... *ma* ‘geben’ > ‘sterben für’. Die Bedeutung von *ma* ‘geben’ ist völlig zurückgetreten; es über-

nimmt hier die Funktion eines {BENEFAKTIV}. *ma* wird jedoch wie ein Verb flektiert.

(b) Verben zur lokalen, temporalen oder quantitativen Fixierung des ausgedrückten Geschehens; sie dienen zur Wiedergabe von Präpositionen und Konjunktionen, z. B.: *fi* ‘herkommen von’ > ‘von, aus, seit’; *ko-si* oder *be-si* ‘{ALL} bzw. {VEN}-steh(bleib)’ > ‘bis’: *w-á-kàn n-hóma á-fi ne m-fiasé a-be-sí n'a-wièi* ‘3.SG-PF-les SG-Buch PF-herkomm 3.SG.POSS SG-Anfang PF-VEN-steh 3.SG.POSS SG-Ende (er/sie hat das Buch von Anfang bis Ende gelesen)’. Daneben existieren folgende Formen:

- (1) (a) *wakan nhoma fi mfiase abesi awiei*  
          (b) *wakan nhoma fi mfiase besi awiei*

Das Nebeneinanderbestehen unterschiedlicher morphologischer Ausprägungen beim Verb macht den vor sich gehenden Grammatikalisierungsprozeß deutlich.

#### 4.6. Adverb

Adverbien stehen entweder in Satzanfangs- oder in Satzendstellung. Unter semantischem Aspekt sind lokale (*há* ‘hier’, *hɔ* ‘dort’), temporale (*ɔkyena* ‘morgen’), kausale (*énti* ‘deshalb’) und modale Adverbien (*dennéennen* ‘schwer’) zu unterscheiden. In morphologischer Hinsicht gibt es neben reinen Adverbien solche, die andere Wortarten (*ntém* ‘Schnelligkeit’) oder Zusammensetzungen (*enó nti* ‘deshalb’) repräsentieren.

#### 4.7. Modalwort

Modalwörter sind im Unterschied zu den modalen Adverbien satzwertig; sie modifizieren den gesamten Satz: *ebiá* ‘vielleicht’, *nokwárem* ‘tatsächlich’.

#### 4.8. Konjunktion

Entsprechend ihren syntaktischen Eigenschaften, d. h. ihrem Fügungswert, sind koordinierende (*na* ‘und’, *mímóm* ‘sondern’) und subordinierende (*sé* ‘daß’, *efisé* ‘weil’, *esiánè* ‘se... nti’ ‘weil’, *kosí sé* ‘bis (daß)’, *sénèa* ‘wie’ Konjunktionen zu unterscheiden. Die subordinierenden sind meistens auf Grammatikalisierungen von Verben zurückzuführen, s. *e-fi-i sé mi-duá-è nò* ‘3.SG-herkomm-PRÄT daß 1.SG-pflanz-PRÄT DEF (seit ich pflanzte)’; *ɔ-yé-è a-dwúma ko-sí-i sé w-a-bré* ‘3.SG-mach-PRÄT SG-Arbeit ALL-steh-PRÄT daß 3.SG-PF-müde werd (er/sie arbeitete, bis er/sie müde war)’.

#### 4.9. Partikel

Es sind verschiedene Partikeln zu unterscheiden: *nà* = Fokusmarkierer, Fokuspartikeln wie *mmom* ‘vielmehr, eher’, Fragepartikeln (*so* = Satz einleitend, *anáa* = Satz abschließend) bzw. Vergangenheits- und Irrealitätspartikeln (*ná, anka*): *ná me- wɔ há* ‘PRT 1.SG-sein(LOKAT) hier ich war hier’.

### 5. Wortbildung

Zu grundlegenden Verfahren der Wortbildung im Twi gehören die Derivation, Komposition und Reduplikation.

#### 5.1. Derivation

Derivative Prozesse (s. Art. 89) spielen vor allem im nominalen Bereich eine große Rolle.

##### 5.1.1. Derivative Substantive

Als morphologische Mittel zur Bildung von Substantiven fungieren Prä- und Suffixe. (Zu den Präfixen vgl. vor allem 4.1.) Ihre derivative Funktion ist u. a. an der Bildung von Nomina actionis nachzuweisen, wozu die Präfixe *ɔ-lo-*, *a-* oder {NASAL} dienen: *hwe* ‘fallen’ > *ɔ-hwé*; *kan* ‘zählen’ > *ɔ-kán*; *pra* ‘fegen’ > *a-prá*; *wo* ‘gebären’ > *a-wó*; *san* ‘anstecken’ > *n-sán*; *kra* ‘sich verabschieden’ > *n-krá*. Verbindungen von einem Verb und einem als dessen Objekt fungierenden relationalen Substantiv tragen grundsätzlich ein nasales Präfix: *kyeré a-se* ‘zeig sg-Unterseite (erklären)’ > *n-kyere-a-sé* ‘Erklärung’; *hwehwé mu* ‘such Innenseite (nachforschen)’ > *n-hwehwe-mú* ‘Nachforschung’.

Die Suffixe stehen in der Regel in Korrelation zu bestimmten Präfixen.

(a) Suffix *-ní*, *-fó* {SINGULAR}, *-fó* {PLURAL}: Beide Suffixe treten an Verben und Substantive und bilden in erster Linie Nomina agentis oder bezeichnen die Herkunft von Personen. *-fó* ist bei deverbalen Ableitungen im Singular häufiger. Solche deverbalen Nomina weisen im {SINGULAR} Präfix *ɔ-lo-*, im {PLURAL} *a-* auf:

{SINGULAR}	{PLURAL}
<i>ɔ-tám-fo</i>	<i>a-tám-fo</i> < <i>tan</i> ‘hassen’
<i>o-suá-ni</i>	<i>a-suá-fo</i> < <i>suá</i> ‘lernen’

Auch denominale Ableitungen sind, bei Substitution des ursprünglichen Nominalpräfixes, mit diesen Suffixen verbunden: *ɔ-tóro-fo* ‘Lügner’ < *a-tóro* ‘Lüge’; *o-busu-fó* ‘Bösewicht’ < *m-musú* ‘Unfug’. Komposita, in denen Substantiv + Verbalnomen in einem Pos-

sessivverhältnis zueinander stehen, bewahren entweder das Präfix des Substantivs, wie in *n-homa-pám-fo* ‘Buchbinder’ < *n-hómá* ‘SG-Buch’ + *pam* ‘zusammenfügen’ oder substituieren es im {SINGULAR} durch *ɔ-lo-*, s. *o-dua-twá-fo* ‘Holzfäller’ < *e-duá* ‘SG-Holz’ + *twa* ‘schneiden’.

(b) Suffix *-nóm*: *-nóm* ist ein pluralisches Suffix zur Bezeichnung von Verwandten und Freunden. Das {SINGULAR}-Präfix bleibt dabei in der Regel erhalten: ‘Ehemann’ *o-kúnú*, {PLURAL} *o-kúnú-nom*; ‘Ehefrau’ *ɔ-yére*, {PLURAL} *ɔ-yére-nom*; ‘Freund’ *a-damfo*, {PLURAL} *n-namfo-nóm*.

(c) Suffix *-wá*: *-wá*, nach nasalem Auslaut *-má*, bildet Diminutiva. Es ist von *ɔ-bá* ‘SG-Kind’ herzuleiten. Die mit dem {DIMINUTIV} gebildeten Formen nehmen in der Regel im {SINGULAR} Präfix *a-*, im {PLURAL} nasales Präfix an: *ɛ-kwá* ‘Wald’ > *a-kwae-wá* ‘kleiner Wald, Unterholz’; *ɛ-hyén* ‘Schiff’ > *a-hyem-má* ‘Boot’, *a-bóá* ‘Tier’ > *a-bóá-wa* auch *a-bóá-a*. ‘kleines Tier’.

(d) Suffix *-él-í*: Dieses Suffix bildet deverbale Substantive, die vor allem den Ort und das Ergebnis eines Geschehens bzw. das Geschehen selbst, seltener das Instrument einer Handlung bezeichnen.

- Ort des Geschehens: Die so gebildeten Substantive sind in der Regel mit dem Präfix *a-* verbunden; *a-da-é* ‘Schlafplatz’ < *da* ‘schlafen’; *a-guare-é* ‘Badestelle’ < *guaré* ‘baden’.
- Ergebnis eines Geschehens: Die entsprechenden Substantive nehmen dabei ein nasales Präfix an: *n-ka-é* ‘Silbe’ < *ka* ‘sprechen’; *n-kyere-é* ‘Beispiel’ < *kyeré* ‘zeigen’.
- Instrument einer Handlung: *fita-é* ‘Fächer’ < *fitá* ‘fächeln’.

##### 5.1.2. Derivative Verben

Derivative Verben sind nur in Spuren feststellbar: *bu-á* ‘bedecken’, *bu-é* ‘aufdecken’; *so-á* ‘hochheben (auf Kopf)’, *so* ‘tragen (auf Kopf)’.

### 5.2. Komposition

#### 5.2.1. Komposition zur Bildung von Substantiven

(a) Substantiv + Substantiv: Zu unterscheiden ist zwischen einer appositionellen Fügung (*ɔsɔfopanyín* ‘Hohepriester’ < *ɔsɔfó* ‘Priester’ + *ɔpanyín* ‘Person hohen Ranges’)

und einem assoziativen Verhältnis (*ahemfi* ‘Häuptlingspalast’ < *shéne* ‘Häuptling’{GEN} + *ofi* ‘Haus’ = ‘Haus des Häuptlings’.

(b) Substantiv + Adjektiv: Adjektive können mit dem durch sie modifizierten Substantiv zu einem Kompositum verschmelzen: *shemfó* ‘neuer Häuptling’ < *shéne* ‘Häuptling’ + *sofó* ‘neu’; *anam móno* ‘rohes Fleisch’ < *enám* ‘Fleisch’ + *momonó* ‘roh’.

(c) Substantiv + Verbalsubstantiv: Beide Bestandteile stehen zueinander in einem assoziativen Verhältnis, wobei das Präfix des nominalisierten Verbs ausfällt. Ein solches Kompositum nimmt häufig Präfix *a-* an: *akatuá* ‘Bezahlung’ < *ekáw* ‘Schuld’ + *otua* ‘das Befestigen’; *afobú* ‘Verurteilung’ < *efí* ‘Schuld’ + *obú* ‘das Beugen’.

(d) Verb + Substantiv: Ein aus Verb und Substantiv bestehendes Kompositum weist in der Regel dann kein assoziatives bzw. Possessionsverhältnis auf (s.(c)), wenn die Ergänzung des Verbs durch ein relationales Substantiv, wie *ase* ‘Unterseite’, *ehó* ‘Außenseite’, repräsentiert wird: *mfiasé* ‘Beginn’ < *fi* ‘herkommen von’ + *ase* = ‘beginnen’; *nkatahó* ‘Deckel’ < *katá* ‘bedecken’ + *eho* = ‘zudecken, einhüllen’. Diese Komposita nehmen nasales Präfix an.

(e) Verb + Verb: *ɔ-dá-dwen* ‘Meditation’ < *da* ‘liegen’ + *dwen* ‘denken’; *ɔ-ká-kyere* ‘Information’ < *ka* ‘sagen’ + *kyeré* ‘zeigen’.

Die einzelnen Bestandteile der Komposita, sind, verglichen mit ihrer tonalen Charakteristik in absoluter Stellung, Tonveränderungen unterworfen. Das lexikalische Morphem des 1. Bestandteils ist in der Regel tieftonig: *afobú* ‘Verurteilung’ < *efí* ‘Schuld’ + *obú* ‘das Beugen’; *shempá* ‘guter Häuptling’ < *shéne* ‘Häuptling’ + *pá* ‘gut’; (vgl. dagegen die Komposita unter (e)).

**5.2.2. Komposition zur Bildung von Verben**  
Sie ist im wesentlichen auf zwei Varianten, in denen die jeweiligen Bestandteile diskontinuierliche Elemente darstellen, beschränkt:

- (a) Verb + Verb (= serielle Verbkonstruktion) ergeben zusammen einen neuen verbalen Begriff (vgl. 4.5.6.)
- (b) Verb + Ergänzung bilden eine semantische Einheit (vgl. 4.5.5.): *bu...fó* ‘verur-

teilen’ < *bu* ‘beugen’ + *efí* ‘Schuld’; *ma... so* ‘hochheben’ < *ma* ‘geben’ + *esó* ‘Oberseite’.

### 5.3. Reduplikation

Reduplikation (total oder partiell; s. Art. 57) ist nicht auf eine bestimmte Wortart beschränkt; sie tritt jedoch am häufigsten bei Verben auf, wobei ihr die Funktion der Pluralität zuzuschreiben ist, indem sie einerseits die Iteration oder Intensivierung eines Geschehens ausdrückt; andererseits ist Reduplikation von Verben durch pluralische Subjekte oder Objekte bedingt. In einigen Fällen kommen Bedeutungsnuancen im Verhältnis zu den jeweiligen Grundformen zum Ausdruck: *hwe* ‘betrachten’, *hwehwé* ‘suchen’; *gye* ‘nehmen’, *gyigye* ‘aufziehen’. Der Vokal der als Präfix gedeuteten 1. Silbe der reduplizierten Form ist in der Regel einer phonologischen Veränderung unterworfen; vgl. auch die folgenden Formen: *tɔ/totɔ* ‘kaufen’; *dal deda* ‘liegen’; *pe/pepe* ‘wünschen’; *paw/popaw* ‘wählen’; *nyal/nyinya* ‘erhalten’.

In einer Reihe von Fällen haben Reduplikation bzw. eine mehrfache Wiederholung der Wurzel eine grammatische Funktion, z. B. prädikatives Adjektiv (*fe* ‘schön’, *den* ‘stark’) > attributives Adjektiv (*fe fe* bzw. *dennén*) > Adverb (*fe fe fe* bzw. *dennénen*). Reduplikationen repräsentieren auch Pluralformen von im wesentlichen im Singular mit *e-/e-*-verbundenen Substantiven: *e-fí*, {PLURAL} *a-fia-fí* ‘Bund’. Die pluralischen Substantive sind dabei zusammen mit ihrem Präfix (*a-*) redupliziert.

### 1. Introduction

Kinyarwanda, which is called *ikinyarwanda* by its native speakers and *urunyarwanda* by Rwandans in Uganda because languages that are spoken there such as Luganda, Runyankole, Runyoro, Rukiga, etc. start with the *ru*-prefix, and *Rwanda* in Coupez's writings (cf. Coupez 1980), is the national language of Rwanda and is a sister dialect of Kirundi, the national language of Burundi. Linguistically speaking, these are indeed dialects of the same language since there is total intelligibility between their respective speakers. Together with another dialect known as Giha spoken in Tanzania, it is the second largest language cluster after Kiswahili within the Bantu language group. Its speakers are perhaps more than 20 million people. Rwanda has around 8 million people right now, Burundi has around 7 million but besides the Giha speakers there are also ethnic Banyarwanda in Southern Uganda in the Kigezi district known as Bafumbira.

Other Kinyarwanda speakers are Banyamulenge in Southern Kivu and ethnic Banyarwanda in Masisi and Rutshuro in Northern Kivu in the Democratic Republic of Congo. Kinyarwanda belongs to the interlacustrine (Great Lakes) Bantu languages. Kinyarwanda has an official orthography.

Although, both short and long vowels are phonemic and are realized at the phonetic level, only short vowels are authorized in the writing system which creates a lot of homonyms (homographs). The language also has high tones but the orthography does not mark them either.

Kinyarwanda like other Bantu languages has open syllables only. It has 5 vowels namely *a*, *e*, *i*, *o*, and *u* which are realized as either short or long at both the phonemic and phonetic levels. Only *i*, *u*, and *a*, occur in (pre)prefix position and in verbal extensions. Vowels of verbal extensions can be realized as mid vowels, however, because of vowel harmony. The other similarity with other Bantu languages is the existence of prenasalized consonants, the application of vowel harmony, vowel lengthening before prenasalized consonants and after palatalized and velarized consonants and consonant mutation also known as the modified form of the verb stem due to the perfective aspect morpheme reconstructed as *-ile* and realized in Kinyarwanda as *-ye* (Kimenyi 1999).

What Kinyarwanda shares with a handful of other Bantu languages are complex consonants and Dahl's law. Complex consonants are produced by different articulators at the same time, such as labio-velarized, labio-palatalized, alveo-palatalized, alveo-velarized, etc. and different manners of production such as aspiration, nasalization, and so on. Dahl's law which is very productive in Kinyarwanda and Kikuyu, voices stop consonants or prefixes which immediately precede the word stem if the latter starts with a voiceless consonant. Like the majority of other Bantu languages, Kinyarwanda also has tone spread rule and second high tone deletion known in Bantu terminology as Meeussen rule (cf. Meeussen 1959). As far the sentence structure is concerned, Kinyarwanda like

other Bantu languages is an SVO language. Modifiers follow head nouns and complements come after the verb. The only modifier which precedes a head noun is the demonstrative. The interesting syntactic behavior of this language and many other Bantu languages are: (i) object-subject reversal, (ii) wh-questioning in situ, (iii) lack of relative pronouns, (iv) multiple auxiliary serialization, (v) the existence of ditransitive verbs, and (vi) objectivization of adjunct complements (Kimenyi 1980; 2002). The object-subject reversal which consists of interchanging the direct object and the subject has the same function as the passive construction: The focus is put on the subject and the object is considered as old information. Wh-questioning is always in-situ. The only way it can appear before the main verb is through cleft or pseudo-cleft constructions.

Nouns and verbs are indeed distinct categories in Kinyarwanda. They differ a lot as far as their form, phonetic shape, and behavior are concerned. The verbal morphology is very complex but the nominal is not.

## 2. Noun

The **noun** in Kinyarwanda consists of a stem, a prefix, and a preprefix or augment. This preprefix which is realized as a vowel, seems to be a copy of the prefix vowel. These prefixes are also known in Bantu as class markers.

### 2.1. Class markers

Kinyarwanda has 16 classes (cf. Art. 98). Modifiers (adjectives, demonstratives, numerals, possessives) agree with the head noun by taking this class marker.

In some cases, however, the modifier takes a different type of prefix depending on whether it is an adjective, a verb, an object pronoun, a quantifier or a possessive as illustrated in Tab. 141.1. The numbers 1–16 correspond to traditional conventional Bantu noun classification.

The sentence in (1) shows how this type of noun class agreement works. The head noun is *utubaati* ‘cupboards’ whose preprefix has been deleted because of the fact that it is preceded by a demonstrative.

Tab. 141.1: Noun classes in Kinyarwanda

‘These three new cupboards of yours which are on the table, we bought them all yesterday.’

### 2.2. Loan-word morphology

Most of **loan-words** are put in class 5 or 9 because there are no class markers there. These words thus take classes 6 or 10 respectively to make their plural.

- (2) *i-taábi* ‘AUG-tobacco’ >  
*a-ma-taábi* ‘AUG-CL6-tobacco (tobaccos)’/  
*i-taábi* ‘AUG-tobacco (tobaccos)’  
*i-shaáti* ‘AUG-shirt’ >  
*a-ma-shaáti* ‘AUG-CL6-shirt (shirts)’/  
*i-shaáti* ‘AUG-shirt (shirts)’  
*i-shuúri* ‘AUG-school’ >  
*a-ma-shuúri* ‘AUG-CL6-school (schools)’

There are loan-words which are found in other classes, however, because of reanalysis. They are mistaken for native words and their initial syllables are taken for class markers or prefixes (cf. 3 a–c; for further examples see Kimenyi 2002).

- (3) (a) *u-mu-sírimú*  
 ‘AUG-CL1-cultivated.person’  
 from Arabic ‘muslim’  
*a-ba-sírimú*  
 ‘AUG-CL2-cultivated.person (cultivated people)’  
 (b) *u-mu-sáriyamú* ‘AUG-CL1-muslim’  
 from Arabic ‘muslim’  
*a-ba-sáriyamú* ‘AUG-CL2-muslim  
 (muslims)’

- (c) *u-mu-notá* ‘AUG-CL3-minute  
from French *minute*  
*i-mi-notá* ‘AUG-CL4-minute (minutes)’

### 2.3. The use of the prefix

The preprefix or **augment** usually doesn't have any semantic function. It is deleted, after demonstratives, in the vocative case, and in onomastics (name creation). Within certain words, however, its absence marks definiteness and its presence indefiniteness as shown in (4).

- (4) *mu-gaanga* ‘CL1-doctor (the doctor)’ >  
*u-mu-gaanga* ‘AUG-CL1-doctor (a doctor)’  
*mu-geenzi* ‘CL1-friend (the friend)’ >  
*u-mu-geenzi* ‘AUG-CL1-friend (a friend)’

The lack of the preprefix bleeds the application of tone rhythm rules such as beat addition namely the addition of a high tone on the first mora of the noun stem if the latter has a lexical high tone at least two moras on the right as shown below (cf. 6.4.1).

- (5) *u-mw-áarimú* ‘AUG-CL1-teacher (a teacher)’  
*mw-aarimú* ‘CL1-teacher (the teacher)’

### 2.4. Grammatical categorization in Kinyarwanda: From natural categories to grammatical categories

The majority of these class markers occur in pairs 1/2; 3/4; 5/6; 7/8; 9/10; 11/10; 16 to mark singularity and plurality. The human category, class 1/2, marked by prefixes *-mu-* and *-ba-* and class 16, the place category, marked by the prefix *-ha-*, are the only ones in Kinyarwanda and in other Bantu languages, which exclude nouns referring to other semantic categories. Other classes include nouns which don't have any semantic relationship whatsoever.

### 2.5. Homonymy

Class 1 *-mu-* (singular for human category) and class 3 marker *-mu-* which pluralizes in *-mi-* look exactly the same, which results in confusing language learners and sometimes in creating regional dialects based on this homonymy.

Class 5 which is marked in the great majority by a zero marker because of the loss of the class marker *-ri-* resembles class 9 which also lost its marker *-n-*, this being phonetically conditioned. Most of the words starting with voiceless fricatives have lost this marker:

- (6) *i-sha* ‘AUG-gazelle’  
*iyi sha* ‘this (CL9) gazelle’  
*i-shámi* ‘AUG-branch’  
*iri shámi* ‘this (CL5) branch’

This derivational function of prefixes and loan-words have made them polysemous. This polysemy is responsible for the grammaticalization of the class markers in Kinyarwanda and other Bantu languages.

### 2.6. Polysemy with class markers

The same class marker or prefix can have different functions. As said earlier (cf. 2.4), most of these classes occur in pairs (singular and plural). Some of these prefixes serve as plural markers for more than one class. Thus class 6 *-ma-* serves as plural for class 5, class 9, class 14, and class 15. Class 8 whose classifier is *-bi-* serves as plural for class 7 and class 11 if the derived pejorative or augmentative nouns with *-ru-* prefix; class 10 also is the plural marker for class 9 and 11. Whereas class 12 can pluralize either in class 13 *-tu-* or class 14 *-bu-*. The following examples illustrate the use of the prefix *-ma-* (class 6 marker).

- (7) *i-táma* ‘AUG-cheek (cheek)’ >  
*a-ma-táma* ‘AUG-CL6-cheek (cheeks)’  
*i-paási* ‘AUG-iron (iron)’ >  
*a-ma-páasi* ‘AUG-CL6-iron (irons)’  
*u-bw-áato* ‘AUG-CL14-canoe (canoe)’ >  
*a-má-ato* ‘AUG-CL6-canoe (canoes)’  
*u-ku-guru* ‘AUG-CL15-leg (leg)’ >  
*a-ma-guru* ‘AUG-CL6-leg (legs)’

The loss of the nasal class marker is common to many Bantu languages spoken in East Africa including Kiswahili.

### 2.7. Metonymic derivation with the prefix

Class prefixes are used very productively to create new lexical items which have a metonymic relationship (semantic association) with the initial nouns they are derived from. This association between the basic lexical item and the new derived one can be that of cause and effect, possessor and possessed, container and content, etc. This type of derivation is also similar to metonymic “zero derivation” in non-category languages such as English (cf. (8); for further examples see Kimenyi 2002).

- (8) (a) *-íuzi*  
*u-rú-uzi* ‘AUG-CL11-river’  
*i-cy-íuzi* ‘AUG-CL7-lake’

- (b) *-kwé*  
*u-mu-kwé* ‘AUG-CL1-son-in-law’  
*u-bu-kwé* ‘AUG-CL14-wedding’
- (c) *-haánga*  
*i-gi-haánga* ‘AUG-CL7-skull’  
*u-ru-haánga* ‘AUG-CL11-forehead’  
*u-mu-haánga* ‘AUG-CL1-intelligent’
- (d) *-rími*  
*u-ru-rími* ‘AUG-CL11-tongue/language’  
*u-bu-rími* ‘AUG-CL14-stuttering’

## 2.8. Metaphoric derivation

Although, classes in Bantu languages are grammatical as pointed out earlier, it happens that the majority of nouns referring to inanimate objects are found in class 7. What is interesting in this language is that human beings who are useless, harmful, and fearful are found in this class also.

- (9) *i-ki-reémba* ‘AUG-CL7-impotent’  
*i-gi-saambo* ‘AUG-CL7-crook’  
*i-gi-pfúamatwí* ‘AUG-CL7-deaf’

This is clearly a case of metaphoric derivation.

Similarly, all praise-names are found in class 9 where the majority of names for animals are found, especially (*i-n-ká*) the cultural icon.

- (10) *i-n-twáari* ‘AUG-CL9-hero’  
*i-n-toóre* ‘AUG-CL9-cadet’  
*i-m-fúra* ‘AUG-CL9-noble’

This is again a metaphoric derivation from the cow. Cow metaphors have of course very much influenced the language especially in vocabulary (Kimenyi 1999). This is an instance of its influence on morphology as well.

## 2.9. Derivational classifiers

Some classes (6, 7, 8, 11, 12, 13, and 14) serve as expressive classes (showing the attitude and feelings of the speaker: likes, dislikes), augmentatives, diminutives, and abstract nouns. Any noun can be shifted in any one of these derivational classes.

Class 6, *-ma-*, when used as derivational morpheme shows the speaker’s indignation:

- (11) *i-gi-tabo* ‘AUG-CL7-book’ >  
*a-ma-tabo* ‘AUG-CL6-book (worthless books)’  
*u-mu-goré* ‘AUG-CL1-woman’ >  
*a-ma-goré* ‘AUG-CL6-woman (worthless women)’  
*u-mu-koóbwa* ‘AUG-CL1-girl’ >

- a-ma-koóbwa* ‘AUG-CL6-girl (worthless girl)’

Class 7, *-ki-* (plural 8, *-bi-*), as a derivational class functions as both expressive (pejorative or ameliorative) and augmentative:

- (12) *u-mu-goré* ‘AUG-CL1-woman (woman)’ >  
*i-ki-goré* ‘AUG-CL7-woman (attractive woman, disgusting woman or big woman)’  
*u-mu-koóbwa* ‘AUG-CL1-girl (girl)’ >  
*i-gi-koóbwa* ‘AUG-CL7-girl (attractive girl, disgusting girl or big girl)’

The same morpheme is also used to refer to languages or national customs:

- (13) *i-gi-faraansá* ‘AUG-CL7-French (French ways)’  
*i-ki-nyáfuriká* ‘AUG-CL7-African (African way)’  
*i-gi-kirisítu* ‘AUG-CL7-Christian (Christian way)’

This same class marker when used without a preprefix, serves as an adverb marker:

- (14) *u-mu-goré* ‘AUG-CL1-woman (woman)’ >  
*ki-goré* ‘CL7-woman (womanly)’  
*u-mw-áana* ‘AUG-CL1-child’ >  
*cy-áana* ‘CL7-child (like a child)’  
*u-mu-swa* ‘AUG-CL1-ignorant’ >  
*gi-swa* ‘CL7-ignorant (like an ignorant person)’

The other classes which are used to derive adverbs are class 6 marker *-ma-* and class 14 *-bu-*, but they are not as productive as *ki-* marker.

Adverbs in *-ma-* are used idiomatically:

- (15) (a) *guheeka ma-pfisi*  
 carry CL6-hyena  
 ‘to carry on the back upsidedown’  
 (literally ‘to carry like a hyena’)
- (b) *kwíciisha bu-gufi*  
 to.make.oneself.pass CL14-short  
 ‘to be humble’

Class 9, *-n-* prefix, is used to derive nouns which express qualities and these nouns can modify nouns in any category without changing the class marker of the head:

- (16) *i-n-kootan-yi* ‘great fighter (CL9)’  
*i-n-twáar-i* ‘courageous (CL9)’  
*i-n-guumba* ‘sterile (CL9)’

This class is sometimes used with certain nouns to show contempt:

- (17) *a-b-áana* ‘AUG-CL2-child (children)’ >  
*i-n-záana* ‘AUG-CL9-child (bad children)’  
*a-ba-sóre* ‘AUG-CL2-young.man (young men)’ >  
*i-n-sóre* ‘AUG-CL9-young.man (bad young men)’

Class 11, *-ru-* (plural 8, *-bi-*), as derivational class marker also functions as both expressive and augmentative:

- (18) *u-mu-goré* ‘AUG-CL1-woman’ >  
*u-ru-goré* ‘AUG-CL11-woman (attractive woman, disgusting woman, big woman)’  
*u-mu-koóbwa* ‘AUG-CL1-girl’ >  
*u-ru-koóbwa* ‘AUG-CL11-girl (attractive girl, disgusting girl, big girl)’

Class 12, *-ka-* (plural marker 13, *-tu-*, or 14, *-bu-*), as a derivational marker also has an expressive or diminutive function (vgl. 18):

- (19) *a-ka-goré* ‘AUG-CL12-woman (attractive woman, disgusting woman or small woman)’  
*a-ga-koóbwa* ‘AUG-CL12-girl (attractive girl, disgusting girl or small girl)’

#### 2.10. Nominal suffixes

As said earlier, nouns are poor in derivation. Only **zero-derivation** or **prefix derivation** is used mostly for metonymic derivation. In very few cases, however, noun stems are added to certain words to show gender. These noun stems are *-gabo* ‘man’; *-rume* ‘man (archaic)’, *-goré* ‘woman’.

- (20) (a) *igishéegabo* ‘virago’  
*igitsínagabo* ‘masculine’  
(b) *nyokórume* ‘your mother’s brother’  
*impweerume* ‘male dog’  
(c) *umukómagoré* ‘type of tree’  
*igitsínagoré* ‘feminine’

The noun stem *-áana* ‘child’ is also found in a handful of words to refer to a young thing.

- (21) *ikibwáana* ‘puppy’  
*umukazáana* ‘son’s wife’

The only productive suffix is *-kazi* from Proto-Bantu ‘wife’ which is added to any noun to mean female of:

- (22) *umwáarimú* ‘teacher’ >  
*umwáarimú-kazi* ‘teacher-F’  
*umunyarwaanda* ‘Rwandan’ >  
*umunyarwaanda-kazi* ‘Rwandan-F’

The only true suffix whose etymology is unknown is *-aazi* which conveys a pejorative meaning:

- (23) *ikiyogá* ‘drink’ >  
*ikiyogáazi* ‘bad drink’  
*ikiintu* ‘thing’ >  
*ikíntaázilíkíntaází* ‘a bad thing’  
*ikigoré* ‘woman’ >  
*ikigoráazi* ‘woman of low character’

#### 2.11. Denominal verbs

There are no specific rules to derive verbs from nouns. They are obtained by either putting the verb final vowel at the end of the stem or adding a prefix.

**Denominal verbs** receive the lexical tone of the noun they derive from: If the noun is toneless then the verb will be toneless as well. The lexical tone is always assigned to the first mora of the verb stem because infinite verbs carry a high tone only on the first mora of the first syllable.

- (24) *u-mu-nebwe* ‘AUG-CL1-lazy’ >  
*ku-nebw-a* ‘INF-lazy-IPFV (to become lazy)’  
*i-n-jiji* ‘AUG-CL9-stupid’ >  
*ku-jij-w-a* ‘INF-stupid-PASS-IPFV (to become stupid)’  
*u-mu-sáaza* ‘AUG-CL9-old.man’ >  
*gu-sáz-a* ‘INF-old.man-IPFV (to get old)’

Denominal verbs are also sometimes obtained by suffixation. Here, too, the lexical tone of the noun is not affected, either. These verbs are obtained by adding a variety of morphemes.

- (25) *u-ru-muri* ‘AUG-CL11-light’ >  
*ku-mur-ik-a* ‘INF-light-STAT-IPFV (to light)’  
*i-naanga* ‘AUG-harp’ >  
*ku-naang-ir-a* ‘INF-harp-APPL-IPFV (to tighten)’

#### 2.12. Compound nouns

Kinyarwanda has two types of **compound nouns**, nouns with onomastic prefixes and nouns which consist of a verb in the relative clause form and a complement.

##### 2.12.1. Nouns with onomastic prefixes

In Kinyarwanda, names are created from any noun by deleting the prefix or by adding an onomastic prefix before the noun or any syntactic construction. Full details and illustrative examples are provided in Kimenyi (1989).

- (26) *i-n-gabo* 'shield'  
*ngabo* 'Ngabo'  
*sée-ngabo* 'Sengabo'  
*rwáa-ngabo* 'Rwangabo'

The prefixes *rwáa-* and *káa-* have the high tone disappear if the head noun has also a high tone:

- (27) (a) *a-ma-nywá* 'AUG-CL6-day.times'  
*rwaamanywá* 'Rwamanywa'  
*kaamanywá* 'Kamanywa'  
*mukaámmanywá* 'Mukamanywa'  
*nyirámmanywá* 'Nyiramanywa'  
(b) *i-sibo* 'AUG-speed'  
*rwáasibo* 'Rwasibo'  
*kásibo* 'Kasibo'  
*mukásibo* 'Mukasibo'  
*nyirasibo* 'Nyirasibo'

The prefixes *sée-* and *rwáa-* are used for male names only, whereas *káa-*, *mukáa-*, and *nyirá-* are for female names.

#### 2.12.2. Verb-noun compound

The verb-noun compound is obtained by putting the verb in the headless relative clause and adding a noun without a prefix. The compound word undergoes tone rhythm rules. That is, if the head noun has a high tone, the compound noun can acquire a secondary or tertiary tone.

The rules which are responsible for compound noun creation are the noun preprefix deletion, assignment of a high tone on the first mora of the noun if has lexical high tone and another high tone on the first mora of the verb stem. High tone deletion or beat deletion or what is referred to in Bantu linguistics as Meeussen's rule takes place within the noun complement if primary beat addition is followed by a high tone on the next syllable. The maximum number of tones that a noun can have is only three.

- (28) *aba-tég-ariú-goré*  
*/a-ba-tég-a+u-ru-goré/*  
 AUG-CL2-wear-IPFV + AUG-CL11-maternity.crown  
 'those who wear the maternity crown (women)'  
*in-shóber-amá-haánga*  
*/i-n-shóber-a+a-ma-haánga/*  
 AUG-CL9-not.understand-IPFV + AUG-CL6-for-eign.country  
 'idiomatic expressions'

The noun morphology is completely different from that of the verb to which we will now turn.

### 3. Verb

The **verb morphology** is more complex than that of the noun. The verb can have multiple prefixes and multiple suffixes. Prefixes have only grammatical information whereas suffixes can be both grammatical and lexical. The verb morphology, however, is influenced by the following factors: Whether it occurs in the main clause or the subordinate clause, whether it is in the affirmative or negative form, and finally whether it occurs with or without a complement.

The obligatory morphemes are the verb stem, the subject agreement prefix, and the final vowel which most of the time is the aspect marker. This is illustrated in (29).

- (29) (a) *A-b-áana ba-som-a*  
 AUG-CL2-child they-read-IPFV  
*i-bi-tabo.*  
 AUG-CL8-book  
 'The children read books.'  
(b) *A-b-áana ba-som-ye*  
 AUG-CL2-child they-read-PFV  
*i-bi-tabo.*  
 AUG-CL8-book  
 'The children have just read books.'  
(c) *A-b-áana ba-som-e*  
 AUG-CL2-child they-read-SUBJ  
*i-bi-tabo.*  
 AUG-CL8-book  
 'The children should read books.'

In (29 a) the verb ends with the imperfective aspect marker *-a*, in (29 b) the perfective aspect morpheme *-ye*, and (29 c) the subjunctive marker *-e*.

The optional morphemes are the **proclitics** *nti-* 'not' and *ni-* 'if/when', the tense-aspect-modality morphemes, the morpheme *-na* 'also', the object pronouns which can be one or many, lexical verb extensions, grammatical suffixes, and the enclitics *-ga* and locative postclitics: *-mó*, *-hó*, and *-yó*.

#### 3.1. The proclitics *nti-* and *ni-*

The negative marker *nti-* precedes the whole verb complex and is used in all verbs in main clauses regardless of mood whereas in subordinate clauses *-ta-* which immediately follows the subject marker is used. *Nti-* is a tone neutralizing morpheme. The morpheme *ni-* is used optionally with verbs in the subjunctive mood and in realis conditionals. It can thus be translated as 'if' or 'when'.

- (30) (a) *A-b-áana ba-kor-é.*  
 AUG-CL2-child they-work-SUBJ  
 ‘The children work.’
- (b) *A-b-áana ní-ba-kór-e.*  
 AUG-CL2-child *ni*-they-work-SUBJ  
 ‘The children should work.’
- (31) *A-b-áana ní-ba-kor-á,*  
 AUG-CL2-child *ni*-they-work-IPFV  
*u-ba-heémb-e.*  
 you-them-pay-SUBJ  
 ‘If the children work pay them. / When  
 the children work pay them.’
- 3.2. The tense-aspect-modality morphemes  
 The **tense-aspect-modality** refers not only to tenses in the traditional sense but to other aspects such as mood, inchoativity, progressivity, etc.
- Semantically, Kinyarwanda has only five referential tenses, namely present, habitual, early today, past, late today, and future. Morphologically, however, the present tense, the habitual tense, and the late today tense look the same.
- (32) *A-b-áana ba-ra-som-a.*  
 AUG-CL2-child they-T-read-IPFV  
 ‘The children are reading. / The children read. / The children will be reading (today).’
- (33) *U-mu-goré a-vuz-e kó*  
 AUG-CL1-woman she-say-IPFV that  
*a-b-áana ba-som-á.*  
 AUG-CL2-child they-read-IPFV  
 ‘The woman just said that the children are reading. / The woman just said that the children read. / The woman just said that the children will be reading.’

A full discussion of the tense-aspect-morphology, how it is assigned and how it affects tone rules is discussed at great length in Kimenyi (1980; 2002). As examples in (34) show, the verb stem *-kór-* has a lexical high tone and the verb stem *-som-* is not tone marked. In some cases, tenses keep this tone contrast, in others these tones are neutralized by either assigning tones to non-toned verb stems or by deleting tones, making all types of verb stems look the same tonologically speaking.

- (34) *a-ba-gabo ba-racyáa-kór-a*  
 AUG-CL2-man they-still-work-IPFV  
 ‘the men are still working’
- a-ba-gabo ba-racyáa-som-a*  
 AUG-CL2-man they-still-read-IPFV  
 ‘the men are still reading’

- a-ba-gabo ba-a-zaa-kor-a*  
 AUG-CL2-man they-COND-FUT-work-IPFV  
 ‘the men would work’
- a-ba-gabo ba-a-zaa-som-a*  
 AUG-CL2-man they-COND-FUT-read-IPFV  
 ‘the men would read’

It is also possible to have two tenses in the same spot.

- (35) *U-mu-gabo y-a-tum-ye kó*  
 AUG-CL1-man he-PAST-send-IPFV that  
*ba-záa-z-a*  
 they-FUT-come-IPFV  
*ba-ka-zaa-som-a.*  
 they-CONSEC-FUT-read-IPFV  
 ‘The man sent a message that they will come and play.’

### 3.3. Object pronouns

Kinyarwanda is among Bantu languages which allow multiple object incorporated pronouns. Unlike some languages such as Swahili in which the pronoun is used as object agreement, in Kinyarwanda these objects are strictly used as pronouns only. Thus the whole verb phrase of the English sentence in (36) is translated into one single agglutinative verb as shown by the example in (37).

- (36) *The woman is also making us read it with them to you for me there.*  
 (The woman is also making us read the book with eyeglasses to you for me in the house).

- (37) *U-mu-goré*  
 AUG-CL1-woman  
*a-ra-na-ha-ki-zi-ba-ku*  
 she-T-also-there-it-it-them-you-  
*n-som-eesh-eesh-er-er-eza*  
 me-read-CAUS-CAUS-APPL-APPL-IPFV

The word order of multiple **object-pronouns** is dictated by either case or personal pronouns. The benefactive comes closer to the verb stem, the dative comes next, and the accusative precedes all of them.

- (38) (a) *U-mu-gabo a-ra-som-er-a*  
 AUG-CL1-man he-T-read-APPL-IPFV  
*u-mu-goré a-b-áana*  
 AUG-CL1-woman AUG-CL2-child  
*i-gi-tabo.*  
 AUG-CL7-book  
 ‘The man is reading the book to the children for the woman.’

- (b) *U-mu-gabo*  
 AUG-CL1-man  
*a-ra-ki-ba-mu-som-er-a.*  
 he-T-it-them-her-read-APPL-IPFV  
 'The man is reading it to them for her.'

If the verb has a reflexive pronoun and a first person direct object, the reflexive becomes part of the stem, followed by the first person, then the second person and the third person comes last. The structure thus becomes ambiguous because any of these pronouns can have any semantic role.

- (39) *A-ba-goré*  
 AUG-CL2-woman  
*ba-zaa-mu-kuu-ny-iy-erek-er-er-a.*  
 they-FUT-him/her-you-me-show-APPL-  
 APPL-IPFV  
 'The women themselves will show her/him to you for me. / The women themselves will show you to her/him for me. / The women themselves will show me to you for him/her. / The women themselves will show you to me for him/her. / The women themselves will show you to him/her for me.'

These complex structures are not used very often because of the difficulty in both production and processing.

### 3.4. Lexical suffixes

**Lexical suffixes** have the same shape as the verb stem namely: -VC-, -VVC-, VVNC-, -VCVC-, -VVVCVC-.

The most common lexical suffixes which are either lexical (part and parcel of the verb stem) or derivational are *-am-*, *-aang-*, *-iriz-*, *-agur-*, *-aanur-*, *-uur-/uuk-*, *-ur-/uk-*, *-iir-*, *-arar-*. It is also possible sometimes to find multiple lexical suffixes within the same verb.

The meanings conveyed by these suffixes are those of iterativity, intensification, stativity, reversal, completeness, etc. This is again discussed at great length in Kimenyi (1980; 2002).

### 3.5. Grammatical suffixes

**Grammatical suffixes** are the causative/instrumental morpheme *-iish-*, the applicative *-ir-*, the comitative/reciprocal *-an-*, and the passive morpheme *-w-*. They differ from the lexical ones not because they come last but also because they are productive. Any verb can occur with them. They are thus in a sense like inflectional morphemes.

The passive morpheme is inserted between the last consonant after consonant mutation has taken place and the final vowel.

- (40) (a) *gu-som-a* 'INF-read-IPFV (to read)' >  
*gu-som-eesh-a* 'INF-read-CAUS-IPFV  
 (to cause to read)' >  
*gu-som-er-a* 'INF-read-APPL-IPFV (to  
 read for)' >  
*gu-som-an-a* 'INF-read-REC-IPFV (to  
 read together)'  
 (b) *gu-som-w-a* 'INF-read-PASS-IPFV (to  
 be read)' >  
*gu-som-eesh-w-a* 'INF-read-CAUS-  
 PASS-IPFV (to be cause to be read)' >  
*gu-som-er-w-a* 'INF-read-APPL-PASS-  
 IPFV (to be read to)' >  
*gu-som-an-w-a* 'INF-read-REC-PASS-  
 IPFV (to be read with)'

#### 3.5.1. Multiple grammatical suffixes

The same verb can have multiple suffixes because in this language oblique objects can become structural direct objects by deleting prepositions and adding appropriate suffixes to the verb.

- (41) *U-mu-goré a-ra-som-a.*  
 AUG-CL1-woman she-T-read-IPFV  
 'The woman is reading.'  
 (42) *U-mu-goré a-ra-som-er-a*  
 AUG-CL1-woman she-T-read-APPL-IPFV  
*a-ba-koóbwa n'i-i-n-dórerwamú*  
 AUG-CL2-girl with-AUG-CL9-glass  
*z'a-a-b-áana.*  
 of-AUG-CL2-child  
 'The woman is reading to the girls with  
 glasses of the children.'  
 (43) *U-mu-goré*  
 AUG-CL1-woman  
*a-ra-som-eesh-er-er-er-er-ez-a*  
 she-T-read-CAUS-APPL-APPL-APPL-CAUS-  
 IPFV  
*a-b-áana i-n-dórerwamó*  
 AUG-CL2-child AUG-CL9-glass  
*a-ba-koóbwa.*  
 AUG-CL2-girl  
 'The woman is using the children's  
 glasses to read to the girls.'

#### 3.5.2. The repetition of the same suffix

The same suffix can be repeated once or many times because these grammatical suffixes have different semantic roles.

The suffix *-an-* indicates reciprocity, accompaniment or the lack of a dative complement as the following examples show.

- (44) (a) *a-ba-goré ba-r-éerek-a*  
 AUG-CL2-woman they-T-show-IPFV  
*a-ba-antu a-ma-shusho*  
 AUG-CL2-person AUG-CL6-picture  
 ‘the women are showing people pictures’
- (b) *a-ba-goré*  
 AUG-CL2-woman  
*ba-r-éerek-an-a*  
 they-T-show-REC-IPFV  
*a-ba-antu a-ma-shusho*  
 AUG-CL2-person AUG-CL6-picture  
 ‘the women are showing the pictures to the people together’
- (c) *a-bagoré*  
 AUG-CL2-woman  
*ba-r-éerek-an-a*  
 they-T-show-REC-IPFV  
*a-ma-shusho*  
 AUG-CL6-picture  
 ‘the women are showing each other pictures’
- (d) *a-ba-goré*  
 AUG-CL2-woman  
*ba-r-éerek-an-an-a*  
 they-T-show-COMIT-REC-IPFV  
*a-ma-shusho*  
 AUG-CL6-picture  
 ‘the women together are showing each other pictures’
- (e) *a-ba-koóbwa*  
 AUG-CL2-girl  
*ba-ra-vúg-ir-an-ir-an-a*  
 they-T-talk-APPL-REC-APPL-REC-IPFV  
 ‘the girls talk for each other’

The morpheme *-iish-* is both a causative and an instrumental marker.

- (45) (a) *u-mu-huúngu a-ra-tém-eesh-a*  
 AUG-CL1-boy he-T-cut-INST-IPFV  
*i-gi-tí i-n-tóorezo*  
 AUG-CL7-tree AUG-CL9-ax  
 ‘the boy is cutting the tree with an ax’
- (b) *u-mu-gabo a-ra-tém-eesh-a*  
 AUG-CL1-man he-T-cut-CAUS-IPFV  
*u-mu-huúngu i-gi-tí*  
 AUG-CL1-boy AUG-CL7-tree  
 ‘the man is making the boy cut the tree’
- (c) *u-mu-gabo*  
 AUG-CL1-man  
*a-ra-tém-eesh-eesh-a*  
 he-T-cut-CAUS-CAUS-IPFV

- u-mu-huúngu i-gi-tí*  
 AUG-CL1-boy AUG-CL7-tree  
*i-n-tóorezo*  
 AUG-CL9-ax  
 ‘the man is making the boy cut the tree with an ax’

Similarly, the applicative morpheme *-ir-* can act as a dummy morpheme, a carefree morpheme, a circumstantial morpheme, a possessive morpheme, or a benefactive and dative case marker (cf. Kimenyi 1980; 1995; 2002).

### 3.5.3. The word order of grammatical suffixes

The word order of grammatical suffixes mirrors syntax. Direct objects which come close to the verb have their corresponding suffixes closer to the verb stem. The applicative suffix *-ir-*, however, always follows the causative morpheme *-iish-*, and *-y-* another causative morpheme always comes last.

- (46) (a) *A-b-áana ba-ra-kór-a.*  
 AUG-CL2-child they-T-work-IPFV  
 ‘The children work.’
- (b) *A-b-áana*  
 AUG-CL2-child  
*ba-ra-kór-an-a.*  
 they-T-work-COMIT-IPFV
- (c) *U-mu-goré*  
 AUG-CL1-woman  
*a-ra-kór-an-iish-a*  
 she-T-work-COMIT-CAUS-IPFV  
*a-b-áana b'-ú-mu-gabo.*  
 AUG-CL2-child of-AUG-CL1-man  
 ‘The woman is making children of the man work together.’
- (d) *Umugore*  
*U-mu-goré*  
 AUG-CL1-woman  
*arakoraniishiriza*  
*a-ra-kór-an-iish-ir-ir-y-a*  
 she-T-work-with-CAUS-APPL-APPL-  
 CAUS-IPFV  
*umugabo abaana.*  
*u-mu-gabo a-b-áana.*  
 AUG-CL1-man AUG-CL2-child  
 ‘The woman is making the man’s children work together.’

The word order of object pronouns and grammatical suffixes is a mirror image of the sentence structure of the language. First, Kinyarwanda allows two inherent direct objects and multiple direct objects through the process of objectivization of adjunct noun phrases by suffixation. The word order of

these objectivized objects is not random. There seems to be a hierarchy of semantic roles. The agent seems to come first, followed by the possessor or the benefactive. The accusative always comes last before the dative.

Many Kinyarwanda verbs allow two direct objects (inherent accusatives) and several direct objects (structural accusatives) through the process of objectivization.

### 3.6. The aspect marker

Kinyarwanda has two **aspect markers**: the imperfective marked by *-a* and the perfective marked by *-ye*.

The imperfective is found with habitual tenses, future tenses, progressive tenses, “not yet” tenses because it shows an event or an action not yet over. Interestingly, however, stative verbs have to take the perfective marker to show that the state has not changed. When suffixed with the imperfective aspect morpheme, stative verbs have a habitual reading only. The verbs *-som-* ‘read’ and *-rwáar-* ‘be sick’, active and stative verbs respectively are used below for illustration.

- (47) (a) *A-b-áana ba-ra-som-a.*  
AUG-CL2-child they-T-read-IPFV  
‘The children are reading.’
- (b) *A-b-áana ba-ra-som-ye.*  
AUG-CL2-child they-T-read-PFV  
‘The children have just read.’
- (48) (a) *A-b-áana ba-ra-rwáar-a.*  
AUG-CL2-child they-T-be.sick-IPFV  
‘The children get sick.’
- (b) *A-b-áana ba-ra-rwáa-ye.*  
AUG-CL2-child they-T-be.sick-PFV  
‘The children are sick.’

*-ga* which is used in past tenses to mark imperfective aspect is really a clitic and not part of the verb stem, first because it comes at the end, secondly because Kirundi doesn’t have it and lastly because vowel lengthening doesn’t take place when the verb ends in *w* as part of the stem or as a passive marker.

### 3.7. The locative postsuffixes

The **locative enclitics**, *hó*, *mó*, and *yó* correspond respectively to the prepositions *ku*, *mu*, and *i*. They are not yet completely part of the verb morphology. They don’t affect its phonology, segmentally or suprasegmentally. Native speakers are always aware of this because in orthography there are those who use them as part of the verb and those who write

them separately. Nothing, however, can be inserted between them and the verb.

- (49) *gu-sig-a-hó* ‘INF-stop-IPFV-LOC<sub>1</sub> (to stop)’
- kw-iigir-a-yó* ‘INF-stop-IPFV-LOC<sub>2</sub> (to push)’
- gu-hít-a-mó* ‘INF-stop-IPFV-LOC<sub>3</sub> (to choose)’

### 3.8. Deverbal Nouns

**Deverbal nouns** and denominal verbs are formally distinguishable in Kinyarwanda. Denominal verbs are assigned the lexical tone of the noun, a high tone on the stem first mora if the original noun has a high tone but toneless if the original noun doesn’t have any. Deverbal nouns, on the other hand, are assigned a high tone either on the second mora of the stem or on the final vowel.

Nominal stems don’t have derivational suffixes except few such as *-kazi* and *-aazi* as seen in the section on noun morphology (see 2.10).

There are many verbal nominal suffixes, however, namely nominalizer *-yi*, the objective *-o*, the manner *-ré*, the stative *-e* as examples below indicate.

- (50) (a) *-yi:*  
*gu-híng-a* ‘INF-farm-IPFV (to farm)’ >  
*u-mu-híinz-yi* ‘AUG-CL1-farm-NR<sub>1</sub>  
(farmer)’
- (b) *-o:*  
*gu-téer-a* ‘INF-attack-IPFV (to attack)’ >  
*i-gi-téer-o* ‘AUG-CL7-attack-NR<sub>2</sub> (an attack)’
- (c) *-ré:*  
*ku-íi-twaar-a* ‘INF-REFL-carry-IPFV  
(to behave)’ >  
*i-my-íi-twaar-re* ‘AUG-CL4-REFL-  
carry-MANR (behavior)’

The suffixes *-yi* and *-o* can occur with verb stems with prefixes of any noun class but *-ré* always requires the prefix *-mi-* of class 4.

There are other nouns also which are derived by tone, by zero affixation or by syllable truncation.

#### 3.8.1. Derivation by tone

The final vowel of deverbal nouns is either the one found in all infinitive forms *-a* or the one found in subjunctive forms *-e*. These nouns are also found in both the active or passive forms, the latter being marker by the

morpheme *-w-* which appears before the final vowel (cf. 3.5).

- (51) *i-hené* ‘AUG-goat’ <  
*gu-hen-a* ‘INF-goat-IPFV (to show the anus’)  
*u-mu-kené* ‘AUG-CL1-poor’ <  
*gu-ken-a* ‘INF-poor-IPFV (to be poor’)  
*i-temé* ‘AUG-bridge’ <  
*gu-tém-a* ‘INF-bridge-IPFV (to cut’)

**3.8.2. Derivation by last syllable truncation**  
Kinyarwanda uses very productively, last syllable **truncation** process to create deverbal nouns. The second mora high tone assignment is of course present all the time as the following examples show.

- (52) *i-cy-aámbu* ‘AUG-CL7-bridge’ <  
*kw-aambuk-a* ‘INF-cross-IPFV’  
*u-mu-hemú* ‘AUG-CL1-traitor’ <  
*gu-hemuk-a* ‘INF-betray-IPFV’  
*i-gi-kanú* ‘AUG-CL7-neck’ <  
*gu-kanur-a* ‘INF-open.eyes-IPFV’

Last syllable truncation is a case of markedness reversal. It becomes a marker also.

#### 4. Adjective

The number of **adjectives** is very much limited. Kinyarwanda doesn’t have any color adjective for instance. They are all nouns and they all occur in the possessive construction as the following color names illustrate:

- (53) (a) ‘green’ < *i-cy-aátsi kibísi* ‘raw grass’;  
(b) ‘red’ < *u-ru-gina* ‘anthill’;  
(c) ‘black’ < *u-mu-kara* ‘otter/marten’;  
(d) ‘light skin’ <*i-n-zóbe* ‘swamp antelope’;  
(e) ‘white’ < *u-ru-táre* ‘rock’;  
(f) ‘yellow’ < *u-mu-hoondo* ‘milk from a cow which has just mated’; etc.

Words which have adjectival properties, thus agreeing with the head noun are the following:

- (a) Numerals referring to one through seven  
(54) *-mwé* ‘one’, *-biri* ‘two’, *-tatu* ‘three’, *-né* ‘four’, *-taanu* ‘five’, *-taandátu* ‘six’ and *-riindwi* ‘seven’.

Other numerals occur in the apposition construction and ordinal numbers even the ones

referring to one through seven occur in the possessive construction (N of N)

(b) Quantifiers

- (55) *-óombí* ‘both’, *-óosel-éese* ‘all’, *-ndi* ‘other’, *-vvhe?* ‘which’.

(c) Qualitative adjectives

- (56) *-bísi* ‘raw’, *-iizá* ‘beautiful/good’, *-bí* ‘bad’, *-tó* ‘young’, *-gufí* ‘short’, *-ree-re* ‘long/tall/deep’, *-shyá* ‘new’, *-zima* ‘healthy/alive’, *-kurú* ‘old’, *-taraga* ‘alive’, *-ké* ‘few’, *-iinshi* ‘many’, *-gari* ‘large’, *-nini* ‘big’, *-hiire* ‘happy’, *-nziinyá* ‘tiny’.

(d) Demonstratives

There are four types of demonstratives: near speaker which is realized as the copy of both the preprefix and prefix of the head noun; near hearer realized as *-o*; far from both hearer and speaker marked by *-riiyá*, and *-áa* and *-ryá*, which refers to antecedents distant in time.

- (57) *iki gitabo* ‘this book’  
*icy-o gitabo* ‘that book (next to you)’  
*ki-riyya gitabo* ‘that (far away) book’  
*cy-áa gitabo* ‘that book (remote past)’  
*ki-rya gitabo* ‘that book (remote past)’

The *-o* demonstrative is also used to refer to something that has just been mentioned in the conversation.

Modification is accomplished by other devices such as the use of apposition (see 58), the possessive construction (see 59), or the relative clause (see 60).

- (58) *a-b-áana i-sokó*  
AUG-CL2-child AUG-flea.market  
‘a lot of children’  
(59) *u-mu-gabo w'u-mu-sáaza*  
AUG-CL1-man of-AUG-CL1-old  
‘an old man’  
(60) *u-mw-áana u-rwáa-ye*  
AUG-CL1-child he.who-be.sick-PFV  
‘sick child’

Possessive adjectives don’t exist in Kinyarwanda either. The possessive construction (such ‘of me’, ‘of you’, ‘of her’, etc.) is used instead.

#### 5. Unclassified categories

Bantu languages are also characterized by the existence of a linguistic category known as “ideophones” as well as the lack of “function words”.

### 5.1. Ideophones

**Ideophones**, a concept studied by Welmers (1973) in different African languages, is a term coined by C. M. Doke (1935) to mean a “vivid representation of an idea in sound”. This linguistic item which conveys “a pictur-esque connotation” or “a word which describes a predicate, qualificative or adverb in respect to manner, color, action, state or intensity”, is not only found in Bantu languages but in the whole Niger-Congo family.

Some of the formal properties of ideophones is the lack of class markers and the excessive use of reduplication, triplication or quadruplication.

- (61) *hó* ‘sound of barking dog’;  
*pyii* ‘sound of hot object in contact with a liquid’;  
*yuguyugu* ‘very fast’;  
*tsiritsiri* ‘very dark’;  
*yíuyíuyíuyíú* ‘sound which expresses pain or astonishment’;  
*póopóopóopóó* ‘sound expressing astonishment’.

Ideophones are expressive and can have multiple interpretations. It is thus difficult to get the proper meaning out of the proper context. I have argued (Kimenyi 1997) that ideophones have to be examined at four separate levels namely: form, function, content, and context.

### 5.2. Function words

Kinyarwanda and other Bantu languages don't have **function words**, such as prepositions, conjunctions, subordinators, auxiliaries. Most of the prepositions, for instance, are expressed by prepositional noun phrases referring to body parts: *in front* ‘in the eyes of’, *behind* ‘in the back of’, *next* ‘in the ribs of’, *inside* ‘in the stomach of’, *over/above/on* ‘the sky of’, *under* ‘the earth of’.

- (62) (a) *h-eejuru y'áa-m-éezá*  
CL16-sky of:AUG-CL6-table  
‘on the top of the table’  
(b) *muunsi y'áa-m-éezá*  
earth of:AUG-CL6-table  
‘under the table’

In some instances this category is being grammaticalized but in the majority of cases, function words become so because of the syntagmatic derivation. It is the structure that is its position within the sentence which determines whether a noun or verb is a function word.

### 5.3. Serial construction of auxiliaries

Another interesting feature of Bantu languages is the multiple **serial construction** of auxiliary verbs as seen in (63). These verbs, as their translation shows, become auxiliary by virtue of their syntagmatic position. Otherwise they can also occur as independent content verbs.

- (63) *Aba b-áana ba-a-ri*  
these CL2-child they-PAST-be  
*bá-tuu-ye bá-saanz-w-e*  
they-live-PFV they-find-PASS-IPFV  
*bá-jy-a bá-kuund-a gu-pf-á*  
they-go-IPFV they-like-IPFV INF-die-IPFV  
*kuu-z-a ku-tu-reeb-a byíburá*  
INF-come-IPFV INF-us-see-IPFV at.least  
*rimwé mu kwéezi.*  
once in month  
‘These children usually came to see us at least once a month.’

## 6. Tones

### 6.1. Role of tones

**Tones** in Kinyarwanda play different roles: they are lexical, morphological, and syntactic (cf. Kimenyi 1979; Sibomana 1974).

They differentiate words which are segmentally the same, they mark tenses and moods or types of phrases, they derive new words or mark syntactic constructions. Examples in (64) show words which are differentiated only by tones. Examples in (65) show that relative clauses are marked by tones, in (66) we have deverbal nouns marked by tones, in (67) we see compound words which have a different tone output than the words they are derived from and finally, the last examples in (68) show that verbal tones are marked or not marked depending on whether there is a complement or not.

- (64) *u-mu-ryaango* – *u-mu-ryáango*  
‘AUG-CL1-family’ ‘AUG-CL1-door’  
*ino* – *inó*  
‘toe’ ‘here’
- (65) (a) *a-bá-ana ba-som-a*  
AUG-CL2-child they-read-IPFV  
*i-bi-tabo*  
AUG-CL8-book  
‘the children read books’  
(b) *a-bá-ana ba-som-á*  
AUG-CL2-child they-read-IPFV.REL  
*i-bi-tabo*  
AUG-CL8-book  
‘the children who read books’

- (66) *gu-kór-w-a* ‘INF-do-PASS-IPFV (to be done)’ – *i-bi-kor-w-á* ‘deeds’  
*gu-kórор-a* ‘to cough’ –  
*i-n-kórор-á* ‘a cough’
- (67) (a) *nyírí izína* ‘the owner of the name’ – *nyírína* ‘in person’ (owner name)  
(b) *amayíra abíri* ‘two paths’ – *amayiráabíri* ‘crossroads’  
(c) *wé nyíne* ‘s/he indeed’ – *wéenyíne* ‘(s/he) alone’
- (68) (a) *A-ba-gabo ba-raa-z-a*  
AUG-CL2-man they-PRES-come-IPFV  
*ba-ga-kór-a*.  
they-CONSEC-work-IPFV  
‘The men come and work.’
- (b) *A-ba-gabo ba-raa-z-a*  
AUG-CL2-man they-PRES-come-IPFV  
*ba-ga-kor-a i-sáahá.*  
they-CONSEC-work-IPFV AUG-hour  
‘The men come and work for an hour.’

## 6.2. Tone assignment

Tone assignment takes into account word category. In nouns, lexical tones can be assigned anywhere in the word stem except the prefix and the preprefix. The noun can have “stray tones”, however. Stray tones don’t affect tone rules. In verbs, tones are assigned either on the first mora of the verb stem or on the first mora of the second syllable of the verb stem. The assignment of a high tone on the first mora of the verb stem is referred to as lexical tone and the assignment of high tone on the first mora of the verb stem second syllable as grammatical tone because low verb stems get it as well. Each morpheme is assigned only one high tone.

- (68) (a) *gu-kór-a* ‘to work’  
*gu-kin-a* ‘to play’
- (b) *a-ba-antu ba-kor-á*  
AUG-CL2-person they-work-IPFV.REL  
‘people who work’
- (c) *a-ba-antu ba-kin-á*  
AUG-CL2-person they-play-IPFV.REL  
‘people who play’

## 6.3. Floating tones

There are some tones in Kinyarwanda which are phonetically manifested only when a full word is formed or are only realized in phrases or sentences. Tones which require these specific structures to appear phonetically are referred to as **floating tones**.

The following words, morphemes and phrase types acquire a high tone only when they occur in the middle of the sentence or if another word precedes: *ni*, *si*, *nta*, *nga*, imperative verb form, negative imperative marker *-ii-*, conditional *ni-*, negative *nti-* and *si-*.

- (69) (a) *ni-i-bi-tabo*  
it.is-AUG-CL8-book  
‘it is books’
- (b) *ibyo ní-i-bi-tabo*  
those it.is-AUG-CL8-book  
‘those are books’
- (70) (a) *b-ii-kor-á*  
they-NEG-work-IPFV  
‘they should not work’
- (b) *ubu b-ii-kor-á*  
now they-NEG-work-IPFV  
‘they should not work’

Some noun and verb stems also acquire a high tone only when a prefix precedes.

- (71) *zi* ‘know’: *ba-ra-zi* > *ba-ráa-zi* ‘they-T-know (they know)’  
*tu-ra-ku-zi* > *tu-ra-kíuu-zi* ‘we-T-you-know (we know you)’

The presence of these tones only when a full word or sentence are formed strongly supports the existence of floating tones.

## 6.4. Tone rules

Using a metrical approach (Kimenyi 2002), Kinyarwanda tone rules are very simple. There are five types of them, namely: **beat movement**, **beat addition** and **beat deletion**, **iambic reversal**, and **weak beat alternation**.

### 6.4.1. Beat addition

In nouns, a second high tone (first beat addition) is assigned on the first mora of the stem if there are at least two moras between the mora which carries the lexical tone and the stem first syllable.

- (72) *u-mu-eendá* > *umwéendá* ‘AUG-CL3-debt’  
*i-ki-kookó* > *igikóokó* ‘AUG-CL7-animal’

Second beat addition occurs in compounds only. For verbs, the second beat is added on the first mora of the verb stem (cf. 73 a–b) and for the onomastic prefix *nyira-*, it is added on its second syllable (cf. 73 c).

- (73) (a) *i-n-shober-a+a-ma-haánga*  
> *inshóberamáhaánga*

- AUG-CL9-not.know-IPFV + AUG-CL6-for-  
eign.country  
'idiomatic expressions'
- (b) *ga-shaak-a+u-bu-haké*  
> *gasháakabúhaké*  
CL12-want-IPFV + AUG-CL14-servi-  
tude  
'colonialist'
- (c) *nyirá-umu-baandé* > *nyirámubáandé*  
OP-CL1-valley  
'valley'

#### 6.4.2. Beat deletion

When two high tones occur in adjacent moras because of high tone addition, the high tone on the right deletes. This beat deletion is known as Meeussen rule.

- (74) *i-n-kor-a + u-mu-tíma* > *inkóramútima*  
AUG-CL9-touch-IPFV + AUG-CL3-heart  
'conscientious'  
*nka kiményi* > *nka kímenyi*  
'like Kimenyi'

#### 6.4.3. Beat movement

Beat movement occurs in verbs only. As noted earlier, verbs in Kinyarwanda can have multiple direct object pronouns. When the verb stem has a high tone, it spreads to all vowels of these pronouns. This area is referred to as the "prosodic domain" or the "suprastem". When it reaches the leftmost mora of the prosodic domain it makes a U-tone creating a Left-to-Right Beat Alternation. That is strong beats switch evenly from strong to weak from the leftmost to the rightmost.

- (75) *ba-ra-kór-a* > *barakóra*  
they-T-work-IPFV  
'they work'  
*ba-ra-na-ha-bi-ba-mu-kór-eesh-erez-a*  
*baranáhabíbamúkoreeshereza*  
they-T-also-there-it-them-him/her-do-  
CAUS-APPL-IPFV  
'they also make them do it for them  
there'

#### 6.4.4. Iambic reversal

Some monosyllabic vowel prefixes or associative prefixes have their high tone shifted to the next mora on the right.

- (76) *ú-no* > *unó* 'this'  
*bá-no* > *báno* 'these'  
*á-te* > *até* 'how s/he?'  
*mú-te* > *múte* 'how you?'

#### 6.4.5. Weak beat insertion

The associative morphemes *na* 'with', *-a* 'of', *nka* 'like', the locative postsuffixes *-mó*, *-hó*, and *-yó* as well as the complementizers *kó*, *ahó*, *iyó*, *ubwó*, etc. undergo Weak Beat Addition.

- (77) *nká + inká* > *nkíinká* 'like + cow (like  
a cow)'

there.is.in + water  
'there is water in it'

### 7. Reduplication

**Reduplication** (cf. Art. 57) is very active in Kinyarwanda. There are three types of reduplication in this language: stem first syllable reduplication, stem reduplication, and whole word reduplication. Reduplication is both lexical and grammatical. Many words appear in the dictionary already reduplicated and others are formed from existing words. Reduplication expresses either plurality, iterativity, intensification, completeness, etc. As far as verbs are concerned only bisyllabic stems undergo reduplication. Monosyllabic and polysyllabic don't. Only adjectives allow full word reduplication. Stem first syllable reduplication is mostly lexical.

#### 7.1. First syllable reduplication

If the verb stem has a lexical high tone, this tone is only realized on the first mora of the reduplicated stem. The reduplicated syllable is also long or short depending on whether the stem first syllable is long or short.

- (78) *gu-cyoo-cyoor-a*  
'INF-RDP-STEM-IPFV (to ask nutty ques-  
tions)'  
*ku-jíuu-juuby-a*  
'INF-RDP-STEM-IPFV (to harass)'  
*ku-nyíuu-nyuuz-a*  
'INF-RDP-STEM-IPFV (to suck)'

#### 7.2. Verb stem reduplication

When the verb stem is reduplicated, both lexical tones and grammatical tones are only realized on the leftmost reduplicated stem. In some cases, the last vowel of the stem on the left is lengthened.

- (79) *ku-geend-a* 'INF-walk-IPFV'  
*ku-geend-a-geend-a* 'INF-walk-IPFV-  
walk-IPFV (to walk around)'  
*ku-ruund-a* 'INF-pile-IPFV'

- ku-ruund-a-ruund-a* ‘INF-pile-IPFV-pile-IPFV (to pile)’  
*gu-shim-a* ‘INF-scratch-IPFV’  
*gu-shim-a(a)-shim-a* ‘INF-scratch-IPFV-scratch-IPFV (to scratch repetitively)’

### 7.3. Noun reduplication

In nouns, if the stem has a high tone on the last syllable, it is not repeated on the second part of the stem.

- (80) *i-hené* ‘AUG-goat’  
*a-ma-hené-hene* ‘AUG-CL6-goat-RDP  
 (goat milk)’

### 7.4. Adjective reduplication

Polysyllabic adjectives get a high tone on the prefix of the stem on the right and monosyllabic stems have the last vowel of the stem on the left lengthened.

- (81) *-nini* ‘big’ *abaantu* ‘people’  
*banini* *banínibánini*  
*-tatu* ‘three’ *inká* ‘cows’  
*zitatu* *zitatuzítatu*

Noun stems’ last syllable lengthen also when reduplication takes place.

## 8. Problems in Kinyarwanda morphology

The following Kinyarwanda phenomena pose a challenge to morphological studies: (a) hundreds of words have different phonetic variations, (b) a larger number of words have an identical vowel in all stem syllables, (c) tones have morphological functions, and (d) the existence of dummy morphemes.

### 8.1. Words with phonetic variations

Kinyarwanda has thousands of words which have alternative different phonetic forms without any change in meaning or register. Look at the Kinyarwanda equivalent English adverbs ‘or’ and ‘at least’ below:

- (82) (a) ‘or’: *cyángwá*, *byáangwá*, *cyáangá*,  
*cyáangwá*, *náangwá*, *yáangwá*.  
 (b) ‘at least’: *byíiburá*, *byíibuzé*, *cyáaburá*,  
*cyáabuzé*, *cyíiburá*, *cyíibuzé*, *níiburá*, etc.  
 (c) ‘diploma’: *dipóroómi*, *dipóromá*, *dipóromó*,  
*dipóromú*, *dipóróoma*, *dipóróome*, etc.

All dictionaries list all these phonetic realizations of the same word as independent lexical

entries making the dictionary voluminous and superfluous. These clearly have one underlying morphological representation. The problem is to decide among all these different phonetic representations, which one is closer to the abstract one.

### 8.2. Suprasegmental representations or non-lineal morphology

It was shown that tones in this language have a morphological function as well (see 6.1). It was also indicated that some phonological tones “float” and are realized phonetically when they find a vowel to attach to (see 6.3). Grammatical tones are assigned to specific moras or syllables in the metrical domain. It is now accepted in phonology that indeed tones and segments belong to two distinct different tiers. As was pointed out earlier also, vowels or the noun prefix and preprefix (augment) are identical: this is clearly a vowel copy. The majority of Kinyarwanda words have an identical vowel in the stem:

- (83) *u-mu-biri* ‘AUG-CL1-body’, *i-ki-biíndi* ‘AUG-CL7-clay.jar’, *u-ru-háanga* ‘AUG-CL11-forehead’, *a-ma-táma* ‘AUG-CL6-cheeks’, *u-ku-bóko* ‘AUG-CL15-arm’.

The fact that loan-words from languages that have closed syllables have the vowel of the open syllable repeated in the closed syllables when they enter Kinyarwanda or are assigned default vowels, namely *u* for bilabial consonants and *i* elsewhere (Kimenyi 2002), lends support to the idea of having two distinct tiers for vowels and consonants in the morphological representation.

### 8.3. Dummy Morphemes

There are morphemes which are added to the verb structure without any semantic or grammatical functions. These are the morphemes *-ij-* in (84), the applicative morpheme *-ir-* in (85), the infinitive morpheme *-ku-* in (86) and the 10 class marker *-zi-* in (87).

- (84) (a) *A-ba-gabo*

*a-ra-som-eesh-er-ez-a*  
*/a-ra-som-iish-ir-ir-y-a/*  
 she-T-read-CAUS-APPL-APPL-CAUS-  
 IPFV  
*u-mw-áana i-n-dórerwamó.*  
 AUG-CL1-child AUG-CL10-glass  
 ‘The woman is reading with the child’s glasses.’
- (86) *mu-i-andik-a > mu-i-ku-andik-a /mwiik-waandikal* ‘you-NEG-INF-write-IPFV’
- (87) *i-n-áana > inzáana* ‘naughty children’  
 comp. *u-mw-áana* ‘AUG-CL1-child’  
*i-n-áagwá > inzáagwá* ‘banana wines’  
 comp. *u-rw-áagwá* ‘AUG-CL11-banana wine’

The insertion of the morphemes in the examples above is historically motivated. These are not random or arbitrary morphemes. The insertion of the infinitive marker in finite verbs is also found with monosyllabic verbs in Kiswahili with certain tense markers. The morpheme *-zi-* class 10 marker goes back to noun stems which lost it. The applicative morpheme *-ir-* also happens to be polyfunctional as it was pointed out earlier.

#### 8.4. Discontinuous Morphemes

In Kinyarwanda and many other Bantu languages, the perfective aspect *-ye* modifies phonetically the verb stem, in Kinyarwanda this modification consists of either making the last consonant palatal and an alveolar sibilant. As the following examples illustrate, when the passive morpheme is added to the

verb stem, consonant mutation applies first and the passive morpheme is inserted between the mutated consonant and the vowel *e* of the aspect morpheme *-ye*. Another way of explaining this phenomenon is to postulate that the passive morpheme *-w-* is inserted inside the morpheme *-ye* before consonant mutation.

(89) Rwanda is a country of the Great Lakes Region in Central Africa. (90) It is surrounded by Uganda, Tanzania, Burundi and Congo. (91) This country is characterized by many tall hills, rivers, and valleys. (92) Its capital is called Kigali. (93) Languages that are used in schools, in works and writings of the government are Kinyarwanda, French and English. (94) In the latest census, the government says that the population has just reached eight million and half. (95) It is not understand-

able, however, because in the year 1994, there was genocide of Tutsi and then died more than a million people. (96) Now the country is full of orphans and widows. (97) Those who survived have a lot of problems, poverty, not to have who can help them, and the fear that they may be killed again. (98) Recently the government released 40,000 murderers because they admitted that they killed even though they didn't try to repent or ask for forgiveness.'

## 10. Uncommon abbreviations

### 1. Allgemeine Angaben

#### 1.1. Geographische Verbreitung. Soziolinguistischer Status

Die vietnamesische Sprache ist die Staats-sprache der im östlichen Teil Hinterindiens gelegenen Sozialistischen Republik Vietnam (Fläche 331.700 km<sup>2</sup>, Bevölkerung über 60 Mio. Einwohner). Der Gebrauch der vietnamesischen Sprache erstreckt sich auf die Bereiche der Presse, des Rundfunks und Fernsehens, der Wissenschaft und Kultur, des Bildungswesens und des überregionalen Verkehrs.

Neben den Vietnamesen als den Sprachträgern, die 80 Prozent der Gesamtbevölkerung ausmachen und im wesentlichen die Küste und die Flachlandregionen besiedeln, leben in Vietnam etwa 60 Völkerschaften und ethnische Gruppen, darunter die Muong, die den Vietnamesen sprachlich und ethnisch am nächsten stehen.

#### 1.2. Genetische Beziehungen

Die zu Beginn des 20. Jh. vertretene Auffassung von der Verwandtschaft des Vietnamesischen mit den Thai-Sprachen (Maspero 1912) wurde in der Folge einer kritischen Überprüfung unterzogen (Przyluski 1924). Gemäß der heute vorherrschenden Ansicht gehört das Vietnamesische zur Gruppe der Mon-Khmer-Sprachen, die ihrerseits ein Bestandteil der austroasiatischen Sprachfamilie ist (Haudri-court 1953). Der langanhaltende kulturelle

Einfluß Chinas auf Vietnam, der sich vom 1. Jh. v. u. Z. bis ins 20. Jh. verfolgen lässt, hatte eine Fülle von chinesischen Entlehnun-gen im Vietnamesischen zum Ergebnis, je-doch entbehrt dieser Umstand, wie auch die typologische Ähnlichkeit der vietnamesischen und der chinesischen Sprache, einer geneti-schen Grundlage (vgl. Hồ Lê 1971).

### 1.3. Schrift

Das chinesische Hieroglyphensystem (*chữ Hán* ‘Han Schriftzeichen’), das in der vietna-mesischen Kultur etwa vom Beginn unserer Zeitrechnung bis zum 13. Jh. uneinge-schränkt dominierend war, besteht neben dem auf seiner Grundlage geschaffenen vietnamesischen Hieroglyphensystem (*chữ Nôm* ‘südliche Schriftzeichen’) fort. Mit Ausnahme einzelner kürzerer historischer Perioden be-wahrte das chinesische Hieroglyphensystem bis zum 20. Jh. den Status der offiziellen Schriftsprache in der Sphäre des Verwal-tungs- und Bildungswesens.

Das moderne, auf dem Lateinischen basie-rende vietnamesische Alphabet (*quốc ngữ* ‘nationale Sprache/Schrift’) wurde im 17. Jh. von portugiesischen, italienischen und fran-zösischen Missionaren ausgearbeitet. Es stellt eine Variante der phonematischen Schrei-bung dar und wird seit 1910 im offiziell-am-tlichen Verkehr verwendet. Das Alphabet sieht wie folgt aus:

<i>a</i>	[a:]	<i>d̥</i>	[d]	<i>k</i>	[k]	<i>o'</i>	[ø:]	<i>u</i>	[u]
<i>ă</i>	[a]	<i>e</i>	[ɛ]	<i>l̥</i>	[l]	<i>p</i>	[p]	<i>u'</i>	[w]
<i>â</i>	[ə]	<i>ê</i>	[e]	<i>m̥</i>	[m]	<i>q</i>	[k]	<i>v</i>	[v]
<i>b</i>	[b]	<i>g</i>	[β]	<i>n̥</i>	[n]	<i>r̥</i>	[ʒ]	<i>x</i>	[s]
<i>c</i>	[k]	<i>h</i>	[h]	<i>o̥</i>	[ɔ]	<i>s̥</i>	[ʃ]	<i>y</i>	[i]
<i>d</i>	[z]	<i>i̥</i>	[i]	<i>ô̥</i>	[o]	<i>t̥</i>	[t]		

Tab. 142.1: *quốc ngữ*

Einige Laute werden durch Digraphen wiedergegeben (s. Tab. 142.2).

<i>ph</i> [f]	<i>ch</i> [t <sup>j</sup> ]	<i>tr</i> [tʃ]	<i>kh</i> [χ]	<i>ng</i> [ɲ]
<i>th</i> [t <sup>h</sup> ]	<i>gi</i> [ʒ <sup>t</sup> ]	<i>nh</i> [n]		

Tab. 142.2: Digraphen

Im Alphabet *quốc ngữ* sind für die Bezeichnung der vietnamesischen Töne spezielle diakritische Zeichen gebräuchlich. Das Fehlen eines diakritischen Zeichens entspricht dem hohen Level-Ton: *ma* ‘Gespenst’. Weiter folgen Zeichen, die in der Regel bei dem silbenbildenden Vokal angeordnet sind: der Gravis zur Wiedergabe des oberen fallenden (zweiten) Tons (*mà* ‘aber’); die Tilde zur Wiedergabe des fallend-steigenden diskontinuierlichen (dritten) Tons (*mā* ‘Pferd im Schachspiel’); die “Frage” zur Wiedergabe des fragenden fallend-steigenden kontinuierlichen (vierten) Tons (*má* ‘Grab’); der Akut zur Wiedergabe des steigenden gespannten (fünften) Tons (*má* ‘Wange’) und schließlich der Punkt in der Unterzeile zur Wiedergabe des abrupt-fallenden schweren (sechsten) Tons (*mq* ‘Setzung(e) der Reispflanze’).

#### 1.4. Literatursprache und Dialekte

Die vietnamesische Sprache der Gegenwart weist drei Dialekte auf:

- (a) den nördlichen Dialekt (hauptsächlich gesprochen im Gebiet von Hanoi),
- (b) den zentralen Dialekt (hauptsächlich gesprochen in den Städten Vinh und Hué) und
- (c) den südlichen Dialekt (hauptsächlich gesprochen in Saigon).

Die Dialekte unterscheiden sich vor allem in phonetischer Hinsicht (vgl. Thompson 1967: 18–51, 78–97).

Die moderne Literatursprache kann zum gegenwärtigen Zeitpunkt noch nicht als gefestigt angesehen werden. Ihre schriftliche Variante, die den Gegenstand der weiterführenden Betrachtung bildet, orientiert sich am Lautbestand des zentralen Dialekts und am Tonsystem des nördlichen Dialekts, im mündlichen Sprachgebrauch wird dieses ideale Schema jedoch selten durchgängig eingehalten.

## 2. Abgeleitetes Wort

### 2.1. Formale und semantische Eigenschaften der Derivation

Das **abgeleitete Wort** ist ein Wort, welches von einem anderen Wort mit Hilfe eines Derivationsformanten gemäß den in der Sprache

wirkenden Wortbildungsmustern gebildet wurde (s. Art. 89). Die Wortbildungsanalyse muß auf die formal-semantische Beziehung zwischen Ausgangswort und Ableitung gerichtet sein: Man kann nicht davon ausgehen, daß engl. *tailor* durch das Wort *tail* motiviert ist (der Zusammenhang ist rein formal), ebenso kann engl. *fear* nicht auf *awe* zurückgeführt werden (die Beziehung ist rein semantisch). Möglich sind indessen Fälle, in denen die semantischen und die formalen Eigenschaften der Derivation nicht übereinstimmen (s. Art. 81): russ. *kačat'* ‘jmdn. schaukeln’ ist semantisch komplexer als *kačat'sja* ‘schaukeln’, in morphologischer Hinsicht verhält es sich umgekehrt (Apresjan 1974: 277), dt. *Schäferei* ist semantisch von *Schaf* abgeleitet, formal hingegen von *Schäfer* (Murjasov 1977: 120). In der vietnamesischen Sprache sind Beispiele, wo die semantischen und die formalen Eigenschaften der Derivation nicht übereinstimmen, unbekannt.

#### 2.2. Derivationsformant

Der **Derivationsformant** zeichnet sich durch die Besonderheit seiner Position im Wort und die Fähigkeit aus, mehr oder weniger großen Klassen von Wörtern als Wortbildungsmittel zu dienen. In semantischer Hinsicht ist wesentlich, daß die Bedeutung des abgeleiteten Wortes sich nicht nach der Formel “Bedeutung des Ausgangswortes, verbunden mit einer gewissen Einschränkung” erklären läßt, auch wenn der Derivationsformant eine einheitliche Veränderung der lexikalischen Bedeutungen der Ausgangswörter bewirkt, aus der sich die Wortbildungsbedeutung des entsprechenden Modells ergibt.

#### 2.3. Vietnamesische Derivationsformanten

Die Zahl der vietnamesischen Derivationsformanten beläuft sich auf einige wenige Einheiten. Das Präfix *nhà*, angefügt an Substantive, bildet Nomen mit Agensbedeutung:

- |                      |                        |
|----------------------|------------------------|
| (1) <i>chính trị</i> | → <i>nhà chính trị</i> |
| ‘Politik’            | ‘Politiker’            |
| <i>khoa học</i>      | → <i>nhà khoa học</i>  |
| ‘Wissenschaft’       | ‘Wissenschaftler’      |
| <i>kiến trúc</i>     | → <i>nhà kiến trúc</i> |
| ‘Architektur’        | ‘Architekt’            |

Das Suffix *hóa*, angefügt an Substantive und Adjektive, bildet Nomen mit kausativer Semantik:

- |                        |  |
|------------------------|--|
| (2) <i>công nghiệp</i> | → <i>công nghiệp hóa</i>                   |
| ‘Industrie’            | ‘industrialisieren/<br>Industrialisierung’ |

<i>tự động</i>	→ <i>tự động hóa</i>
‘Automat’	‘automatisieren/ Automatisierung’
<i>quân sự</i>	→ <i>quân sự hóa</i>
‘militärisch’	‘militarisieren/ Militarisierung’

Zu den genannten Formanten kommen vielleicht noch zwei hinzu – die Präfixe *dánh* und *làm*, die von intransitiven Verben und Adjektiven transitive Verben bilden:

(3) <i>thúc</i>	→ <i>dánh thúc</i>
‘wachen’	‘wecken’
<i>rơi</i>	→ <i>dánh rỗi</i>
‘fallen’	‘fallen lassen’
<i>bẩn</i>	→ <i>dánh bẩn</i>
‘schmutzig’	‘verschmutzen’
<i>hở</i>	→ <i>làm hở</i>
‘kaputt’	‘kaputt machen’
<i>khổ</i>	→ <i>làm khổ</i>
‘qualvoll’	‘quälen’

Das Präfix *dánh* verbindet sich nur mit einer normativ beschränkten Klasse von Wörtern und läßt in allen Fällen seiner Verwendung den Ersatz durch den produktiveren Formanten *làm* zu, währenddessen ein Ersatz in umgekehrter Richtung bei weitem nicht immer möglich ist. Das Element *làm* ist noch insoweit von Interesse, als es ein selbständiges Wort (Verb) mit derselben kausativen Bedeutung zu repräsentieren vermag. Deshalb kann in einer Reihe von Fällen ein und dieselbe Semantik entweder durch eine kausative Konstruktion oder durch ein transitives Verb mit dem Derivationsformanten *làm* ausgedrückt werden: *làm tôi nhục* ‘mich erniedrigen’ (mich zum Erniedrigten machen); *làm nhục chúng ta* ‘uns erniedrigen’ (Nguyễn Kim Thành 1977: 55).

### 3. Zusammengesetztes Wort

#### 3.1. Zusammengesetztes Wort und syntaktische Fügung

Das **zusammengesetzte Wort** ist ein Wort, das durch die Juxtaposition von mindestens zwei Wurzelmorphemen ohne Beteiligung von Derivationsformanten gebildet wurde (s. Art. 87). In Verbindung mit der Analyse des Kompositums entsteht die Frage nach der Möglichkeit des Vergleichs mit der syntaktischen Fügung. Im Rahmen der synchronen Wortbildung ist ein solcher Vergleich auf die Untersuchung der strukturell-semantischen Be-

sonderheiten der Komposita ohne Bezug zu ihrer Entstehungsgeschichte gerichtet. Deshalb setzt die Anwendung dieses Untersuchungsverfahrens nicht die Abstammung des Wortes von einer mit ihm korrelierenden syntaktischen Fügung voraus.

Ein Extrem bei der Untersuchung der Relation zwischen Kompositum und syntaktischer Fügung läuft darauf hinaus, das Kompositum als Korrelat zur syntaktischen Fügung zu definieren, so daß die Wurzelmorpheme des Kompositums sich in den Komponenten der syntaktischen Fügung wiederholen. Dem entgegengesetzten Standpunkt folge darf das Kompositum auch dann nicht auf einer Ebene mit der syntaktischen Fügung betrachtet werden, wenn es durch eine solche wiedergegeben werden kann. Eine Klassifikation der Komposita nach der assoziativen Zuordnung ihrer Wurzelbestandteile zu der einen oder anderen Wortart überträgt die Verhältnisse der Syntax in ungerechtfertigter Weise auf die Wortbildung.

Wie sonderbar es auch scheinen mag, es müssen beide Extrempositionen Berücksichtigung finden: Bei allen zweifellos bestehenden Unterschieden zwischen Wort und syntaktischer Fügung lassen sich, insbesondere im Vietnamesischen, einige Varianten von Wörtern nicht ohne Probleme von syntaktischen Fügungen abgrenzen. So werden z. B. Bildungen des Typs *dánh chét* ‘schlag sterb (zu Tode prügeln)’, *tìm thấy* ‘such seh (finden)’ von den einen Autoren als Wörter, von den anderen als syntaktische Fügungen angesehen. Offensichtlich ist, daß die Komposita einen unterschiedlichen Grad an Nähe zu den syntaktischen Fügungen aufweisen, angefangen bei einer Nullstufe, die einen Vergleich dieser Einheiten ausschließt, bis hin zu einer maximalen Stufe, die den Vergleich unausweichlich macht. Unbedingt ist jedoch zu berücksichtigen, daß nur solche Wörter als Gegenstand des Vergleichs mit der syntaktischen Fügung in Betracht kommen, deren Wurzelmorpheme als selbständiges Wort verwendet werden können, z. B. *máy bay* ‘Maschine fliegt (Flugzeug)’. Die Möglichkeit des Vergleichs entfällt, wenn auch nur eines der Wurzelmorpheme nicht über diese Eigenschaft verfügt (wenn es, fachterminologisch gesprochen, ein ‘gebundenes Morphem’ ist). Das ist z. B. der Fall bei *súng trù'ó'ng* ‘Gewehr lang (Gewehr/langes Gewehr)’, wo die erste Komponente ein selbständiges Wort sein kann, während die zweite nur als Wortbestandteil gebraucht wird.

### 3.2. Nähe des Kompositums zur syntaktischen Fügung

Es erscheint zweckmäßig, die Nähe des Kompositums zur syntaktischen Fügung nach der folgenden dreistufigen Skala einzuschätzen:

- (a) Minimale Nähe. Die Wortkomponenten lassen sich in der Terminologie der Wortarten natürlich charakterisieren, jedoch erlaubt ihre Relation weder eine semantische noch eine formale Gegenüberstellung mit der syntaktischen Fügung: *trai tré* ‘Bursche jung (jugendlich)’ – Juxtaposition einer Substantiv- und einer Adjektivwurzel, die sich unter Beachtung der Bedeutung des Ganzen nicht als attributive Zusammensetzung interpretieren lässt.
- (b) Mittlere Nähe. Die Wortkomponenten lassen sich in der Terminologie der Wortarten charakterisieren, die innere Form (Motivierung) des Wortes ist mittels einer für die syntaktische Fügung typischen semantischen Relation interpretierbar, wobei die formalen Merkmale der entsprechenden syntaktischen Fügung fehlen: *cà chua* ‘Aubergine sauer (Tomate)’ – semantisch attributive Verbindung, die in

keinem Kontext die Weglassung des “Attributs” gestattet.

- (c) Maximale Nähe. Das Wort lässt sich nach der Zugehörigkeit seiner Komponenten zu der einen oder anderen Wortart sowie nach der syntaktischen Bedeutung der Relation zwischen den Komponenten charakterisieren, wobei eine formale Gegenüberstellung mit der syntaktischen Fügung in der einen oder anderen Weise möglich ist: *xe dép* ‘Fahrzeug tretr (Fahrrad)’ – ein nach dem attributiven Modell aufgebautes Wort, das in einem eindeutigen Kontext auf die erste Silbe verkürzt wird; *làm việc* ‘mach Sache (arbeiten)’ – ein nach dem Objekt-(Komplement-)Modell aufgebautes Wort, das die Umwandlung der zweiten Komponente in ein vollgültiges Objekt erlaubt (*làm một việc nặng* ‘eine schwere Arbeit verrichten’).

### 3.3. Modelle zusammengesetzter Wörter im Vietnamesischen

Bei den Komposita (mit Ausnahme der Wörter mit minimaler Nähe zur syntaktischen Fügung) ist eine koordinative oder subordinative Relation zwischen den Komponenten zu beobachten. Gehört das Wort bei koordi-

	Mittlere Nähe	Maximale Nähe
Subst. + Subst.	<i>sát</i> <i>dá</i> Eisen Stein ‘fest’	<i>áo</i> <i>quần</i> Hemd Hose ‘Bekleidung’
	<i>trò</i> <i>i</i> <i>bé</i> Himmel Meer ‘unendlich’	<i>bút</i> <i>mực</i> Pinsel Tusche ‘Schreibzubehör’
	<i>gan</i> <i>da</i> Leber Magen ‘kühn’	<i>giày</i> <i>dép</i> Schuhe Sandalen ‘Schuhwerk’
Verb + Verb	<i>sói</i> <i>nói</i> brodel auftret ‘lebhaft’	<i>thu'o'ng</i> <i>yêu</i> Mitleid.hab lieb ‘lieben’
	<i>đi</i> <i>đi</i> <i>ng</i> geh steh ‘Gang(art)’	<i>nhảy</i> <i>múa</i> tanz gestikulier ‘tanzen’
	<i>chǎn</i> <i>nuôi</i> sich.sorg aufzieh ‘Viehzucht’	<i>cày</i> <i>cây</i> pflüg Setzlinge.umpflanz ‘Ackerbau betreiben’
Adj. + Adj.	<i>xa</i> <i>gắn</i> weit nah ‘überall’	<i>cô</i> <i>xưa</i> alt vergangen ‘alt’
	<i>đỏ</i> <i>đen</i> rot schwarz	<i>già</i> <i>yếu</i> alt schwach ‘gebrechlich’
	‘Partie im Kartenspiel’	<i>mạnh</i> <i>khỏe</i>
	<i>đen</i> <i>tối</i> schwarz dunkel ‘verbrecherisch’	stark gesund ‘gesund’

Tab. 142.3: Komposita mit koordinativer Relation der Wortkomponenten

	Mittlere Nähe		Maximale Nähe	
Attributives Modell	<i>máy</i>	<i>bay</i>	<i>xe</i>	<i>hṝa</i>
	Maschine	flieg ‘Flugzeug’	Fahrzeug	Feuer ‘Zug’
	<i>tháng</i>	<i>hai</i>	<i>cá</i>	<i>vàng</i>
	Monat	zwei ‘Februar’	Fisch	Gold ‘Goldfisch’
	<i>nhà</i>	<i>máy</i>	<i>áo</i>	<i>mura</i>
	Haus	Maschine ‘Betrieb’	Bekleidung	Regen ‘Regenmantel’
Komplement-Modell	<i>trả</i>	<i>lời</i>	<i>đán</i>	<i>co'm</i>
	erwider	Worte ‘antworten’	ess	Reis ‘essen’
	<i>làm</i>	<i>khách</i>	<i>chụp</i>	<i>ánh</i>
	mach	Gast ‘Umstände machen’	fotographier	Aufnahme ‘fotographieren’
	<i>theo</i>	<i>gót</i>	<i>nói</i>	<i>chuyện</i>
	verfolg	Absatz ‘verfolgen’	sprech	Ereignis ‘sich unterhalten’

Tab. 142.4: Komposita mit subordinativer Relation der Wortkomponenten

nativer Relation nicht zu derselben Wortart wie seine Bestandteile, so ist für ein solches Wort nur eine mittlere Nähe zur syntaktischen Fügung möglich. In den übrigen Fällen, in denen das Wort und seine Bestandteile derselben Wortart zugerechnet werden können, ist gleichermaßen eine mittlere wie eine maximale Nähe zur syntaktischen Fügung möglich.

In Tab. 142.3 werden die Grundmodelle der Komposita mit koordinativer Relation der Wortkomponenten angeführt.

In den Modellen mit subordinativer Relation lassen sich ebenfalls unterschiedliche Stufen der Nähe des Kompositums zur syntaktischen Fügung ausmachen. Wir veranschaulichen das hier am Beispiel des attributiven und des Komplement-Modells.

#### 4. Reduplikation

##### 4.1. Reduplikation und Ausgangswort

**Reduplikationen** sind Wörter des Typs *đẹp đẽ* ‘schön’, die aus einem Wurzelmorphem (*đẹp* ‘schön’) und einer bedeutungsleeren phonetisch modifizierten Variante desselben bestehen (s. Art. 57). Die asemantische Komponente der Reduplikation nennen wir Reduplikator. Wörter, die allein in iterativer Form existieren (*ba ba* ‘Schildkröte’, *đu đú* ‘Papaya’), werden nicht zu den Reduplikationen gerechnet. Sie verfügen über keine korrelierende Ausgangseinheit und fallen insofern nicht in die Zuständigkeit der synchronen Wortbildung. Die semantische Korrelation mit dem Ausgangswort ist neben der formalen Korrelation ein wesentliches Kriterium

der Wortbildungsanalyse sekundärer Einheiten. Für die Reduplikation ist die Verbindung zum Ausgangswort solange gegeben, wie dieses an der Bedeutungserklärung der Reduplikation teilnehmen kann, z. B.: *nhỏ* ‘klein’ → *nhỏ nhán* ‘winzig’ (*nhỏ* và *xinh* ‘klein und angenehm’). Sobald die zu untersuchende Einheit nur noch in phonetischer Hinsicht Merkmale einer Reduplikation aufweist und sich in semantischer Hinsicht so weit vom Ausgangswort entfernt hat, daß es nicht mehr in die Bedeutungserklärung dieser Einheit einzubezogen werden kann, wird sie zu einem einfachen Wort: *nhỏ nhén* ‘gemein’.

Im Unterschied zur Ableitung als Verbindung eines Wurzelmorphems mit einem Derivationsformanten, der die reguläre Bedeutung des entsprechenden Wortbildungsmodells wiedergibt, stellt sich die Reduplikation als Verbindung einer Wurzel mit einem unikalen Wortbildungsmittel dar, wobei eine streng individuelle Korrelation mit dem Ausgangswort vorliegt.

##### 4.2. Reduplikator

Der Reduplikator wird gewöhnlich nach der Wurzel angeordnet, es sind aber auch Fälle einer Voranstellung des Reduplikators anzutreffen: *toi* ‘verstreut, verschüttet’ → *tá to'i* ‘zerstreut’, *trộn* ‘mischen’ → *trà trộn* ‘sich unter die Menge mischen’ (Lê Văn Ly 1981: 58). Nach der Form des Reduplikators, die zu einem gewissen Grade von der Form der Wurzel bestimmt wird, lassen sich zwei Arten von Reduplikationen unterscheiden: initiale Reduplikationen – im Reduplikator wiederholt sich der Anlaut der Wurzelsilbe (*lám* ‘machen’ → *lám lỵng* ‘arbeiten’) – und finale Reduplikationen – im Reduplikator wiederholt

sich der Auslaut der Wurzelsilbe (*ké* 'erzählen' → *ké lè* 'faseln'). Der Ton des Reduplikators wird auch zu einem gewissen Grade vom Ton der Wurzel bestimmt (vgl. Glebova & Sitnikova 1980: 66 f.), aber obwohl die lautive Form des Reduplikators nicht beliebig ist, ist es nicht möglich, sie in jedem konkreten Fall völlig eindeutig vorherzusagen.

Die Anfügung eines Reduplikators an eine Ausgangseinheit signalisiert die Bildung eines neuen, vom Ausgangswort verschiedenen Wortes. Ganz allgemein bestehen die grammatischen Unterschiede zwischen Reduplikation und Ausgangswort in folgendem: bei Substantiven – Übergang in die Unterkategorie der Kollektiva (*máy* 'Maschine' → *máy móc* 'verschiedene Maschinen und Apparate'); bei Verben – Übergang in die Unterkategorie der Intransitiva (*làm* 'machen' → *làm lung* 'arbeiten'); bei Adjektiven – Verlust der Möglichkeit einer substantivischen Ergänzung: *đẹp* 'schön', wo *đẹp măt* 'schön Auge (angenehm fürs Auge)', *đẹp ngu'o'i* 'schön Körper (äußerlich schön)' möglich ist, gegenüber *đẹp dẽ* 'schön', wo eine nominale Ergänzung unmöglich ist (Đái Xuân Ninh 1978: 203). Neben den grammatischen Unterschieden gibt es auch semantische. Zum Beispiel wird *lanh* 'kalt' sowohl im wörtlichen als auch im übertragenen Sinne gebraucht, während *lanh léo* 'kalt' nur im wörtlichen Sinne und *lanh lung* 'kalt' nur im übertragenen Sinne verwendet wird: *một gian phòng lanh léo* 'ein kaltes Zimmer'; *một thái độ lanh lung* 'ein kühles Verhältnis' (Hô Lê 1976: 285; Sitnikova 1980: 245 f., 254–256).

## 5. Iteration

### 5.1. Wurzeliteration

Die **Iteration** ist der einzige Bereich der Formenbildung im Vietnamesischen, berücksichtigt man die Regularität sowie den rein quantitativen Charakter der zusätzlichen Bedeutung, die der Ausgangseinheit verliehen wird. Bei den Wurzeliterationen wird das Wurzelmorphem der Ausgangseinheit dem Verfahren der Iteration unterzogen. Es gibt vollständige und unvollständige (abweichende) Wurzeliterationen. Bei ersteren wiederholt sich die Wurzel in unveränderter Form (*đẹp* 'schön' → *đẹp đẹp* 'sehr schön'), bei letzteren erfolgt die Wiederholung mit einigen phonetischen Modifikationen. Im Ergebnis dessen wird der Wurzel eine bedeutungsleere Einheit hinzugefügt: *đẹp* 'schön' → *dém đẹp* 'ziemlich schön' (Glebova & Sitnikova 1980: 56–58).

Substantive bilden nur vollständige Iterationen mit der Bedeutung der distributiven Pluralität: *ngu'o'i* 'Mensch' → *ngu'o'i ngu'o'i* 'jeder Mensch, Leute', *nhà* 'Haus' → *nhà nhà* 'jedes Haus'. Einige semantische Klassen von Handlungsverben lassen ausschließlich vollständige Iterationen mit der Bedeutung der Iterativität der Handlung zu: *vuốt* 'streichen' → *vuót vuót* 'ab und zu streichen', *gãi* 'kratzen' → *gãi gãi* 'ab und zu kratzen'. Nicht-handlungsverben bilden in Abhängigkeit von ihrer phonetischen Gestalt vollständige oder abweichende Iterationen (vgl. Glebova & Sitnikova 1980: 57) mit der Bedeutung der Abschwächung des Merkmals: *lo* 'sich beunruhigen' → *lo lo* 'sich leicht beunruhigen', *sợ* 'sich ängstigen' → *sợ sợ* 'sich etwas ängstigen'. Komplizierter verhält es sich mit den Adjektiven. Adjektive im hohen Level oder oberen fallenden Ton können nur vollständige Iterationen bilden, die in Abhängigkeit vom Kontext die Abschwächung oder die Verstärkung des Merkmals wiedergeben: *hay* 'interessant' → *hay hay* 'ziemlich/sehr interessant'. In allen anderen Tönen bezeichnet die vollständige Iteration die Verstärkung des Merkmals, während die Semantik abweichender Iterationen zu einem gewissen Grade von der Position des bedeutungsleeren Segments in Relation zur Wurzel abhängt: die Bedeutung der Abschwächung des Merkmals wird nur durch die Voranstellung der bedeutungsleeren Komponente wiedergegeben (*héo* 'verwelkt' → *heo héo* 'leicht verwelkt'); die Bedeutung der Verstärkung des Merkmals ist nicht fest an eine bestimmte Position der bedeutungsleeren Komponente gebunden (vgl. *còn* 'klein' → *còn còn* 'sehr klein', *héo* 'verwelkt' → *héo héo* 'ganz verwelkt') (Nguyễn Phú Phong 1977: 62). Außerdem sei angemerkt, daß nur abweichende Iterationen mit der Bedeutung der Merkmalsverstärkung mehr als ein bedeutungsleeres Segment enthalten können: *héo* 'verwelkt' → *héo héo* 'ganz verwelkt' → *héo héo héo* 'ganz ganz verwelkt' → *héo héo héo héo* 'ganz ganz ganz ganz verwelkt' (Nguyễn Phú Phong 1977: 62).

### 5.2. Silbeniteration

Neben der Wurzeliteration gibt es im Vietnamesischen auch die Silbeniteration, bei der die asemantische Silbe der Ausgangseinheit dem Verfahren der Iteration unterzogen wird. Silbeniterationen lassen sich ebenfalls in vollständige und abweichende unterteilen. So kann z. B. vom Adjektiv *đen* 'schwarz' durch Hinzufügung der bedeutungsleeren Silbe *sì*

das Wort *đen sì* ‘schmutzig’ gebildet werden, dessen vollständige Silbeniteration die Einheit *đen sì sì* ‘sehr schmutzig’ ergibt. Vom Adjektiv *tho;m* ‘wohlriechend’ läßt sich durch Ergänzung der bedeutungsleeren Silbe *phú;c* das Wort *tho;m phú;c* ‘aromatisch’ bilden, dessen abweichende Silbeniteration wiederum die Einheit *tho;m phúng phú;c* ‘sehr aromatisch’ ergibt (vgl. Đái Xuân Ninh 1978: 186–190).

## 6. Von der syntaktischen Fügung zum Wort

### 6.1. Silbenschwund

Möglich ist eine “Kompression” der syntaktischen Fügung im Text, die unter günstigen Bedingungen zu einem vollwertigen Ergebnis aus Sicht der Wortbildung führt (s. Art. 60). So scheint es aus rhythmisch-phonetischen Erwägungen angebracht, die dreisilbige Wortfügung *khoa triết học* ‘philosophische Fakultät’ auf die zweisilbige Konstruktion *khoa triết* mit derselben Bedeutung, jedoch mit den Formmerkmalen eines Wortes zu verkürzen (vgl. russ. *biologičeskij fakul'tet* → *biofak*). Anstelle von *xír Nghé An* ‘Provinz Nghean’ wird häufiger *xí Nghé* gebraucht, anstelle von *tàu Hải Phòng* ‘Haiphonger Zug’ – *tàu Phòng*. Da das letztere Beispiel aber den Einschub eines autosemantischen Wortes gestattet (*tàu đi Phòng* ‘Zug, der nach Haiphong fährt’), scheint es eher am Platz, hier von der Bildung einer einsilbigen, funktional eingeschränkten Variante des Wortes *Hải Phòng* zu sprechen. Eine einsilbige Variante des Wortes *Hải Phòng* ist z. B. nicht möglich in der Fügung *học sinh Hải Phòng* ‘Haiphonger Schüler’ (Tru'o'ng Đông San 1976: 10).

Bisweilen wird der Schwund einer oder mehrerer Silben von einer Veränderung der Stellung der verbliebenen Silben zueinander begleitet, wodurch der Wortstatus der neu entstandenen Bildung sowohl grammatisch als auch lexikologisch noch überzeugender ausfällt: *vận động thanh niên* ‘Bewegung Jugend’ → *thanh vận* ‘Jugendbewegung’, *phòng thủ biên giới* ‘Schutz Grenze’ → *biên phòng* ‘Grenzsicherung’ (Lê Xuân Thái 1982: 53).

### 6.2. Silbenausklammerung

Das Verfahren der Silbenausklammerung kommt in Betracht für das gemeinsame bedeutungstragende Element von zwei oder drei zweisilbigen Wörtern, die ein parataktisches Gefüge bilden: *công nghiệp*, *nông nghiệp*

→ *công nông nghiệp* ‘Industrie (und) Landwirtschaft’, *thủy quân, lục quân, không quân* → *thủy, lục, không quân* ‘Flotte, Infanterie, Luftfahrt’. Silbenausklammerung in Gefügen mit mehr als drei Wörtern tritt nur in Einzelfällen auf: *nông nghiệp, công nghiệp, lâm nghiệp, ngư nghiệp* → *nông, công, lâm, ngư nghiệp* ‘Landwirtschaft, Industrie, Forstwirtschaft, Fischerei’ (Nguyễn Huy Cần 1981: 66).

Innerhalb des Komplexes, der durch Silbenausklammerung gebildet wurde, haben die einzelnen Elemente eine feste, normativ vorgegebene Anordnung. Der Komplex selbst weist Merkmale eines Wortes auf. Einige Bildungen dieser Art sind lexikalisiert und werden in Wörterbücher aufgenommen: *bi hài kịch* ‘Tragikomödie’ (*bi kịch* ‘Tragödie’ + *hài kịch* ‘Komödie’), *âm du'o'ng lịch* ‘Sonnen- und Mondkalender’ (*âm lịch* ‘Mondkalender’ + *du'o'ng lịch* ‘Sonnenkalender’) (Nguyễn Huy Cần 1981: 68).

### 6.3. Silbenüberschneidung

Bei Kontaktposition eines ein- und eines zweisilbigen Wortes kann das erstere innerhalb des zweiten “wiederholt” werden: *nghĩ vo* → *nghĩ vân* ‘zerstreut (über etw.) nachdenken’. Bei Kontaktposition zweisilbiger Wörter ist eine wechselseitige Überschneidung ihrer Silben nach dem Muster ABCD → ACBD möglich: *thay đổi lòng dạ* → *thay lòng đổi dạ* ‘die Absicht ändern’.

Die Silbenüberschneidung ist – ungeachtet ihrer Verbreitung im vietnamesischen Text, insbesondere im künstlerischen Text, wo ihr eine wichtige stilistische Funktion zukommt – ebenfalls exquisiten normativen Einschränkungen unterworfen. Bekannt sind auch Fälle einer Lexikalisierung von Überschneidungsbildungen, wo die Möglichkeit einer Gegenüberstellung mit den (normativ nicht zulässigen) Ausgangsvarianten lediglich theoretisch besteht. Derartige Fälle sind z. B. die im Wörterbuch der festen Wortverbindungen angeführten Ausdrücke *bu'o'm chán ong chu'o'ng* ‘Schmetterling sich.übersättig Biene überdrüssig.werd (verstoßen (eine Frau))’, *cơm bưng nu'o'c rót* ‘Reis (dar)reich Tee eingieß (mit Kost und Logis)’.

Die Komponenten wenigstens eines der sich überschneidenden Wörter müssen semantisch vollwertig sein, während dieses Moment für die Komponenten des anderen Wortes nicht wesentlich ist. Unter diesem Gesichtspunkt betrachtet, heißt das für die Wortüberschneidung, daß sich ein Wortbe-

standteil (der bedeutungstragende oder nichtbedeutungstragende) in einem gewissen engen formalen Rahmen wie das Wortganze verhält.

## 7. Wortklassen

### 7.1. Morphologischer und syntaktischer Ansatz

Die Erörterung des Problems der **grammatischen Wortklassen** (Wortarten) im Vietnamesischen, wo morphologische Formenbildung vollständig und morphologische Wortbildung nahezu vollständig fehlt, macht deutlich, daß für die Wortartenunterscheidung nicht allein vom morphologischen Ansatz ausgegangen werden kann (s. Art. 70–72). Die ausschließliche Berücksichtigung des morphologischen Aspekts führt dazu, die Existenz von Wortarten im Vietnamesischen zu negieren (Grammont & Lê Quang Trinh 1911–1912). Morphologische Wortartklassifikationen rufen selbst in bezug auf Sprachen mit entwickeltem Formensystem Einwände hervor. Es wird z. B. darauf hingewiesen, daß die Deklinierbarkeit nicht als Merkmal der russischen Substantive angesehen werden kann, weil es in der russischen Sprache viele indeklinable Substantive gibt. Beim morphologischen Ansatz erfolgt die Subklassifikation der flektierbaren und der nichtflektierbaren Wörter anhand verschiedener Kriterien. Im weiten typologischen Kontext erscheinen die morphologischen Wortartindikatoren als rein äußerliche, im Grunde fakultative Marker, durch die tiefergehende, vorwiegend syntaktische Unterschiede fixiert werden. Ohne die morphologischen Indikatoren büßt die Wortartenunterscheidung an formaler Einfachheit ein, sie kehrt aber zugleich zu ihrer realen Basis – zur Syntax – zurück.

### 7.2. Klassifikation nach kombinatorischen Merkmalen

Der erste Versuch einer Wortartklassifikation nach kombinatorischen Merkmalen wurde von Lê Vǎn Ly unternommen, in dessen Arbeit die vietnamesischen Wörter nach ihrer Kombinierbarkeit mit sog. "Zeugenwörtern" (*mots temoins*) in einige größere Klassen unterteilt werden. Die Prinzipien der Herausgliederung der Zeugenwörter, zu denen die Marker von grammatischen Kategorien und einige synsemantische Wörter gehören, werden nicht diskutiert, und die Zeugenwörter selbst werden gleichsam a priori in einer Liste

angegeben. So sind etwa Zeugenwörter für Substantive die Pluralmarker *nhung*, *các*, die Wörter *máy* 'einige', *mọi* 'alle', *nhiều* 'viele', *bao nhiêu* 'wieviele' und eine Reihe weiterer (Lê Vǎn Ly 1948: 173–197). Der vorliegende Ansatz ist interessant als grundsätzlich richtiger Versuch einer Wortartklassifikation nach kombinatorischen Merkmalen. Überzeugender ist dieser Ansatz in Klassifikationen vertreten, die die Tradition von Lê Vǎn Ly fortsetzen, aber seine sehr umfangreichen Listen von Zeugenwörtern vereinfachen (Martini 1950: 186–190, Honey 1956: 537–539).

### 7.3. Funktionale Klassifikation

Der funktionale Ansatz stützt sich auf die unterschiedliche Verwendbarkeit der Wörter in verschiedenen syntaktischen Funktionen. Genauer gesagt geht es nicht darum, in welcher Funktion ein Wort in einem konkreten Beispiel auftritt, sondern um das funktionale Spektrum an syntaktischen Möglichkeiten des Wortes. Ebenso wird ein morphologisches Merkmal nicht durch irgendeine einzelne Form, sondern durch ein System von Formen repräsentiert (Jachontov 1968: 73 f.). Das sind die allgemeinsten theoretischen Ausgangspositionen für die funktionale Klassifikation, deren Ausarbeitung bestimmte Schwierigkeiten bereitet. Erforderlich ist die theoretisch überzeugende und praktisch wirkungsvolle Bestimmung des Funktionsbegriffs, die Abgrenzung unterschiedlicher Typen von Funktionen, die Beachtung möglicher Zusammenhänge zwischen den Funktionen sowie die Lösung einer Reihe weiterer komplizierter Fragen. Diese Schwierigkeiten lassen sich jedoch überwinden. Mit Hilfe des funktionalen Ansatzes – das scheint besonders wichtig – wird es möglich sein, eine Klassifikation des gesamten Materials auf einheitlicher Grundlage vorzunehmen (Panfilov 1990).

## 8. Illustrativer Text

In der vietnamesischen Orthographie wird jede Silbe getrennt geschrieben, unabhängig davon, ob sie ein Wort oder einen Wortbestandteil repräsentiert.

### 1. Einleitung

Im folgenden geht es vornehmlich um die Problematik der morphologischen Beschreibung einer nicht primär auditiv, sondern primär visuell wahrnehmbaren Sprache, der Deutschen Gebärdensprache (DGS), stellvertretend für die verschiedenen existierenden Gebärdensprachen der Gehörlosen. "SprecherInnen" dieser Sprache (in der Linguistik sind noch keine auf Gebärdensprachen bezogenen Ersatztermini für "SprecherIn – HörerIn" etabliert) sind in Deutschland schätzungsweise 80.000 prälingual Gehörlose sowie eine Anzahl schwerhöriger und hörender Personen wie hörende Kinder gehörloser Eltern oder GebärdensprachdolmetscherInnen. Die Weltgesundheitsorganisation geht davon aus, daß weltweit 0,08–0,1 Prozent der Bevölkerung prälingual gehörlos sind.

Entgegen dem landläufigen Glauben gibt es keine internationale natürliche Gebärdensprache, sondern untereinander nur begrenzt verständliche (nationale) Gebärdensprachen, die in bestimmten Bereichen strukturelle Gemeinsamkeiten haben. Dabei sind die jeweili-

gen Gebärdensprachen keine Erfindung der hörenden GehörlosenlehrerInnen zum Zweck der sogenannten Sprachanbahnung, sondern von den Gehörlosen-Gemeinschaften in der Alltagskommunikation selbst entwickelte Sprachen. Für die Sprachgeschichte können wir davon ausgehen, daß, wo immer Gehörlose zusammentreffen, zunächst in der Familie, später verstärkt durch die Bildung größerer Gehörlosen-Gemeinschaften in Städten, dann durch das "institutionalisierte Taubstummenwesen" (in Deutschland ab dem Ende des 18. Jahrhunderts durch Samuel Heinicke), gebärdete Kommunikationsformen ausgebildet werden, die u. a. durch Konventionalisierung über Generationen hinweg zu Gebärdensprachen entwickelt werden (wir wollen mit dieser Aussage Gebärdensprachentwicklung nicht an Schulgründungen binden – für Paris ist z. B. belegt, daß es dort eine Gehörlosengemeinschaft unabhängig von der Gründung der Pariser Schule gab; vgl. Desloges 1779). Die sprachlichen Minderheiten der Gehörlosen sind soziolinguistisch insofern eine Besonderheit, als in der Regel ein Generationenbruch vorliegt. Da nur schätzungsweise 10 Prozent der Gehörlosen auch gehörlose Eltern haben, lernen die meisten Gehörlosen Gebärdensprache nicht von ihren Eltern, sondern in der *peer group* resp. von älteren SchülerInnen, vorzugsweise von gehörlosen Kindern gehörloser Eltern.

Es handelt sich bei der Deutschen Gebärdensprache (wie bei jeder Gebärdensprache Gehörloser) um eine Sprache mit eigener Grammatik und Lexik. Damit nicht identisch sind andere visuelle Kommunikationsformen

wie z. B. von Gebärdensprache begleitetes Deutsch ("lautsprachbegleitendes Gebärdensprache") oder das Fingeralphabet (mit welchem deutsche Wörter "in der Luft buchstabiert" werden), auch wenn einige dieser Elemente für bestimmte Teifunktionen in die Deutsche Gebärdensprache integriert sind.

Die Deutsche Gebärdensprache wird im deutschsprachigen Raum benutzt. Hier wie auch für andere Gebärdensprachen ist beim jetzigen Stand der Dialektforschung eine Bezeichnung wie "die" Deutsche Gebärdensprache allerdings eher eine Notlösung. Es gibt bisher weltweit keine normierten Gebärdensprachen Gehörloser; die Gebärdensprachdialektologie steckt noch in den Anfängen. Mehr als in sonstigen soziolinguistischen Fragen spielen bei Gebärdensprachdialekten neben geographischen Verhältnissen die jeweiligen Gehörlosenschulen eine Rolle; auch in der Deutschen Gebärdensprache erkennen Gehörlose sich z. T. als (ehemalige) Angehörige unterschiedlicher Schulen/Internate aufgrund des jeweiligen Gebärdensprachdialekts, obwohl Gebärdensprache in den Schulen bisher kein reguläres Schulfach ist, sondern allenfalls im Rahmen von Modellversuchen oder Lerngruppen unterrichtet wird.

Keine Gebärdensprache Gehörloser hat eine Gebrauchsschrift. Für die Deutsche Gebärdensprache wie auch international gibt es keine gebräuchlichen Schriftsysteme, sondern allenfalls miteinander konkurrierende, wenig verbreitete Gebärdensprach-Verschriftungsvorschläge oder Gebärdensprach-Notationen für den wissenschaftlichen Gebrauch. Die erste Gebärdensprachsschrift, die ausdrücklich Alltags- wie gelehrt Zwecken dienen sollte, wurde zu Beginn des 19. Jahrhunderts in Paris entwickelt (Bébian 1825; vgl. Fischer 1995); nicht zuletzt aus sprachpolitischen Gründen wurde ihre Verwendung an der Pariser Schule regelrecht verhindert.

Folglich gibt es im strengen Sinne keine historischen Quellen der Deutschen Gebärdensprache – und dies, obwohl z. B. Graßhoff in Anerkennung eines leistungsfähigen Kommunikationsmediums für eine "Lebens-Erliechterung der Taubstummen durch Gründung einer Taubstummengemeinde" (Graßhoff 1820: Titel) plädierte, in der sie – wie man heute sagen würde – als sprachliche Minderheit "die ihnen allen gemeinsame Gebärdensprache" (1820: 6) verwenden würden. Zwar gibt es etliche Quellen, die vor allem Einzelgebärden aus dem deutschen Sprachraum beschreiben oder sie in Zeichnungen

darstellen (vgl. Fischer 1996); als frühe Zeugnisse der Deutschen Gebärdensprache können sie aber unseres Wissens insofern nur eingeschränkt gelten, als

- sie (bis auf zeichnerische Darstellungen) lautsprachvermittelt (d. h. in Lautsprache beschriebene Gebärdensprache) sind, also genau genommen keine Primärquellen darstellen;
- sie ausgewählte Einzelgebärdenbeschreibungen darstellen, Angaben z. B. über Syntax oder auch nur über Gebärdensprachverknüpfung weitgehend fehlen;
- sie z. T. keine Gebärdensprache Gehörloser, sondern z. B. Mönchsgebärden (Leibniz 1717) sind;
- fast alle Gebärdensprachbeschreibungen von Hörenden stammen, die sie für bestimmte (pädagogische u. a.) Zwecke formulieren; d. h. diese Gebärdensprachbeschreibungen sind in Auswahl und Form abhängig vom pädagogischen Zweck, also nicht ohne weiteres als authentische Gebärdensprache Gehörloser zu bezeichnen (Czech 1836; Reich 1834; Gebärdensprachbeispiele aus beiden Werken sind von R. Fischer in Reich 1991 zusammengestellt worden).

Der wohl wichtigste Aspekt noch heute sowohl für die GebärdensprachverwenderInnen wie auch für die Gebärdensprachforschung ist die Tatsache, daß Gebärdensprachen unterdrückte Sprachen sind – im Fall der Deutschen Gebärdensprache eine fast mit allen Mitteln unterdrückte Sprache, denkt man an die Gesetzgebung zur "Verhinderung erbkranken Nachwuchses" im Dritten Reich mit Zwangssterilisation und Zwangsausbildung mit dem Ziel der Ausrottung von (unter anderem) erblicher Gehörlosigkeit (Biesold 1988; Fischer et al. 1997). Erst das Sozialgesetzbuch IX (2001) und das Bundes-Behindertengleichstellungsgesetz (2002) haben eine neue gesetzliche Grundlage in Richtung auf kommunikative Barrierefreiheit geschaffen.

## 2. Problem der Entwicklung von Beschreibungskategorien

Auf internationaler Ebene setzt man den Beginn der Gebärdensprachforschung nach 1960 mit der verspätet einsetzenden Rezeption der Arbeiten Stokoes an (beispielsweise Stokoe 1960). Eine solche Einordnung läßt allerdings außer acht, daß im 19. Jahrhundert in verschiedenen europäischen Ländern eine

auch sprachwissenschaftlich orientierte Beschäftigung mit Gebärdensprache, teilweise durch Gehörlose selbst, bereits möglich war, bevor in der zweiten Hälfte des 19. Jahrhunderts länderübergreifend die Unterdrückung der Gebärdensprachen (erneut) durchgesetzt wurde. Die 40 Jahre neuerer linguistischer Forschungstätigkeit zu Gebärdensprachen haben (durchaus politisch mitbedingt) Arbeiten insbesondere über die Amerikanische (*American Sign Language*, ASL), die Australische (*Auslan*) und die Britische Gebärdensprache (*British Sign Language*, BSL) sowie über skandinavische Gebärdensprachen hervorgebracht. Für die Deutsche Gebärdensprache gibt es bisher weder eine präskriptive noch eine deskriptive Grammatik. Interessierte können einen ersten Eindruck von Strukturbeschreibungen aus Boyes Braem (¹995) gewinnen; die Verfasserin geht jedoch ausdrücklich nicht speziell auf die Deutsche Gebärdensprache ein, sondern gibt als Ziel an, „die linguistischen Prinzipien (zu) illustrieren, die allen Gebärdensprachen gemeinsam sind“ (Boyes Braem ¹995: 15).

In gewisser Weise ist dieser Stand Spiegel der oben kurz angedeuteten Situation der Unterdrückung der Gebärdensprachen, zu der auch die jahrhundertealte Fixiertheit auf Lautsprache als vermeintliches Definiens des Menschen gehört.

Diese Umstände wirken sich in der Gebärdensprachforschung inhaltlich aus. Die Gebärdensprachforschung ist überwiegend orientiert an Lautsprachlinguistik, indem sie ganz grundsätzlich auf deren Kategorien aufbaut. Dies geschieht als zunehmend reflektierter Rückgriff auf bereitliegende wissenschaftliche Begrifflichkeit oder ganz offen in der Absicht, Gebärdensprachen sprach- und gesellschaftspolitisch zur Anerkennung zu verhelfen. Comrie notierte als einer der ersten UniversalienforscherInnen als Desiderat typologischer Forschung, daß Gebärdensprachen zu beachten seien; er tat dies mit dem ausdrücklichen Hinweis, daß sich viele der heute noch als Universalien geltenden Aspekte bei Beachtung von Gebärdensprachen schlicht als Eigenheiten des Mediums, nicht aber als Charakteristikum einer „Sprachfähigkeit“ herausstellen könnten (Comrie 1981: 221).

### 3. Aspekte der Morphologie in Gebärdensprachen

Wir greifen zunächst, um einen Eindruck zu vermitteln, auf Arbeiten zu morphologischen Teilbereichen verschiedener Gebärdenspra-

chen zurück; dabei verzichten wir weitestgehend auf die u. E. ansonsten erforderliche Spezifizierung der jeweiligen Gebärdensprache.

Zentrale Bedeutung für Gebärdensprachverwendung und -beschreibung hat der Umgang mit dem dreidimensionalen **Gebärdensraum**, der sich vor Oberkörper und Kopf der Gebärdenden befindet. In ihm kommen insbesondere die Hände und Arme, aber auch der Oberkörper insgesamt sowie der Kopf, Mimik und insbesondere auch der Mund (Mundbild, Mundgestik u. ä.) zum Einsatz. Die in diesem Gebärdensraum geleistete sprachliche Lokalisierung und Repräsentation von „Objekten“ oder Vorgängen mutet zunächst so anders als die Grammatik von Lautsprachen an, daß in früheren Phasen der Gebärdensprachforschung des 20. Jahrhunderts durchaus noch Formulierungen benutzt wurden, die die heute übliche Verwendung von Kategorien der Lautsprachlinguistik als nicht zwingend erweisen. So sagt beispielsweise Deuchar:

“(… ) we find that the nearest approximation to inflection for case is spatial modification (… ).” (Deuchar 1978: 80)

“So in a limited class of BSL verbs the direction of movement, and in some verbs the orientation also, indicate the case roles associated with those verbs. This may be compared to inflection in spoken languages, except that it is more restricted.” (Deuchar 1978: 82)

Unseres Wissens ist bisher keine Gebärdensprachmorphologie in ihrer Gesamtheit beschrieben und typologisch eingeordnet worden. Man ist lange davon ausgegangen, daß **Gebärden** in nicht unerheblichem Maß quasi isoliert als Einzelgebärden vorkommen. Soffern man sich für diese Einschätzung auf die Ebene der Hände beschränkt und nicht-manuelle Elemente wie Mimik oder Körperhaltung unberücksichtigt läßt, mag eine derartige Aussage für etliche Gebärden vertretbar scheinen. Daneben sind schon früh Gebärden aufgefallen, die sich einer derartigen Einstufung vollkommen entziehen und die man z. B. aufgrund des Eindrucks, daß sie reale Abläufe direkt nachzuahmen scheinen, anfangs noch für eher pantomimische, i. S. von nicht-analysierbare und „nicht-sprachliche“ Elemente hielt. Im Zuge der weiteren Gebärdensprachforschung sind nun diese komplexen Gebärden mit ihrem Flexionsreichtum und ihrer polysynthetischen Gebärdensstruktur zu einem viel bearbeiteten Gegenstand ge-

worden. Das Vorliegen oder Nicht-Vorliegen morphologischer Komplexität wird zur Unterscheidung von Gebärdentypen verwendet (beispielsweise die Verbklassen "inflecting verbs – plain verbs – spatial verbs" seit Padden 1988).

Für die Amerikanische Gebärdensprache ist eine Wortartenunterscheidung in Verben und Substantive postuliert worden u. a. der Art, daß die jeweilige Nominalgebärde in der Bewegung kürzer sei und als solche wiederholt werde (Supalla & Newport 1978).

Für die semantische Kategorisierung wurden etliche Ausdifferenzierungen vorgeschlagen. Es scheint beispielsweise relativ unstrittig, daß in Gebärdensprachen Negationsinkorporation vorliegt; daß Tempus wohl keine morphologische Kategorie darstellt, wohingegen es diverse Aspektunterscheidungen auch mit Mitteln der Mimik zu geben scheint; daß Numerus morphologisch beschreibbar ist, nicht aber Genus (Smith 1990 legt nahe, daß sich in der Taiwanischen Gebärdensprache als bisher erster diese Markierung doch finden läßt). Über das Vorkommen von "Person"-Markierung ist z. Zt. eine Diskussion im Gange. Generizität werde morphologisch realisiert u. a. durch Wegfall bestimmter Kongruenzmorpheme. In formaler Hinsicht überwiegen diversen Darstellungen zufolge Inkorporation und Flexion als morphologische Prozesse.

Angesichts letzterer scheint für die strukturelle Bearbeitung von Gebärdensprachen die Morphonologie von besonderer Bedeutung zu sein. Das meist verwendete, von Stokoe (1960) begründete, später erweiterte phonologische Modell für Gebärdensprachen sieht die Gebärdensbeschreibung mithilfe der phonologischen (cherologischen) Merkmale Handform, Handstellung, Ausführungsstelle und Bewegung (mit jeweils einer Anzahl von Unteraspekten) vor. Diesem Modell liegt zentral die Annahme der Simultaneität der verschiedenen Merkmale zugrunde; ein anderes Modell betont demgegenüber mit seiner Unterscheidung von Bewegungs- und Halte-Segmenten Sequentialität (Liddell & Johnson 1989) und ermöglicht darüber hinaus die morphonologische Beschreibung von Gebärdensstrukturen über Leerstellen.

Mit der auf Stokoe basierenden phonologischen Beschreibung lassen sich Gebärdeminimalpaare aufstellen und einordnen; für die Deutsche Gebärdensprache z. B. RUSSLAND vs. KUH, wo dem obigen Modell zufolge der Aspekt der Ausführungsstelle (Kinn

vs. Stirnseite) unter Beibehaltung aller anderen Merkmale bedeutungsentscheidend wirkt. Variiert man Merkmale, so erhält man nicht immer Minimalpaare oder Nonsensegebärden, sondern in vielen Fällen eine grammatische Modifikation (Flexion, Inkorporation) des ursprünglichen Gebärdentokens.

#### 4. Modell der Morphologie der Bewegungsverben

In verschiedenen Gebärdensprachen gelten **Bewegungsverben** aus der Gruppe der "spatial verbs" als ein Bereich komplexer morphologischer Verhältnisse; man zählt sie zu den polysynthetischen Konstruktionen. An ihnen möchten wir den von KritikerInnen so genannten "traditionellen" Ansatz der Gebärdensprachlinguistik (d. h. denjenigen, der Kategorien der Lautsprachlinguistik übernimmt) exemplifizieren. Wir tun dies anhand einer frühen Analyse, die für diesen Bereich wohl als die ausgearbeitetste gelten durfte, nämlich die von Supalla (1978; 1982; 1986; 1990) für die Amerikanische Gebärdensprache vorgestellte. Bei dieser morphologischen Analyse sind zunächst zu trennen 1) der Stamm und 2) fakultative Affixe wie dasjenige für Aspekt. Die Morphologie des Verbstammes selbst wird beschrieben als eine Kombination von a) obligatorischen und ggf. zusätzlichen fakultativen Elementen aus dem Bereich **Bewegung** mit b) anderen obligatorischen Affixen, die über den die Bewegung ausführenden **Körperteil** zu beschreiben sind.

- zu a): Die jeweilige Bewegung stellt in den meisten Fällen ihrerseits eine Morphemkombination aus obligatorischer Wurzel und fakultativen anderen Bewegungsaffixen dar. Dabei entspricht die Wurzel einer der Basisprädikationen für die dazugehörigen Nomina: 'existence' – 'location' – 'motion'. Es gibt nur eine begrenzte Anzahl Wurzeln, die ihrerseits aus einer noch geringeren Anzahl von Bewegungsmerkmalen wie 'stative' oder 'linear' zusammengesetzt und zu komplexen Bewegungsfolgen kombinierbar sind. Fakultativ können hinzukommen sekundäre Bewegungsaffixe für aa) 'degree of change', bb) 'directionality of change' und cc) 'frequency of change' (verstanden als Art der Bewegung), wobei es jedoch für die Kombination mit den Wurzeln verschiedene Restriktionen gibt.

	BEWEGUNGSKOMPONENTE		KLASSIFIKATOR	
	{ART}	{RICHTUNG/PFAD}	{KÖRPER(TEIL)}	semantisch
1. Sequenzteil	+	-	+	-
2. Sequenzteil	-	+	-	+

Tab. 143.1: Morphemkombinationsrestriktionen

– zu b): Der die Bewegung realisierende Körperteil verweist in Bewegungsverben auf (semantische) Merkmale und ggf. Lokalisation des oder der betreffenden Referenten und wird von Supalla in Analogie zu einigen Lautsprachen als Klassifikator eingeordnet (s. Art. 97). Die mit Bewegungsverben kombinierten Klassifikatortypen sind diejenigen der semantischen Klassifikatoren, bei denen sogenannte abstrakte semantische Merkmale oder Merkmalskombinationen wie ‘vertikal’ oder ‘mit zwei Beinen’ zum Tragen kommen, und diejenigen der Körper(teil)-Klassifikatoren, bei denen der Körper oder Körperteile auf den-/dieselben oder auf andere, über eine Ähnlichkeitsrelation verbundene Körperteile (Hände für Füße u. ä.) des jeweiligen Referenten(nomens) verweisen. Die Körper(teil)-Klassifikatoren werden von Supalla nicht in den phonologischen Teil der Analyse einbezogen; die jeweils wechselnde Handform gilt somit als morphonologisches Merkmal des betreffenden Klassifikators. Im Unterschied zu anderen, als multi-morphemisch analysierten Klassifikatortypen (z. B. den “size-and-shape-specifiers”) sieht Supalla sowohl die semantischen wie die Körper(teil)-Klassifikatoren als je ein Morphem an.

Semantische Klassifikatoren haben eine morphonologische Markierung der Hand als ausführendem Körperteil nicht nur über die Form, sondern Supallas Analysen zufolge auch über Orientierung und Plazierung der Hand; hierbei werden Aspekte aus dem Bereich “reference scale” morphologisch gefasst.

## 5. Serialverb-Konstruktionen

Die unter 4. skizzierte Morphonologie der Bewegungsverben basiert auf der Annahme, daß alle Morpheme simultan vorkommen. Supalla (1990) sieht jedoch eine Modifikation insofern für angebracht an, als er einige

grammatische Restriktionen ausgemacht hat, die die Sequentialität von Morphemgruppen erzwingen und dadurch eine spezielle Konstruktion, von Supalla in Anlehnung an Lautsprachen **serial verbs** genannt, hervorbringen. Hierbei werden, anders als in den simultan ausgeführten Morphemkombinationen, die verschiedenen Komponenten eines einzigen Geschehens in der Versprachlichung nicht in einem einzigen Verbkomplex verknüpft, sondern auf eine Gebärdensequenz in charakteristischer Weise verteilt.

Beide Teile der Sequenz bestehen wie jedes “normale” Bewegungsverb mindestens aus einem Bewegungskomplex und einem Morphem für den Klassifikator. Jedoch sind erster und zweiter Verbalteil unterschiedlich spezifisch in Hinblick auf Bewegung und Klassifikator. Der erste Sequenzteil enthält für die Bewegungskomponente ein Morphem {ART DER BEWEGUNG}; der zweite hat mindestens ein Morphem {RICHTUNG UND PFAD DER BEWEGUNG}. Obwohl der Referenzausdruck der gleiche ist, fällt das Morphem dafür im ersten Sequenzteil anders aus als im zweiten: {ART DER BEWEGUNG} wird verbunden mit einem Morphem, das für Supalla zur ikonischen Gruppe der so genannten Körper(teil)-Klassifikatoren gehört; die übrigen Bewegungsmorphe werden im zweiten Teil mit einem Morphem der “abstrakteren” Klasse der “semantischen” Klassifikatoren verbunden.

Supalla führt als Erklärungen für die “serial verbs”-Sequentialität an:

- schwierig auszuführende Bewegungen (“physical restrictions on simultaneity”; Supalla 1990: 131 f.);
- “arbitrary grammatical restrictions” (Supalla 1990: 132), zu denen essentiell die morphonologischen Kombinationsbeschränkungen gehören, die die Verbindbarkeit a) bestimmter Bewegungsmorphe untereinander, b) bestimmter Bewegungsmorphe mit bestimmten Klassifikatortypen betreffen.

S. Fischer & Janis (1990: 287) erwägen darüberhinaus das Kriterium "heaviness": daß es "too many inflections" an einer Verbwurzel geben könnte.

## 6. Gegenpositionen

Supallas morphonologische Analysen sind nicht unwidersprochen geblieben. Wir möchten zur Illustration der grundsätzlichen Problematik einige Gegenvorschläge erwähnen.

Noch im Rahmen morphologischer Analysen bleiben die Ansätze z. B. von Schick und Engberg-Pedersen. Schick (1990) kritisiert an Supalla, seine morphonologische Analyse sei mit einem wichtigen Charakteristikum gebärdensprachlicher Klassifikatorprädikate unvereinbar, nämlich mit ihrer **Ikonizität** (s. Art. 30). Daher möchte sie – neben anderen Abweichungen von Supallas Analyse – für die Bewegungsmorphe in diesen Prädikaten folgende drei Klassen, die der Ikonizität gerecht würden, zugrundelegen: "movement through space (MOV), a stylised imitation of real-world action (IMIT), and a single point in space (DOT)" (Schick 1990: 17). Im Vergleich mit Supallas erscheint ihre morphologische Analyse entsprechend "gröber".

Ebenfalls auf der Basis morphologischer Analysen arbeitet Engberg-Pedersen (insbesondere Engberg-Pedersen 1993). Neben einer anders vorgenommenen morphologischen Analyse und der Ablehnung der Klassifikator-Interpretation (Engberg-Pedersen 1989; Engberg-Pedersen & Pedersen 1985) ist die bei ihr vorfindbare Abweichung von Supalla eine inhaltlich-funktionale Interpretation. So findet sich in ihren Analysen eine Beachtung lange vernachlässigter, auch für morphologische Analysen relevanter Aspekte, insbesondere bezüglich der Gebärdensprachenverwendung im Diskurs, womit sie über Einzelgebärden oder Beispielsätze hinausgeht. Sie beschäftigt sich mit der gleichzeitigen Verwendung beider Hände außerhalb von Zwei-Hand-Gebärden, mit Fragen von Figur-Grund-Realisierungen, mit der Variation bei der Artikulatorenwahl für identische Referenten.

S. Fischer & Janis (1990), die bei einem Nachvollzug die Analysen Supallas betreffend Serialverben experimentell nicht durchgehend bestätigen konnten, bringen die von Supalla beschriebenen Konstruktionen in Verbindung mit Satzkonstruktionen, die ebenfalls bestimmte Formen der Sequentiali-

tät incl. Teilwiederholungen beinhalten (vorläufig "verb sandwiches" genannt). So gesehen wären Supallas Serialverb-Konstruktionen weniger morphonologisch als (morpho-)syntaktisch, dann auch pragmatisch zu analysieren.

Andere Ansätze (bisher in geringerer Zahl) stellen dagegen die an Lautsprach-Morphologie orientierte Analyse an sich in Frage mit der Begründung, sie sei in verschiedener Hinsicht für Gebärdensprachen nicht adäquat (daß Lautsprach-Linguistik auch ihren Gegenstand Lautsprache reduziert, ihm nicht in seiner Komplexität gerecht wird, wird dabei bisher nicht eigentlich in Betracht gezogen). Die grundsätzliche Frage, was in Gebärdensprachen überhaupt als Morphem gelten kann, muß als nicht geklärt angesehen werden, trotz des Vorliegens einer Reihe morphologischer Detailanalysen. So ist beispielsweise Supallas detailliertes morphologisches Modell nur haltbar, wenn die differenzierte Analyse auf die Hände beschränkt wird. Anderweitige Untersuchungen haben aber inzwischen erwiesen, daß die grammatische Strukturierung in Gebärdensprachen über eine Interaktion der diversen körperlichen Artikulatoren bewerkstelligt wird, die nicht einfach eine Addition isoliert bearbeiteter Artikulatorenmorphologien o. ä. darstellt – eine derartige Komplexität ist linguistischerseits bisher überhaupt nicht beschreibbar.

Zu den frühen Gegenvorschlägen zählen die Arbeiten Jouisons, die durch seinen Tod 1991 ein Ende gefunden haben. Jouison hat ebenfalls grundsätzliche Kritik geäußert und bereits Einzelanalysen, die u. a. das Klassifikatorproblem in polysynthetischen Verben berühren, vorgelegt (u. a. Jouison 1989). Charakteristikum seines Ansatzes ist, der "Faszination der Hände" entgehen zu wollen und stattdessen das körperliche Gesamtgeschehen im gebärdensprachlichen Diskurs zu beachten (Jouison 1992). Er nimmt eine doppelte Gliederung der Gebärdensprachen an; bereits bei der Bearbeitung der *signifiant*-Ebene verzichtet er auf eine Reduktion auf die manuelle Ebene. Dies wird in Verbindung mit der Grundlage Ikonizität zum Bestimmungsfaktor seiner Systemskizze: Ausgehend von der Ähnlichkeitsbeziehung des körpersprachlich Geformten mit dem außersprachlichen Gemeinten ("Objekt" oder Handlung), sucht er die von dieser ikonischen Beziehung implizierten Relationen der ausführenden Artikulationsorgane untereinander und gelangt so zu Hypothesen über phonologische und

morphologische Inventare, die gleichermaßen einem systematischen, nicht-pantomimischen Charakter der (Französischen) Gebärdensprache wie auch ihrer offensichtlichen Ikonizität Rechnung tragen sollen.

Für den deutschsprachigen Raum verweisen wir auf die Kritik des "traditionellen" Ansatzes bei Ebbinghaus & Heßmann (1991). Sie greifen auf "vergessene" frühere Vorschläge (insbesondere von DeMatteo in den 70er Jahren) zurück und kritisieren die vorherrschende Tendenz, "ausschließlich auf diskretisierbare Einheiten Bezug (zu nehmen)" und dabei "die Möglichkeit der Dynamisierung des ikonischen Potentials" als "eine der wesentlichsten Eigenschaften gebärdensprachlicher Zeichengenerierung" unberücksichtigt zu lassen (Ebbinghaus & Heßmann 1991: 65).

## 7. Weiterentwicklung

Seit 1992 hat sich international und auch bezüglich der Deutschen Gebärdensprache gebärdensprachlinguistisch sehr viel getan, so daß unser Beitrag auf grundsätzliche Fragen bezüglich gebärdensprachlicher Morphologie verweist statt den aktuellen Forschungsstand wiederzugeben. Bezüglich der Klassifikatorkonstruktionen, für die wir Supallas klassische morphologische Analyse vorgestellt haben, bietet Emmorey (2003, ed.) einen Einblick in derzeit diskutierte Forschungsperspektiven.

Zu diesen grundsätzlichen Fragen zählt weiterhin die Berücksichtigung beziehungsweise linguistische Identifizierung ikonischer/motivierter Gebärdanteile. So werden zum Beispiel wechselnde Ausführungsstellen bei der Gebärdengruppe der Kongruenzverben/Richtungsgebärden als grammatischer Bestandteil (Kongruenz) einer polymorphemischen Gebärde resp. als ein durch räumliche Faktoren motivierter gestischer Gebärdanteil interpretiert (vgl. Liddell 2000). Keller (1998) diskutiert eine Anzahl morphosyntaktischer Phänomene, u. a. Kongruenz, umfassend vor dem Hintergrund der grammatisierten Raumnutzung in der Deutschen Gebärdensprache.

Bis heute ist die morphologische Beschreibung der manuellen Ebene fortgeschritten gegenüber derjenigen der non-manuellen Komponenten, und um so mehr fehlt es an Vorschlägen für deren gemeinsame morphologische Betrachtung. Mit Ebbinghaus (1996)

liegt ein Beispiel für die Leistung der non-manuellen Komponente Blick(-richtung) für Referenz in Deutscher Gebärdensprache vor. Fachgebärdensleksikographische Arbeiten haben zunächst praktische Probleme identifiziert und dann zur vertieften Auseinandersetzung mit der "Wortstruktur" in der Deutschen Gebärdensprache geführt; die Schwierigkeiten, ein Lemma angesichts einer durch ggf. zahlreiche grammatische Leerstellen charakterisierten Gebärdensstruktur zu bestimmen, ähneln denjenigen, mit denen "die" (Lautsprach-) Linguistik bei so genannten kleinen Sprachen außerhalb des indo-europäischen Sprachraums konfrontiert ist. Damit hängt ferner auch das Problem zusammen, ein Lemma X als einen Gebärdentyp semantisch und morphologisch von Tokens und anderen Types zu unterscheiden (Konrad et al. 2001; vgl. auch Ebbinghaus & Heßmann 2000). Linguistische Identifizierung und Terminologiearbeit gehören entsprechend weiterhin notwendig zur Gebärdensprachforschung.

Mit der Gebärdensstruktur im Sinne der Wortartenbeschreibung und Wortbildung beschäftigen sich für die Deutsche Gebärdensprache zum Beispiel Becker (2001) und Erlenkamp (2000). Morphologische Aspekte berücksichtigen auch die Studien zu Vergebärdlern ("Versprechern") in Deutscher Gebärdensprache (Happ & Hohenberger 2001).

Angewandte Linguistik als kontrastive Grammatik für Deutsch und Deutsche Gebärdensprache ist ebenfalls ein neuer gebärdensprachlinguistischer Bereich, in dem für die Numeruskongruenz didaktisch aufbereitete Materialien zur Verfügung stehen (Fischer et al. 2000).

Die vorherrschenden Untersuchungsebenen sind weiterhin die Einzelgebärde und der Beispielsatz, textgrammatische Forschungen dagegen noch der Einzelfall.

Dies gilt auch für die textlinguistische Relevanz von Perspektivierung und Rollenwechsel, die zu den grundlegenden Charakteristika von Texten der Deutschen Gebärdensprache gehören.

Insgesamt muß trotz aller in den vergangenen Jahren erreichten Fortschritte in der Gebärdensprachforschung festgestellt werden, daß viele theoretische Fragen noch ungeklärt sind und darüber hinaus so wichtige Bereiche wie die Lehre der Deutschen Gebärdensprache und die GebärdensprachdolmetscherInnenbildung hohe Anforderungen stellen (vgl. Johnston 2000; Kollien 2000; Leven

2001), denen auch in der Zukunft von Seiten der Gebärdensprachforschung begegnet werden muß.

3. Herkunft der Morpheme
4. Wortbildung
5. Grammatische Kategorien und Paradigmen
6. Linguistische Bedeutung
7. Illustrative Texte
8. Zitierte Literatur

### 1. Zum Begriff "Plansprache"

**Plansprachen** sind nach bestimmten Kriterien bewußt geschaffene sprachliche Systeme von meist regelmäßigerer Struktur als Ethnospalten. Sie sollen vor allem der Erleichterung der internationalen sprachlichen Kommunikation dienen. Sie folgen ethnospachlichen Vorbildern kaum oder gar nicht (apriorische Systeme) oder lehnen sich an solche in mehr oder weniger starkem Maße an (aposteriose Systeme). Ihre Strukturen folgen entweder stärker genetischen oder funktionalen Gesichtspunkten (vgl. Back 1996: 883 f.; Blanke 1985: 99–110; Couturat & Leau 2001; Large 1985). Der Terminus wird in der interlinguistischen Fachliteratur zunehmend synonym für **Universalsprache** (universal language), **internationale Kunstsprache/künstliche Sprache** (international artificial language) und **Welthilfssprache** (auxiliary world language) verwendet (vgl. Blanke 1997).

Plansprachen werden von der **Interlinguistik** untersucht, deren Gegenstand einige Autoren nicht auf Plansprachen begrenzen (vgl. Blanke 1998 a: 47–58; Sakaguchi 1998: 309–322; Schubert 1989: 7–18). Bis 1973 wurden 912 Plansprachensysteme bibliographisch erfaßt (vgl. Duličenko 1990: 13). Ihre Zahl liegt inzwischen bei weit über 1000. Zahlreiche Autoren veröffentlichen ihre neuen Projekte im Internet (vgl. Becker 2001).

Die meisten Autoren woll(t)en durch ihre Projekte einen Beitrag zur Völkerverständigung und für eine demokratischere und effektivere internationale Kommunikation leisten. In Abhängigkeit von philosophischen, sprachbezogenen und auch politischen Grundauffassungen wird dieses Hauptmotiv jedoch in den einzelnen Jahrhunderten durch weitere Motive in unterschiedlichem Maße ergänzt und modifiziert. Hinzu kommt die Freude am spielerischen Umgang mit Sprache. Diese Motive (vgl. Blanke 2000: 43–52; Sakaguchi 1998: 36–53) und die angestrebten Zielgrup-

pen (z. B. gebildete Elite vs. breitere Schichten, Weltregionen vs. gesamte Welt) haben die morphologische Struktur der einzelnen Plansprachensysteme mitgeprägt.

### 2. Volapük, Esperanto und Interlingua

Nur wenige Plansprachensysteme konnten sich vom Projekt zu einer in der Praxis funktionierenden Sprache entwickeln, eine Unterscheidung, die oft übersehen wird (vgl. Blanke 2000: 51–56). Auf Volapük, Esperanto und Interlingua wird genauer eingegangen.

Volapük wurde 1879 von Johann Martin Schleyer (1831–1912) veröffentlicht und basiert vor allem auf stark modifizierter germanischer, französischer und lateinischer Lexik. Volapük verfügt über ausgeprägte Wortbildungsmöglichkeiten und eine regelmäßige Grammatik. Es ist die erste Plansprache, die in gewissem Maße in der Praxis funktioniert hat. Sie war besonders Ende des 19. Jahrhunderts bekannt. 1889 gab es weltweit ca. 400 Volapük-Klubs und 18 nationale und internationale Verbände. Es erschienen über 120 Zeitschriften, zahlreiche Lehrmittel, Original- und Übersetzungsleiteratur (vgl. Blanke 1985: 204–218, 335 f.; Haupenthal 1982). In den 20er Jahren wurden in Volapük Reformen vorgenommen (vgl. Bishop 1983). Dieses Volapük, das selbst Anfang des 21. Jahrhunderts noch einige Anhänger hat, wird hier behandelt (vgl. de Jong 1931; Schmidt 1933; Cherpillod 1995).

Interlingua, auf der Grundlage der Arbeiten der **International Auxiliary Language Association**, IALA (vgl. Blanke 1985: 167–173, 329 f.) maßgeblich von Alexander Gode (1907–1970) ausgearbeitet, erschien 1951 (vgl. Gode 1971; Gode & Blair 1971). Interlingua imitiert die romanischen Sprachen und ist ein Versuch, im Sinne von Benjamin L. Whorf das **Standard Average European** (SAE) zu modellieren (vgl. Gode 1953: 90). Interlingua hat eine relativ regelmäßige Grammatik. Seine Wortbildung orientiert sich völlig an den romanischen Vorbildsprachen. Die Sprache hat, vor allem in Europa, einige hundert Anhänger, die jährliche Treffen durchführen. In Interlingua erschienen im Jahr 2002 acht Zeitschriften. Es werden pro Jahr 10–15 Buchtitel, vor allem Lehrmittel, veröffent-

licht. Interlingua wird gelegentlich als Alternative zum Esperanto gesehen (vgl. Gopsill 1990: 107 f.).

Esperanto geht auf eine Projektskizze von Ludwig L. Zamenhof (1859–1917) zurück (vgl. Dr. Esperanto 1887) und ist eine voll entwickelte Sprache mit vorwiegend romanischer Lexik, einer produktiven Wortbildung und regelmäßiger Grammatik (vgl. Gledhill<sup>2</sup> 2000). Es verfügt über eine wachsende, sozial und fachlich differenzierte, in über 100 Ländern repräsentierte aktive Sprachgemeinschaft, die über eine Infrastruktur mit Buchproduktion (jährlich 200–250 Titel), Presse, Kulturzentren, Bildungseinrichtungen, Radiosendungen und zahlreichen Veranstaltungen verfügt (vgl. Lapenna et al. 1974; Blanke 2000: 59–69). Esperanto wird für diverse Kommunikationsbereiche verwendet und hat entsprechende Funktionalstile entwickelt (so u. a. als Umgangs-, Literatur- und Fachsprache). Diese Plansprache ist Gegenstand linguistischer Forschung (vgl. Blanke 2003; Tonkin & Fettes 1996: 9–15). Die Zahl der Esperanto-Kenner kann auf einige Hunderttausend geschätzt werden.

Die nur geringe Praxis von Volapük und von Interlingua haben kaum zu einem relevanten Sprachwandel geführt. Er beschränkt sich auf Neologismen in der Lexik. In Esperanto jedoch auf Grund seiner längeren Tradition und umfangreichen Praxis ist er konstatierbar, so u. a.: Herausbildung und Stabilisierung einer Aussprachenorm, Entlehnungen von Grundmorphemen als Basis für neue Wortbildungen, Entwicklung von Polysemie, Synonymie und (weniger) Homonymie, Entwicklung von Phraseologismen, stärkere Aus schöpfung der Wortbildungsmöglichkeiten, Entwicklung von Funktionalstilen (vgl. Philippe 1991). Die hier nur skizzenhaft mögliche morphologische Darstellung der drei Plansprachen geht von geschriebenen Texten aus.

### 3. Herkunft der Morpheme

Volapük, Esperanto und Interlingua verwenden das lateinische **Alphabet**. Volapük kennt auch die deutschen Umlaute <ä>, <ö> und <ü>. Es fehlen die **Grapheme** <q>, <w>. In Esperanto fehlen die Umlaute sowie <q>, <w>, und <y>. Es benutzt einige diakritische Zeichen: <ê> [ɛ], <î> [dʒ], <ô> [χ], <j> [ʒ], <ñ> [ʃ] und <û> [w]. In Esperanto und Volapük ist die Orthographie phonema-

tisch, in Interlingua dagegen historisch orientiert.

Die **Morpheme** der drei Plansprachen sind den europäischen Hauptsprachen entnommen und in unterschiedlichem Maße verändert worden.

Die Morpheme des Volapük stammen vor allem aus dem Englischen, Deutschen und Französischen sowie aus dem Latein. Sie wurden meist bis zur Unkenntlichkeit verändert:

- (1) engl. *knowledge* → *nol* ‘Wissen’, *speak* → *pük* ‘Sprache’; dt. *Mund* → *mud* ‘Mund’, *Dank* → *dan* ‘Dank’; lat. *animal* → *nim* ‘Tier’, *angulus* → *gul* ‘Ecke’; frz. *université* → *niver* ‘Universität’, *compliment* → *plim* ‘Kompliment’.

Die Morpheme des Esperanto der ersten zwei bis drei Jahrzehnte seiner Existenz entstammen zu ca. 75 Prozent latiniden Sprachen, zu 20 Prozent germanischen und zu 5 Prozent anderen (vgl. Janton 1993: 51). Sie wurden nach graphematischen, phonematischen und semantischen Gesichtspunkten ausgewählt und z. T. verändert (vgl. Szerdahelyi 1983: 285–290). Dabei geht es um Morpheme als Teile der synchronen Wortbildung:

- (2) lat. *augurare* → *augur-i* ‘wahrsgag-INF’, *certus* → *cert-a* ‘sicher-ADJR’; frz. *accoucher* → *akuš-i* ‘entbind-INF’, *crayon* → *krajon-o* ‘Bleistift-NR’; engl. *in spite of* → *spit-e* ‘trotz-ADVR’, *team* → *team-o* ‘Mannschaft-NR’; ital. *ancora* → *ankorau* ‘noch’, *autunno* → *aŭtun-o* ‘Herbst-NR’; dt. *Bild* → *bild-o* ‘Bild-NR’; russ. *kolbasa* → *kolbas-o* ‘Wurst-NR’, *krome* → *krom* ‘außer’.

Die Morpheme in Interlingua sind Durchschnittsformen des Italienischen, Spanischen, Portugiesischen und Französischen. Fehlt Übereinstimmung in mehr als einer dieser Sprachen, die als Kontrollsprachen gelten, so werden die Morpheme aus dem Lateinischen entnommen (vgl. Gode<sup>2</sup> 1971: XXVI). Die Äquivalente des Beispiels (1) lauten in Interlingua:

- (3) *cognoscentia* (*saper*), *lingua*, *bucca* (*ore*), *regratiamento*, *animal*, *angulo*, *universitate*, *complimento*.

Die Interlingua-Äquivalente für (2) lauten:

- (4) *auguar*, *certe*, *assister in le parto*, *stilo de graphite*, *malgrado*, *equipa*, *anque (etiam)*, *autumno*, *pictura*, *salsicia*, *foris de*.

**Wortstammvarianten** fehlen in Volapük und Esperanto, sind aber in Interlingua häufig, da

diese Plansprache das Wortbildungssystem ihrer Quellsprachen übernommen hat (z. B. zu *face-r* ‘mach<sub>1</sub>-INF (machen)’, *fact-o* ‘mach<sub>2</sub>-NR (Tatsache)’, *effect-o* ‘wirk<sub>1</sub>-NR (Wirkung)’, *effic-ace*, ‘wirk<sub>2</sub>-ADJR<sub>1</sub> (wirksam)’, *effect-ive*, ‘wirk<sub>1</sub>-ADJR<sub>2</sub> (wirklich)'). Nur in diachroner Sicht auf die Quellsprachen gibt es auch im Esperanto solche Varianten (*far-i* ‘mach<sub>1</sub>-INF (machen)’, *fakt-o* ‘mach<sub>2</sub>-NR (Tatsache)’, *efekt-o* ‘wirk<sub>1</sub>-NR (Wirkung)’, *efik-a* ‘wirk<sub>2</sub>-ADJR (wirksam)’, *efektiv-e* ‘wirk<sub>3</sub>-ADVR (wirklich)'). Sie sind synchron jedoch selbständige Basen für weitere Wortbildungen.

#### 4. Wortbildung

##### 4.1. Kompatibilität der Morpheme

Die Morpheme in Volapük und Esperanto zeichnet eine hohe **Kompatibilität** aus. Die **syntagma-internen Beziehungen** der unmittelbaren Konstituenten einer Konstruktion werden durch die Faktoren der phonologisch-morphologischen und der semantischen inneren **Valenz** gesteuert (vgl. Stepanova 1971). Das Wirken der semantischen Faktoren ist bei Volapük und Esperanto stärker möglich als bei Interlingua, deren Morphemkonstruktionen ihren Prototypsprachen folgen müssen und durch zahlreiche Ausnahmen gekennzeichnet sind. Volapük und insbesondere Esperanto zeichnen sich somit durch eine leistungsfähige autonome Wortbildung aus, die natürlich auch durch ethnopsprachige Einflüsse, Analogiebildung, die Morphemstruktur, Wirkungen der Sprachtradition und andere Faktoren beeinflußt wird. Die wichtigsten morphologischen Eigenschaften des Esperanto sind durch Unveränderbarkeit, hohe Kompatibilität und eine relativ einfache Struktur der vorwiegend romanischen Morpheme umrissen. Das unterstreicht das folgende Zitat des Begründers des Esperanto:

“Ich habe die bestehenden Begriffe vollständig *zergliedert*, so dass die ganze Sprache nur aus *unveränderlichen Wörtern* besteht, anstatt aus Wörtern mit einer unendlichen Anzahl von grammatischen Formen ... Verschiedene grammatischen Formen aber, so wie die gegenseitigen Beziehungen zwischen den Wörtern u. dergl., werden durch Anreihung unveränderlicher Wörter ausgedrückt ... er [der Lernende-DB] ahnt sogar nicht, dass das, was er Endung, Präfix oder Suffix nennt, ein völlig selbständiges Wort ist, das immer dieselbe Bedeutung behält, sei es am Anfang oder am Ende eines anderen Wortes, oder auch als selbständiges Wort; dass jedes Wort mit gleichem Rechte als Stammwort

oder als grammatisches Anhängsel gebraucht werden kann.” (Dr. Esperanto 1887: 13)

Zamenhofs Auffassung von der Zergliederung der Ideen in selbständige Elemente impliziert das Konzept vom lexikalisch-kategorialen Charakter der autosemantischen Grundmorpheme (vgl. Kalocsay & Warinighien <sup>5</sup>1985: 375–390), wonach diese substantivische, adjektivische oder verbale Grundbedeutung haben und erst durch Anfügen der wortkategorialen Suffixe auf die Wortebene gehoben werden. So hat das substantivische wortkategoriale Morphem {-o}, angefügt an das substantivische Morphem {film} (*film-o*, ‘Film-NR’), in lexikalischer Hinsicht pleonastische Bedeutung, trägt aber grammatische Information (Singular). An das verbale Grundmorphem {skrib} (*skrib-i* ‘schreib-INF’) angefügt, substantiviert es dieses (*skrib-o*, ‘Schrift’ oder ‘Schreiben’, in Abhängigkeit vom Kontext). Das bedeutet, daß in Esperanto Komposition als Wortbildungsvorfahren vorherrscht. Diese Theorie wurde durch den Bruder von Ferdinand de Saussure begründet (vgl. René de Saussure 1910; Coutrat 1907). Sie hat sich u. a. für kontrastiv-linguistische Untersuchungen (vgl. Blanke 1981) und für Zwecke der automatischen Übersetzung (vgl. Schubert 1997: 129 f.) bewährt.

##### 4.2. Einige Wortbildungstypen und -prozesse

Volapük, Esperanto und Interlingua unterscheiden sämtliche traditionellen **Wortarten**. In Esperanto können substantivische, adjektivische und verbale **Grundmorpheme** (Träger des Wortbedeutungskerns und Ausgangspunkt der Wortbildung) auf der Wortebene nur als gebundene Morpheme auftreten. Die **Autosemantika** sind morphologisch gekennzeichnet. Das betrifft in Volapük nur Adjektiv, Verb und abgeleitetes Adverb und in Interlingua ebenfalls Verb und abgeleitetes Adverb. Die folgende Tabelle macht das für drei Wortarten deutlich:

Abgeleitete Adverbien werden in Esperanto durch {e}, in Volapük durch {o} und in Interlingua durch {(a)mēte} gekennzeichnet: Esperanto *rapid-e*, Interlingua *rapidamente*, Volapük *vif-o* ‘Schnelligkeit-ADVR (schnell)’.

Da Interlingua den Wortbildungsmustern der romanischen Sprachen folgt, macht es dem romanisch Gebildeten – gemessen an seinen Sprachgewohnheiten – einen natürl-

	Substan-	Adjektive	Verben
	tive	(Inf.)	
Volapük	<i>böd</i>	<i>gret-ik</i>	<i>vob-ön</i>
	<i>plan</i>	<i>ful-ik</i>	<i>vok-ön</i>
	<i>nam</i>	<i>gol-ik</i>	<i>pön-ön</i>
Interlingua	<i>ave</i>	<i>grande</i>	<i>labora-r</i>
	<i>planta</i>	<i>plen</i>	<i>puni-r</i>
	<i>mano</i>	<i>prematur</i>	<i>voce-r</i>
Esperanto	<i>bird-o</i>	<i>grand-a</i>	<i>labor-i</i>
	<i>plant-o</i>	<i>plen-a</i>	<i>vok-i</i>
	<i>man-o</i>	<i>fru-a</i>	<i>pun-i</i>
(Deutsch)	<i>Vogel</i>	<i>groß</i>	<i>arbeiten</i>
	<i>Pflanze</i>	<i>voll</i>	<i>rufen</i>
	<i>Hand</i>	<i>früh</i>	<i>strafen</i> )

Tab. 144.1: Substantive, Adjektive und Verben in Volapük, Interlingua und Esperanto

cheren Eindruck als Esperanto und insbesondere als Volapük. Diese "Natürlichkeit" erhöht die passive Verständlichkeit der Texte, geht aber zu Lasten der Regelmäßigkeit in der Wortbildung. Diese wiederum erleichtert die aktive Beherrschung und von Vorbildsprachen unabhängige Abbildung von Begriffen, wie die folgende Tabelle für die von Substantiven abgeleiteten Adjektive zeigt:

In Esperanto ist das Hauptverfahren die **Komposition**. **Denominale Komposita** sind häufig:

- (5) *dom-o + pord-o → dom-pord-o*  
‘Haus-Tür-NR (Haustür’)

Weniger häufig sind **Deadjektiva**:

- (6) *rapid-a + trajn-o → rapid-trajn-o*  
‘schnell-Zug-NR (Eilzug’)

und **deverbale Komposita**:

- (7) *plor-i + lament-i → plor-lament-i*  
‘wein-klag-INF (wehklagen’)

Diese und auch mit Affixoiden gebildete Komposita:

- (8) *skrib-i + il-o* ‘schreib-INF + Instrument-NR (Schreibstift’); *mis-skrib-i* ‘NEG-schreib-INF (verschreiben’)

sind syntaktisch auflösbar, wie die auf (5)–(8) bezogenen Beispiele zeigen:

- (9) *pord-o de dom-o* ‘Tür-NR von Haus-NR’, *rapid-a trajn-o* ‘schnell-ADJR Zug-NR’, *plor-(ant-)e lament-i* ‘wein-(PART.AKT.PRÄS)-ADVR klag-INF’, *il-o por skrib-i* ‘Instrument-NR für schreib-INF’, *mis-e skrib-i* ‘NEG-ADVR schreib-INF’.

Esperanto verfügt traditionell über 10 Präfixe und 31 Suffixe, von denen der größte Teil als **Affixoide** angesehen werden kann, da sie auch als selbständige Basen für Wortbildungsprozesse funktionieren. Das ist in Volapük selten der Fall und fehlt in Interlingua. Konstruktionen nur aus Affixoiden sind häufig:

- (10) *estr-ar-an-o* ‘Leiter-Menge-Mitglied-NR (Vorstandsmitglied’); *re-dis-ig-i* ‘wieder-auseinander-INCH-INF (sich wieder trennen’).

Aber auch Adjektive, Präpositionen und andere Wortarten können den Status eines Affixoids erhalten, wenn sie reihenbildend sind:

- (11) *plen-a* ‘voll-ADJR’, *dolor-o* ‘schmerz-NR’ → *dolor-plen-a* ‘schmerz-voll-ADJR (schmerzvoll’), *labor-plen-a* ‘arbeit-voll-ADJR (arbeitsvoll, arbeitsreich’); *en* ‘in’, *ir-i* ‘geh-INF (gehen’ → *en-ir-i* ‘in-geh-INF (hineingehen’), *jet-i* ‘werf-INF (werfen’), *en-jet-i* ‘in-werf-INF (hineinwerfen’).

**Explizite Derivativa** entstehen durch Kombinationen von Grundmorphemen (*labor-o + temp-o → labor-temp-o* ‘arbeit-Zeit-NR (Ar-

Tab. 144.2: Adjektivableitungen von Substantiven in Interlingua, Esperanto und Volapük

beitszeit') oder durch Konstruktionen mit wortkat. Suffixen (*blu-a + okul-o + -a → bluokul-a* 'blau-Augen-ADJR (blauäugig)').

Die hohe Kompatibilität der Morpheme des Esperanto erlaubt oft eine weitestgehende Auffüllung von Modellen der Wortbildung. Es sei z. B. das Modell Präposition + Substantiv + faktitives Suffix *-ig-* angeführt:

- (12) *sur-tabl-ig-i* 'auf-Tisch-FAKT-INF (auf den Tisch bringen, auftischen)', *sub-tabl-ig-i* 'unter-Tisch-FAKT-INF (unter den Tisch bringen)', *sur-ter-ig-i* 'auf-Erde-FAKT-INF (auf die Erde bringen, landen)', *en-ter-ig-i* 'in-Erde-FAKT-INF (in die Erde bringen, begraben)', *el-ter-ig-i* 'aus-Erde-FAKT-INF (aus der Erde bringen, ausgraben)'.

Diese Konstruktionen sind dann wieder Basen für weitere Wortbildungen, z. B. für Adjektive und Substantive:

- (13) Adjektive: *sur-tabl-ig-a* 'auf-Tisch-FAKT-ADJR', *sub-tabl-ig-a* 'unter-Tisch-FAKT-ADJR', *sur-ter-ig-a* 'auf-Erde-FAKT-ADJR', *en-ter-ig-a* 'in-Erde-FAKT-ADJR', *el-ter-ig-a* 'aus-Erde-FAKT-ADJR';  
Substantive: *sur-tabl-ig-o* 'auf-Tisch-FAKT-NR', *sub-tabl-ig-o* 'unter-Tisch-FAKT-NR', *sur-ter-ig-o* 'auf-Erde-FAKT-NR', *en-ter-ig-o* 'in-Erde-FAKT-NR', *el-ter-ig-o* 'aus-Erde-FAKT-NR' usw.

Die Faktoren der **Sprachökonomie** bei Wortbildungsprozessen in Esperanto wirken durch die Prinzipien der **Sprachbequemlichkeit** und der **Redundanz** (s. Art. 31). Sie regeln, daß in ein Wortsyntagma alle die Morpheme einge-fügt werden, die erforderlich sind, aber nicht mehr als ausreichen, um möglichst klar und genügend redundant die Bedeutung zu motivieren, die durch das Wort bezeichnet werden soll (vgl. René de Saussure 1910: 74; Kalocsay & Waringhien<sup>5</sup> 1985: 385–388). So kann z. B. in Abhängigkeit vom Kontext 'Essen' (als Nahrungsmittel oder Handlung) durch *mang-o* 'ess-NR' bezeichnet werden. Fehlen jedoch Kontextinformationen, so ist für 'konkrete Sache' das Suffix *-af-* (*mang-af-o* 'ess-konkrete.Sache-NR') oder für 'Dauer der Tätigkeit' das Suffix *-ad-* (*mang-ad-o* 'ess-andauernde.Tätigkeit-NR') anzufügen. In Esperanto entstehen zahlreiche Synonyme oder Teilsynonyme durch das parallele Wirken von zwei Möglichkeiten der Wortschatzerweiterung. Zum einen werden komplett (meistens romanische, aber zunehmend auch

englische) Konstruktionen übernommen und in Esperanto als Grundmorpheme eingepaßt: *redaktor-o* 'Redakteur-NR (Redakteur)'. Zum anderen werden vorhandene Wortbildungsmorpheme genutzt: *redakt-ist-o* 'redigier-be-ruflich. Tägler-NR (Redakteur)'.

Volapük kennt **Komposition** und **Derivation**. Derivation überwiegt. Es gibt 56 Präfixe und 85 Suffixe, Wortbildungssuffixe und grammatische Affixe inklusive. Darunter sind 20 nur für die Fachsprache der Medizin und der Chemie vorgesehen (vgl. Schmidt 1933: 17).

Bei **denominalen Komposita** wird in die Kompositionsfuge das Genitivmorphem {a} eingefügt: *vin-a-flad* 'Wein-GEN-Flasche (Weinflasche)', *vol-a-pük* 'Welt-GEN-Sprache (NOM.SG) (Weltsprache)'. Bei denominalen Komposita bezeichnet Volapük die syntagma-internen Beziehungen der unmittelbaren Konstituenten manchmal genauer als Esperanto:

- (14) Esperanto: *hom-am-o* 'Mensch-lieb-NR (Menschenliebe, Liebe des [zum] Menschen)'. Volapük: *men-a-löf* 'Mensch-GEN-Liebe (des Menschen Liebe)', *mel-i-löf* 'Mensch-AKK-Liebe (Liebe zum Menschen)'.

In Interlingua ist das Hauptverfahren der Wortbildung die *Derivation*, die jedoch mehr eine Lehre der Etymologie der romanischen Quellsprachen ist als ein produktives Wortbildungsverfahren. Es werden 124 aktive Wortbildungssuffixe aufgeführt, 44 Präfixe und 80 Suffixe (vgl. Gode & Blair<sup>2</sup> 1971: XLVI–XLVII). Statt nominaler Komposition wie in Esperanto oder Derivation wie in Volapük, bevorzugt Interlingua syntaktische Ausdrücke:

- (15) Esperanto: *bus-staci-o* 'Bus-Station-NR (Busstation); *sun-lum-o* 'Sonne-Licht-NR (Sonnenlicht)'; *akv-o-fort-o* 'Wasser-NR-Kraft-NR (Wasserkraft)'; *akv-o-vapor-o* 'Wasser-NR-Dampf-NR (Wasserdampf)'; *sen-akv-a* 'ohne-Wasser-ADJR (wasserlos)'

Interlingua: *station de omnibus; lumine solar; fortia hydraulic; vapor de aqua; sine aqua.*

Syntaktische Ausdrücke können bei Bedarf auch im Esperanto gebildet werden, und zwar sowohl attributive als auch präpositionalen. Die Äquivalente zu (15) sind:

- (16) *bus-a staci-o* 'Bus-ADJR Station-NR', *staci-o de bus-o* 'Station-NR von Bus-

NR'; *sun-a lum-o* ‘Sonne-ADJR Licht-NR’, *lum-o de sun-o* ‘Licht-NR von Sonne-NR’; *akv-a fort-o* ‘Wasser-ADJR Kraft-NR’, *fort-o de akv-o* ‘Kraft-NR von Wasser-NR’; *akv-a vapor-o* ‘Wasser-ADJR Dampf-NR’, *vapor-o de akv-o* ‘Dampf-NR von Wasser-NR’; *sen akv-o* ‘ohne Wasser-NR’.

Mit Wortbildungsmitteln können in Volapük und Esperanto (jedoch nicht in Interlingua) besonders regelmäßig und systemdurchgängig einige Aktionsarten bezeichnet werden. Dazu folgende Beispiele:

(17) Intensiva:

Volapük (*le-*): *le-dun-ön* ‘INTS-Tat-INF (eifrig tun)’; *le-fäl-ön* ‘INTS-Fall-INF (stürzen)’. Esperanto (-*eg*-): *rid-eg-i* ‘lach-INTS-INF (schallend lachen)’; *krieg-i* ‘schrei-INTS-INF (brüllen)’.

(18) Faktitiva:

Volapük (-*iükön*): *red-iükön* ‘Röte-FAKT.INF (rot machen, röten)’; *fin-iükön* ‘Ende-FAKT.INF (beenden)’. Esperanto (-*ig*-): *ruğ-ig-i* ‘rot-FAKT-INF (röten)’, *pli-grand-ig-i* ‘KMPR-groß-FAKT-INF (vergrößern)’. In Interlingua selten: z. B. *purifica-r* ‘sauber-FAKT-INF (säubern)’, *neutral-isa-r* ‘neutral-FAKT-INF (neutralisieren)’.

(19) Kausativa:

Volapük (*a→i*; *a→ä*): *seat-ön* ‘lieg-INF’ → *seit-ön* ‘lieg:KAUS-INF (legen)’; *lag-ön* ‘häng(intr.)-INF’ → *läg-ön* ‘häng(intr.): KAUS-INF (hängen, tr.)’. Esperanto (*ig*-): *kuş-ig-i* ‘lieg-KAUS-INF (etw./jmd. hin legen)’; *pend-ig-i* ‘häng(intr.)-KAUS-INF ((auf)hängen, trans.)’.

(20) Inchoativa:

Volapük (-*ikön*): *red-ikön* ‘rot-INCH.INF (rot werden)’; *fin-ikön* ‘Ende-INCH.INF (zu Ende gehen)’. Esperanto(-*ig*-): *ruğ-ig-i* ‘rot-INCH-INF (rot werden, erröten)’; *pal-ig-i* ‘bleich-INCH-INF (erbleichen)’.

Volapük und Esperanto können die Aspekt-kategorie **Perfektiv** lexikalisch bezeichnen:

(21) Volapük (*fi*-): Infinitiv *dun-ön* ‘Tat-INF (tun)’, Perfektiv *fi-dun-ön* ‘PFV-Tat-INF (zu Ende tun, erledigen)’; *pen-ön* ‘Schreibstift-INF (schreiben)’, *fi-pen-ön* ‘PFV-Schreibstift-INF (fertig schreiben)’.

(22) Esperanto (*fin*- von *fin-i* ‘Ende-INF (beenden)’): *fin-skrib-i* ‘Ende-schreib-INF (zu Ende schreiben)’, *fin-far-i* ‘Ende-tun-INF (zu Ende tun, erledigen)’.

## 5. Grammatische Kategorien und Paradigmen

Die drei Plansprachen kennen kein **Genus**. Beim **Numerus** wird der Singular durch Nullmorphem und der Plural für alle Kasus durch ein Formativ (Volapük: {-s}, Esperanto: {-j}, Interlingua: {-s} bzw. {-es}) morphologisch bezeichnet:

(23) Volapük: *ob-ik gud-ik buk* ‘ich-ADJR gut-ADJR Buch (mein gutes Buch)’, *ob-ik gud-ik buk-s* ‘ich-ADJR gut-ADJR Buch-PL (meine guten Bücher)’. Esperanto: *mi-a bon-a libr-o* ‘ich-ADJR gut-ADJR Buch-NR’, *mi-a-j bon-a-j libr-o-j* ‘ich-ADJR-PL gut-ADJR-PL Buch-NR-PL’. Interlingua: *mi bon libro* ‘mein gut Buch’, *mi bon libro-s* ‘mein gut Buch-PL’.

In Volapük werden die **Kasus** Genitiv, Dativ und Akkusativ morphologisch bezeichnet. Es kennt außerdem den Vokativ. In Esperanto wird nur der Akkusativ durch das monofunktionale {-n} bezeichnet, das ggf. hinter dem Plural-Marker {-j} folgt: *mi vid-as mi-a-j-n bon-a-j-n amik-o-j-n* ‘ich seh-AKT.PRÄS ich-ADJR-PL-AKK gut-ADJR-PL-AKK Freund-NR-PL-AKK (ich sehe meine guten Freunde)’. Für den Nominativ kann ein Nullmorphem (*la amik-o-o* ‘ART Freund-NR-NOM’) angenommen werden. Interlingua kennt keine morphologisch bezeichneten Kasus, hat aber Varianten zur Bezeichnung der Objektformen für einige Personalpronomen (*io* ‘ich’ – *me* ‘mich’, *ille* ‘er’ – *le* ‘ihn’). Sämtliche in anderen Sprachen markierten Kasus werden in Esperanto und Interlingua durch Präpositionalphrasen wiedergegeben (Genitiv: Esperanto: *de la teknik-o* ‘von ART Technik-NR’, Interlingua: *del technica* ‘von:DEF Technik’; Dativ: Esperanto: *al la teknik-o* ‘zu ART Technik-NR’, Interlingua: *al technica* ‘zu Technik’).

Das Deklinationsparadigma für Substantive in Volapük ist regelmäßig (*fat* ‘Vater’):

	Singular	Plural
Nominativ	<i>fat</i>	<i>fat-s</i>
Genitiv	<i>fat-a</i>	<i>fat-a-s</i>
Dativ	<i>fat-e</i>	<i>fat-e-s</i>
Akkusativ	<i>fat-i</i>	<i>fat-i-s</i>
(Vokativ)	<i>o fat</i>	<i>o fat-s</i>

Tab. 144.3: Deklination von Substantiven in Volapük

		Aktiv	Passiv
Volapük	Präs.	<i>vok-öl</i>	<i>pa-vok-öl</i>
	Prät.	<i>ä-vok-öl</i>	<i>pä-vok-öl</i>
	Fut.	<i>o-vok-öl</i>	<i>po-vok-öl</i>
Esperanto	Präs.	<i>vok-ant-a</i>	<i>vok-at-a</i>
	Prät.	<i>vok-int-a</i>	<i>vok-it-a</i>
	Fut.	<i>vok-ont-a</i>	<i>vok-ot-a</i>
Interlingua	Präs.	<i>voca-n-te</i>	
	Prät.		<i>voca-t-e</i>

Tab. 144.4: Partizipien in Volapük, Esperanto und Interlingua

Nach dem gleichen Paradigma werden in Volapük auch Adjektive (wenn sie nicht unmittelbar hinter dem Substantiv stehen), der Artikel, einige Pronomen und Numeralien dekliniert.

Die **Konjugation** ist in allen drei Plansprachen regelmäßig. Für die Bildung der komplexen Zeiten werden **Partizipien** verwendet. {-öl} dient in Volapük zur allgemeinen Bezeichnung von Partizipien (Infinitiv: Volapük *vok-ön*, Esperanto *vok-i*, Interlingua *voca-r* ‘ruf-INF’):

Volapük kann auch Partizipien vom Perfekt, Plusquamperfekt und Futur II bilden, die hier nicht aufgeführt sind. Interlingua kennt nur die Partizipien Präsens Aktiv und Präteritum Passiv. Esperanto hat in Übereinstimmung mit seinen Tempi ein symmetrisches System. Interlingua übernimmt eine Reihe von Unregelmäßigkeiten aus den romanischen Sprachen, so drei Verbalstämme: auf -a- (*voca-r* ‘ruf-INF’), auf -e- (*batti-r* ‘schlag-INF’) und auf -i- (*puni-r* ‘straf-INF’). Bei e-Stämmen wird im Passivpartizip -e- zu -i- (*batti-te* ‘schlag-PART.PASS.PRÄT’).

Sowohl Volapük als auch Esperanto verfügen über die sprachlichen Mittel, Tempi in verschiedenen Modi sehr differenziert darzustellen. Dazu dienen im Esperanto die Partizipien und das Modalverb *est-i* (‘sein-INF’). Neben dem **Indikativ** kennen Esperanto und Interlingua als Modi nur noch **Imperativ** und **Konditional**. Volapük unterscheidet zusätzlich **Konjunktiv** und **Volitiv**. Volapük geht synthetisch, Esperanto und Interlingua sowohl synthetisch als auch analytisch vor. Die wichtigsten Zeitformen des Verbs im Indikativ zeigt Tab. 144.5.

In Esperanto können in den verschiedenen Zeitstufen auch komplexe Ausdrücke mit den

Futurpartizipien Aktiv (-ont-a) und Passiv (-ot-a) gebildet werden:

- (24) *mi est-as vok-ont-a* ‘ich sein-PRÄS ruf-PART.AKT.FUT-ADJR (ich bin im Begriff zu rufen)’, analog dazu: Präteritum *est-is vok-ont-a*, Futur *est-os vok-ont-a* und Konditional *est-us vok-ont-a*.

Dazu gehören die Passivformen:

- (25) *mi est-as vok-ot-a* ‘ich sein-PRÄS ruf-PART.PASS.FUT-ADJR (man ist im Begriff, mich zu rufen)’, analog dazu: Präteritum *est-is vok-ot-a*, Futur *est-os vok-ot-a* und Konditional *est-us vok-ot-a*.

Auch die Bildung synthetischer Formen durch die Anfügung des finiten Hilfsverbs *est-as* ‘sein-PRÄS’, *est-is* ‘sein-PRÄT’, *est-os* ‘sein-FUT’ an das jeweilige Partizip (-ant-a, -int-a, -ont-a bzw. -at-a, -it-a, -ot-a) ist möglich, kommt aber selten vor (*mi labor-as* ‘ich arbeit-AKT.PRÄS’ → *mi est-as labor-ant-a* → *mi labor-ant-as* ‘ich arbeit-PART.AKT.PRÄS-AKT. PRÄS (ich arbeite)’ als Verlaufsform). Analog dazu gibt es Formen im Passiv: *la leter-o skrib-at-is* ‘ART Brief-NR schreib-PART.PASS. PRÄS-AKT.PRÄT (der Brief wurde geschrieben)’ usw.

Nur in Volapük werden die Stufen der **Komparation** morphologisch bezeichnet: *glet-ik* (‘groß-ADJR’), *glet-ik-um* ‘groß-ADJR-KMPR (größer)’, *glet-ik-ün* ‘groß-ADJR-SUP (am größten)’ (Esperanto: *grand-a* ‘groß-ADJR’, *pli grand-a* ‘mehr groß-ADJR’, *plej grand-a* ‘am meisten groß-ADJR’; Interlingua: *grande*, *plus grande*, *le plus grande*).

Unter Esperantologen umstritten ist die Frage, ob die zusammengesetzten Zeiten im Passiv mit *estis -at-alestis it-a* **Aspektualität** ausdrücken oder nur temporale Bedeutung vermitteln (vgl. La Zamenhofa 1961; Lötzsch 1991).

Die in Esperanto erfolgte regelmäßige morphologische Markierung der Verben, Substantive, Adjektive und der abgeleiteten Adverbien, der grammatischen Kategorien des Verbs und des Akkusativs ermöglichen eine klare Markierung der Satzglieder und damit der Satzstrukturen. Die Satzstruktur *la ~o ~e ~as ~an ~on en la ~o* ist durch semantisch kompatible Wörter leicht auffüllbar:

- (26) *la student-o rapid-e*  
ART Student-NR schnell-ADVR  
*leg-as interes-a-n*  
les-AKT.PRÄS interessant-ADJR-AKK  
*libr-o-n en la bibliotek-o*  
Buch-NR-AKK in ART Bibliothek-NR  
'der Student liest schnell ein interessantes Buch in der Bibliothek'

	Aktiv	Passiv
Präsens:		
Volapük	<i>vok-ob</i>	<i>pa-vok-ob</i>
Esperanto	<i>mi vok-as</i> ( <i>mi est-as vok-ant-a</i> )	<i>mi est-as vok-at-a</i>

Interlingua	<i>io habe-rá voca-te</i>	<i>io habe-rá essi-te voca-te</i>

Tab. 144.5: Konjugationsbeispiele (Indikativ) für Volapük, Esperanto und Interlingua

Seine klare morphologische Struktur macht Esperanto geeignet für computerlinguistische Zwecke (vgl. Schubert 1997). Vergleichbare Aussagen lassen sich zu Volapük und Interlingua wegen fehlender Untersuchungen nicht machen.

Typologisch ist Volapük eine lexikalisch apriorisch-aposteriorische Mischsprache (vgl. 1) des agglutinierenden Typs. Interlingua ist lexikalisch rein romanisch und hat wie seine Quellsprachen flektierende Züge. Esperanto ist ebenfalls hochgradig agglutinierend, hat aber auch isolierende Züge. Einige Besonderheiten seiner Struktur ergeben sich aus der Spannung zwischen europäischer Herkunft des Morphemmaterials und seiner Verarbeitung, die asiatische Züge aufweist (vgl. Piron 1980: 33 f.; Nuessel 2000: 55–57).

## 6. Linguistische Bedeutung

Die wissenschaftliche Auseinandersetzung mit Plansprachen kann nicht nur helfen, neue Wege zur Lösung praktischer internationaler

Kommunikationsprobleme zu finden, sondern hat auch heuristische Bedeutung für linguistische Erkenntnisse. Das betrifft sowohl die Reflexion linguistischer Einsichten und Fakten sowie sprachphilosophischer Probleme der jeweiligen Epoche, in der die einzelnen Projekte seit dem Mittelalter entstanden sind, als auch die Möglichkeit, an (wenn auch unterschiedlich lange und intensiv funktionierenden) Plansprachen Theorien zu überprüfen und weiterzuentwickeln.

Erwähnt sei z. B. die Frage der Planbarkeit sprachlicher Strukturen und Prozesse und die Rolle des Bewußten in der Entwicklung von Sprachen, die Bewertung sprachlicher Eigenschaften (was ist „leicht“ oder „schwer“ an einer Sprache) u. a. Quasi unter experimentellen Bedingungen lassen sich Fragen des Sprachwandels an in ihrer Entstehung und Entwicklung genau datierbaren Sprachen verfolgen. Bei vielen Autoren von Plansprachen waren Aspekte der komparativen und konfrontativen Linguistik intuitiv vorhanden, oder es wurden entsprechende Untersu-

chungen durchgeführt. Das schließt auch häufig Reflexionen über die allen Sprachen gemeinsamen Züge (Universalien) ein. Für die Entstehung und Entwicklung der Terminologiewissenschaft z. B. waren plansprachliche Impulse von großer Bedeutung (vgl. Blanke 1998 b: 136). Erfahrungen mit Plansprachen haben sich auf die Entwicklung der Theorien mancher Linguisten ausgewirkt (vgl. Martinet 1991).

Eine qualitativ und quantitativ ständig wachsende interlinguistische und esperantologische Fachliteratur erleichtert die Auswertung der mit Plansprachen gewonnenen theoretischen und praktischen Erkenntnisse und Erfahrungen (vgl. Blanke 2003: 155–192).

## 7. Illustrative Texte

Von Volapük über Esperanto zu Interlingua zeigen die Texte für den mit europäischen Sprachen Vertrauten eine zunehmende Verständlichkeit. Der romanische Charakter der Morpheme nimmt deutlich zu. Der synthetische Charakter von Volapük kontrastiert mit dem analytischen von Interlingua. Esperanto weist sowohl synthetische als auch analytische Züge auf.

##### 1. Introduction

For the purpose of this article **morphological change** is defined as any change that results in a different morphological system of a language.

There are a number of traditional concepts regarding morphological change, such as leveling, rule generalization, and, probably the most widespread among these, analogy. These concepts are not very satisfying. On the one hand, they show a great deal of overlap; on the other hand, these terms do not shed light on the general forces underlying the different types of morphological change since they refer to the effects rather than to the processes of change as such.

In the following discussion of the fundamental concepts regarding morphological change, the existing terminology will therefore not constitute the starting-point. Following Koefoed (1978), the view is taken that a language is never an active force in itself. The causes of change must be sought in processes of language acquisition and language use. Any change is the result of such a process acting or reacting upon a given ‘state of affairs’ in the language in question. By a language we do not only mean the grammar (or the linguistic knowledge of a native speaker), but also the output of that grammar.

In many cases a language may show characteristics, either in its rule system or in the

system’s output, that may be said to ‘trigger’ a morphological change. Examples of such triggers are for instance a rule the conditions of which are little transparent, or a set of output strings that may easily be reanalyzed. As was pointed out above, such characteristics of a language are not considered the cause of a change. Rather, we consider them only a factor leading to change.

An insightful discussion of morphological change, then, must show in which way the different processes of language acquisition and language use are triggered by specific linguistic situations, i. e. in which way the characteristics of a language and the processes of language acquisition and language use interact. The relevant processes of language acquisition and language use are discussed in section 2. As to the configurations that may give rise to morphological change, we will distinguish between (i) morphological change proper, i. e. changes originating in the morphological system and/or its output; (ii) morphologization, i. e. the incorporation of (morpho)phonological and syntactic phenomena into morphology; and (iii) morphological change due to extragrammatical forces. These will be discussed in sections 3, 4 and 5, respectively. In section 6 the effects of language contact on morphological systems will be briefly dealt with, while 7 contains the conclusions.

##### 2. Processes of language acquisition and language use

With regard to morphological change, especially the types subsumed under the label of **analogy**, it has been a long tradition to assign a prominent role to the language learning child. Leveling, overgeneralization, reinterpretation are often exclusively ascribed to the child’s ‘language acquisition device’ or to

some specific heuristic principles that form part of it. The child, having no direct access to the grammar of his parents' language, looks for patterned relations within the set of utterances he hears and may arrive at a different grammar than that of his parents' generation. In this way, language acquisition, and particularly the process of **rule discovery**, may lead to **rule change**.

This picture, with its stereotypical distinction between the language learning child and the language using adult speaker, is too simplistic. No doubt, processes of rule discovery play a role in many types of morphological change (cf. 2.1). However, it is clearly wrong to associate all processes of rule discovery or **rule creation** exclusively with language acquisition by young children. Since these activities may also be rooted in language use (cf. 2.2), rule discovery and/or rule creation may also play a role in the speech of adult speakers.

### 2.1. Language acquisition, particularly rule discovery

The first step in rule discovery is to assign a morphological structure to a given set of words. That is, to observe a formal-semantic relation between these words and another set of words, so that the first can be seen as in some way formed on the basis of the latter. The relation can then be interpreted as the product of a rule of word formation. The second step is to establish the precise nature of that rule and the conditions which determine its domain of application. In his search for morphological relations and word formation rules the learner/user is guided by what has been called the **Humboldtian principle**, that is a preference for one-to-one relations between forms and meanings. Both alternation in form and variation in meaning diminish the transparency of a rule and may trigger a change. As to the domain of application, the language learner has a preference for general, clear-cut conditions. Therefore, the transparency or 'discoverability' of a rule depends on three factors: the analyzability of the derived words, the regularity of its effects and the 'straightforwardness' of its conditions. If a rule is less than optimal in one or more of these respects, language acquisition can lead to a change. The rule in question may not only be 'missed' by the language learner, but the complex forms that derive from it may be reinterpreted, the rule may be altered in such a way that its effects become more regular,

and the conditions delimiting the rule's domain may be adjusted. In other words, rule discovery may lead to regularization. In 3.1 a number of such changes will be discussed.

It is important to see, however, that not every formal-semantic relation between words implies the existence of a morphological 'rule'. That is, not all relationships between words that language users may be aware of, are necessarily translated into rules with which new words can regularly be formed. Some of these relationships, for instance, bear upon categories that are unproductive. Besides, in order to learn a language it is not necessary to discover all the morphological relations between the existing words within the lexicon of that language. One can learn complex words as unstructured entities. As a matter of fact, some complex words must be learned in this way before the learner can start to discover morphological structure. This implies that not all morphological rules have the same function and status with regard to the linguistic knowledge of the speakers. Morphological rules may vary in necessity (from the viewpoint of language acquisition) and saliency (from the viewpoint of language use). Rules that apply very often, among them those that define the obligatory categories of a language, cannot be 'missed', of course. That is, they must be learned by all language learners in order to achieve an acceptable level of competence. Evidently, this applies to most inflectional rules. In addition, it may also apply to derivational morphology in that at least a passive knowledge is called for of those derivational rules that are frequently used to derive new words. However, at the other end of this scale one finds rules which only pertain to a handful, not too frequently used words, the occurrence of which is by and large restricted to the formal registers. As to the level of competence that a learner must acquire, these rules represent a kind of luxury; knowledge of these rules is not obligatory to obtain 'full' competence of the language involved.

### 2.2. Language use

Within the rather heterogeneous domain of 'language use', three domains of processes or activities should be distinguished:

- the psycho-physiological mechanisms of speech production and perception;
- the expression of thoughts and intentions by individual speakers by means of the

- conventional language system that they have acquired;
- (c) the establishing of linguistic conventions, essentially a process of negotiation about social contracts.

#### 2.2.1. Speech production and Speech perception

In general, the mechanisms of speech production and perception (domain a) do not directly affect the morphological system of a language. Indirectly, however, they often have repercussions on the morphological system of a language, since these mechanisms may affect the phonological shape of words. This will be briefly discussed in 5.

#### 2.2.2. ‘Looking for words’

Words, their mutual relations and their internal structure, are directly involved when people try to express their thoughts in the language they know (domain b). In expressing his thoughts, in ‘looking for words’ for what he wants to say, a speaker has essentially two sources at his disposal. First, the set of conventional names for concepts and situations (what Saussure 1916 called the *tréSOR* of the language community) and, second, the regular morphological system of his language, which by means of productive rules provides for new, non-conventional expressions. When a speaker, in expressing a concept, applies a productive rule of his language, this can be considered a manifestation of ‘rule-governed creativity’ (Chomsky 1964). The speaker does not exceed the existing possibilities of the conventional language system; his (knowledge of the) language provides for the expressions he needs, the language remains intact. However, as will be pointed out below, in looking for words a speaker may also exceed the limits of the regular system. That is, he may also turn to ‘rule-changing creativity’ (Chomsky 1964).

With regard to the existing complex words, it is important to see that within the activity to express one’s thoughts two processes are at work. The first process leads to the loss of word structure due to conventionalization and lexicalization. This will be discussed in 2.2.3. The second process leads to the systematization of the lexical stock (i. e. the set of existing complex words).

In formulating their thoughts speakers not only use their language, but constantly ‘re-examine’ it. As was already clearly observed by Von Humboldt, the lexical stock of lan-

guages should not be equated with “eine fertig daliegende Masse”, since it is “ein fortgehendes Erzeugniss und Wiedererzeugniss des wortbildenden Vermögens” (Von Humboldt 1836: 109–110). It is this activity of reflection on the set of existing expressions (the language as the speaker’s *repertoire* of linguistic expressions) that lies at the root of different types of reinterpretation (among which back formation, restructuring, folk-etymology, etc.) and adaptation. What these processes have in common is that they involve the systematization of the lexical stock.

The inspection of the lexical stock of a language by its speakers does not only lead to systematization of the existing complex words, but this activity may also underlie ‘creative coinage’. Words formed in this way exceed the limits of the regular system, meaning that they represent instances of rule-changing creativity. That is, the activity of expressing one’s thoughts and intentions does not only have repercussions on the existing words, but it may also lead to the formation of new words. Precisely because of the fact that the lexical stock of a language is not a given morphologically structured whole, the inspection of the lexical stock may result in all sorts of discoveries, which in their turn may underlie all kinds of ‘creative’ coinings. Put differently, the lexicon of a language also contains the germ of all kinds of creative coinage. Thanks to this inspection of the lexical stock, unproductive relations may be revitalized, new relations between words may be discovered, a relation between not more than two existing words may be extrapolated to other words, a rule may be ‘inverted’ so that back formations are produced, and so on.

One type of situation in which this activity is called for is the one in which the speaker’s knowledge of his language does not provide a conventional expression for the concept he wants to refer to. This situation is typical of children and that is why manifestations of creative coinage are more frequent in the speech of children than in that of adults. However, it is certainly not so that children have a monopoly on rule-changing creativity. It may also be the case that there is a referential gap in relation to the concept in question, i. e. the language does not provide conventional means to express that concept. In that case, adult speakers may also take recourse to creative coinage. Creative coinage, finally, can also be invoked because of socio-stylistic

reasons. Evidently, the desire to be original can also be the motive to coin new expressions instead of using ready-made conventional names. Like in the preceding case, creative coining because of socio-stylistic reasons presupposes relatively high level of competence, meaning that it is particularly common in the language of adults.

### 2.2.3. The establishing of linguistic conventions

As was pointed out in 2.2.2, looking for and using usual expressions (expressions that one has heard before and has remembered) may lead to **lexicalization**, through an intermediate step which we call '**conventionalization**' (domain c). Conventionalization implies that a linguistic expression, although regularly formed by means of productive rules, acquires a kind of 'currency' within the usage of the community. More and more speakers use the expression as a ready-made form, instead of coining it (or another new word) to express the concept. The essential moment in this process of conventionalization is that, in a growing number of speech situations, the expression functions as a whole. That is, its internal structure, although for most speakers still recognizable, is no longer essential for its referential function. In this respect, the regular complex expression already functions in the same way as an unanalyzable simplex word. Once conventionalized, the expression becomes susceptible to processes affecting its systematic properties. Sound changes may obscure its internal structure and the relation with the original base, while shifts in meaning may obscure its semantic transparency (of these, the sound changes originate in domain a, the shifts in meaning in extralinguistic social reality). The result will be a lexicalized word with unpredictable phonological and/or semantic properties, which has to be learned separately. Eventually, lexicalized words may lose their internal structure completely. Crucial to this development is that it is the process of conventionalization that makes it possible that processes of speech production and perception do their 'destructive' work with regard to morphological structure.

The establishing of linguistic conventions, however, is not only relevant to the conventionalization of individual complex words, but it is also relevant to the morphological system. The fact is, that morphological rules may have a specific social status as well. It is not uncommon, for instance, that a derivational

rule is only used in a specific register of the language (cf. Art. 33). Besides, whether or not a morphological rule is considered productive is not a question of its systematic properties alone, but also of its conventional status. Changes in **productivity** or in the stylistic properties of morphological categories or rules must therefore also be considered morphological changes. These changes lead to different morphological system as well.

### 2.2.4. Summary

In the preceding, two opposite processes were distinguished within the central activity to express one's thoughts and intentions. First, the inspection of the lexical stock may result in the systematization of existing words. In addition, the same activity may underlie creative coining, too. Second, the use of complex words may also result in conventionalization. This process entails that the internal structure of the words in question is no longer essential for their referential functioning. Subsequently, this may lead to lexicalization: the conventionalized words develop unpredictable semantic and formal properties.

## 3. Morphological change proper

Under this heading those types of morphological change are discussed which originate in a language's morphology and/or the words it has produced. That is, in all instances of morphological change that will be treated in this section the starting point, i. e. the configuration that triggers the change, is to be situated either in the morphological rule system or in its output, i. e. the set of existing ('conventional') complex words.

### 3.1. Changes triggered by the rule system: regularization

This class of morphological changes comprises those developments which somehow or other involve the 'streamlining' of the morphological rule system. As a general term for these changes we propose regularization. In many cases, regularization of a rule implies **generalization**, i. e. the extension of its domain of application. This, however, is not always the case since regularization may be more dramatic than the mere streamlining of the morphological rule system (cf. below).

The most obvious cases of **regularization** are those in which a given rule becomes less restricted (more general) or more transpar-

ent. Note that rule generalization may both relate to the elimination of accidental exceptions and to the elimination of systematic 'gaps' in the system. Generalization, finally, may also come into effect in the delimitation of rival categories.

An example of the elimination of an accidental exception is the coming into existence of regular preterites such as *scheerde* next to irregular ('strong') *schoor* in Dutch (cf. *scheren* 'to shave'). Irregular forms of strong verbs, so to say, run the risk of being ousted by their regular ('weak') counterparts. In many cases, these regular forms are not in common use, of course, but they may be formed any moment by the regular application of the rule of preterite formation.

The elimination of a systematic gap can be illustrated by means of the female personal names in *-e* in Dutch. When these forms became a more or less regular pattern in the present-day language, they refrained from pluralization. In the course of time, however, they gradually came under the reach of the plural system, resulting in plurals such as *studente-s* 'female students'. (Note, however, that this process has not yet been completed, meaning that there are still quite some female personal names in *-e* which do not readily underlie a plural form.)

In the case of rival categories – particularly when more than one is productive – there can be question of gradual changes in the division of labour between the categories involved, leading to a greater transparency of the system. An example of such a shift is the pluralization of simplex words ending in *-ing* in modern Dutch, examples being *haring* 'herring', *ketting* 'chain', and *koning* 'king'. In standard Dutch these words pluralize in *-en*, irrespective of the fact that the syllable in *-ing* does never bear main stress. In all kinds of non-prestigious varieties of Dutch (dialects, child language), and also in Afrikaans, however, these words have a plural in *-s*, which is completely in line with the general pattern of Dutch (and Afrikaans) plural formation, according to which words with non-final main stress generally have *-s* plurals.

Another type of regularization involves the streamlining of the semantic properties of morphological rules. An interesting example of the latter development is presented by Dutch deverbal adjectives in *-baar* '-able', which represent a relatively recent pattern in the language. During the period of their in-

roduction, adjectives in *-baar* were little transparent as far as their meaning was concerned. Specifically, they could have both active and passive readings. In the nineteenth century, however, the passive meaning became more and more dominant. In contemporary Dutch the productive rule invariably produces words with a passive meaning (cf. e.g. *converteerbaar* 'able to be converted'). It is evident that the process of 'semantic leveling' that the category in *-baar* has undergone had consequences for the way in which coining in *-baar* is conditioned in the present-day language. In modern Dutch, adjectives in *-baar* can only be regularly derived from transitive verbs (or, more precisely, from verbs with a transitive reading), meaning that the rule's domain has become more restricted.

The above examples, particularly the latter one, already made clear that regularization is a phenomenon which is more comprehensive than the mere elimination of exceptions to a given rule. That is, **regularization** is more comprehensive than **rule generalization**. In the case of the semantic streamlining of the adjectives in *-baar*, there was no question of the elimination of gaps (neither accidental nor systematic) in the rule's morphological domain. The following example, although of a completely different nature, illustrates the same fact: regularization is a much wider phenomenon than the mere elimination of gaps in the input of a rule. In Van Marle (1978) attention was drawn to the regularization of formations expressing 'to be able/to be unable' in the eastern dialects of Turkish and in closely related Azeri (or Azerbaijani). In modern Turkish the notion 'to be able' is expressed by means of compounding: the verb *bil* 'to know' is added to the required verb stem which as such is extended by the element *-el-a*, e.g. *gel-ir-im* 'come-PRES-1.SG (I come)' versus *gel-e-bil-ir-im* 'come-ø-know-PRES-1.SG (I can come)'. A remarkable feature of modern Turkish is, that the negative counterparts of the above verb forms – i.e. the forms expressing 'to be unable' – are not formed in a parallel way, as is the case in other negative verbs. As can be inferred from the following example, the so-called impotential verb does not involve compounding at all but suffixation instead. The impotential verb is formed by means of adding the suffix *-emel-ama* (to the verb stem: e.g. *gel-eme-di-m* 'come-IMPOT-PAST-1.SG (I could not come)' versus *gel-di-m* 'come-PAST-1.SG (I

have come)'. As a result, in the impotential verb the element *bil-* 'to know' is lacking. In closely related Azeri/Azerbaijani and in the adjacent Turkish dialects, this anomaly in the Turkish verb has been regularized (Cafe-roğlu & Doerfer 1959: 304). In these varieties the impotential verb is no longer characterized by a unique pattern – i. e. a pattern completely independent of the potential verb – but it is formed in a way that is completely parallel to the potential verb, e. g. impotential *gäl-ä-bil-mä-di-m* 'come-ø-can-NEG-1.SG (I have not been able to come)' which, except for the negative suffix *-mä*, is similar to potential *gäl-ä-bil-di-m* 'come-ø-can-PAST-1.SG (I have been able to come)'. Crucial to this regularized pattern is, that the impotential verb, like the potential verb, involves the compounding of *bil-* 'to know' to the verb stem.

In conclusion, regularization involves the replacement of an idiosyncrasy in the system by a form or pattern which directly conforms to the system. This process may vary from the straightforward elimination of accidental exceptions to much more dramatic developments leading to fundamental changes in the system (see also Koch 1995 for other types of regularization with far-reaching consequences).

### 3.2. Changes triggered by characteristics of existing words: systematization

Many morphological changes have their origin in the constant, never ending inspection of lexical stock from the part of speakers of the language (cf. 2). This activity of the speakers may manifest itself in essentially two ways: reinterpretation and adaptation. The common characteristic of both processes is that they both involve the systematization of the lexical stock (however limited this may be). Eventually, reinterpretation may give rise to rule creation.

#### 3.2.1. Reinterpretation

**Reinterpretation** involves the assignment of a structure to existing words which involves a change with respect to the original situation. There are many different types of reinterpretation. First, we have to do with at least three possibilities: (i) a simplex word is assigned a morphological structure, (ii) a complex word is considered simplex, and (iii) a complex word is assigned a structure that differs from its original structure. Second, the process of reinterpretation may be governed

by all kinds of additional factors which may bear upon phonology, semantics and 'use'. Consequently, the notion of reinterpretation bears upon a rather heterogeneous set of phenomena, ranging from folk etymology to affix telescoping.

A well-known instantiation of the first type of reinterpretation mentioned above, i. e. a simplex word is considered complex, is the phenomenon of **back formation** (Rückbildung). In Bloomfield (1933: 412) this phenomenon is illustrated with the example of the reinterpretation of Middle English *cheris* 'cherry' (from Old French *cherise*). The final *s* of *cheris* was associated with the formally identical plural ending, which resulted in the coming into existence of a new singular form *cherry*. In this new system, the form *cherries* – which was the original singular – functions as plural form. Similar examples are not hard to come by. In Dutch, singular forms ending in *-en*, so to say, run the risk of being reinterpreted as plural forms. The fact is, that the most frequently used plural ending in Dutch reads *-en*. In this way, *cyclamen* 'id.' became *cyclaam*, *varken* 'pig' became *vark* (in child language, also in Afrikaans), and *molen* 'mill' became *mool* (in American Dutch).

The second type of reinterpretation distinguished above, involves the loss of internal structure of a complex word. Most instances of complex words losing their internal structure involve conventionalization/lexicalization rather than reinterpretation (see 2 and 5). However, reinterpretation, too, may result in loss of structure. An example is formed by words such as *biels* '(railroad) sleeper/tie' or *rails* 'rail' in modern Dutch. For many speakers of the present-day language, these words are simplex. Diachronically, however, these words are plurals, be it plurals which did not join in with the general characteristics of Dutch plural formation. According to this system, monosyllabic words that are consonant-final take the plural ending *-en*, which means that regular plural forms are never monosyllabic. That is, in terms of the living structure of Dutch, the plurals *biels* and *rails* looked like singulars, and that is how they were reinterpreted.

The third type of reinterpretation, i. e. the type which leads to a change in the original structure of complex words, can best be illustrated with the help of the phenomenon that is known as affix telescoping. In Paul (1920: 245) it was already pointed out that

derivatives of the second degree may develop into derivatives of the first degree, in consequence of the fact that the original derivative of the second degree is directly related to the simplex base. This process results into the amalgamation of the two suffixes that are involved (Van Marle 1984; 1990 b; Haspelmath 1995). Evidently, the reinterpreted words may develop into a new derivational pattern, on the basis of which new words may be directly formed by means of the amalgamated suffix. This may be illustrated by means of Dutch female personal names in *-er-es*, e.g. *dans-er-es* 'female dancer'. Words of this type are generally looked upon as derivatives in *-es* which have neutral personal names in *-er* (*dans-er* 'dancer') as their starting point. However, the possibility should not be excluded that female personal names of the *dans-er-es* type are considered to be directly derived from the verb *dans-en* 'to dance', the result of which is the amalgamation of *-er* and *-es* into *-eres*. In this way, the formations in *-eres* become identical to their productive rivals in *-ster*, by means of which deverbal female personal names are coined. Cf. *roei-ster* 'female rower' which has the verb *roei-en* 'to row' as its base. That the formations in *-er-es* are really reinterpreted as formations in *-eres*, is proven by the fact that we find words in *-eres* for which there is no ready base in *-er* at hand. Examples are *post-eres/postbod-eres* 'female postman' and *strip-teas-eres* 'female stripper' which can best be looked upon as derivatives in *-eres* which have *post/postbode* 'postman' and *striptease* 'id.' as their starting point.

In the example just given, the reinterpretation of a derivative of the second degree as a derivative of the first degree was, to a certain extent, determined by the morphological system. In Van Marle & Koefoed (1980) instances of this type of reinterpretation were characterized as 'short cuts' in the morphological system. A derivative of the second degree is directly related to the simplex base, which results in the coming into existence of a derivative of the first degree.

Complex words may also fall victim to processes of reinterpretation of a completely different kind. They may also be reinterpreted on the basis of their 'phonological' properties, i.e. on the basis of the phoneme sequences of which they consist. This type of reinterpretation can best be characterized as a process of **resegmentation**. The prime force behind this process does not involve the

form-meaning characteristics of the words in question, but the classification (and concomitant segmentation) of these words on the basis of their shared phonological properties. Consider the following personal names in Dutch: *leugen-aar* 'liar', *molen-aar* 'miller' and *Nijmegen-aar* 'inhabitant of Nijmegen'. In Dutch neutral personal names take *-aar* when the base ends (among other things) in *en*. This pattern has given rise to a new suffix *-enaar*, which we meet in e.g. *bult-enaar* 'hunch back' and *Delft-enaar* 'inhabitant of Delft', which are based on *bult* 'hunch' and *Delft* respectively. The coming into existence of the new suffix *-enaar* is interesting in that it makes clear that complex words may be classified and segmented on the basis of their phonological properties while their morphological properties are glossed over. A salient characteristic of Dutch personal names, apparently, is that they often share the final sequence *enaar*. Originally, this 'surface characteristic' of the words in question had no morphological status, *-aar* being the suffix and *en* only being the final part of the simplex stem (without any meaning whatsoever). However, this phonological property of the personal names was assigned morphological importance, meaning that *enaar* became a suffix. This is evidenced by the fact that new words were coined by means of 'resegmented' *-enaar*.

The rise of *-enaar* in Dutch is also interesting in that it makes clear that this phenomenon of resegmentation need not be governed by syllable boundaries, as is sometimes suggested in the literature. The syllable boundary, to be sure, never lies before the schwa of *-enaar*, the syllable boundary always lies before the *n*, i.e. 'within' the suffix. That is, as far as prosody is concerned, *-enaar* is no unit. This is not to say that syllable structure is never relevant. A classic example of resegmentation which is generally considered to be governed by syllable structure, is the coming into existence of the suffix *-ling*, which used to be *-ing*. In formations such as *Karol-ing* the syllable boundary lies before or 'within' the *l* preceding *-ing*. It has often been suggested that this fact may have contributed to the coming into existence of the suffix *-ling*. Evidently, in the case of *-ling* the position of the syllable boundary may have played a part. However, Dutch *-enaar* makes clear that syllable structure is no necessary factor in the phonologically governed resegmentation of complex words, in that the initial

schwa of *-enaar* exceptionlessly forms part of another syllable than remaining *naar*. Still, the phonologically determined resegmentation of words such as *molenaar* ‘miller’ has resulted in a new suffix *-enaar*.

To conclude, Dutch *-enaar* illustrates that the phonological classification and segmentation of complex words may be governed by phonological similarity alone. As was pointed out above, it may well be that there are instances of phonologically determined resegmentation in which syllable structure plays a part, but this is certainly no general condition for this process to take place.

### 3.2.2. Adaptation

**Adaptation** is the effect of paradigmatic pressure. Individual words may undergo a change which makes them more ‘fit’ into the morphological patterns of the language as a whole. Like reinterpretation, morphological adaptation may adopt quite different shapes. The common trait of adaptive processes is that they are primarily triggered by the surface forms and that they cannot be linked to the underlying rule system in a direct way. (See 3.2.1 where the relevance of ‘surface characteristics’ came up for discussion as well.)

A well-known type of adaptation is **hypercharacterization** (Van Marle 1978). This kind of morphological change represents the formal adaptation of a given word to the regular patterns that it is semantically related to, but not formally. Consider e.g. an irregular (‘strong’) preterite such as *liep* (cf. *lopen* ‘to walk’). This irregular preterite lacks the formal characteristics of regular preterites which take *-te* or *-de* (depending on the voice quality of the stem-final segments). The adaptive change that such forms may undergo, involves the ‘superfluous’ addition of *-del-te* to the irregular preterites, resulting in ‘hypercharacterized’ forms such as *liep-te*. The latter forms are sometimes referred to as ‘double preterites’, but this characterization is somewhat misleading in that these adapted preterites are normal preterites as far as their meaning is concerned. Hypercharacterization is not only prominent in inflection – cf. also ‘double plurals’ such as Dutch *musea* ‘museums’ besides ‘correct’ *musea* – but also in derivation. Throughout the history of Dutch, personal names which are not formed by means of *-er* (*-der*), have been assigned this suffix superfluously. Cf. e.g. *dragon-der* ‘dragoon’ and *medicijn-er* ‘doctor’ (from French

*dragon* and *médecin* respectively) which represent older examples, while *aio-er*, *uhd-er* and *postdoc-er* for *aio* (an acronym based on *assistent in opleiding* ‘research assistant’), *uhd* (an acronym based on *universitair hoofddocent* ‘university lecturer’) and *post-doc* ‘idem’ represent recent adaptations.

Crucial to **morphological adaptation** is that it cannot be explained in terms of the rule system proper. Morphological adaptation can only be understood in terms of the ‘output’ of this system. That is, regular preterites are formed by means of *-del-te*. Preterites which are not formed in this way, are assigned the formal characteristics of their regular counterparts all the same. Morphological adaptation, then, is a process that is triggered by the canonical forms that the rule system produces, but not by the rule system as such.

### 3.2.3. Summary

In general, systematization (i.e. reinterpretation and adaption) contribute to the coherence of the lexical stock of a language. In addition, reinterpretation may result in new affixes which may become the formal exponent of new productive patterns (Dutch *-enaar*). In that way reinterpretation may – indirectly – contribute to the ‘lexical enrichment’ of a language.

## 3.3. Changes triggered by characteristics of inflectional paradigms

As we have seen in 3.2, morphological change need by no means be triggered by the rule system, since in many cases morphological change is rooted in properties of the output. Particularly morphological adaptation makes this clear (see 3.2.2). Another phenomenon which illustrates this point, is **paradigm leveling** (which, in contrast to morphological adaptation, is well-known and frequently discussed). The forms constituting an inflectional paradigm either tend to give up formal differences that do not correspond with differences in meaning (leveling), or tend to generalize them throughout the paradigm (extension). Well-known, for instance, is the elimination of the vowel alternation between singular and plural in the preterite of Dutch ‘strong’ verbs such as *binden* ‘to bind’. Originally, the singular had *a* as stem vowel (*bant*) vis-a-vis the *o* in the plural (*bonden*). This difference between singular and plural has been eliminated (leveled), resulting in modern Dutch *bont* (spelled *bond*) *-bonden*.

Crucial to changes of this kind is that they, like the instances of adaptation (cf. 3.2.2), bear upon the surface characteristics of the forms in question. However systematic the above discussed vowel alternation may have been, the difference at the surface between the singular and the plural constituted the trigger for the change in question. This change involves the elimination of the meaningless difference in form between the singular and the plural. Consequently, paradigm leveling represents an adaptive process: the singular forms (with *a*) have adapted their form to the plural forms (with *o*), a development which results in new singulars (with *o*).

#### 4. Morphologization

Generally speaking, morphologization involves the incorporation of originally (morpho-)phonological or syntactic phenomena into morphology. On the whole, the incorporation of extra-morphological phenomena into the morphological system involves complex changes in which all kinds of factors interact. Morphologization, finally, forms part of the more comprehensive phenomenon of grammaticalization.

##### 4.1. The incorporation of (morpho)phonological phenomena

The classic example of the morphologization of a non-morphological phenomenon is the occurrence of umlaut in cases such as *Bruder* ‘brother’ versus *Brüder* ‘brothers’ or *Vater* ‘father’ versus *Väter* ‘fathers’. As is well-known, the history of **umlaut** represents a development from a phonetic to a phonological, and from a phonological to a morphophonological process. In present-day German, umlaut is predominantly morphophonological in nature, since its occurrence is determined by morphology. In *Baum* ‘tree’ – *Bäum-e* ‘trees’ or *Mann* ‘man’ – *Männ-er* ‘men’, for instance, umlaut is concomitant to pluralization by means of *-e* and *-er*, respectively. However, in the case of *Bruder* ‘brother’ – *Brüder* ‘brothers’ or *Vater* ‘father’ – *Väter* ‘fathers’, things are different, in that in these cases umlaut is the only bearer of the notion ‘plural’. That is, in these cases umlaut is no longer concomitant to pluralization. In the words in question umlaut has become plural marker itself, meaning that it has developed into a purely morphological phenomenon.

The **morphologization** of originally morphophonological phenomena is not particu-

larly rare. Morphonological phenomena are concomitant, i.e. they are associated with a particular morphological process. If the overt marker of that process – i.e. the suffix – disappears, the concomitant phenomenon may take over the function of overt morphological marker. This also happened to plural formation in certain varieties of Spanish, particularly in the dialect of Granada. In certain nouns the notion of plurality is exclusively expressed by vowel laxing. Cf. e.g. [kaβéθa] ‘head’ versus [kɑβéθɑ] ‘heads’ or [sélvɑ] ‘forest’ versus [sélvɑ] ‘forests’ (all vowels that are marked are lax). In other nouns the notion of plural is expressed by a combination of vowel laxing and aspiration. Cf. e.g. [lóʃo] ‘wolf’ versus [lóʃøʰ] ‘wolves’ or [píso] ‘floor’ versus [píʃøʰ] ‘floors’ (all the above data stem from Alonso et al. (1950) and are cited in Hooper (1976: 36)). Like in German, in this variety of Spanish the plural ending (*-s*) has disappeared. In Spanish this happened via a process of aspiration, which in its turn functioned as the phonetic trigger of vowel laxing. Exactly like in German, the phonological phenomena which were originally concomitant to pluralization have developed into the markers of plurality when the suffix disappeared. In the case of Spanish this implies that in the words in question vowel laxing and aspiration have lost their concomitant morphonological character and have developed into true morphological phenomena.

Morphologization of originally non-morphological phenomena may come into existence in another way as well. Consider the morphologization of tone in the dialects spoken in the Dutch and Belgian Provinces of Limburg. As is pointed out in Goossens (1964), apocope of final schwa in bisyllabic words may lead to a tone shift in the first syllable. Specifically, the original dragging tones is replaced by a falling tone. In the dialects in question, this phenomenon cannot only be observed in certain plural forms, but also in adjectival declension and in a few gerunds. In some nouns a difference in tone is the only marker of plurality, e.g. *ste:\_n* ‘stone’ versus *ste:\_n* ‘stones’ where the difference in tone is the sole marker of plurality (\*-subscript indicates a dragging tone, whereas \*-superscript indicates a falling tone). The same difference can be found in the verb system. Verbs like *du:\_n* ‘to do’ and *zi:\_n* ‘to see’ have a dragging tone in the infinitive, whereas they have a falling tone in the gerund (the form used after the preposi-

tion *te*), cf. *tə du<sup>\*</sup>n* and *tə zi:<sup>\*</sup>n* (in all cases Goossens' notation has been used). Originally, these gerunds ended in *-ə*. When this ending got lost, there was a tone shift, meaning that the new monosyllabic gerunds got a falling tone. Goossens suggests, then, that in these examples it is not the case that an originally concomitant phenomenon has taken over the primary function, but that an originally non-morphological phenomenon is invoked to signal a morphological distinction, thus becoming a morphological phenomenon itself.

#### 4.2. From word to affix

It is not only (mor)phonological phenomena which can be incorporated into morphology. Syntactic phenomena may be incorporated into morphology as well. This latter development typically results in the rise of new affixes (as was pointed out in 3.2.1, reinterpretation may also result in new affixes). The prototypical form that this development adopts is that words lose their individual status and turn into 'affix-like' elements and eventually become true affixes. However, this is not the only way in which morphologization may give rise to new affixes. Another way in which new suffixes may arise is the gradual transition of the second constituent of compounds into suffixes. This development, too, may be considered the result of morphologization.

An interesting example of this gradual shift of a word into an affix is provided by the Turkish postposition *ile* 'with' which has developed into a suffix (but which still functions as a postposition as well). This change in status is reflected by the fact that the new suffix *-le* (after consonants)/*-yle* (after vowels) is, like all regular suffixes, subject to vowel harmony (but see below), whereas postpositions are not. So, in modern Turkish we have both the original construction *vapur ile* 'boat with<sub>1</sub>' (by boat) with bisyllabic *ile* and the new suffixed variant *vapur-la* 'boat-with<sub>2</sub>' (by boat) (with reduced, i.e. monosyllabic *-la*). The fact that developments like these are gradual by definition is evidenced by the fact that there are cases where the original postposition appears already as an affix, but where it is 'not yet' subject to vowel harmony. (The affix-status of *-yle/-le* is clear from its condensed form: it has lost its initial vowel, i.e. *i*, meaning that it has lost its bisyllabic character.) This is the case when it is used after a third person possessive suffix,

e.g. *kari-si-yle* 'wife-poss:3.SG-with<sub>1</sub> (with his wife)' or *omuz-u-yle* 'shoulder-poss:3.SG-with<sub>1</sub> (with his shoulder)'. Note, however, that the latter phenomenon – after a third person possessive suffix, *-yle* is invariable – is a characteristic of, as Lewis (1967: 87) calls it, 'educated pronunciation' which is neglected by many speakers of modern Turkish. In the language of these speakers, *yle* is no longer invariable after the third person possessive suffix as is evidenced by e.g. *kari-si-yla* and *omuz-u-yla* where it has become subject to vowel harmony.

Evidently, the language of the latter speakers reflects a stage that can best be considered one step further into the direction of 'true suffix' that the postposition *ile* has taken. The development of *ile* not only illustrates the formal change from word to affix, but also the incorporation of syntactic phenomena into the morphological system: a function word gradually develops into a case suffix (5.1).

The change from word to affix is also prominent in a completely different context, viz. in compounds. The second constituent of compounds may develop into a suffix-like element fairly easily. This phenomenon underlies the fact that in many languages suffixes can be found that have word-like properties. In Dutch there is a whole series of words that end in *-boer*. Cf. e.g. *groente-boer* 'greengrocer', *melk-boer* 'milkman', *patat-boer* 'seller of French fries', *vis-boer* 'fishmonger', *vodden-boer* 'old-clothes-man', etc. This element is formally identical to the word *boer* 'farmer'. However, in many of the compounds with *boer* as a second constituent, this element cannot simply be equated with the independently occurring and formally identical word. That is, in these cases there is no direct semantic link between the second constituent *-boer* in compounds and the word *boer* 'farmer'. What has happened, is that the word *boer* in compounds such as *groenteboer* and *melkboer* has developed into a suffix-like element, meaning 'seller of X'. This 'seller of' interpretation has gained a certain popularity as far as the coining of new words is concerned. In these newly coined words (e.g. *patat-boer* 'seller of French fries', *sigarenboer* 'seller of cigars', etc.) there need not be question of goods produced by farmers any longer, which means that the link between the suffix-like element *-boer* in the compounds in question and the word *boer* 'farmer' has become weaker and weaker.

Both in the case of Turkish *ile vis-a-vis -ylel-le* and in the case of Dutch *boer vis-a-vis -boer*, the original word and the newly arisen affix still form part of the language. This need not be the case, however. Not infrequently, the original word has disappeared from the language. The Dutch suffix *-loos*, for example, has no doubt developed from the adjective *loos* ‘deprived of’. However, this word no longer forms part of modern Dutch, its sole remnant (apart from some frozen expressions) is the word-like suffix *-loos*. Complex adjectives in *-loos* still display a compound-like character. This is, among other things, evidenced by its phonological characteristics: *-loos* is still a phonological word. As far as grammar is concerned, however, *-loos* is a suffix, since it does not occur independently. In other cases, the affix has undergone such drastic changes that the link with the word it has developed from, is no longer clear. In Dutch, many prefixes have also originated from independent words. This is for instance the case with the prefixes *be-* and *ver-*, both with schwa. However, for the speakers of present-day Dutch, these prefixes are no longer related to the words they have developed from, viz. *bi* and *for* respectively (in the modern language *bij* ‘with’ and *voor* ‘for’).

Morphologization, finally, is a very important process – particularly when it is followed by (or interacts with) regularization – because of its potential drastic character. **Morphologization** is the force underlying dramatic developments such as the development of postpositions into case endings (see above) or the development of auxiliaries into tense markers. Particularly in the case that such changes lead to large-scale regularization, they may result in morphological systems that are fundamentally different from those that preceded them.

It has been suggested that all affixes stem from words. The correctness of this far-reaching hypothesis concerning the origin of affixes is doubtful, however (see also 3.2.1). What has been overlooked, among other things, is that phonological phenomena may be assigned a morphological interpretation as well (also 4.1). One way in which this incorporation of purely phonological (i. e. meaningless) elements into morphology may come about, is the development of ‘phonological chunks’ into suffixes. This phenomenon is known as **secretion** (Jespersen 1922: 384–386). A particularly interesting example of

this development is presented in Jespersen (1939). In that study it is pointed out that the variation in English between forms with and without final *n* sometimes resulted in the addition of *n/en* to words, without changing their meaning. In this way, Jespersen points out, forms such as *hidden* (next to *hid*) and *olden* (next to *old*) came into being. Verbs, too, were candidates for extension by means of *en*. This extension is particularly interesting in the case of verbs derived from adjectives. Originally, these verbs were formally identical to their adjectival base, i. e. they were formed by means of conversion. In this stage, there was no formal difference between the adjective *hard* and the verb *hard* which is formed on the basis of the adjective. These deadjectival verbs could undergo *en* extension as well and in this way verbs such as *darken*, *deepen*, *harden*, *ripen* and *sharpen* came into being. Originally, the element *en* in these latter verbs was not linked to any grammatical and/or semantic value, meaning that it is completely comparable to *en* in e. g. *often* (from older *oft*) (Jespersen 1939).

However this may be, the extended deadjectival verbs became subject to reanalysis. These verbs were no longer regarded as extended verbs, but they were considered to be directly derived from the adjectival base by means of the suffix (!) *-en*. This new status of the verbs in *-en* is evidenced by the fact that the newly established derivational pattern led to new coinings. An example is the verb *biggen*. There has never been a verb *big*, which means that the verb *biggen* cannot be conceived of as an extended version of it. Put differently, the verb *biggen* can only be considered to be directly derived from the adjective *big*, meaning that the element *en* has developed into a derivational suffix *-en*. The same holds for verbs such as *cheepen*, *coarsen*, *laten*, *louden*, and *ruden*. These verbs make clear that it is not necessarily the case that all ‘bound forms’ (i. e. affixes) stem from originally free forms. As said, according to Jespersen (1939), the suffix *-en* in the de-adjectival verbs in question does not stem from a free form: *en* has never been a word. In older English *en* was only the phonological extension of the original verb. This makes clear that purely phonological entities may also be incorporated into morphology, in this case in consequence of the reinterpretation of the verbs they are part of. The net result of this reinterpretation is that a purely phonological sequence develops into a suffix.

## 5. Morphological changes due to extragrammatical forces

In this section two distinct sets of phenomena will be dealt with. In both cases the phenomena in question relate to different aspects of language use (see 2.2). First of all, changes will be discussed that relate to the indirect repercussions of speech production and speech perception on the morphological system. Subsequently, it is the effects of conventionalization that will be discussed. Clearly, these are the effects of, respectively, the first and the third domain of language use that were discerned in 2.2. (The relevance of the second domain of language use ('looking for words') for morphological change was discussed in section 2.2.2, where it was associated with the never-ending inspection of the lexical stock by the speakers of a language (also 3.2)).

### 5.1. The effects of speech production and speech perception

As was pointed out in section 2.2, the processes of speech production and speech perception particularly affect the phonological form of words. This means that they affect morphology only indirectly. In general, it is particularly the final parts of words that fall victim to these processes, the net result of which is the weakening and eventual loss of word-final elements. Since these latter elements are often (part of) suffixes, the net result is that these phonological forces are particularly devastating with respect to suffixes. In the case of complex words it is not only the word form that may be affected by these forces, but the grammatical information associated with the affected suffixes may get lost as well. Particularly in the case that suffixes do not bear stress, they easily fall victim to phonological weakening and loss. It has been suggested that the phonological factors in question may become operative more easily when the semantic content of the endings is opaque. Case systems, for instance, are considered to resist phonological weakening better when each case has a transparent semantic content and, consequently, has a neatly defined position within the case system as a whole. However this may be, even cases whose semantic characteristics are clear, may fall victim to phonological erosion when they do not bear stress. One of the reasons why the case system of a language like Turkish is so strong, is that the case endings in Turkish

are stressed. As a matter of fact, the Turkish case system is even expanding: the above discussed suffix *-ylel-le* (which stems from the postposition *ile*, see 4.2) clearly develops into the direction of a new case suffix (viz. that of instrumental/comitative).

### 5.2. The effects of conventionalization

As will be clear by now, the processes of conventionalization and lexicalization first of all affect individual words. Once formed, complex words may become part and parcel of the conventional lexical stock, which means that their internal morphological properties are no longer relevant to their functioning. As was pointed out in section 2, as to their functioning conventionalized complex words are similar to simplex words. In consequence of the 'irrelevance' of their structural properties, conventionalized complex words are an easy target for phonological and semantic forces affecting and obscuring their internal structure. However, the conventionalization of complex words may in the long run also affect the morphological system. Morphological processes may lose their productivity when their semantic properties get obscured. This may be the case when too many of the words that they have produced have become semantically opaque. This happened for instance with the Dutch deverbal adjectives in *-lijk* (e.g. *wenselijk* 'desirable', cf. *wens-en* 'to desire'). In Van Marle (1988) it is suggested that this once very productive pattern has lost its productivity in consequence of the semantic diversity that the words in *-lijk* exhibited.

Another type of change which should be discussed in this section on conventionalization, are changes in the register-dependent character of morphological processes. As was pointed out in Art. 33, many morphological processes are conventionally linked to a specific (set of) register(s). The category of deverbal adjectives in *-baar* '-able', for instance, is a typical representative of a process with a clear High-character (Van Marle 1990 a), and so is the category of deverbal abstract nouns in *-ing* (Van Haeringen 1971). In Art. 33 it was pointed out, too, that categories with a High-character tend to have morphological domains which are clearer defined (and, not infrequently, more restricted) than categories with a Low-character. This implies that changes in the register-dependent character of morphological processes may have consequences for the range of words which may

potentially serve as input for the process in question. In Van Marle (1990a) it is pointed out that this is indeed the case. The category in *-baar*, for instance, which is the successor of the category in *-lijk*, has a much more restricted domain than its predecessor. In contrast to the category in *-lijk*, the category in *-baar* is a typical exponent of the High-registers. In Afrikaans, the daughter language of Dutch which ‘copied’ Dutch derivational morphology during its standardization, the category in *-baar* lost its High-character, the consequence of which is that in Afrikaans deverbal adjectives in *-baar* can be formed much more freely than in Dutch (Van Marle 1996). Similarly, there are dialects in Dutch where coining in *-ing* is remarkably popular. In these dialects, and different from the standard language, the category in *-ing* has no clear High-character, a fact which directly fits in with the observation that in general there is no strong trend in dialects to distinguish between distinct registers. Not surprisingly, in these dialects coining in *-ing* runs much more smoothly than in the standard language.

A quite uncommon type of morphological change which also belongs to this category, finally, is the development of a morphological process into the direction of a register marker. This is what happened to Afrikaans diminutive formation. Apart from normal diminutives, Afrikaans has a whole series of a-typical **diminutives**, the occurrence of which is restricted to ‘affective usage’ (see Art. 33). Interesting about these a-typical diminutives is, that they may be based on pronouns, prepositions and verbs and that the attachment of the diminutive suffix is not associated with a change in word class. Specifically, if an a-typical diminutive is formed on the basis of a pronoun or verb, the resulting word is still a pronoun or verb. Cf. *hom* ‘him’ versus *hompie*, where the latter diminutivized form is still a pronoun. Typical of these a-typical diminutives in Afrikaans is, that they have lost their referential function, in consequence of which the development underlying their coming into existence can best be considered an instance of ‘demorphologization’.

## 6. Morphology and contact-induced change

In our above discussion of morphological change we have concentrated on monolingual situations. All forces discussed operate

language-internally, i.e. in a situation in which a given language is transferred from one generation to another without there being other languages spoken in the same community at the same time. That is, contact-induced change was left out of consideration completely. Evidently, it is beyond the scope of this article to discuss the effect of language contact on morphological systems in detail. Language contact may adopt various shapes, and the effects on the morphology of a language may vary accordingly. In this connection we confine ourselves to some brief remarks.

### 6.1. Borrowing

In 4 we discussed the fact that morphological systems may expand due to the incorporation of phonological and syntactic phenomena. Another well-known type of morphological expansion involves language contact, i.e. the incorporation of loan affixes (cf. also Art. 152). Note, however, that as a rule this type of expansion is – as far as morphology is concerned – only an indirect effect of the bilingual situation in question. More often than not, these so-called loan affixes have not been directly borrowed at all. In most cases it is not the affixes that are borrowed but the complex words that these affixes are part of. Put differently, in most cases the **borrowing** of words is a predominantly (or even exclusively) lexical process which results in an expansion of the lexicon in the first place. However, since the lexical stock – native or non-native – is subjected to a constant process of inspection from the part of the speakers of the language (see 2), the affixes figuring in complex words may be recognized and subsequently ‘isolated’ from the borrowed words in question. The implication of this is that in many cases the occurrence of loan affixes is no directly contact-induced phenomenon and neither is their ‘recognition’. What is contact-induced, is the lexical process of borrowing (lexical expansion).

In cases of long-term cultural contact, borrowing may result in a lexical stock and a morphological system in which two **strata** can be distinguished, a native and a nonnative one. This is the synchronic reflex of the contact-induced process of borrowing.

### 6.2. Morphological erosion

In 5.1 it was discussed that morphological systems may experience erosion, since the processes of speech production and speech

perception often affect the phonological form of words. As a rule, the erosion of morphological systems due to performance factors represents a process with a gradual character. However, morphological erosion may also have a contact-induced character, since certain types of language contact may lead to morphological erosion as well. This loss of morphological distinctions may affect both the (original) first language of the speakers due to language shift and language loss, and the (original) second language due to imperfect learning. Note that the decay of a morphological system due to language contact is much more abrupt than the gradual erosion of a morphological system due to the effects of speech production and speech perception. In American Dutch, for instance, both the plural suffixes of nouns and the verb endings are spontaneously dropped, simply because of the fact that the present-day speakers of American Dutch do no longer have full command of their language (Smits 1996).

Evidently, the effects of language contact on morphological systems may be quite dramatic, depending among other things on the intensity of the contact situation. Morphology, particularly inflection, appears to be highly vulnerable to language contact, since one of the most radical contact-induced developments typically affects this part of a language. In cases of intense contact, (the greater part of) morphological systems may fall victim to large-scale erosion, meaning that large parts of the original system are lost more or less completely.

## 7. Conclusions

In the preceding sections an attempt has been made to arrive at a classification of morphological changes based on the idea that any morphological change is the result of a certain type of process acting upon a specific domain or component of a language. By way of conclusion the various types of morphological change discussed so far will be briefly characterized in terms of the language domains in question and the processes of language acquisition and use that are involved.

The first two types of morphological change that were discussed are regularization and systematization. These two types of change originate in the morphological system itself, i. e. in the set of existing words, in the

relations between them, or in the rules by means of which they are formed.

Regularization bears upon those changes that are triggered by idiosyncrasies in the rule system. As its name indicates, this process is directed towards more regular and transparent morphological rules. This may result in the well-known phenomenon of **rule generalization**, i. e. the increase of a rule's domain by the elimination of its exceptions. On the other hand, the effect may be the restriction of a rule's domain as well, as a consequence of the fact that its conditions may also become more strictly delimited.

Systematization comes in two types: **reinterpretation** and **adaptation**. Reinterpretation comprises a number of changes in the morphological analysis of existing words. The factor at work is the speaker's tendency to look for transparent and clearly recognizable structure and segmentation of the words of his or her language. Well-known subtypes of reinterpretation are **back formation**, restructuring, **folk etymology**, and the isolation of affixes out of complex loan words. (In the latter case this may lead to the coming into existence of a new productive morphological rule.) **Adaptation** refers to the morphological adjustments of existing words, due to the paradigmatic pressure of semantically similar but formally different words. The best known subtypes are **leveling** and **hypercharacterization**. In the first case, a word (or class of words) loses its (their) characteristics which makes it (them) deviant from semantically similar words, in the second case a word (or class of words) acquires the formal characteristics of the category whose meaning it shares.

As said, both regularization and systematization have their roots in the morphological system. In terms of the processes involved, they are different, of course. Regularization is primarily associated with language acquisition (particularly with rule discovery), whereas systematization is primarily considered to be the outcome of language use (viz. the activity of 'looking for words'). The view that systematization is a manifestation of language use is further corroborated by the fact that the processes of reinterpretation and adaptation presuppose that the relevant systematic properties of the language have already been acquired. On a deeper level, however, regularization and systematization are

related processes. Both processes are the result of essentially the same activity: the ongoing search by language learners/language speakers for structure, patterns and regularity within the lexical stock and its underlying system. In addition, both processes tend to have a 'streamlining effect' on the domain they bear upon: regularization involves the streamlining of the rule system, whereas systematization involves the streamlining of the lexical stock.

The second group of changes that were discussed can be subsumed under the heading of morphologization. These changes do not originate in the morphological system of a language itself; rather they arise as reactions upon originally (mor)phonological or syntactic configurations in the output of a language (which, in their turn, may have come into existence due to the efficacy of performance factors). The essential process is the same as in the first group of morphological changes: the search for transparent morphological patterns. A common type of morphologization is the incorporation of (mor)phonological distinctions into morphology, which involves, among other things, the reinterpretation of a meaningless formal characteristic of a given set of words as meaningful. A second type of **morphologization** is the transition of words to affixes. Particularly well-known is the development of function words into affixes. Another change that may be mentioned here is the development of 'part of a compound' into suffix. Evidently, due to the latter developments new affixes come into existence. Note, however, that this does not necessarily imply that all affixes derive from independent words. Phonological chunks in the output may be morphologized as well, which means that new affixes may also have a phonological origin. In general, morphologization results in the growth of morphological systems. As was pointed out above, however, this does not imply that the forces underlying morphologization are fundamentally different from those in which morphological change proper is rooted. On the contrary, both morphological change proper and morphologization are largely rooted in the same source: the speaker's disposition to look for meaningful and transparent word structure. As a matter of fact, this seems to be the most fundamental force in morphology, in that it creates, maintains, extends and recreates morphological systems.

The remaining types of morphological change are due to performance factors. In general, these forces lead to the loss of morphological structure. First, the mechanisms of speech production and speech perception often bring about the loss of morphologically relevant distinctions and finally to deflection. Second, spontaneous use of language in concrete situations easily leads to the conventionalization of complex words, a phenomenon which opens the way to lexicalization. In its turn, lexicalization may result in the loss of productivity of morphological rules, due to the fact that a rule may lose its transparency when too many of the words it has produced have become lexicalized and have become opaque, either formally or semantically.

Finally, a type of change which is also due to performance factors but which does not necessarily lead to the loss of morphological structure, are changes in the conventional status of morphological rules. Since many morphological categories, particularly categories belonging to derivational morphology, are to a certain extent sensitive to stylistic conditions, various social and cultural processes may lead to a change in their conventional status. Such changes may lead both to the increase and the decrease of the morphological potential of these rules, depending on the direction that the change in conventional status has taken.

By way of conclusion, a brief remark on the overall nature of morphological change. More often than not, morphological change displays a little mechanistic nature. This is very clear in the case of systematization, but even in the case of regularization – i.e. in the case of morphological change proper! – morphological change may be remarkably idiosyncratic. This non-mechanistic and often unpredictable character of morphological change is due to two factors. First, many types of morphological change do not react upon characteristics of the morphological system as such, but upon properties of individual words, specific groups of words, or output strings. Second, the main force in morphological change itself is not a mechanistic but rather a creative process, stemming from the speaker's aptness to assign – i.e. to recognize or to create – internal structure to words.

### 1. Introduction

#### 1.1. History of grammaticalization studies

That bound morphological formatives often have their ultimate origin in independent lexical items has been a commonplace observation since the early 19th century (cf. Bopp 1816; Humboldt 1825). The phenomenon was not of primary interest to historical linguists more concerned with morphological constructions which could be reconstructed for a proto-language than with secondary developments, but its importance is explicitly recognized in discussions of general principles of diachronic linguistics such as Whitney (1875), Paul (¹1920 [¹1880]), and von der Gabelentz (1891).

Meillet (1912) first applied the term **grammaticalization** to the process by which lexical items enter into the grammatical system (“le passage d'un mot autonome au rôle d'élément grammatical”), a process whose endpoint is the development of new morphological constructions. Already in this discussion Meillet anticipates one of the most significant facts about the process, viz. that it is a gradual process rather than a sudden categorial shift. He distinguishes four degrees of grammaticalization of the French copula, from its lexical use in equational sentences (*je suis celui qui suis*) to its use as a tense auxiliary (*je suis parti*), and points out the ambiguous category of French *faire*, which is both a lexical verb ‘do, make’ and a causative:

“laissez peut être un mot principal, dans *laissez cela* par exemple; mais ici [in *laissez venir à moi les petits enfants*] *laissez venir* forme un ensemble, où *laissez* est, en quelque mesure, un auxiliaire.” (Meillet 1912 [1926: 134])

Since Meillet's recognition and naming of grammaticalization as a distinct phenomenon worthy of study, the topic has attracted the attention of a few scholars, notably Kurylowicz, who defined it in similar terms:

“Grammaticalization consists in the increase of the range of a morpheme advancing from a lexical to a grammatical or from a less grammatical to a more

grammatical status, e.g. from a derivative formant to an inflectional one.” (Kurylowicz 1965: 69)

However, the phenomena of grammaticalization have not been of central interest to most scholars of historical or synchronic linguistics, and it is only since about 1970 that it has begun to be systematically studied; it became the subject of sustained cross-linguistic investigation by the scholarly community only in the 1980's. Important contemporary works and collections include Givón (1979), C. Lehmann (1986; 1995), Heine & Reh (1984), Heine et al. (1991), Heine (1993; 1997), Hopper & Traugott (1993), Traugott & Heine (1991, eds.), Rissanen et al. (1997, eds.), Ramat & Hopper (1998, eds.), and Fischer et al. (2000, eds.).

The word *grammaticalization* (*grammaticalization* and *grammatization* are also used in the same sense) implies a process of becoming “grammatical”. The reference can be taken as being to lexical morphemes becoming grammatical ones, or, more broadly, to any linguistic construct (a morpheme, syntactic construction, or discourse pattern) becoming part of the grammatical system of a language. Recently scholars have begun to use the term to refer to shifts from more pragmatic to more grammatical function of syntactic constructions, e.g. the development of subject from topic constructions (see e.g. Givón 1979; 1989).

Grammaticalization involves changes in each of the three basic areas of linguistic structure: semantics/pragmatics, morphology/syntax, and phonology. The shift of a lexical form to a grammatical function involves, first, some shift in its semantic and/or pragmatic function. This is the necessary precondition for a shift in syntactic category, a reanalysis of the syntactic construction. These two shifts in turn result in destressing of the grammaticalized morpheme, resulting in phonological reduction and cliticization, which in turn can lead to morphologization. The process is essentially unidirectional (Haspelmath 1999); the development of lexical from grammatical forms, while attested, is rare. Two fundamental questions outline the topic of grammaticalization: when, how, and why does a lexical form grammaticalize, and what specific types of grammatical formative develop from what specific types of lexical item?

### 1.2. Grammatical and lexical meaning

The phenomenon of grammaticalization has important implications for the traditional notion of “lexical” vs. “grammatical” morphemes. On the one hand, the traditional conception of grammaticalization as the passage of a form from the first to the second of these categories relies crucially on this distinction. On the other, the actual phenomena which we discover in studying cases of grammaticalization show that, like many other dichotomous categorizations in linguistics, this distinction is in fact a gradient rather than a clear split, and that forms must be thought of as more or less grammatical rather than simply as grammatical or lexical.

While it is easy to find unambiguously lexical and unambiguously grammatical morphemes, it is notoriously difficult to draw a clear dividing line. Thus prepositions and subordinating conjunctions are more lexical than case inflections, but less lexical, and more likely to have syntactic as opposed to lexical value, than ordinary nouns and verbs. Grammaticalization research shows that historical change is almost always from more lexical to more grammatical status. All such change is grammaticalization, the shift of a relational noun or serialized verb into an adposition just as much as the shift of a adposition to a case desinence.

The gradual nature of grammaticalization also calls into question the common conception of purely grammatical meaning. There is a strong correlation between the semantics of lexical items and their potential for grammaticalization – for example, future tense constructions develop from verbs originally meaning ‘want’ or ‘go’. If the meanings of grammatical forms derive by regular processes from lexical meaning, then grammaticalization provides a key to our understanding of the notion of grammatical meaning (Bybee 1988; Sweetser 1988; Heine et al. 1991; Heine 1993). The fact that not only do grammatical morphemes develop from lexical morphemes, but that specific types of grammatical morpheme regularly develop from lexical forms with particular meanings, suggests that grammatical meaning must to some degree have the same sort of semantic content as lexical meaning, rather than being purely structural.

### 1.3. Theoretical significance of grammaticalization studies

Already in 1912 Meillet points out that grammaticalization, though equally as important as analogy in the development of new gram-

matical forms, had received much less attention in historical linguistics. From a modern perspective, informed by knowledge of a wider range of languages, we can assert that grammaticalization is in fact much more important than analogy; nevertheless until recently it has continued to receive less attention than it merits in historical and general linguistics.

One reason for this neglect is that the facts of grammaticalization pose a serious challenge to a fundamental aspect of structuralist synchronic analysis, an aspect which remains fundamental to omit much contemporary work in the generative paradigm. A structuralist or generative model consists of an inventory of syntactic categories and a set of rules for combining them into larger structures. The initial problem posed by examples such as Meillet’s is that in such data we seem to find one and the same morpheme as a member of two or more categories (e.g. in Meillet’s example as both copula and tense auxiliary). On further examination of such data the problem worsens, as it often is difficult or impossible, at least on any non-ad hoc basis, to assign some uses of an etymon to one or another category.

Grammaticalization sensu strictu involves the shift of morphemes from one form class to another, and often involves the innovation of a new form class. Thus, in grammaticalization we find evidence bearing on the nature of morphosyntactic categories and their place in the organization of grammar. We regularly find cases in which grammaticalizing forms occupy intermediate categorial status. For example, in modern English we find a range of more and less verb-like characteristics among grammaticalizing forms such as *used to*, *want to*, *ought to*, etc. (Bolinger 1980). Such data call into serious question the adequacy of any model of linguistic structure which takes the notion of discrete, clearly defined morphosyntactic categories as a theoretical given.

Another traditional distinction which requires reevaluation in the light of modern studies of grammaticalization is the opposition of **synchronic** and **diachronic analysis**. Some scholars (especially Hopper 1987; 1991; Givón 1989), are now suggesting that our traditional notion of a static synchronic “state” of a language in which every morpheme and construction can be unambiguously assigned a categorial place in the grammar is not only an idealization, but an unre-

alistic one, and that viewing grammar in terms of the fluid categories and indeterminately syntacticized constructions which are the stuff of the diachronic study of grammaticalization provides a more adequate basis for understanding the “synchronic” structure as well as the diachronic changes in language.

## 2. An overview of grammaticalization

### 2.1. Grammaticalization exemplified

The study of grammaticalization reveals recurrent patterns for the origin of particular grammatical structures. For example, causative morphemes regularly develop from serialized or complement-taking verbs with meanings like ‘make’, ‘give’, or ‘send (on an errand)’. Dative case markers originate in ‘give’ verbs or in locative/allative markers, and locative and allative markers derive diachronically from relational nouns or from verbs of location, position, and motion. One important aspect of ongoing research on grammaticalization is the cataloguing of typical sources for various grammatical constructions, which show common patterns throughout the world. As a typical example, we may consider the origin of grammatical tense categories. While Bopp is still criticized for his promiscuous identification of Sanskrit conjugational endings as grammaticalized copulas, the mechanism which he suggested as the origin of verbal desinences in Sanskrit is one which is widely attested in languages of the world (e.g. Givón 1971; Haas 1977; Heine & Reh 1984). A well-known example is the development of the modern French, Spanish, and Italian synthetic future conjugations from fusion of auxiliary *habere* ‘have’ with the infinitive, so that e.g. Fr. *chanterai* ‘I will sing’ reflects a Vulgar Latin morphologization of an earlier infinitive + auxiliary construction *cantare habeo* (cf. Benveniste 1968; Hopper & Traugott 1993). While in the world’s languages we can find many tense affixes for which no etymology is recoverable from available data, and there are occasional examples of tense morphology with other origins (e.g. in morphologized adverbs; cf. Art. 110), in the vast majority of cases, if the origin of morphological tense markers can be traced, they will be found to originate in auxiliary verb constructions of some sort.

Auxiliary verbs, in turn, represent grammaticalizations of originally biclausal syntac-

tic constructions, in which the potential auxiliary is a finite verb with a complement clause, or the highest verb in a **serialization** construction (cf. Art. 78). We can illustrate the sequence with a grammaticalization series from modern Central Tibetan (DeLancey 1991; 1997). Tibetan, like many verb-final languages, makes abundant use of a **clause-chaining** structure in which only the last of a sequence of clauses has tense/aspect/evidentiality marking. Preceding clauses are marked with a subordinator, here glossed ‘NF’ for “non-final”, which functions only to mark them as non-final clauses in a chain. It is common for two chained clauses to share all arguments, with the result that their verbs occur in sequence, separated only by the ‘NF’ morpheme:

- (1) *khos kha=lags zas-byas phyin-song*  
he:ERG meal ate-NF went-PF  
'He ate and left.'

There is a small set of verbs which can occur as the second member of such a sequence without intervening ‘NF’ marking. These thus constitute a distinct syntactic subcategory, which we can categorize as auxiliaries. The difference between the two constructions can be illustrated using the same etymon, *bzhag*, which as a lexical verb means ‘put’, and as a grammaticalized auxiliary forms a perfect construction:

- (2) *kho phyin-byas bzhag-pa\_red*  
he went-NF put-PF  
'He went and put it there.'
- (3) *kho phyin bzhag-pa\_red*  
he went put-PF  
'He has gone.'

In the auxiliary construction (3), *bzhag* is still clearly the main verb; it carries full lexical tone, and takes tense/aspect marking. The same etymon occurs also in an even more grammaticalized construction, as a suffix marking inferential perfect:

- (4) *kho phyin-zhag*  
he went-INF.PF  
'He has left (I infer).'

Here the lexical verb *phyin* is the main verb. *Zhag* is unstressed and phonologically reduced, and represents still another morphosyntactic category, that of tense/aspect/evidentiality suffix.

## 2.2. Stages of grammaticalization

Discussion of processes of historical change traditionally present a series of “stages” leading from an initial to a final state, with the implication that these stages are themselves distinct states of linguistic structure. This can be a useful idealization, as long as it is recognized as an idealization of what is in fact a continuous phenomenon (cf. C. Lehmann 1985, which develops a scale for assessing the degree of grammaticalization of a morpheme). But the overall process of grammaticalization is perhaps better conceptualized in terms of a number of processes, some of which facilitate, precondition, or promote others, but which do not necessarily proceed strictly serially.

The starting point of the process is a productive syntactic construction: noun phrase with genitive dependent, matrix with complement clause, conjoined or chained clauses, etc. The precondition for grammaticalization is that there be some lexeme or lexemes which occur frequently in this construction for some semantic/pragmatic reason: potential relational nouns like ‘top’, ‘face’, ‘back’, regularly used to provide further locational specification in noun phrases used as locatives, phasal or other complement-taking verbs like ‘finish’ or ‘want’, semantically non-specific transitive verbs like ‘use’ or ‘hold’ conjoined or serialized with more specific verbs. This usually involves a lexeme with a very general meaning, which can therefore be used in a wide range of contexts. Thus a verb meaning ‘finish’ is much more likely to metamorphose into an aspectual marker, and thus potentially to enter the morphological system, than one meaning ‘buy’ or ‘repair’, which are initially usable in a much smaller range of semantic/pragmatic contexts.

This situation, in which a particular construction – a productive syntactic structure with a specific lexeme in a specific slot – is a useful and regularly-used locution in the language, i.e. where speakers regularly refer to ‘the face of [noun phrase]’, ‘finish [verb phrase]’, etc., is the initial point of grammaticalization. We can refer to this situation as “functional specialization” of the construction. The next step is for the lexeme to undergo a certain amount of **semantic bleaching**, to use Givón’s term, or, put another way, for the locution to be used in an extended set of contexts, including some in which the literal meaning of the lexeme is not applicable:

“... without an external change of its exponent a category may undergo important internal (functional) changes due simply to an extension of a limitation of its range. The logical principle of the mutual relation of range and content has to be applied in such a case: the *increase of the range* of a given category entails the impoverishment of its content, and vice versa.” (Kuryłowicz 1965: 57f.)

This can often be observed even in forms which have not undergone any formal grammaticalization. For example, *finish* in English is often used to mean simply ‘stop’, so that one can say *I’ve finished writing for today*, even when the project on which the speaker is working is far from completed. A more grammaticalized example is the Tibetan verb *sdad* ‘sit’, which is currently developing into a progressive auxiliary. It can now occur in sentences such as (5):

- (5) *kho rgyugs=shar\_slod(-ni) sdad-zhag*  
 he run(-NF) sit-PF  
 ‘He was running/kept running/was always running.’

The semantic incompatibility of ‘run’ and ‘sit’ is such that *sdad* cannot possibly be interpreted with its original lexical sense here. The structure thus cannot be a simple case of verb serialization, but represents an early stage of grammaticalization.

The next stage of grammaticalization occurs when this lexeme begins to “decategorialize” (Heine et al. 1991; for further examples see Matisoff 1991), i.e. to lose the morpho-syntactic characteristics of its original category. (This is a broad notion which includes more specific concepts such as C. Lehmann’s (1985: 307) “morphological degeneration ... the loss of ability to inflect”). For example, in the English construction *on top of* [noun phrase], *top*, while clearly a noun in origin, is un-nounlike in several respects. It lacks an article, and it cannot pluralize: we can say *on top of all the houses*, with *top* as a relational noun, or *on the tops of all the houses*, with *top* as an ordinary noun, but we cannot pluralize the relational noun: \**on tops of all the houses*.

Note that *top* in its relational noun use is already semantically bleached, in that *the top of* [noun phrase] necessarily refers to a specific part of the object, while *on top of* [noun phrase] simply refers to whatever side of it is uppermost at the moment. (E.g. if a refrigerator is lying on its back, something resting on the door, which is the uppermost surface, is *on top of the refrigerator*, but is not *on the*

*top of the refrigerator*). This is typical, and apparently universal; it is easy to find lexemes, like English *finish*, which have undergone some semantic bleaching without any morphosyntactic decategorialization, but decategorialization does not occur without some prior functional shift, toward either grammaticalization or lexicalization.

From this point we have a continuous process of further decategorialization and phonological reduction. One possible outcome is **recategorialization** (cp. C. Lehmann's 1985 "paradigmaticization"). There may already exist a morphosyntactic category into which the grammaticalizing form will fit and which it can enter. For example, the English preposition *atop* represents one endpoint of the grammaticalization of a noun 'top'. Or, if similar changes are occurring involving several functionally related morphemes, they may become a new paradigmatic category – a famous example is the English modals.

The final stages of grammaticalization are **cliticization** and **morphologization**, in which a grammaticalized form becomes increasingly bound phonologically and syntactically to a lexical head. While outlines of grammaticalization sometimes present this as a necessary final step, it is not; grammaticalized forms may remain as auxiliaries or "particles", never becoming bound. The exact conditions which determine whether and to what extent morphologization will occur are as yet not well-understood, though they appear to have to do with stress patterns and with word-order typology – morphologization appears to be more common in verb-final than in verb-medial languages, for example. (For some discussion see W. Lehmann 1973; Donegan & Stampe 1983.)

### 2.3. The cycle

The best-known version of the idea of discrete ordered stages in historical change is the hypothesis of the "**morphology-syntax cycle**". The traditional version describes an essentially mechanical sequence. Morphology is by its nature subject to phonological erosion, which over time reduces the distinctiveness of affixes to the point where essential distinctions are lost. In the face of this languages resort to grammaticalization as a therapeutic measure, creating new periphrastic grammatical constructions to replace lost morphological forms. Since grammatical for-

matives, whether free or bound, do not normally carry accent, newly-grammaticalized forms are now subject to phonological reduction, and over time cliticize, and eventually develop into new morphological constructions. These now are by nature subject to phonological erosion, and over time the new formation loses distinctiveness, and a new cycle takes place.

It has sometimes been suggested that this is a typological cycle, i.e. that every language passes through successive analytic and synthetic stages (cf. Hodge 1970). This is certainly open to doubt, and in any case would be impossible to document for most languages and families. A more plausible claim is that the cycle operates at the level not of whole-language typology, but of the instantiation of particular functions, so that, for example, tense marking, or even more specifically the expression of a particular tense category, in a language will alternate between periphrastic and morphological encoding. Examples at this level are easier to find; consider for example the contemporary competition of the French morphological future – itself the end-point of grammaticalization of an earlier periphrastic construction with 'have' – with a new periphrastic future in *aller* 'go': *je chanterai* vs. *je vais chanter* 'I will sing'.

While there is no doubt that the cycle is a descriptively useful schema for interpreting historical change, the traditional explanatory account which accompanies it is empirically inadequate. In the traditional description, the rise of new periphrastic constructions is motivated by, and thus follows, the loss of older morphological ones:

"Das, was man Aufbau nennt, kommt ja, wie wir gesehen haben, nur durch einen Verfall zu Stande, und das, was man Verfall nennt, ist nur die weitere Fortsetzung dieses Prozesses. Aufgebaut wird nur mit Hilfe der Syntax. Ein solcher Aufbau kann in jeder Periode stattfinden, und Neuaufgebautes tritt immer als Ersatz ein da, wo der Verfall ein gewisses Mass überschritten hat." (Paul 1920: 351)

Such interpretations of diachronic development effectively assume an information-theoretic functional model of language in which there is a fixed set of functions which linguistic structure must be able to handle, and some inherent pressure to avoid redundancy. The simple picture of the cycle is one

in which a language at any given synchronic stage has one mechanism to carry out each essential function, and as this mechanism wears out it must be replaced by a new one so that the function will not be lost. Thus, for example, Benveniste (1968), in discussing the innovation of periphrastic grammatical constructions which constitutes the first step of what we call grammaticalization, labels it **conservative mutation**, explicitly assuming that **periphrastic constructions** develop to replace earlier morphological constructions in the same function.

However, there is abundant evidence that this model is too simple. It is not the case that a language will have only one functioning means of expressing a particular meaning at a given stage, or that serious phonological erosion of one construction is a necessary condition for the rise of another (DeLancey 1985; Hopper 1991; Hopper & Traugott 1993). Consider, as a simple example, the gradual replacement of the French inflected past and future verb forms by periphrastic constructions with *avoir* and *aller*. There is clearly a stage in this development (i.e. Modern French) where the inflectional and periphrastic constructions co-exist, where the new construction is already grammaticalized while the older one remains functional. Arguably we could claim that the traditional account has the direction of causation backwards, that it is in fact the development of the new construction which leads to the loss of the old, rather than the decay of the older one leading to the development of a new replacement (Bybee 1985; DeLancey 1985).

#### 2.4. Sources and pathways

Grammaticalization processes are not random; particular types of grammatical formative tend to develop from specific lexical sources. Recent studies have made considerable progress in developing a catalogue of such pathways of development (Traugott 1978; 1988; Ultan 1978; Givón 1979; Heine & Reh 1984; Bybee 1988; Bybee et al. 1994; Bybee & Dahl 1989; Heine et al. 1991; various papers in Traugott & Heine 1991, eds.).

The best studied category of nominal morphology is **case** inflection. Since the functions of case inflection and adpositional marking show considerable overlap – indeed in many languages case marking is accomplished by adpositions rather than inflections – we should expect to find a diachronic connection between the two. Indeed, case inflection does

ordinarily develop from cliticization and subsequent morphologization of postpositions (Kahr 1975); examples of morphologization of prepositions appear to be rare. Postpositions and prepositions both develop either from **serial verbs** or from **relational noun** constructions. Other categories of nominal inflection have not been as well-studied, but see for example Greenberg (1978) on the origin of gender marking.

Verbs, of course, show a much wider range of common inflectional categories than nouns (cf. Art. 72), but most of these come from the same proximate source, auxiliary verbs, which are the typical source of tense/aspect and modality marking, deictic specification, and causative, benefactive, and other “applicative” constructions. The other common morphological category in verbs, person and number agreement, arises most commonly from the morphologization of unstressed, non-contrastive pronouns.

**Auxiliary verbs** develop from lexical verbs through two types of construction: either complementation or clause-chaining. Since European languages are not prone to clause-chaining, many of the best-known examples of the development of auxiliaries and hence verbal inflection arose from complement constructions; for example, the French synthetic future represents reanalysis and subsequent morphologization of the infinitive form as a complement of the verb *habere* ‘have’. The path from **clause-chaining** through **verb serialization** to auxiliarization is also widely attested. For example, the Lhasa Tibetan perfect/perfective paradigm includes, among other forms, an inferential perfect *-zhag l-ša/* and a volitional perfective *-pa yin l-payii/*, reduced in running speech to *l-pii/*. The first of these developed from a serial verb construction with the verb *bzhag* ‘put’, originally a grammaticalization of clause-chaining constructions along the lines of (6):

- (6) *sha btsabs-nas bzhag*  
meat chop-NF put  
'chop the meat and put it (aside)'

The second developed from a nominalized clause (*-pa* is a nominalizer) as the complement to a higher copula (*yin*), so that the modern perfective construction *V-pii* reflects an older structure *\*[S-pa] yin*. Special note should be made of this second pattern, which exemplifies a cross-linguistically very com-

mon phenomenon of tense/aspect and/or evidentiality marking through the grammaticalization of copulas.

### 3. The process of grammaticalization

#### 3.1. Functional aspects of grammaticalization

We have referred to the notion of “functional specialization” as prerequisite to grammaticalization. The essential precondition for grammaticalization is that a lexical form have some special functional status which distinguishes it from other members of its syntactic category. We can describe three paths to grammaticalization: semantic specialization through metaphor, reanalysis through pragmatic inference, and what we may call **referent conflation**. It must be emphasized that these are not presented here as competing explanations; all are clearly attested as occurring. Moreover, they are not mutually exclusive, and particular cases of grammaticalization may be best explained in terms of some combination of these processes.

Many examples of shift from a lexical to a more grammatical meaning for a morpheme involve **metaphorical extension**. One example that has been well-explored is the “body-part model” for the development of spatial expressions. In a wide range of languages some or most of the relational nouns which express spatial relations such as ‘front’ and ‘back’, and eventually adpositions derived from these relational nouns, are drawn from body-part vocabulary (see e.g. Friedrich 1969; Brugman 1983; Heine et al. 1991). Among the commonest such semantic transfers are expressions for ‘on’ derived from nouns meaning ‘head’, for ‘behind’ from ‘back’, for ‘in front of’ from ‘face’, and for ‘inside’ from ‘belly’.

Another well-explored metaphorical field is the wide range of “localist” phenomena in which spatial expressions are used with temporal, logical or other meaning (Anderson 1973; Traugott 1978). The most prevalent example of this is the use of forms meaning ‘at’, ‘from’, and ‘to’ to express temporal as well as spatial relations, which is so universal as to leave open to question in what sense it is appropriately considered to be metaphorical. Another is the common development of perfect or past tense constructions from con-

structions with ‘come’, and of futures from ‘go’ (Traugott 1978). A well-explored type of abstraction from one cognitive domain to another is the development of grammatical from spatial (or “local”) case forms (Anderson 1971; DeLancey 1981); the most widely attested development is the origin of dative case markers from locative or allative adpositions (e.g. English *to*, French *à*, and their cognates in other Germanic and Romance languages).

Another line of explanation for **semantic shift**, sometimes referred to as metonymic (Heine et al. 1991), finds the initial shift in the transfer of the primary meaning of the construction from one to another aspect of the situation to which it applies. For example, we often find perfective constructions developing from verbs meaning ‘go’, ultimately deriving from serial verb constructions meaning ‘did X and then went’; the obvious inference that the doing was completed before the doer left ceases to be merely an inference and becomes the primary semantic content of the construction.

As we will note below, grammaticalization typically involves the flattening of a syntactic structure – a biclausal construction is reanalyzed as a single clause, or a noun phrase with another noun phrase embedded within it is reinterpreted as a single adpositional phrase. This **syntactic reanalysis** is driven by a semantic reinterpretation in which two conceptually distinct referents are reinterpreted as one. For example, in an ordinary genitive construction like *the leg of the table*, each lexical noun refers separately; although the leg is part of the table, the noun phrase makes distinct reference to the table and its leg. An adpositional construction such as *on the table*, in contrast, refers only once. Thus in the development of an adposition from a relational noun, e.g. *atop* from \**on the top of*, we see the conflation of two referents into one.

#### 3.2. Syntactic aspects of grammaticalization

Functional specialization is an ubiquitous phenomenon; lexemes with certain semantic characteristics tend to be almost automatically specialized in this sense to some degree. While these functional factors are the engine which drives the process, most linguists do not recognize grammaticalization per se until actual changes of grammatical structure have occurred (but cf. Hopper 1987; Givón 1989

for suggestions that this distinction is to some extent artificial). The critical patterns of structural change relevant to the development of morphology are concerned with changes in constituent structure, particularly head-dependent relations, and changes in the status of the morphosyntactic boundaries setting off the grammaticalizing morpheme.

Consider again the three stages of grammaticalization illustrated by the Lhasa Tibetan examples (2)–(4) (see 2.1). In (2), we can identify *bzhag* as both the syntactic head and the semantic/pragmatic center of the construction. Syntactically, it is the finite verb, and in the rightmost position which in Tibetan is characteristic of heads. Semantically, the ‘putting’ is the primary foregrounded information; the informational contribution of ‘went’ is essentially adverbial. In (3) the syntactic and functional analyses are no longer congruent: while *bzhag* remains the syntactic head, as noted previously, *phyin* is the lexical verb and the information focus. By the stage illustrated in (4), the shift of informational focus is complete, and by many analyses the head-dependent relations have also shifted. Some modern interpretations of the head-dependent relation would identify *zhag* as still the head of its construction; in any framework with this feature the description of the changes involved in grammaticalization is simpler, since it does not have to involve reanalysis of the head-dependent relations in the construction.

Accompanying each of these shifts is a downgrading of the boundary between the two verbs. In (2), the two verbs are in two distinct clauses, and a clausal boundary separates them. In (3) there is only one clause, but the lexical verb *phyin* and the auxiliary *bzhag* remain separate words. In (4) -*zhag* is a suffix, with a morpheme boundary corresponding to the word boundary in (3) and the clause boundary in (2). The mechanics of this sort of boundary downgrading and erasure are discussed at length by Langacker (1977).

### 3.3. Grammaticalization and lexicalization

A lexical morpheme which loses its autonomy may follow various career paths, which we can broadly categorize as grammaticalization and **lexicalization**. (I use “lexicalization” here to refer to the process by which originally independent lexemes become parts of

new lexical items; the term has several other uses, including one, essentially the converse of grammaticalization, in which it refers to an inflected form leaving its paradigm and becoming a distinct lexeme; the best-known category of example is the development of adverbials from oblique case-forms of nouns; cf. Art. 150). The difference is in whether the output of the process is a new lexeme or a new construction. For example, consider the Early New English and now dialectal progressive prefix *a-* in English, as in:

- (7) *I'm a-wanting for to go.*

This represents grammaticalization of an earlier preposition. Exactly the same process of phonological reduction and cliticization of a preposition is the source of the *a-* in *atop*. In this case, the end product of the process is, not a new construction, but a single lexical item, and thus an example of lexicalization. (As discussed above, the shift of *top* out of the open class of nouns, and the creation of a new member of the closed class of prepositions, are more profitably discussed as grammaticalization.)

Obviously this distinction depends on the distinction between lexical and grammatical morphemes, and thus like that distinction must be viewed as a continuum rather than a dichotomy. For example, the same reduction of a preposition discussed in the preceding paragraph also produced the odd family of *a-* adjectives (*awake*, *asleep*, *alone*, etc.). In terms of productivity this development lies somewhere between that of *atop* and the entirely productive progressive prefix. Here the process created a new subcategory; the resulting forms differ from most adjectives in that they cannot occur in prenominal position (\**an alone man*). But as a new category this has no other repercussions in the grammar, since there is no new grammatical construction associated with it, and it is not particularly useful to consider this as an example of grammaticalization.

Occupying the middle ground between lexicalization and pure grammaticalization is the development of derivational morphology, which as Paul points out is not systematically distinguishable from the origin of inflection:

“Auf die gleiche Weise wie die Ableitungssuffixe entstehen Flexionssuffixe. Zwischen beiden gibt es ja überhaupt keine scharfe Grenze.” (Paul 1920: 349)

For the purposes of grammaticalization theory the most useful criterion for identifying grammaticalization is the degree to which the output of the process is a new productive construction, i.e. a new element of grammatical structure, as opposed to simply a new set of (one or more) lexical forms.

## 147. Morphologisierung: von der Phonologie zur Morphologie

1. Was ist Morphologisierung?
2. Zur Geschichte des Konzepts
3. Parameter der Morphologisierung
4. Zitierte Literatur

### 1. Was ist Morphologisierung?

Von Morphologisierung spricht man im allgemeinen, wenn im Laufe der Sprachgeschichte nichtmorphologische grammatische Erscheinungen zu morphologischen Erscheinungen werden. Will man den Begriff der Morphologisierung etwas genauer umschreiben, so geschieht das am zweckmäßigsten, indem man von der Bestimmung der Morphologie, genauer gesagt der Flexionsmorphologie, ausgeht. Die **Flexionsmorphologie** ist im Rahmen des Sprachsystems dadurch gekennzeichnet, daß sie erstens grammatische Kategorien formal durch Marker symbolisiert, und daß sie zweitens innerhalb der Grenzen des Wortes operiert. Eine Morphologisierung findet immer dann statt, wenn eine grammatische Erscheinung, die bisher nur eine dieser beiden für die Flexionsmorphologie konstitutiven Eigenschaften zukam, infolge von Sprachwandel auch die jeweils zweite dieser Eigenschaften herausbildet. Damit ergeben sich grundsätzlich zwei unterschiedliche Möglichkeiten der Morphologisierung. Zum einen können syntaktisch-analytische Marker (Marker mit Wortcharakter), die ja bereits grammatische Kategorien symbolisieren, durch Tilgung von Wortgrenzen zu morphologischen Markern werden. Zum anderen können phonologische Alternationen, die innerhalb des Wortes operieren und die Formen von Flexionsparadigmen betreffen, durch Ersetzung ihrer phonologischen Bedingungen durch morphologische zu morphologischen Markern werden. Allen Morphologisierungen ist gemeinsam, daß sich im Wort, der Domäne der Morphologie, neue Zeichenverhältnisse herausbilden, neue Relationen zwischen Zeicheninhalten, also grammatischen Kategorien, und Zeichenformen, also grammatischen Markern. Dennoch unterscheiden sich die beiden Typen von Morphologisierung hinsichtlich ihres Status und ihrer Ergebnisse beträchtlich. Im ersten Fall ist die Morphologisierung nur eine Etappe eines umfassenden Grammatikalisierungsprozesses; sie führt zur Herausbildung von additiven Markern (Markern mit Morphemcharakter)

und ist entsprechend in den Zusammenhang der Grammatikalisierung einzuordnen (vgl. Art. 145). Im zweiten Fall hingegen stellt die Morphologisierung selbst einen eigenständigen, meist relativ komplexen Wandelprozeß dar; sie führt typischerweise (wenn auch nicht ausschließlich; vgl. 3.3) zur Herausbildung von modifikatorischen Markern (Markern mit Alternationscharakter). Die Morphologisierung phonologischer Alternationen (im weiteren kurz Morphologisierung) konstituiert einen spezifischen Bereich der historischen Morphologie.

Da phonologischen und morphologischen Alternationen jeweils entsprechende Regeln zugrundeliegen, läßt sich auch die Morphologisierung am angemessensten bezogen auf den Regelbegriff definieren:

**Morphologisierung** liegt genau dann vor, wenn an die Stelle einer Regel/mehrerer Regeln, die in einem phonologischen Kontext eine formale Operation vornimmt/vornehmen, eine Regel tritt/mehrere Regeln treten, die die entsprechende Operation oder deren Inversion in einem morphologischen Kontext vornimmt/vornehmen.

Es findet also, kurz gesagt, ein Übergang von phonologischen Regeln zu morphologischen Regeln statt, wobei dieser Übergang kein unmittelbarer sein muß, sondern auch vermittelt über morphonologische Regeln erfolgen kann (vgl. 3.2). Eine notwendige Voraussetzung für die Morphologisierung einer phonologischen Regel ist, daß diese formale Alternationen innerhalb von Flexionsparadigmen bewirkt. Der resultierende morphologische Kontext besteht aus grammatischen Kategorienmerkmalen (wie Numerus-, Kasus-, Tempusmerkmalen); in Sprachen mit Flexionsklassen treten auch entsprechende Klassenmerkmale auf. Bei Morphologisierungen gibt es nicht notwendigerweise ein Eins-zu-eins-Verhältnis zwischen einer phonologischen und einer morphologischen Regel. Das zeigen z. B. die verschiedenen Morphologisierungen des Umlauts im Deutschen; im Laufe der Sprachgeschichte wird eine einheitliche phonologische Umlautregel durch eine ganze Anzahl von morphologischen Umlautregeln ersetzt. Ein Beispiel dafür, daß eine resultierende morphologische Regel die inverse Operation der ursprünglichen phonologischen Regel vornimmt, ist der morphologische ‘Rückumlaut’ der deutschen Verben

des Typs *brennen* – Präteritum *brannte* mit Umkehrung der ursprünglichen Ableitungsrichtung von ‘a → e’ zu ‘e → a’ (vgl. 3.4).

Mit der Morphologisierung von phonologischen Regeln ändert sich deren Status grundsätzlich. Eine Regel, deren (vollständig oder doch partiell erhaltene) Funktion darin bestand, eine Klasse von Lautfolgen an den phonologischen Kontext anzupassen, erhält die neue Funktion der formalen Symbolisierung morphologischer Kategorien, wie sie allen morphologischen Regeln zukommt. Damit wird die phonetische Motivierung der Regel durch eine semiotische Motivierung ersetzt; aus lautlichen Alternationen werden sprachliche Zeichen; vgl. dazu z. B. urnordisch *londa* ‘Land’ – Nom./Akk. Pl. *lond* mit Assimilation [a] > [ɔ] an das [u] der Folgesilbe und neuisländisch *land* – Nom./Akk. Pl. *lönd* mit morphologischer *a/ö*-Alternation als alleinigem Numerus-Kasus-Marker.

## 2. Zur Geschichte des Konzepts

Bereits die traditionelle Sprachwissenschaft der zweiten Hälfte des 19. Jahrhunderts stößt bei ihren sprachhistorischen Untersuchungen auf die Problematik der Morphologisierung, ohne daß freilich der Terminus auftritt. So stellt Paul (1880) fest, daß es normalerweise kein “lautgesetz” gibt, “das nicht, sobald es einmal in einer anzahl von fällen das etymologisch eng zusammenhängende lautlich differenziert hat, auch eine reaction gegen diese differenzierung hervorriefe” (Paul 1880: 104). Paul konstatiert, daß eine solche Entwicklung jedoch nicht eintritt, wenn die formale Differenzierung mit einem Funktionsunterschied, d. h. einem morphologischen Unterschied, zusammenfällt. Dieses Zusammenfallen kann dann nämlich “die ursache zu dauernder bewahrung eines lautlichen unterschiedes sein, und dies vor allem, wenn er zugleich [...] durch die formale analogie widerstandsfähig gemacht wird” (Paul 1880: 114), d. h. wenn die Alternation morphologisch systematisiert wird:

“Bei dem zusammentreffen dieser beider umstände kann sich die vorstellung von dem lautlichen unterschiede so fest mit der von dem functionsunterschied verbinden, dass dem sprachgefühl beides unzertrennbar erscheint. Auf diese weise wird allmälig der zufällig entstandene bedeutungslose unterschied zu einem bedeutungsvollen. Er wird es um so mehr, je weniger die bedeutungsverschiedenheit durch sonstige unterschiede in der lautgestaltung deutlich gekennzeichnet ist. So vermag sich die sprache einen ersatz zu schaffen für den in folge

des lautlichen verfalls eintretenden verlust der charakteristischen merkmale des functionsunterschiedes.” (Paul 1880: 114; Hervorhebung im Original)

Um die theoretische Einordnung der Morphologisierung haben sich dann bereits zur Zeit der Junggrammatiker vor allem namhafte Vertreter des frühen russischen Strukturalismus verdient gemacht. Baudouin de Courtenay, der offenbar auch den Terminus “Morphologisierung” prägt, unterscheidet in seiner “Theorie phonetischer Alternationen” (Baudouin de Courtenay 1895) u. a. drei für den Morphologisierungszusammenhang einschlägige Typen von Alternationen, nämlich (i) “neophonetische”, d. h. phonologisch reguläre Alternationen, (ii) “traditionelle”, d. h. phonologisch und morphologisch irreguläre Alternationen und (iii) “psychophonetische”, d. h. phonologisch irreguläre, aber morphologisch reguläre Alternationen (Baudouin de Courtenay 1895: 110). Die Morphologisierung wird bei Baudouin in umfassendere grammatische Zusammenhänge gestellt. Für ihn hat die Sprache eine phonetische, eine semasiologische (semantische) und eine morphologische Seite, wobei sich letztere auf die grammatische Struktur der Sprache bezieht. Dabei verbinden sich phonetische Vorstellungen mit semasiologischen oder morphologischen; Lautsegmente oder auch phonetische Merkmale werden semasiologisiert oder morphologisiert (Baudouin de Courtenay 1908: 10f.). Semasiologisierung und Morphologisierung haben jedoch einen recht unterschiedlichen Status. Alle (distinktiven) Unterschiede werden generell im Rahmen von Morphemen semasiologisiert, d. h. zur Unterscheidung der Morpheme als Bedeutungsträger genutzt.

“Demgegenüber ist die Morphologisierung bestimmter Unterschiede zwischen artikulatorisch-auditiven Elementen in der Geschichte der Sprachen eine Übergangsscheinung. Sie wird gewöhnlich durch bestimmte historisch-phonetische Prozesse hervorgerufen, die zur Auflösung eines Phonems in zwei oder mehr führen; und diese neu entstandenen Abwandlungen eines ehemals einzigen Phonems [...] können psychophonetische Alternationen werden, die mit einem festen Unterschied von Formen verknüpft sind.” (Baudouin de Courtenay 1922: 67; deutsche Übersetzung nach Mugdan 1984: 75)

Die Morphologisierung erfolgt also in zwei Schritten: “Neophonetische” Alternationen verlieren zunächst durch Lautwandel ihre phonologische Motivierung und werden zu “traditionellen” Alternationen (i > ii). Wenn

diese dann morphologisch systematisiert werden, bilden sich “psychophonetische” Alternationen heraus. Es tritt Morphologisierung ein (ii > iii). Wenn das nicht geschieht, bleiben sie als rein traditionelle, irreguläre Alternationen erhalten (für Details vgl. Mugdan 1984: 73 ff.).

Auf Baudouin aufbauend legt dann sein Schüler Kruszewski (der auch Baudouins erst später publizierte Auffassungen zur Morphologisierung kennt) ein geradezu erstaunlich modernes Konzept der unterschiedlichen Typen von “Lautabwechslungen”, d. h. von Alternationen, und der sprachhistorischen Übergänge zwischen ihnen vor (Kruszewski 1881), das in seinen Grundzügen noch heute gilt. Er unterscheidet als erster zwischen (i) phonetisch bedingten Alternationen, (ii) morphphonologisch bedingten Alternationen und (iii) morphologisch bedingten Alternationen. Es gibt einen sprachhistorischen Entwicklungsprozeß von (i) zu (iii), wobei der Wandel von (i) zu (ii) “den Anfang der Verbindung von phonetischen Erscheinungen mit morphologischen Kategorien” darstellt (Kruszewski 1881: 23). Da die morphonologisch bedingten Alternationen eine Art von Umbauperiode zwischen (i) und (iii) markieren, stellen sie sich zunächst als scheinbar unregelmäßig dar; sie tendieren aber quasi gesetzmäßig zu einer neuen Regularität. Für die weitere Entwicklung gibt es zwei Möglichkeiten. Entweder erfolgt ein Wandel von (ii) zu (iii) in Form einer “Differenzierung”, d. h. einer Funktionalisierung der Alternation, wie beim deutschen Umlaut als Pluralmarker in Fällen wie *Loch – Löcher*; die Alternation ist dann morphologisiert. Oder es findet eine morphologische “Assimilation”, ein Ausgleich innerhalb des Paradigmas, statt, wie im Konsonantismus bestimmter starker Verben des Deutschen, vgl. ahd. *lesan – las – lärum* > nhd. *lesen – las – lasen*. In diesem Fall verschwindet die Alternation aus der Grammatik (Kruszewski 1881: 24 ff.; vgl. dazu Klausenburger 1994: 2562).

Nach einer langen Zeit, in der die Morphologisierung in der theoretischen Linguistik faktisch keine Rolle spielte, wird die Problematik in den siebziger Jahren wieder aufgegriffen. Ausgangspunkt dafür ist die zusammenfassende Darlegung der generativen phonologischen Standardtheorie durch Chomsky & Halle (1968). Diese Theorie betrachtet sämtliche Alternationen von Lauteinheiten ungeachtet ihrer jeweiligen Bedingtheit und Funktion einheitlich als phonologi-

sche Regeln. In den dadurch hervorgerufenen Diskussionen wird auch die Frage nach den zu unterscheidenden Typen von Alternationsregeln und den Kriterien ihrer Abgrenzung voneinander thematisiert. Damit wird dann auch wieder die Problematik der Genese und Entwicklung von Alternationsregeln theoretisch relevant. So entsteht eine ganze Anzahl von Arbeiten, die sich unter unterschiedlichen Gesichtspunkten mit der Morphologisierung auseinandersetzen. Dabei steht meist die Frage nach den Triebkräften von Morphologisierungsprozessen im Mittelpunkt.

Unmittelbaren Bezug auf die Schwachstellen der generativen Phonologie nimmt Skousen (1975). Bei der Behandlung der finnischen Konsonantengradation kommt er zu dem Ergebnis, daß diese durch (vermeintliche) phonologische Regeln und die entsprechenden abstrakten Repräsentationen nicht in auch nur einigermaßen angemessener Weise erfaßt werden kann, denn ihre Domäne ist im modernen Finnischen durch nichtphonologische, nämlich morphologische Bedingungen eingeschränkt bzw. ausgeweitet. Die ursprüngliche phonologische Regel ist im Laufe der Sprachgeschichte zu einer morphologischen Alternation geworden. “The motivating force” für die Morphologisierung von Regeln ist “a desire for surface regularity”, das Bestreben nach morphologischer Regularität (Skousen 1975: 125). Hooper (1976) hebt die semiotische Seite von Morphologisierungsprozessen hervor: “After a phonetic alternation appears in the language, the tendency is for this alternation to walk its way up towards the meaning end of the grammar, moving from a purely phonetic function to a semantic function” (Hooper 1976: 86). Hier setzt dann auch Dressler (1977) an, der Morphologisierungen generell damit erklärt, daß “morphologische Funktionen semiotisch wichtiger sind als phonologische” und demgemäß in entsprechenden Fällen “die morphologische Funktion [...] immer wichtiger, die phonologische Funktion hingegen immer unwichtiger wird” (Dressler 1977: 24). Klausenburger (1979) macht auf das Faktum aufmerksam, daß phonologische Regeln nur dann morphologisiert werden können, wenn sie über ein “preexisting morphological conditioning” verfügen (Klausenburger 1979: 32), d. h. wenn die Alternationen von Anfang an (zufälligerweise) an morphologische Kategorien gebunden sind. Alle diese Arbeiten haben gemeinsam, daß Morphonologisierungen und Morphologisierun-

gen ausschließlich als durch morphologische Triebkräfte bedingt angesehen werden.

Einen gegensätzlichen Standpunkt vertritt Robinson (1975) bei einer historischen Analyse des deutschen Umlauts. Er setzt sich (ähnlich wie Skousen 1975 hinsichtlich der finnischen Gradation) mit der abstrakt-generativen Behandlung des neuhochdeutschen Umlauts als phonologischer Regel auseinander und wertet diesen (Wurzel 1970 folgend) als morphologisch bedingt. Die Morphologisierung der phonologischen Umlautregel findet seiner Meinung nach einheitlich zu dem Zeitpunkt statt, zu dem die phonologischen Umlauffaktoren durch phonologische Tilgungen und Neutralisierungen abgebaut worden sind (Robinson 1975: 4f.). Die Morphologisierung des deutschen Umlauts ist damit ausschließlich phonologisch bedingt, was im übrigen der gängigen germanistischen Lehrmeinung entspricht (vgl. jedoch dazu 3.1). Des weiteren wird angenommen, daß im Fall des deutschen Umlauts die Morphologisierung ohne morphonologische Zwischenstufe erfolgt.

In Wurzel (1980) wird dann anhand von einschlägigen Beispielfällen gezeigt, daß sowohl morphologisch als auch phonologisch ausgelöste Morphologisierungen anzunehmen sind. Dabei wird auch die oft sehr große innere Komplexität von scheinbar einfachen Morphologisierungsprozessen im Spannungsfeld von Phonologie und Morphologie herausgearbeitet. Schließlich wird eine Klassifizierung von Morphologisierungen nach den Parametern der Bedingtheit, des Typs der Ausgangsregel, der Anzahl der Schritte im Gesamtprozeß, der Anzahl der Ausgangsregeln und der resultierenden Regeln sowie des Auftretens bzw. Nichtauftretens von Regelinversion vorgeschlagen (Wurzel 1980: 457 ff.).

Die Beiträge zur Morphologisierung aus den achtziger und neunziger Jahren thematisieren speziell die Unidirektionalität von Morphologisierungsprozessen und deren Erklärbarkeit. Dressler (1985) ordnet die Morphologisierung in einen semiotischen Theorierahmen ein: Wörter sind primäre sprachliche Zeichen; Morpheme und morphologische Regeln sind Zeichen von Zeichen (den Wörtern), d. h. damit sekundäre Zeichen; und Phoneme sind Zeichen von Zeichen (den Morphemen) von Zeichen (den Wörtern), d. h. tertiäre Zeichen. Damit hat das Lexikon semiotische und epistemologische Priorität gegenüber der Morphologie und die Morphologie gegenüber der Phonologie (Dressler

1985: 283). Das bedeutet, daß auch morphologische Indexikalität höher zu bewerten ist als phonologische Indexikalität. Wenn man weiter berücksichtigt, daß (grammatisch bedingter) Sprachwandel zu effizienteren grammatischen Strukturen von Subsystemen führt, so ergibt sich daraus die Tendenz des Übergangs von phonologischen Regeln zu morphonologischen Regeln und weiter zu morphologischen Regeln. Die umgekehrte Entwicklungsrichtung ist dagegen nicht möglich (Dressler 1985: 311).

Diese auf Kruszewskis Konzept zurückgehende Gerichtetheit der Übergänge zwischen den drei Regeltypen kann heute weitgehend als allgemein akzeptiert gelten. Anders argumentieren jedoch Morin et al. (1990), daß im Fall der Herausbildung des französischen ‘o-Tensing’ im Auslaut die eingetretene Sprachveränderung überhaupt nur dann erklärbar ist, wenn man annimmt, daß morphonologische Regeln ‘rephonologisiert’ werden können, was bedeuten würde, daß die Unidirektionalität unhaltbar wäre. Klausenburger (1994) arbeitet jedoch heraus, daß in diesem Fall nicht eine (ohnehin fragwürdige) morphonologische Regel, sondern ein phonetischer bzw. phonotaktischer Sachverhalt der französischen Aussprache phonologisch generalisiert wird (Klausenburger 1994: 2563 f.). Um zu ermitteln, ob ein ‘Weg zurück’ unter entsprechenden Bedingungen möglich ist, überprüft er Fälle aus der romanischen Sprachgeschichte, in denen die Sprecher in ihrer Sprache gegebene Alternationen prinzipiell entweder phonologisch oder morphologisch werten könnten. Der weitere Verlauf der Entwicklung erweist in allen Fällen, daß jeweils die morphologischen Bedingungen für die Alternation gewählt wurden. Das gleiche Ergebnis zeigen auch Experimente, in denen sowohl phonologisch als auch morphologisch interpretierbare Vokalalternationen in spanischen Nonsense-Verben von nativen Sprechern eindeutig an morphologischen Kategorien festgemacht wurden (Bybee 1985: 66 ff.). Der Weg von einer morphonologischen Regel zu einer phonologischen Regel, der der semiotischen Priorität der Morphologie gegenüber der Phonologie widerspricht, ist aller vorliegenden Evidenz nach ausgeschlossen.

### 3. Parameter der Morphologisierung

Alle Morphologisierungen sind (*per definitio nem*) durch den Übergang von phonologischen zu morphologischen Regeln gekenn-

zeichnet, doch darüber hinaus haben sie kaum durchgängige Gemeinsamkeiten. Die vorkommenden Morphologisierungen unterscheiden sich in einer ganzen Reihe von relevanten Eigenschaften, die zudem auch noch jeweils weitgehend unabhängig voneinander sind. Eine wirklich erschöpfende Typologisierung von Morphologisierungen stellt sich unter diesen Bedingungen als sehr kompliziert dar und wäre nur im Rahmen einer umfassenden Darstellung anhand einer großen Anzahl von Beispielen möglich. Hier können demgegenüber nur einige wenige einschlägige Beispiele vorgestellt und aufgrund der wichtigsten **Parameter der Morphologisierung** zueinander in Bezug gesetzt werden. Diese Parameter sollen sein: die Initiierung der Morphologisierung, der Weg von der phonologischen zur morphologischen Regel, der Typ der resultierenden morphologischen Regel, die Ableitungsrichtung der morphologischen Regel und der Status des neuen Kategorienmarkers.

### 3.1. Die Initiierung von Morphologisierungen: phonologisch versus morphologisch

Jede Morphologisierung wird durch einen Sprachwandel ausgelöst. Das kann entweder ein phonologischer oder ein morphologischer Wandel sein, womit sich ein erster Klassifizierungsparameter für Morphologisierungen ergibt. Vgl. dazu zunächst die folgenden Beispiele.

**Beispiel 1:** Im Althochdeutschen zeigen starke Verben mit einem hinteren Stammvokal im Infinitiv wie *graban* ‘graben’ bedingt durch die phonologische Umlautregel im Präsens Indikativ entsprechende Alternationen: 1. Sg. *grabu*, 2. Sg. *grebis*, 3. Sg. *grebit*; 1. Pl. *graben*, 2. Pl. *grabet*, 3. Pl. *grabent*. Vor einem [i] der Folgesilbe erscheint der umgelautete Vokal, sonst der unumgelautete. Beim Übergang zum Mittelhochdeutschen tritt ein phonologischer Wandel ein, durch den die unbetonten Endsilbenvokale zu [ə] (phonologisch /e/) neutralisiert werden; vgl. Infinitiv *graben*; 1. Sg. *grabe*, 2. Sg. *grebest*, 3. Sg. *grebet*; 1. Pl. *graben*, 2. Pl. *grabet*, 3. Pl. *grabent*. Der Umlaut hat seine phonologische Bedingtheit verloren (vgl. 3. Sg. *grebet* vs. 2. Pl. *grabet*). Er tritt in den Präsensparadigmen der starken Verben jetzt im morphologischen Kontext ‘2./3. Sg. Präs. Ind.’ auf und ist damit zum Kategorienmarker geworden. An die Stelle der phonologischen Umlautregel ist bei

diesen Verben eine morphologische Umlautregel getreten, die noch heute gilt; vgl. *ich grabe*, *du gräbst* usw.

**Beispiel 2:** Einen parallelen Ausgangspunkt (wenn auch einen anderen Verlauf) hat eine Morphologisierung im Nordischen. Hier alternieren im späteren Urnordischen entsprechend einer phonologischen *i*-Umlautregel nichtumgelautete und umgelautete Flexionsformen im Präsens Indikativ der langsilbigen starken Verben auf gleiche Weise wie im Althochdeutschen; vgl. Infinitiv *blōta(n)* ‘opfern’; 1. Sg. *blōtu*, 2. Sg. *blōtiR*, 3. Sg. *blōtiR*; 1. Pl. *blōtum* usw. Die Morphologisierung beginnt in diesem Fall mit einem morphologischen Wandel, der Systematisierung des Verhältnisses zwischen Funktion und Form im Paradigma. Die 1. Person Singular wird im Vokalismus an die beiden anderen Singularformen angeglichen; es ergibt sich das Teilparadigma: Inf. *blōta(n)*; 1. Sg. *blōtu*, 2. Sg. *blōtiR*, 3. Sg. *blōtiR*; 1. Pl. *blōtum*, 2. Pl. *blōteð*, 3. Pl. *blōta(n)*. Die Umlautregel gilt weiterhin für die Vokale vor [i], aber zusätzlich dazu morphologisch bedingt für den Vokal der 1. Person Singular. Damit erfaßt die Alternation durch Ausdehnung ihrer Domäne außer den *i*-Instanzen anderer Paradigmen jetzt auch den gesamten Singular Präsens Indikativ der Verben des Typs *blōta(n)*. Aufgrund von phonologischen Tilgungen verschwindet dann später das (ursprünglich) umlautbewirkende [i]; vgl. das resultierende altsländische Paradigma: Inf. *blōta*; 1. Sg. *blōt*, 2. Sg. *blōtr*, 3. Sg. *blōr*; 1. Pl. *blōtum* usw. Die Alternation ist für diese Verben zu einer morphologischen Regel geworden. Dieser schließen sich dann auch die kurzsilbigen starken Verben an, vgl. *taka* ‘nehmen’, *tek*, *tekr* usw., wodurch die eine morphologische Regel belastende phonologische Einschränkung der Langsilbigkeit verschwindet.

**Beispiel 3:** Im frühen Althochdeutschen zeigen die Maskulina der *i*-Deklination wie *gast* ‘Gast’ die folgenden Flexionsformen: Sg. Nom./Akk. *gast*, Gen. *gastes*, Dat. *gaste*, Instr. *gestiu*; Pl. Nom./Akk. *gesti*, Gen. *gestio*, Dat. *gestim*. Die Alternation ist bedingt durch die erwähnte phonologische Umlautregel. Im späteren Althochdeutschen tritt dann in den entsprechenden Paradigmen ein ‘analogischer’ Ausgleich ein, durch den bei weiterhin vorhandenem [i] die Instrumental Singular Form *gestiu* durch *gastiū* ersetzt wird. Die Domäne der phonologischen Umlautregel wird morphologisch eingeschränkt; der

Umlaut tritt nur noch, und zwar durchgängig, im Plural auf. Beim Übergang zum Mittelhochdeutschen werden auch hier die Vokale der Flexionsendungen zu [ə] reduziert. Des weiteren verschwindet die Kategorie des Instrumentals aus dem Flexionssystem. Das Substantiv *gast* flektiert dann in folgender Weise: Sg. Nom./Akk. *gast*, Gen. *gastes*, Dat. *gaste*; Pl. Nom./Akk./Gen. *geste*, Dat. *gesten*. Die phonologische Umlautregel ist durch eine morphologische Regel ersetzt worden, die im Kontext der grammatischen Kategorie Plural den Vokal verändert, wenn das Wort zur Umlautklasse gehört. Diese Klasse ist durch ein Flexionsmerkmal spezifiziert, das diese von der Klasse der sonst gleich flektierenden nichtumlautenden starken Maskulina des Typs *tac* ‚Tag‘ unterscheidet; vgl. *gast* – Nom. Pl. *geste* vs. *tac* – Nom. Pl. *tage*.

Im ersten Beispiel wird die Morphologisierung also durch einen phonologischen Wandel ausgelöst, in den beiden anderen Beispielen durch einen morphologischen Wandel. Das bedeutet jedoch nicht, daß diese Morphologisierungen jeweils ausschließlich phonologisch bzw. ausschließlich morphologisch bedingt sind. In allen drei betrachteten Fällen wirken phonologische und morphologische Bedingungen zusammen. Im Beispiel 1 folgt dem phonologischen Abbau des umlautbewirkenden [i] eine morphologische Reanalyse, indem das Auftreten des Umlautvokals mit den entsprechenden grammatischen Kategorien verbunden wird. Und in den Beispielen 2 und 3 werden nach dem jeweils auslösenden morphologischen Wandel die umlautbewirkenden Vokale durch phonologische Reduzierungen bzw. Tilgungen abgebaut. Da weder eine phonologisch ausgelöste Morphologisierung ohne morphologische Reanalyse, noch eine morphologisch ausgelöste Morphologisierung ohne phonologische Tilgung des ursprünglichen phonologischen Kontextes vorstellbar ist, ergibt sich die Schlußfolgerung, daß alle Morphologisierungen zugleich phonologisch und morphologisch bedingt sind. Deshalb soll hier nicht (wie häufig) zwischen phonologisch und morphologisch bedingten, sondern genauer zwischen **phonologisch** und **morphologisch initiierten Morphologisierungen** unterschieden werden.

Phonologisch initiierte Morphologisierungen kommen morphologisch gesehen zufällig zustande; die phonologischen Bedingungen der Alternation verschwinden und werden notgedrungen durch morphologische Bedin-

gungen, d. h. grammatische Kategorien, ersetzt. Demgegenüber werden morphologisch initiierte Morphologisierungen von den Sprechern ‚gezielt‘ in die Wege geleitet. Eine Alternation wird trotz ihrer fortbestehenden phonologischen Bedingtheit von den Sprechern als zusätzlicher Marker derjenigen Kategorie oder Kategorien reanalysiert, in der oder denen sie typischerweise auftritt. Das morphologisch unsystematische Nichtauftreten der Alternation wie im Fall des urnordischen 1. Sg. Präs. Ind. *blōtu* bzw. ihr unsystematisches Auftreten wie im Fall des althochdeutschen Instr. Sg. *gestiu* wird durch Ausdehnung bzw. Einschränkung der Domäne der Regel beseitigt. Bei den morphologisch initiierten Morphologisierungen zeigt sich damit deutlich die (von verschiedenen Linguisten konstatierte) semiotische Priorität der Morphologie gegenüber der Phonologie. Zu ergänzen ist, daß beide Typen der Morphologisierung von phonologischen Regeln die im System vorhandenen Flexionskategorien voraussetzen. Durch sie entstehen neue Marker für bereits gegebene Kategorien, aber (anders als bei der Morphologisierung syntaktischer Marker) niemals neue Flexionskategorien.

### 3.2. Der Weg von der phonologischen zur morphologischen Regel: direkt vs. indirekt

Im Rahmen von Morphologisierungsprozessen sind (wie gesagt) drei Klassen von Regeln zu unterscheiden. **Phonologische Regeln** nehmen formale Operationen im Kontext phonologischer Einheiten wie Merkmale, Segmente und Silben vor. Sie enthalten grundsätzlich keine grammatischen Kategorienmerkmale wie ‚Plural‘, ‚Genitiv‘, ‚Präsens‘ usw. und keine Flexionsklassenmerkmale. **Morphologische Regeln** vollziehen demgegenüber solche Operationen im Kontext von grammatischen Kategorien, in Sprachen mit Flexionsklassen bezogen auf diese. **Morphologische Regeln** nehmen formale Operationen in einem Kontext vor, der sowohl phonologische Einheiten als auch grammatische Kategorien enthält. Ein Blick auf die Beispiele zeigt, daß im Prozeß der Morphologisierung der Übergang von phonologischen zu morphologischen Regeln entweder direkt oder indirekt, d. h. über eine morphonologische Regel, erfolgen kann.

Im Beispiel 1 vollzieht sich die Morphologisierung direkt. Aufgrund des phonologischen Abbaus sämtlicher umlautbewirkender [i]-Instanzen im Paradigma werden diese voll-

ständig durch grammatische Merkmale ersetzt. Anders im Beispiel 3. Hier wird der im Prinzip weiter funktionierende phonologische Umlaut für die Instrumental Singular Formen von Substantiven des Typs *gast* blockiert. Der althochdeutsche Umlaut erfährt darüber hinaus noch eine morphologisch bedingte Blockierung, d. h. eine weitere Morphonologisierung.

Beispiel 4: Im älteren Althochdeutschen zeigen die schwachen Maskulina wie z. B. *hano* ‘Hahn’ die folgenden Flexionsformen: Sg. Nom. *hano*, Gen./Dat. *henin*, Akk. *hanun*; Pl. Nom./Akk. *hanun*, Gen. *hanōnō*, Dat. *hanōm*. Vor folgendem [i] tritt also ‘lautgesetzlich’ Umlaut auf. Dieser Umlaut im Genitiv und Dativ Singular wird schon sehr früh durch einen morphologischen Wandel beseitigt; *henin* wird durch *hanin* ersetzt, wodurch im Paradigma jetzt durchgängig der unumgelautete Vokal erscheint. Beim Übergang zum Mittelhochdeutschen wird auch das [i] des Markers *-in* phonologisch zu [ə] reduziert. Die Flexionsformen des Paradigmas lauten jetzt Sg. Nom. *hane*, Gen./Dat./Akk. *hanen*; Pl. *hanen*.

Die gemeinsame Zwischenstufe dieser Entwicklungen, die spätalthochdeutsche Umlautregel, lässt sich damit wie folgt skizzieren:

$$V \rightarrow [-\text{hinten}] / \left\{ \begin{array}{ll} \text{Mask} & (\text{a}) \\ \sim i\text{-Dekl} \\ -\text{Pl} \\ \sim [n\text{-Dekl}] & (\text{b}) \\ \_\_ K_1 i & (\text{c}) \end{array} \right.$$

Abb. 147.1: Spätalthochdeutsche Umlautregel

Diese Regel ist eine morphonologische Regel; ihre Anwendung ist partiell (noch) phonologisch und partiell (schon) morphologisch bedingt. Die morphologischen und phonologischen Bedingungen der Alternation lassen sich hier nicht unabhängig voneinander formulieren. Die Teilregeln sind extrinsisch geordnet, denn die blockierenden morphologischen Teilregeln (a) und (b) müssen der phonologischen Teilregel (c) vorausgehen. Im Mittelhochdeutschen ist dann der phonologische Kontext der Regel abgebaut. Die Teilregel (a), die den Vokalwechsel im Paradigma *gast* systematisiert, findet ihre Entsprechung in einer morphologischen Regel, die dann den Vokal im inversen (positiven) Kategorienkontext ‘*i*-Dekl + Pl’ umlautet. Die ursprüngliche phonologische Regel ist auf indi-

rektem Wege morphologisiert worden. Die Teilregel (b), die den Wechsel im gesamten Paradigma *hano* blockiert, verschwindet aus der Grammatik, da sie keine Kategorienmerkmale enthält. In solchen Fällen tritt ein morphologisch bedingter Ausgleich im Paradigma (eine ‘Assimilation’ in Kruszewskis Sinne), aber keine Morphonologisierung einer Alternation ein. Nicht jede Morphonologisierung führt also zur Morphonologisierung.

Auch im Beispiel 2 erfolgt die Morphonologisierung über eine morphonologische Zwischenstufe. Die zunächst nur vor einem [i] der Folgesilbe eintretende Alternation wird auf die Umgebung ‘Stark, – Prät, – Konj, – Pl’ ausgedehnt; sie folgt wiederum teils (schon) morphologischen, teils (noch) phonologischen Bedingungen. Die morphologische und die phonologische Teilregel sind zwar nicht untrennbar miteinander verzahnt wie im vorangehenden Beispiel (da die morphologische Teilregel einen positiven Kontext hat, ließen sich die beiden Teilregeln mit etwas größerem Aufwand auch als selbständige Regeln formulieren und zeigen keine extrinsische Ordnung), doch sie nehmen die gleiche formale Operation vor und haben sich überschneidende Anwendungsbereiche. Mit der Tilgung der [i]-Instanzen im Paradigma verschwindet die phonologische Teilregel, übrig bleibt eine morphologische Regel.

Die diskutierten (wie auch viele weitere) Beispiele scheinen dafür zu sprechen, daß phonologisch initiierte Morphonologisierungen direkt zu morphologischen Regeln führen (Beispiel 1), während morphologisch initiierte (Beispiele 2 und 3) den Weg über morphonologische Regeln nehmen. Doch vgl. dazu den folgenden Fall:

Beispiel 5: Bedingt durch die phonologische *u*-Umlautregel tritt im späteren Urnordischen u. a. auch in den Paradigmen der maskulinen und neutralen *a*-Substantive eine Alternation zwischen [a] und [ɔ] (ø) auf. Vor einem [u] im Flexiv erscheint im Stamm [ɔ], sonst [a]. Vgl. z. B. Maskulinum *armaR* ‘Arm’; Sg. Nom. *armaR*, Gen. *armas*, Dat. *armē*, Akk. *arma*; Pl. Nom. *armōR*, Gen. *armō*, Dat. *ormumR*, Akk. *arma(n)* und Neutr. *landa* ‘Land’; Sg. Nom./Akk. *landa*, Gen. *landas*, Dat. *landē*; Pl. Nom./Akk. *londu*, Gen. *landō*, Dat. *londumR*. In der Entwicklung zum Altländischen werden die Flexionsendungen aufgrund von eindeutig phonologischen Veränderungen getilgt bzw. reduziert, so daß sich die Formen Sg. Nom.

*armr*, Gen. *arms*, Dat. *armi*, Akk. *arm*; Pl. Nom. *armor*, Gen. *arma*, Dat. *ormum*, Akk. *arma* und Sg. Nom./Akk. *land*, Gen. *landas*, Dat. *landi*; Pl. Nom./Akk. *lond*, Gen. *lando*, Dat. *londum* ergeben. Während der Umlaut im Dativ Plural bei erhaltenem [u] weiterhin phonologisch bedingt ist, wird er (notgedrungen) im Nominativ und Akkusativ Plural der Neutra mit dem entsprechenden morphologischen Kategorienkontext assoziiert (ähnlich übrigens auch in anderen Paradigmen). Der *u*-Umlaut ist im Altländischen damit zu einer morphonologischen Regel geworden. Die weitere Entwicklung ist dadurch gekennzeichnet, daß zum Neuisländischen hin durch phonologische Epenthese neue [u]-Instanzen in den Flexiven entstehen, vgl. altländisch *armr* > neuisländisch *armur*, wobei (erwartungsgemäß) kein Umlaut auftritt. Es erfolgt weiterhin der Übergang von [u] zu [y] (orthographisch weiter *u*) und von [ø] (ø) zu [ø] (ö). Umlaut erscheint also in den Paradigmen nicht mehr im phonologischen Kontext 'vor [y]', sondern im morphologischen Kontext 'vor dem Dat. Pl. Flexiv -um [ym]'; vgl. Dativ Plural *örnum* und *löndum*, aber Nominativ Singular *armur*. Daß hier tatsächlich der Kategorienkontext entscheidend ist, zeigen auch Neubildungen wie *farum* 'darüber' (aus *far* 'dort' und *um* 'um, über'), die ebenfalls umlautlos bleiben. Damit ist auch die phonologische Teilregel der bisherigen morphonologischen Regel morphologisiert worden. Im Laufe des Morphologisierungsprozesses sind an die Stelle der ursprünglichen phonologischen *u*-Umlautregel u. a. (die Regel unterliegt auch weiteren Morphologisierungen) zwei für die betrachteten Paradigmen geltende morphologische Regeln getreten, eine für den Nominativ/Akkusativ Singular Neutr. vgl. *lond*, und eine für den Dativ Plural beider Genera, vgl. *örnum*, *löndum* (für Details vgl. Árnason 1985).

Hier führt eine phonologisch initiierte Morphologisierung anders als im Beispiel 1 zunächst zu einer morphonologischen Regel. Dieser Unterschied ergibt sich daraus, daß durch den auslösenden phonologischen Wandel die umlautbewirkenden [u]-Instanzen nicht vollständig, sondern nur partiell getilgt werden. Es läßt sich somit generalisieren: Phonologisch initiierte Morphologisierungen, bei denen im ersten Schritt sämtliche bedingenden phonologischen Kontexte abgebaut werden, führen direkt zu morphologischen Regeln, alle anderen Morphologisierungen dagegen über morphonologische Regeln.

Beispiel 6: Diese bedingt in den Paradigmen der *ir*-Stämme des Typs *hrind* 'Rind' Alternationen zwischen [ir] und Ø der folgenden Art: Sg. Nom./Akk. *hrind*, Gen. *hrind-ir-as*, Dat. *hrind-ir-a*, Instr. *hrind-ir-u*; Pl. Nom./Akk. *hrind-ir-u*, Gen. *hrind-ir-o*, Dat. *hrind-ir-um*. Später tritt ein phonologischer Wandel ein, durch den ein auslautendes [u] unter bestimmten Bedingungen beseitigt wird. Die frühalthochdeutsche Entsprechung des Paradigmas sieht dann so aus: Sg. Nom./Akk. *hrind*, Gen. *hrind-ir-es*, Dat. *hrind-ir-e*, Instr. *hrind-ir-u* (hier ist die Erhaltung des [u] durch Ausgleich bedingt); Pl. Nom./Akk. *hrind-ir*, Gen. *hrind-ir-o*, Dat. *hrind-ir-um*. Es ergeben sich also Instanzen von [ir] im Auslaut; das Nichtvorkommen bzw. Vorkommen von [ir] im Paradigma ist nicht mehr phonologisch faßbar und wird statt dessen an die grammatischen Kategorien gebunden. Da das Element [ir] nicht in der Nominativ Singular Form des Paradigmas, wohl aber in den meisten abgeleiteten Formen auftritt, wird es als ein Flexiv interpretiert, das in den Kategorien des Genitivs, Dativs und Instrumentals Singular und des Plurals durch eine morphologische Regel eingeführt wird. Die phonologische Regel ist durch eine morphologische Regel ersetzt worden. In einem weiteren Schritt wird [ir] im Verlauf des Althochdeutschen dann aufgrund seiner Verteilung im Paradigma (sowie weiterer Faktoren; vgl. Wurzel 1980: 445 ff.; 1992: 282 ff., 291 f.) als Pluralmarker reanalyisiert und entsprechend in seinen Singularvorkommen beseitigt, vgl. 'normalahd.' Sg. Nom./Akk. *hrind*, Gen. *hrind-es*, Dat. *hrind-e*, Instr. *hrind-u*; Pl. Nom./Akk. *hrind-ir*, Gen. *hrind-ir-o*, Dat. *hrind-ir-um*. Die unsystematische morphologische Regel wird so in eine Pluralregel umgewandelt, die als *er*-Pluralregel bekanntlich noch heute existiert; vgl. *Rind – Rinder*.

Hier ist das Ergebnis der Morphologisierung einer phonologischen Regel keine **modifikatorische**, sondern eine **additive morphologische Regel**. Für diese Entwicklung gibt es zwei Gründe: Erstens ist die Ausgangsregel eine phonologische Tilgungsregel und keine Alternationsregel, und zweitens operiert sie am Wortende. Daraus läßt sich verallgemeinernd der Schluß ziehen, daß die Morphologisierung von phonologischen Regeln, die am Wortende phonologische Substanz tilgen oder einführen, zu additiven morphologischen Regeln führt. Das gilt in dieser Form natürlich nur für Suffixsprachen; es ist jedoch

zu erwarten, daß das gleiche auf am Wortanfang operierende Tilgungs- bzw. Epentheseregeln in Präfixsprachen zutrifft.

### 3.3. Die Ableitungsrichtung der resultierenden morphologischen Regel: Beibehaltung vs. Inversion

Bei Morphologisierungen von phonologischen Regeln kann die Ableitungsrichtung der Regeln beibehalten oder umgekehrt werden. In den Beispielfällen 1, 2, 3 und 5 bleibt die Ableitungsrichtung auch nach der Morphologisierung die gleiche. Unumgelautete Vokale werden in bestimmten Kontexten in umgelautete Vokale überführt. Anders im Beispiel 6. Hier wird bei der Morphologisierung eine phonologische Regel mit der Operation ‘ir → Ø’ durch eine morphologische Regel mit der inversen Operation ‘Ø → ir’ ersetzt. Auch über die Beispiele hinaus ist die **Beibehaltung der Ableitungsrichtung** weitaus häufiger als ihre **Inversion**, was darauf hindeutet, daß die Inversion spezifische Bedingungen voraussetzt, was durch einen weiteren Fall von Regelinversion, der Morphologisierung des sogenannten Rückumlauts im Deutschen, bestätigt wird:

Beispiel 7: In einer Teilkasse der schwachen Verben stehen sich im frühen Althochdeutschen bedingt durch die phonologische Umlautregel umgelautete Infinitiv- und Präsensformen einerseits und unumgelautete Präteritalformen andererseits gegenüber. Vgl. z. B. Infinitiv *brenjan* ‘brennen’, 1. Sg. Präs. Ind. *brennu*, 2. Sg. Präs. Ind. *brenis* usw. – 1. Sg. Prät. Ind. *branta*, 2. Sg. Prät. Ind. *brantōs* usw. und Infinitiv *stelljan* ‘stellen’, 1. Sg. Präs. Ind. *stellju*, 2. Sg. Präs. Ind. *stelis* usw. – 1. Sg. Prät. Ind. *stalta*, 2. Sg. Präs. Ind. *staltōs* usw. (Die Geminaten sind dabei durch das folgende unsilbische [i] hervorgerufen.) In der weiteren Entwicklung wird durch phonologischen Wandel das [i] getilgt, wobei die Infinitivendung in [en] übergeht. Es ergeben sich die Formen *brennen*, *brennu*, *brenis* – *branta*, *brantōs* bzw. *stellen*, *stellu*, *stelis* – *stalta*, *staltōs*. Das Auftreten des Umlautvokals [e] im Infinitiv und in den meisten Präsensformen (allen außer der 2./3. Person Singular) ist nicht mehr phonologisch faßbar. Da bei diesen Verben im Infinitiv und im Präsens durchgängig umgelautete Vokale und im Präteritum durchgängig unumgelautete Vokale erscheinen, wird der Vokalwechsel (als eine Art ‘neuer Ablaut’) mit diesen Kategorien assoziiert und damit morphologisiert.

Dabei wird als Ausgangsvokal nicht das umgelautete [a] des Präteritums, sondern das umgelautete [e] des Infinitivs und des Präsens gewählt; die Ableitungsrichtung der Regel wird also von ‘a → e’ zu ‘e → a’ umgekehrt. Daß die Annahme der Inversion korrekt ist, zeigt der spätere weitgehende Abbau der Vokalalternation, der stets zugunsten des Präsensvokals erfolgt; vgl. *stellen* – *stellte*.

Weshalb tritt nun in den beiden letzten Beispielen eine Inversion der Ableitungsrichtung ein? Die anderen Morphologisierungen betrafen jeweils phonologische Regeln, die innerhalb des Paradigmas bestimmte abgeleitete Flexionsformen, aber nicht die Grundform erfaßten; vgl. z. B. ahd. *graban* – 2. Sg. Präs. Ind. *grebis* und urnord. *landa* – Nom. Pl. *londu*. Die formale Ableitungsrichtung der Regeln entspricht der grammatischen Ableitung der Kategorien in den Paradigmen. In solchen Fällen gibt es keinen Grund zur Inversion; die Ableitungsrichtung der Regel bleibt auch nach der Morphologisierung erhalten. Dagegen sind die beiden hier relevanten Beispiele dadurch charakterisiert, daß jeweils eine phonologische Regel morphologisiert wird, die gerade die Grundform des Paradigmas, aber nicht bestimmte abgeleitete Flexionsformen erfaßt; vgl. *hrind* mit *ir*-Tilgung, aber Nom. Pl. *hrindiru* ohne *ir*-Tilgung sowie Infinitiv *brenjan* mit Umlaut, aber Präteritum *branta* ohne Umlaut. Die formale Ableitungsrichtung der Regel ist der grammatischen Ableitung der Kategorien in den Paradigmen gegenläufig. In solchen Fällen wird bei Verlust der phonologischen Bedingungen (zumindest normalerweise) die Ableitungsrichtung der Regel umgekehrt, so daß dann die in der Grundform auftretende Alternative die Eingabe der neuen morphologischen Regel darstellt; vgl. Nom. Sg. *hrind* ohne *ir*-Einführung, aber Nom. Pl. *hrindir* mit *ir*-Einführung sowie Infinitiv *brennen* ohne Vokalwechsel, aber Präteritum *branta* mit Vokalwechsel ‘e → a’. Damit spezifiziert die morphologisierte Regel dann – wie in den Fällen ohne Inversion – einen Marker für eine abgeleitete Kategorie, in den Beispielen den Pluralmarker [ir] bzw. den Präteritalmarker ‘Vokalwechsel’. Daß Inversionen bei Morphologisierungen relativ seltener vorkommen als die Beibehaltung der Ableitungsrichtung resultiert einfach daraus, daß phonologische Alternationen typischerweise durch Segmente in Flexiven hervorgerufen werden, und daß in abgeleiteten (markierten)

Kategorien eher Flexive auftreten als in (unmarkierten) Basiskategorien (Greenberg 1963: 74 f.). Man vgl. dazu noch einmal die [i]- und [u]-haltigen Flexive des Germanischen.

### 3.4. Der Status des neuen Kategorienmarkers: Hauptmarker vs. Nebenmarker

Die Kategorienmarker der Flexionsformen haben nicht alle den gleichen Status. Ein Marker kann die einzige Symbolisierung (*Hund – Hund-e*, *Vater – Väter*), die primäre Symbolisierung (*Wolf – Wölf-e*) oder eine sekundäre Symbolisierung (*Wolf – Wölf-e*) einer Kategorie am Wort sein. In den ersten beiden Fällen liegt ein Hauptmarker, im letzten Fall ein Nebenmarker der entsprechenden Kategorie vor. Welcher Marker bei Mehrfachsymbolisierung den Status des Hauptmarkers hat, ergibt sich aus der Systematik des Sprachsystems. Wenn, was für Sprachen wie das Deutsche typisch ist, eine Kategorie durch einen additiven und einen modifikatorischen Marker symbolisiert wird, so ist im allgemeinen der additive Marker der Hauptmarker, weil dieser in allen Wörtern der betreffenden Flexionsklasse vorhanden ist, während der modifikatorische Marker nur eingeschränkt auftritt. Man denke etwa an die Substantive der deutschen *er*-Pluralklasse wie *Kalb – Kälber* und *Rind – Rinder*, wo das Suffix bei allen Wörtern, der Umlaut (bedingt durch seine phonologische Genese) aber nur bei Wörtern mit hinterem Stammvokal erscheint. Doch durch Morphologisierungen von phonologischen Regeln können sowohl **Hauptmarker** als auch **Nebenmarker** entstehen, wie die Beispiele im einzelnen erweisen.

Morphologisch initiierte Morphologisierungen wie die Fälle 2 und 3 sind immer dem Bestreben der Sprecher geschuldet, formale Alternationen an die grammatischen Kategorien anzupassen. Im Beispiel 2 wird die 1. Person Singular an die anderen Singularformen angeglichen, vgl. 1. Sg. *blōtu* > *blōtu* wie 2./3. Sg. *blōtiR*; im Beispiel 3 der Instrumental Singular an die übrigen Singularformen, vgl. Instr. Sg. *gestiu* > *gastiū* wie Nom./Akk. Sg. *gast* usw. Im ersten Fall resultiert daraus ein Präsens Singularmarker, im zweiten ein Pluralmarker. Da in beiden Fällen vorher keine einheitlichen Marker für die betreffenden Kategorien existierten, erhalten die neuen Marker jeweils den Status von Hauptmarkern. Hingegen ist die Herausbildung

von Nebenmarkern durch morphologisch initiierte Morphologisierungen nur schwer vorstellbar. Dazu müßte bereits ein einheitlicher Marker für die betreffende Kategorie vorhanden sein. Ein solcher einheitlicher Marker würde sich (zumindest in Fällen, die den hier diskutierten Beispielen vergleichbar sind) aber dann auch in einheitlicher Weise auf die Form des Stammes auswirken. Alternationen zwischen den verschiedenen Formen der Kategorie (etwa den einzelnen Kasusformen des Plurals) und damit morphologisch initiierte Morphologisierungen (im Sinne von Ausgleichen) sind unter solchen Bedingungen überhaupt nicht möglich.

Unter den phonologisch initiierten Morphologisierungen sind zwei Gruppen von Fällen zu unterscheiden. Bei der Morphologisierung der Alternationen ahd. 1. Sg. *grabu* – 2. Sg. *grebis* > mhd. 1. Sg. *grabe* – 2. Sg. *grebest* (s. Beispiel 3) und frühahd. Inf. *brenjan* – Prät. Ind. 1. Sg. *branta* > ahd. Inf. *brennen* – Prät. Ind. 1. Sg. *branta* (Beispiel 7) bleiben trotz der phonologischen Reduktionen die alten additiven Marker als Hauptmarker erhalten. Die neuen modifikatorischen Marker erhalten folglich den Status von Nebenmarkern. Davon abweichend verschwinden bei der Entwicklung von vorahd. Nom./Akk. Sg. *hrinda* – Nom./Akk. Pl. *hrindiru* > ahd. Nom./Akk. Sg. *hrind* – Nom./Akk. Pl. *hrindir* die ursprünglichen Marker, so daß das Element [ir] zum alleinigen Pluralmarker und damit zum Hauptmarker wird. Interessant ist in diesem Zusammenhang das Beispiel 5, die Morphologisierung des *u*-Umlauts in Paradigmen des Typs *urnord*. Nom./Akk. Sg. *landa* – Nom./Akk. Pl. *londū*, Dat. Pl. *londum* > nisl. Nom./Akk. Sg. *land* – Nom./Akk. Pl. *lönd*, Dat. Pl. *löndum*. Hier wird aufgrund der phonologischen Reduzierung der alte Marker des Nominativs und Akkusativs Plural beseitigt; der *u*-Umlaut wird zum alleinigen Marker, d. h. zum Hauptmarker. Dagegen bleibt im Dativ Plural der alte Marker erhalten, der neue Marker '*u*-Umlaut' ist entsprechend der Nebenmarker.

Es sei noch darauf verwiesen, daß durch Morphologisierung entstandene Marker im Laufe der weiteren Entwicklung unter entsprechenden Bedingungen durchaus Veränderungen in ihrem Status erfahren können, wie das Beispiel 3 anschaulich zeigt: Mit dem Übergang von Wörtern des Typs *gast* zur mittelhochdeutschen Flexion Sg. Nom./Akk. *gast*, Gen. *gastes*, Dat. *gaste*; Pl. Nom./Akk./

	Initiierung	Weg phon. Regel > morph. Regel	resultierender Regeltyp	Ableitungs- richtung	Markerstatus
B. 1: mhd. <i>grebest</i>	phonologisch	direkt	modifikatorisch	Beibehaltung	Nebenmarker
B. 2: urnord. <i>blōtu</i>	morphologisch	indirekt	modifikatorisch	Beibehaltung	Hauptmarker
B. 3: ahd. <i>gastiū</i>	morphologisch	indirekt	modifikatorisch	Beibehaltung	Hauptmarker
B. 4: ahd. <i>hanin</i>	(morphologisch)	(indirekt)	–	–	–
B. 5: isld. <i>lönd; löndum</i>	phonologisch	indirekt	modifikatorisch	Beibehaltung	Hauptmarker; Nebenmarker
B. 6: ahd. <i>hrind; hrindir</i>	phonologisch	direkt	additiv	Inversion	Hauptmarker
B. 7: ahd. <i>brennen; branta</i>	phonologisch	direkt	modifikatorisch	Inversion	Nebenmarker

Tab. 147.1: Übersicht

Gen. *geste*, Dat. *gesten* entsteht auf phonologischem Weg ein neuer, einheitlicher additiver Pluralmarker *-e* [ə] (vgl. Dat. Pl. *gest-e-n*) mit dem Status des Hauptmarkers; der Umlaut wird so zum Nebenmarker. Doch noch während des Mittelhochdeutschen wird der Umlaut u. a. auf Maskulina übertragen, die über keinen Pluralmarker am Wort (mehr) verfügen, vgl. *vater – veter, nagel – negel*. In diesen Wörtern ist der Umlaut damit wieder alleiniger Marker, also Hauptmarker, für den Plural; bei den übrigen Substantiven bleibt er Nebenmarker.

### 3.5. Zusammenfassung

Abschließend soll in Tab. 147.1 noch kurz zusammenfassend dargestellt werden, wie sich die diskutierten Fälle von Morphologisierungen hinsichtlich der einzelnen Parameter verhalten. Auf diese Weise ergibt sich eine Kreuzklassifikation von Morphologisierungssprozessen, die zwar bei weitem kein vollständiges, aber doch wohl ein recht instruktives Bild des Gesamtphänomens der Morphologisierung von phonologischen Regeln und damit des Weges von der Phonologie zur Morphologie bietet.

## 148. Analogical change

1. Introduction
2. Definition and exemplification
3. Previous analyses
4. Optimality Theory
5. Conclusion
6. References

### 1. Introduction

Analogical change is a topic which has received relatively little attention in recent handbooks on phonology, morphology, or historical linguistics. The reason for this may well be that it touches on so many different aspects of our linguistic capacity and on different components of linguistic theory that it is not clear where it is most properly treated. This also makes it one of the most interesting topics of investigation, and testing grounds for particular linguistic theories, especially those which seek to unite such different aspects in a unified model.

**Analogical change** is a specific type of **sound change**, simply because the sounds of a word change in the process. However, it has been assumed for centuries that the motivation for analogical changes is to be found not so much in the phonetic/phonological environment of the sound(s) concerned, but rather that other words in the language to which the changing word is morphologically related, play a role. This is where morphol-

ogy and the organisation of the lexicon come in. Finally, all processes of change must be examined in the light of theories of acquisition and variation, which have now developed to such an extent that we may test them against new sets of data. The sometimes erratic process of analogical change is then test material just like more regular sound changes.

### 2. Definition and exemplification

The concept of **analogy** has been used in various branches of science for ages. In linguistics, the Alexandrian grammarians used it to establish grammatical correctness in Homer. More recently, analogy has been used as a shorthand term for the historical phenomenon of analogical change, and, loosely, as a way of indicating the explanation for such historical language changes (cf. Lehmann 1995).

Let us first give a simple example (cited in Joseph 1998; cf. also Meillet & Vendryès 1924: 77; Schindler 1974: 3, 6). In Early Latin, the word for ‘small’ was *parwos* ‘small. NOM.SG’, with genitive *parwī* (see 1a). A process then became active in the language which deleted the rounded semivowel *w* before round vowels (1b).

- (1) (a) Early Latin  
*parwos* ‘small.NOM.SG’  
*parwī* ‘small.GEN.SG’  
(b)  $w \rightarrow \emptyset / \_ [V, +round]$   
(c) Intermediate: *paru:s*, *parvi*  
(d) Classical Latin: *parvus*, *parvī*

As a result, an alternation between *w* and  $\emptyset$  was introduced into the paradigm of the word for ‘small’ (1c). By the time of Classical Latin, this alternation was destroyed again, or levelled out, by restoring the original consonant sound in the nominative, resulting in *parvus*, *parvī* (1d). The latter change is usually referred to as paradigmatic levelling, as its motivation is generally felt to be a restoration of uniformity in the paradigm of this word.

### 3. Previous analyses

The assumption that the cause for analogical levelling is connected to regularity in morphological paradigms dates back at least to the Neogrammarians (cf. Art. 10). Hermann Paul (1920: 205), for instance, concluded that paradigmatic pressure (“Festigkeit des Zusammenhangs der etymologischen Gruppen”), i.e. the pressure to keep a paradigm as uniform as possible, played an important role in this type of change. Note that paradigmatic pressure usually operates in retrospect: it restores regularity after regular phonetic/phonological changes have created alternations in a paradigm: it does not prevent such irregularities from occurring (cf. Art. 32).

For the Neogrammarians, as historical linguists, the linguistic structure of words had very much still a historical outlook: for them a word was defined as its history, and not as its role and function in the synchronic system. This is the reason why the Neogrammarians could not yet gain a full insight into its mode of occurrence. To attain this, comprehension of the Saussurean concept of language as a synchronic system was an indispensable precondition (see Jankowsky 1972: 137). Saussure would also develop the so-called proportional solution to analogical changes, already mentioned by Paul (e.g. Paul 1920: 117), for instance to shed light on another case of analogical levelling, the well known (partial) levelling of the [s] ~ [r] alternation caused by **rhotacism** in Latin (see Kiparsky 1982 for further discussion, among many other sources):

- (2) *ōrātōrem* : *ōrātor* = *honōrem* : x  
x = honor

Saussure also notes the capricious character of analogy. In German, for instance, the plurals in (3a) are regular i.e. etymological Umlaut formations. The plurals in (3b) have become umlauted analogically. However, the plurals in (3c) have resisted analogy for some reason or another. It is therefore impossible to say in advance how far the imitation of a particular model will extend, or which patterns are destined to provoke it (Saussure 1983: 222).

- (3) (a) *Gast/Gäste* ‘guest.SG/PL’  
*Balg/Bälge* ‘skin.SG/PL’  
(b) *Kranz/Kränze* ‘wreath.SG/PL’  
(from earlier plural *Kranza*)  
*Hals/Hälse* ‘neck.SG/PL’  
(from earlier plural *Halsa*)  
(c) *Tag/Tage* ‘day.SG/PL’  
(not \**Täge*)  
*Salz/Salze* ‘salt.SG/PL’  
(not \**Sälze*)

Proportional solutions as explanations of analogical changes are insightfully intuitive and easy to work with. Still, this line of thinking about analogical change came under attack in the 1960s, under influence of the generative paradigm (Chomsky & Halle 1968), which of course had to redraw its own position with regard to language change in general and analogy in particular. One of the critics of the proportional model as an explanatory device was King (1969). One question which must be asked with respect to proportional analogies like that in (2) is just how similar the inputs have to be to give rise to a possible analogical proportion. In this case, it makes intuitive sense to “compare” *ōrātōrem* and *honōrem*, but the question remains if satisfactory conditions on possible inputs can be formulated. Hence, such proportions are useless as an explanatory device, i.e. a device which will predict what analogical changes are possible and what are impossible changes. A second piece of criticism was that in some cases different proportions must be drawn up for different words, which seem to be undergoing the same levelling process, as in the case of the spread of the plural *s* in English: a different proportion must be drawn up for words ending in a vowel, an obstruent or any other consonant. Much effort has therefore gone into introducing more

structure into analogical proportions, so that its effects are better understood, primarily already by Kuryłowicz (1949) and Mańczak (1958). These efforts show that, without morphological analysis, analogical proportions are useless as predictive devices.

In Chomsky & Halle (1968), grammars were conceived of as lexicons complemented by lists of rules. Language change could therefore be conceived of as changes in lexical entries or in changes of the rules of the language. One important idea of historical generative linguistics was that languages become simpler formally. One way of simplifying grammars is to simplify the rules themselves, e.g. in terms of the number of distinctive features affected by the rule. Another way was to lose rules completely from the grammar. Finally, there was much discussion on the question whether some orderings of rules were simpler than others. Kiparsky (1972) argued that grammars evolved into simplicity and that as a result analogical effects were observed. For instance, the levelling which took place after the rule in (1b) had created an alternation in the paradigm, can be simply formalised as the loss at a later stage of that same rule. Similar effects can be obtained by rule reorderings of different types (see Kiparsky 1972).

In more complicated cases of analogical levelling, however, grammar simplification could not be achieved. Take the Latin rhotacism case briefly mentioned above. Because the change from the earlier underlying form /hono:s/ to the later /honor/ was only partial, it could not be expressed as being motivated by the grammar at all, as Kiparsky (1982: 100) notes, although intuitively the change to a uniform paradigm represents a simplification. If the grammar must be complicated to describe processes of analogical levelling, then we must surely be on the wrong track. In response to this, Kiparsky (1971) proposed that **functional constraints** should also help to establish whether a grammar was simpler than an older grammar. To this effect he proposed the constraint given in (4):

(4) **Paradigmatic Uniformity** (Kiparsky 1971: 598)

Allomorphy tends to be minimized in a paradigm.

This constraint evaluates the output of a grammar as a whole, and is in effect a restatement of Hermann Paul's "paradigmatic pressure" mentioned above.

#### 4. Optimality Theory

There are a number of reasons to believe why the recently introduced framework of **Optimality Theory** (OT) (Prince & Smolensky 1993, and much subsequent work) may shed further light on analogical change. First, the traditional assumption is that analogical change is caused by relations between different output forms. Optimality Theory is a theory of grammar in which outputs are selected on the basis of how well they observe general constraints, which are formalised over the outputs. No single output form will observe all constraints, but constraint interaction will ensure that an output form is mapped onto an input. Given this concern for the output, Optimality Theory may be a good candidate for dealing with an evidently output-related phenomenon such as analogical change. Second, analogical change represents a case of conflicting interests: phonological rules will bring about an alternation, and morphological wellformedness conditions (such as (4)) will try to level these out. In principle, such a state of affairs should be readily amenable to an Optimality-theoretic treatment, especially since in recent years proposals have been made to extend this framework with modules describing acquisition and variation (see e.g. Hayes 2000; Boersma 2000; Tesar 2000).

In the case of **analogical levelling**, exemplified in (1), a number of stages must be distinguished. The first stage is the introduction of an alternation as a result of the loss of the rounded semivowel before round vowels. This can be regarded as the effect of a constraint against the adjacency of two elements which are too much alike, the **Obligatory Contour Principle** (OCP, see e.g. McCarthy 1986). This constraint conflicts with a Faithfulness constraint which demands that underlying forms are changed as little as possible. Possibly after a stage of variation, in which the two constraints are somehow "balanced", the Obligatory Contour Principle constraint takes precedence and the semivowel will not be pronounced. Later, a labial consonant is restored. This could be formalised as a reversal of the ranking of the two constraints, on the assumption that underlying forms have remained the same, quite parallel to rule reordering in generative grammar. This begs the question of why the two constraints should be reordered, however. Recent analyses (e.g. Kenstowicz 1996) have

sought the explanation in the interplay of the two constraints mentioned above with a third one, a correlate of Paradigmatic Uniformity (4). The operation of such a constraint would favour outputs which have a uniform base form. An issue here is which direction of levelling is taken: there are always multiple ways in which a paradigm could be regularised, and the question is if we can predict which way will be taken in individual cases.

### 5. Conclusion

The term analogy is used for a wide variety of purposes. Here we focused on one of the most common types of analogical change, viz. analogical levelling. Since the times of the Neogrammarians, it has been suggested that pressure to keep paradigms as uniform as possible plays a role in eradicating phonologically-induced alternations. It turned out to be difficult to formalise this idea in traditional generative grammar. The framework of Optimality Theory may be better suited for the purpose in the light of its insistence on surface constraints and its explicit way of dealing with conflicting tendencies.

## 149. Remotivation and reinterpretation

1. Characterization of the phenomena and definition of terms
2. Subclassifications and typical examples
3. Causes and hindering factors of secondary motivation
4. Effects of secondary motivation
5. Different approaches to secondary motivation
6. References

### 1. Characterization of the phenomena and definition of terms

Words which for some reason (non-native origin, nonce-morpheme, phonological structure) cause problems for memory processing and storage sometimes acquire secondary morphological and/or semantic structure; they thus change from **opaqueness** to **transparency**. This stands in contrast to the reverse process of **demotivation** and **obscuration**, by which originally motivated words lose their transparency (cf. Art. 150; see 3.1 for the reasons for the existence of these opposite processes). The process of **secondary motivation** or **remotivation** may take a number of different forms, for which different terms are used (there is, however, no universal agreement on the use of terminology).

**Reinterpretation** is a type of remotivation where no formal change has occurred; reinterpreted words show secondary semantic association with etymologically unconnected elements, which may effect semantic change (Fr. *jour ouvrable*, from Lat. *operari* '[to] work', now reinterpreted as connected with *ouvrir* '[to] open', 2.2.3). The term is also used for certain processes involving the analysis of inflectional affixes as word formation affixes (or vice versa), and for the reanalysis of syntagmatic structures (2.2.6, 2.2.7).

**Metanalysis** is another process which does not involve formal change. Here, the internal morpheme boundary of a word is shifted, so that semantic change as well as secondary analogies may result (standard example: Eng. *hamburg-er* → *ham-burger*, with resulting suffix {-burger}, which becomes productive in analogous formations like *cheese-burger*, *onion-burger*, etc.).

**Re-motivation** (as a specific process of remotivation) occurs when the opaqueness of the word, too, is secondary, i.e. when a word loses its original transparency and after a

period of opaqueness re-acquires it (e.g. through spelling pronunciation, as Eng. *fore-head* > /fɔrid/) > /fɔ:hed/) or (rarely) when a word acquires a new transparency different from the secondary one (= tertiary motivation, e.g. Germ. *Maul-wurf*, see 2.2.2).

**Folk etymology** or **popular etymology** are terms frequently used for secondary motivation, particularly of non-native words (e.g. Latinisms) or obsolete words or words with one obsolete element. The terms are, however, also used synonymously with *secondary motivation*. The term folk-etymology was coined by Ernst Förstemann in his article "Über deutsche Volksetymologie" (Förstemann 1852), but has often been criticized as inappropriate (Ullmann 1966: 34 f.; 1972: 101; Mayer 1962: 5–20; Miettinen 1965: 30; Koziol 1974: 118) because it disregards "erroneous" interpretation or intentional misetymologizing of words by medieval scribes, Renaissance humanists, etc. Such suggestions as *a posteriori motivation* (Ullmann 1959: 91), *associative etymology* (Ullmann 1966: 35), or *synchrone Etymologie* (Bergenholtz 1975) have however not been successful (cf. also Mayer 1962: 11, Fn. 2).

Phenomena related to secondary motivation are **malapropism** (the confusion of Latinisms), **agglutination/deglutination** (see 2.2.7), **back-formation** and **analogization** (see 2.2.8; cf. also Mayer 1962: 25–27), and certain types of **initialization** (Ungerer 1991; see also 2.2.8).

All processes of secondary motivation were for a long time seen as erroneous etymologies or (later) as rarely occurring reactions against the arbitrariness of the linguistic sign and therefore as exceptional if not "pathological" (this word is used in Saussure 1967: 210, orig. 1916: 241). Following Gilliéron (1922), they were later and are now usually viewed as normal and frequent processes which have their cause in the storage problems of human memory (Plank 1981: 196 f.). These processes are now also seen in connection with certain stages of child (first) language acquisition, at which children tend to "wrongly" analyze or overinterpret newly acquired words (Leopold 1949: 144 f. with additional literature; Berko 1958: 168–170; Karpf 1990: 129 f.; Art. 165).

Secondary motivation seems to be a fairly universal phenomenon in language change

and language contact. Examples quoted in the literature range from Ancient Greek, Latin, and Old English to most modern European and some African languages. The literature listed in a comprehensive bibliography (Schreiner 1987) concerns 48 different languages (see also the commented bibliography in Olschansky 1996).

## 2. Subclassifications and typical examples

### 2.1. Criteria of subclassification

A more systematic subclassification than the one implied in the different terms defined in 1 may use the following criteria (see also Olschansky 1996: 178–220 and Blank 1997: 304 f.):

- (a) etymological origin of the remotivated word. This word can either be of foreign origin (2.2.1) or a native word of which (usually) one element has become obsolete and is replaced by a still existing morpheme (2.2.2);
- (b) total or partial remotivation. If the remotivated word was originally opaque, total remotivation as compound or derivative is the normal case. This is the usual process with words of foreign origin, which however sometimes remain partially opaque (2.2.1). With words of native origin, which have usually remained semi-transparent, partial remotivation occurs, since only the obsolete or obscured element has to be remotivated (2.2.2);
- (c) change of phonetic and/or graphemic form, which may (2.2.4) or may not occur (2.2.3; cf. 1, “reinterpretation”; see also Mugdan 1984: 113 on Baudouin de Courtenay’s distinction between “inner” and “outer” folk etymology);
- (d) change of morpheme-structure, which may or may not occur. The remotivation of foreign words usually involves the acquisition of a new morphological structure (usually as compound, 2.2.1), while partial remotivation of indigenous words normally retains the old morpheme-structure (2.2.2). However, the following changes may occur: shift of morpheme-boundary (metanalysis), reanalysis of affix as root (2.2.4), reanalysis of root syllable or word formation affix as inflectional affix or vice versa (2.2.6);

- (e) re-motivation as simplex or as complex word (the different possibilities are listed in Koziol<sup>2</sup> 1972: 317–320);
- (f) other criteria (see the examples in 2.2.7).

### 2.2. Typical examples

In the following lists of examples only the information necessary for understanding the process of remotivation is given. Naturally, each word underwent a number of stages in pronunciation, spelling, and semantic interpretation, and some words show different stages of remotivation in the different varieties (e.g. dialects) of the language. To single out one example, Germ. *Friedhof* ‘peace-yard (cemetery)’ appears in Old High Germ. as *frit-hof*, in Middle High Germ. as *vrīt-hof* ‘fenced-in-yard (forecourt [of house or church])’. “Undisturbed” development would have resulted in Modern Germ. *Freit-hof*, which indeed is the form in certain dialects. Association of the meaning ‘church-yard’ with ‘Friede’ (‘peace’), however, was responsible for the remotivated form *Friedhof*, which is used in most varieties including Standard German. For detailed information concerning the development of the individual examples the reader is referred to the etymological dictionaries (Gamillscheg<sup>2</sup> 1969; Kluge<sup>22</sup> 1989; Onions 1966).

#### 2.2.1. Total remotivation of foreign words

This sub-section and the next contain the most frequently quoted examples of folk-etymology. Typically, in German and English, a polysyllabic word of Romance origin undergoes secondary motivation (other origins, however, are also possible); alternately, an obsolete element of an indigenous word is replaced by a still existing morpheme (see 2.2.2).

- Eng. *beak-iron* < Old Fr. *bicorne* ‘two-horn’;
- (American) Eng. *carry-all* < Fr. *carriole* ‘small cart’;
- Eng. *cause-way* < Fr. *chaussée* < Lat. *calciata (via)* ‘lime-road’;
- Eng. *Charter-house* < Fr. *chartreuse* < Anglo-Norm. *chartrouse* ‘Carthusian monastery’;
- Eng. *cut-lass* < Fr. *couteau* < Lat. *cultellus* ‘knife’;
- Eng. *goose-berry* (with obscured pronunciation) < Fr. *groseille*;
- Eng. *lance-knight* < Germ. *Lands-knecht* (with remotivation of *Lands-* as *lance*, and

- etymologically, but not semantically correct interpretation of *-knecht* as *-knight*) ;
- Eng. *leg-horn (hen)* < It. *Legorno* (now *Livorno*);
  - Eng. *man-drake* < Medieval Lat. *mandragola*;
  - Eng. *pent-house* < Old Fr. *appentis* < Medieval Lat. *appenditium* ‘that which is attached’;
  - Eng. *prim-rose* < Fr. *primerole* < Lat. *prim(er)ula* ‘firstling’;
  - Eng. *rose-mary* < Lat. *ros marinus* ‘sea-dew’;
  - Eng. *sparrow-grass* (dialectal) < Lat. *aspasagus* (see also 2.2.8);
  - Fr. *chou-croute* < Alsatian *sur-krut* (= Germ. *Sauerkraut*);
  - Fr. (*jeu de*) *l'âne salé* < Eng. (*game of*) *Aunt Sally*;
  - Germ. *Arm-brust* < Lat. *arcuballista* < *arcus* ‘bow’ + *ballista* ‘catapult’ (< Gk. *ballen* ‘[to] throw’);
  - Germ. *Fell-eisen* < Fr. *valise*;
  - Germ. *Hänge-matte* < Du. *hang-mat* (here the remotivation occurred) < Sp. *hamaca* < Taino (Haiti) *hamaka*;
  - Germ. *Murmel-tier* < *murmuntin* < Lat. *murem montis* ‘mountain-mouse’;
  - Germ. *Viel-fraß* < Norw. *fjell-fross* ‘mountain-cat’;
  - Germ. *Wetter-leuchten* < *Wetter-leichen* ‘weather-dancing’.

The following examples show only partial remotivation of foreign words, which has resulted in formations containing a nonce-morpheme:

- Eng. *cray-fish* < Fr. *écrevisse* < Middle High Germ. *krebis*;
- Eng. *cater-pillar* (with possible analogy to *caterwaul*) < Fr. *chatepeloze* ‘hairy cat’;
- Eng. *fe-male* < Fr. *femelle*;
- Eng. *mush-room* < Fr. *mousseron*.

## 2.2.2. Partial re-motivation of native words

Partial re-motivation is found in the following examples:

- Eng. *black-mail* < *black-māl* ‘black agreement’;
- Eng. *bride-groom* < *brīde-guma* ‘bride-man’;
- Eng. *mistle-toe* < *mistle-tān* ‘mistle-twigs’;
- Eng. *sand-blind* < *sam-blind* ‘half-blind’
- Eng. *shame-faced* < *seam-faest* ‘shame-bound’;
- Eng. *tit-mouse* < *tit-māse* ‘small bird’;

- Eng. *wed-lock* < *wed-lāc* ‘wedding gift, pledge’;
- Germ. *Fast-nacht* < *fase-nacht* ‘roving-night’;
- Germ. *Fried-hof* < *vrīt-hof* ‘fenced-in yard’;
- Germ. *Hage-stolz* < *hagu-stalt* ‘owner of (fenced-off) yard’;
- Germ. *Maul-wurf* < *molt-werf* ‘earth-thower’ < *mūwerf* ‘heap-thrower’ with re-motivation (tertiary motivation);
- Germ. *Lein-wand* < 17th c. *lein-wāt* ‘linnen-garment’;
- Germ. *Sünd-flut* (dialectal) < *sint-vluot* ‘great flood’.

The following example shows remotivation of a foreign element in a hybrid word:

- Germ. *Elfen-bein* < *helfent-pein* ‘elephant-bone’.

## 2.2.3. Remotivation without change of form (“reinterpretation”)

The examples in 2.2.1 and 2.2.2 all involve phonetic and/or graphemic change of the original word. However, examples of merely semantic reinterpretation without formal change also occur (see also the examples in Mayer 1962: 140–233):

- Eng. *auburn* < Lat. *alburnus* ‘whitish’, now associated with *burn*;
- Fr. *ouvrable* < Lat. *operari* ‘[to] work’, now associated with *ouvrir*;
- Germ. *irritieren* ‘[to] confuse, mislead in an annoying way’ < Lat. *ir-ritare* ‘[to] excite’, now associated with *irre-(machen* etc.).

This type may also involve homonymic elements, as in the association of Eng. *breakfast* with *fast* (adj.).

The following words are examples of remotivation through graphemic change (with no change in pronunciation):

- Eng. *island* (with learned introduction of <s> from Lat. *insula* (Old Eng. *īglānd*, Middle Eng. *īland*);
- Eng. *sovereign* (with introduction of <g> and association with *reign*);
- Eng. *posthumous* (with introduction of <h> and association with Lat. *humus*);
- Eng. *hiccup* (with association with *cough*).

Change from “obscured” to “transparent” pronunciation (with no change in spelling) is now common with a number of English

words whose spelling is still transparent. This phenomenon of “spelling pronunciation” is a type of re-motivation. Examples are *fore-head*, *waist-coat*, and *boat-swain*.

#### 2.2.4. Remotivation with change in morphemic structure

Examples of the type Eng. *beak-iron* and Germ. *Fell-eisen* (2.2.1) show acquisition or change of morpho-semantic structure (at least as far as the remotivating language is concerned), while those of the type Eng. *black-mail* and Germ. *Fast-nacht* (2.2.2) retain an already existing structure. Examples of change of morphemic structure in indigenous words are the following:

- (occasional) Eng. *cow's lip* < *cow-slip* < *cū-slyppe* ‘cow- dung’;
- Eng. *worm-wood* < *wermod* (monomorphemic Old English word);
- Germ. *Ein-öde* < *ein-oete* (suffix reinterpreted as root).

Remotivation of compound as derivative or vice versa occurs in:

- Germ. *weis-sagen* < *wīzagōn* ‘act as prophet’ (derivative of *wīzag* ‘knowing’, now interpreted as compound);
- Eng. *brid-al* < *bride-ale* < Old English *brīd-ealo*;
- Germ. *Junk-er* (with doubtful transparency) < *jungk-herr*;
- Eng. *fore-most*, *inner-most*, *utter-most* with reinterpretation of superlative suffix *-mest* as *most*.

#### 2.2.5. Remotivation as simplex

Most types of secondary motivation result in complex words (more frequently compounds than derivatives). The following are examples of monomorphemic remotivation:

- Eng. *jerusalem* (type of artichoke) < It. *girasole*;
- Germ. *Kater* (‘hangover’) < *Katarrh*.

Monomorphemic remotivation must be kept apart from word confusion and resulting semantic convergence (*ravel/rove*, *sheen/shine*, etc.), where two words of different origins, but similar form and already related meanings approach each other semantically even further.

#### 2.2.6. Remotivation involving inflexion

The reinterpretation of inflectional endings occurred with a number of Latin neuter plurals, which appear in French as feminine singulars, e.g.:

- Fr. *corne* < Lat. *cornu-a*;
- Fr. *levre* < Lat. *labr-a*;
- Fr. *voile* < Lat. *vel-a*.

Conversely, the Old Northern French singular form *cherise* was reinterpreted in English as the plural form *cherries*.

#### 2.2.7. Remotivation involving syntax

In some examples remotivation transcends the word boundary, as when the combination article + noun is reanalysed “wrongly” through association with another word (“agglutination” and “deglutination”), e.g.:

- Eng. *an aitch-bone* < *a nache-bone* < Fr. *nache* ‘buttock’;
- Eng. *a nick-name* < *an ēke-name* ‘an also-name’.

Secondary motivation may also affect syntagmas, which in the process undergo changes in syntactic structure or are reinterpreted as complex or simple words:

- Eng. *atone* < (*maken*) *at ūn* ‘make whole, reconcile’;
- Eng. *help-mate* < *help meet (for him)*, (from Genesis 2: 18,20, with misunderstanding of *meet* = ‘suitable’);
- Eng. *upside down* < *up so down*;
- Germ. *während des Sommers* < *währendes Sommers*.

Occasionally, an opaque word is reanalysed as a phrase, as the name of a coarse material, *mungo*, which in Yorkshire is associated with “it mun go” (it must go), allegedly said by the inventor of the machine for it (Weekley<sup>5</sup> 1961: 161).

#### 2.2.8. Other examples

The following examples show remotivation of a simplex (of either native or foreign origin) with expansion by addition of explanatory determinatum:

- Eng. *rein-deer*, Germ. *Renn-tier* < Icel. *hreinn*;
- Germ. *Lind-wurm* < *lint* ‘winding’;
- Germ. *Maul-beere* < Lat. *mūrus*;
- Germ. *Maul-tier* < Lat. *mūlus*;
- Germ. *Wind-hund* < *wint* ‘Vendic dog, greyhound’.

In some cases, remotivation operates simultaneously with other processes, particularly blending (cf. Art. 91). Eng. *run-a-gate* is both a remotivated word (from Fr. *renégat*) and a blend of this with *run-away*.

Formal analogizing, rather than remotivation, occurred in Eng. *lar-board* < *lade-board* ‘loading side’, which was brought in line with its opposite, *starboard* ‘steering side’, whereby partial loss of transparency was compensated with formal similarity to a frequent collocate. A quite different type of analogizing was the source of the semitransparent word-creation *mono-kini*, which owes its origin to the remotivated word *bi-kini* (originally from *Bikini Atoll*).

Initialization, i.e. the formation of **acronyms**, may lead to secondary motivation if the sequence of letters/phonemes results in a pronounceable word, particularly if this has some semantic relation with the initialized phrase. Thus such acronyms as *AIDS* (= acquired immune deficiency syndrome), *CALL* (= computer assisted language learning), *CARE* (= Cooperative for American Relief to Europe), and *WASP* (= White Anglo-Saxon Protestant) are primarily and secondarily motivated for some speakers (cf. Art. 92; for further discussion see Ungerer 1991).

Secondary motivation may operate in loan-translation, as is the case with Germ. *Tausend-giilden-kraut*. For the formation of this compound, the Latin word *centaureum* (< Gk. *kentauros*) was reanalyzed into the elements *centum* ‘a hundred’ and *aurum* ‘gold’ (see also 5.2).

Secondary motivation is sometimes restricted to a short period in the history of the word. Thus the remotivation of Eng. *coward* as *cow-heart* or *cow-herd* and *abundance* as *hab-undance* was only transitory, and the process was reversed. Remotivated forms may also persist, or exist only, in non-standard varieties: “the corruption of *asparagus* to *sparrow-grass*, which is now regarded as vulgar [...] was in good use in the eighteenth and early nineteenth centuries” (Greenough & Kittredge 1900: 334).

### 3. Causes and hindering factors of secondary motivation

#### 3.1. Causes

Secondary motivation is commonly attributed to the need of the language user for transparency and association with familiar elements (Koziol ²1974: 117), “the desire to motivate what is, or has become, opaque in language” (Ullmann 1972: 102) or an “Urbedürfnis des Menschen nach Deutung und Stützung der Wörter, die sich durch feh-

lende Motivation seinem Verständnis entziehen,” (Scheler 1977: 116, cf. also Leisi ¹1985: 76–79, where remotivation is discussed as a reaction against the “dissociation” of “hard words”). This explanation, however, is not entirely satisfactory in view of the existence of the reverse process of obscuration, which is almost as frequent as that of remotivation. The assumption of “two opposite tendencies [...] at work all the time in the development of language,” (Ullmann 1972: 93), or of “two rival factors, conventionality and motivation” (Ullmann ²1959: 92) is not convincing if it is not further explained. Somewhat more plausible is the assumption of two attitudes towards language, a naive, “non-reflective” one associated with the speaker’s interest in an economical use of language, and a “reflective” one resulting from the speaker’s need to make him/herself understood and from the hearer’s search for meaningful elements (Fill 1980: 25–27); these attitudes are thought of as present in both hearer and speaker, with one of them predominating depending on the situation – but each of them can also be thought of as having been prevalent in different periods, as for instance the reflective one, which favours secondary motivation, in the Renaissance period.

The opposite process of obscuration may even have favoured remotivation in some cases. Obscured and transparent forms of compounds frequently existed side by side, so that with words showing some formal relation to the opaque form hypercorrect formations began to appear. Thus the existence of the forms *gozzard* and *goose-herd*, *shepherd* and *sheep-herd* may have been an important factor in the remotivation of *coward* as *cow-herd* (Götz 1971: 22 f.).

Other explanations seek the need for transparency in the facilitation of language acquisition and word retention. These explanations are supported by evidence from the language of aphasics and from the linguistic associations of children. Examples: “*breakfast* is called *breakfast* because you have to eat it fast when you rush to school”, “*Friday* is a day when you have fried fish” (Berko 1958: 170), *chaotisch* – wenn jemand am Boden liegt und zusammengeschlagen ist < k. o. (Karpf 1990: 129), *chicken pox* – *chicken pots*, *ice cream cone* – *ice cream comb* (Bolinger 1968: 105), *forec'sle* reinterpreted as *fox-hole* by two children in Richard Hughes’ novel *A High Wind in Jamaica* (cf. Fill

1980: 26). Ad-hoc folk-etymologies of this kind are also provided by parents teaching new words to their children (Germ. *Bagger* explained as *Pack-er*, cf. Fill 1980: 26).

Frequently certain specific remotivations first appear in certain varieties of a language, e.g. in a specific dialect, or even in the idiolect of individual speakers. The association of Eng. *ballistic* with *ball*, of *mysticism* with *mist*, of *standard* with *stand* (cf. Waldron 1967: 124), of *hurricane* with *hurry* (cf. Mayer 1962: 197) and of Germ. *Gastronomie* (< Gk. *gaster* ‘stomach’) with *Gast*, *Dienstag* with *Dienst* and *Freitag* with *frei* (Weisgerber 1950: 60f.) is certainly still specific, not universal. Idiolectal remotivations may, however, spread and become “accepted”.

Another cause of remotivation concerns place names which conquering nations or new settlers fail to understand and try to adapt to their own language. “The first American hearing a French trapper in Colorado refer to the *Purgatoire River* judged that what he heard was *Picket Wire* with a foreign accent” (Bolinger 1968: 104f.). Other American examples of this type are *Smackover* < Fr. *Chemin Couvert* and *Low Freight* < *L'Eau Frais*. The Old Eng. place name *Eofor-wīc* (now York), ‘boar-town’ is remotivated from Celtic *Eburacum*, *Bear Park* in Durhamshire from Fr. *Beau Repas* (Görlich 1974: 84). Examples of remotivated place-names in German (*Mai-land* < *Mediolanum*, *Merse-burg* < Slavic *-bor* ‘wood’, etc.) are already given by Förstemann (1852: 15f.). For a discussion of folk-etymology in place-names see Vennemann (1999).

Until the beginning of the 19th century, the attempts of etymologists to explain the origin of words were frequently unscholarly guesses wide off the mark. Medieval writers, in particular, supplied examples of “learned folk-etymology” (Weekley<sup>5</sup> 1961: 156) or “guesstymology” (Bolinger 1968: 105) aimed at edification rather than presentation of the facts. Philippe de Thaun (12th century), for instance, explained Fr. *lundi* as ‘day of light’ (*lumière*), *mercredy* as ‘day of market’ (*marché*), *jeudi* as ‘day of joy’ (*joie*), *vendredi* as ‘day of truth’ (*vérité*), etc. (Weekley<sup>5</sup> 1961: 156). Wild etymologizing of the type “*lucus a non lucendo, canis a non canendo*” (= ‘grove from not being light, dog from not singing’) was also frequent in Classical Antiquity and in the Renaissance period. However, very few of these learned mis-etymolo-

gies left any traces in actual language use, so that as a cause of folk-etymology they can be disregarded.

### 3.2. Hindering factors

There are only few factors which hinder or prevent secondary motivation. Remarkably, it is not prevented or hindered by initial lack of semantic relation between the parts and the whole of the word. Analysis into familiar elements seems to be more important at first than the semantic connexion of these elements with the whole. With compounds, frequently one root element shows a semantic relation with the whole, the other one being completely arbitrary (cf. Eng. *mush-room* < *mousseron*, Eng. *cut-lass* < *coutelas*). Here, morphological transparency seems to be more important than constructional transparency, i.e. rule-dependent semantic relation between the elements and the whole (Plank 1981: 195f.). With non-compounds, a semantic relation is sometimes re-established through semantic change (at least on the connotative level) of the remotivated word (see 2.2.3).

The laws of sound-change likewise do not prevent or hinder secondary motivation. Baudouin de Courtenay already characterizes “outer” folk etymology as one of the changes which do not follow these laws (cf. Mugdan 1984: 113). Indeed, remotivation involving phonetic change almost by definition defies sound-laws: the need for analysis into existing elements seems to be stronger than the rules for semantic derivation or phonetic change. Phonotactics, however, may sometimes play a role as a cause of secondary motivation (Mayer 1962: 54–61).

A factor which has sometimes hindered or even reversed folk-etymological processes can be seen in the influence of (scholarly) etymologists, lexicographers, and orthoepists, particularly of the 19th century. Especially in German, a number of words which had undergone folk-etymological changes in previous centuries (e.g. *Sprichwort*, which in the 16th century had adopted the form *Sprüchwort* from *Spruch*) returned to their original form under this influence (Andresen<sup>4</sup> 1886: 17f.).

### 4. Effects of secondary motivation

Those effects of secondary motivation which are connected with its causes are self-evident: morphological and/or semantic transparency

are maintained or re-established, and problems of pronunciation are removed. However, the new morphological structure (or connexion) naturally influences the semantic structure of the word and may result in semantic changes on the denotative or the connotative level. Frequently, certain semantic elements are given more prominence than before the remotivation. This is the case, for instance, with 'Maul' in Germ. *Maulwurf* and *Maulesel*, with 'Sünde' in Germ. *Sündflut* or with 'bell' in Eng. *belfry* (< Old Fr. *berfray* < Middle High Germ. *ber(c)-vrit*). Other words develop an occasional meaning strongly influenced by a secondary element (Eng. *pundit*, also 'sophist' with influence from *pun*). The usual meaning of a word, too, can be affected by secondary motivation (e.g. Germ. *irritieren*).

Folk-etymology has frequently influenced popular beliefs concerning saints, sects, plants, and animals, and has given rise to anecdotes about the origin of customs and to legends about the origin of place-names (for examples see Weisgerber 1950: 56–66 and Kainz 1972: 366–374, who also discusses prejudices and superstitions originating in secondary motivation). A well-known English example of an anecdote inspired by remotivation is the story (told by Jonathan Swift of King James I) of the knighted loin of beef (*sir-loin*, really from Fr. *surlonge* 'above the loin', cf. Weekly 51961: 162; Greenough & Kittredge 1900: 331; Mayer 1962: 95).

**Child-etymology** has been shown to be an important phenomenon in child language acquisition, since it facilitates the acquisition of a more comprehensive vocabulary by establishing semantic links between words already stored in the brain and words to be newly acquired (Leopold 1949: 114). To what extent these early attempts at motivation persist and have an influence on the thinking of the grown-up still remains to be investigated.

Other effects concern intentional remotivation by writers and journalists. These effects can be either humorous or poetic. A humorous example is the formation *Vi-queens* to Vikings (Weekly 51961: 142; quoted from *Punch*). Comic effects are also intended by Shakespeare in *The Merchant of Venice* ("more than sand-blind, high-gravel blind" Act II, scene ii), and Friedrich von Schiller in *Wallensteins Lager* (the "Kapuzinerpredigt", scene 8). For didactic or poetic purposes remotivation has been used by many writers

from Bede (*Angli – Angeli*) to James Joyce (particularly in *Finnegans Wake*; see also the examples in Mayer 1962: 288–310). Effects of both comic relief and characterization are achieved by "malapropisms" in *The Rivals* by R. B. Sheridan and *Der Zauberberg* by Thomas Mann.

## 5. Different approaches to secondary motivation

Secondary motivation has been investigated with different approaches depending on the different levels of language involved, and from various theoretical positions adopted by the different schools of linguistics. The different linguistic levels from which it has been approached are the phonological (Ullmann 1972: 101; Mayer 1962: 54–79, 234–287), the morphological (Erben 1964, Koziol 21972: 317–320, Ullmann 1972: 101–105), the semantic (Waldron 1967: 124 f., 153 f.; Koziol 21974: 117–121; Mayer 1962: 127–233), and the psycho-pragmatic (Kainz 1972: 366–374). There are, however, no comprehensive treatments of remotivation which concentrate specifically on any one of these levels. The different approaches depending on linguistic school and theoretical background will be sketched out in the following sub-sections.

### 5.1. The historical approach

Secondary motivation, under the term *folk-etymology*, was already investigated in some detail in the second half of the 19th century. The interest of scholars was, however, chiefly historical. Three types of etymology were distinguished, the popular, the learned and the scholarly, of which the popular was held to be the oldest (Fürstemann 1852: 2). In accordance with the aims of Comparative Philology, examples of folk-etymology were investigated in many ancient languages (Ancient Greek, Latin, Gothic, Anglo-Saxon, Old Norse, etc.) and a few modern ones, particularly German, English, and the Scandinavian languages (Andresen 1876; Fürstemann 1877).

Folk-etymology was judged as "distortion of words" ("Verunstaltungen der Wörter", Fürstemann 1852: 7; "volksetymologische Entstellung", Andresen 41886: 16), as "false derivation" and "verbal corruption" (Palmer 1882: subtitle) or as "the tendency of the un-educated [...] to distort an unfamiliar or un-

intelligible word into some form which suggests a meaning" (Weekley<sup>5</sup> 1961: 105 f.). Evaluative judgments of this kind have occasionally persisted into the 20th century (in Saussure 1916 folk-etymology is discussed in the diachronic section as a rare and pathological phenomenon).

Since folk-etymology defies any claims concerning the regularity of sound-change (claims which were made in the 19th century by the Neogrammarians), it was frequently regarded from the onomasiological point-of-view, and remotivated words were categorized according to object groups or conceptual categories (proper names, place-names, words denoting plants, animals, etc., Andersen 1876). There was also a tendency to see folk-etymology largely as a thing of the past, at least as far as the standard language was concerned (Förstemann 1852: 14). In a number of publications, folk-etymology is discussed as one of the strange and curious adventures which words may undergo in the course of their romantic history (Greenough & Kittredge 1900; Weekley<sup>5</sup> 1961).

### 5.2. The synchronic approach

Since the advent of Structuralism and the possibility of a synchronic approach, the majority of scholars have taken a more tolerant and even positive attitude towards the phenomena under discussion. This change in attitude has also affected judgments concerning the frequency and statistical importance of the phenomena. While scholars adopting the historical approach tended to view folk-etymology as an exceptional and rare phenomenon restricted to a small number of examples of the type listed in 2.2.1 and 2.2.2, secondary motivation was later and is now regarded as frequent, natural, and indispensable for a living language: "Sekundäre Motivation offenbart sich als ein durchgängiges Prinzip der Sprache" (Mayer 1962: 348). Consequently, scholars interested in secondary motivation no longer restrict their research to previous stages of linguistic development (e.g. the period between the 14th and the 17th century), but increasingly take into account recent and contemporary instances. There is a growing awareness that remotivation and the phenomena related to it (e.g. rhyme association) are extremely widespread, particularly in colloquial speech and substandard varieties, and that the instances brought to the notice of researchers represent only a fraction of the actually existing cases (Miettinen

1965: 29). Interest also no longer focuses on the word alone, but scholars now consider syntagmatic and syntactic reinterpretation to be at least closely related to folk-etymology (Mayer 1962: 310–321).

With the synchronic approach and the introduction of the term "motivation", the phenomenon under discussion began to be seen as a "force" (Mayer 1962: 349) and an expression of the creativity of a language ("schöpferisches Mißverständnis", Knobloch 1968). This view is most strongly manifested in the so-called "inhaltsbezogene" and "leistungsbezogene Sprachbetrachtung" (Weisgerber 1950: 56–66), where folk-etymology is discussed as one of the powers which create and determine folk-customs and types of behaviour, and from which popular beliefs about animals (*Vielfraß*), plants (*Tausendgäuldenkraut*), patron saints (*St. Vincent – vin*), etc. are derived.

Folk-etymology is now seen as "acquisition of morphological and semantic motivation" (Ullmann 1972: 101–105). In an extension of this approach, the following types of secondary motivation have been distinguished (Mayer 1962; see also the criteria of subclassification in 2.1):

- phonological with mere adjustment on the level of sounds (e.g. Eng. *shamrock* < Ir. *seamróg* 'small clover');
- phono-semantic, roughly corresponding to Ullmann's "morphological motivation" (e.g. Eng. *beak-iron* < Fr. *bi-corne*);
- semantic motivation, i.e. semantic association without phonological change (e.g. Engl. *hurricane*, with association to *hurry*);
- onomatopoeic motivation, i.e. acquisition of sound-symbolism (e.g. Eng. *rush* < Fr. *reuser*);
- intentional secondary motivation (e.g. *Vi-queen*, her-story; see also the examples discussed in 4);
- parallel syntactic developments (Eng. *help-mate* < *help meet* (noun + adjective)).

Particularly with the inclusion of "semantic motivation" (in Mayer 1962 about 140 examples from English are discussed), secondary motivation becomes a frequent every-day phenomenon with idiolectal differences, or rather a dynamic process based on the "synchronic etymological competence" of the speaker (Augst 1975: 156–230; see also 5.3).

The generative-transformational approach to language has contributed to viewing secondary motivation as a process, which goes on in the individual, rather than as a historical fact. However, this approach has not played an important role in the further investigation of the phenomena. Folk-etymology is too “irregular” to admit the setting-up of rules. The products of secondary motivation do not normally show constructional transparency, since frequently only one element contributes to semantic motivation (Plank 1981: 195 f.). Besides, remotivated words do not follow one particular pattern of word-formation; rather, they show a variety of structures, from endocentric noun + noun structures (e.g. *Fried-hof*) to exocentric noun + noun (e.g. *Arm-brust*) or verb + noun (e.g. *cut-lass*) structures. In addition, most of them must be regarded as highly idiomatized complex words. As far as their generation is concerned, they are fairly isolated and lexicalized formations, for whose production no generalization is possible (Dressler 1976: 157).

**5.3. Psychological and sociological aspects**  
 Psychological aspects concerning the role of memory were first drawn attention to around the turn of the century (Paul 1909: 221 f.), when folk-etymology was also explained as a phenomenon related to a specific type of slip of the tongue, viz. substitution (Meringer & Mayer 1895: 76), slips being regarded as non-pathological phenomena stemming from constantly operating psychic forces which are subject to rules (Meringer & Mayer 1895: 9). In contrast to this, more recent psychological explanations of folk-etymology seek its causes in the “interpretative correction” of unfamiliar words and phrases (Bolinger 1968: 104).

The psychological aspects of secondary motivation have received special attention with the investigation of child language acquisition. Many children have private meanings for compounds, which they analyse in their own way, without being aware of or considering the history of the word (Berko 1958: 169). It is now generally accepted that child etymology is an important factor in language acquisition and concept-formation (Leopold 1949: 114 f.; Porzig 1967: 203; Fill 1976: 14 f.; Karpf 1990: 129). It has even been suggested that secondary motivation, which is thought to be based on synchronic etymological competence and to precede generative competence, can be practised to facilitate fur-

ther language acquisition (Augst 1975: 178). In child etymology, as in folk-etymology, the formal similarity need not be very close, as in *pretty coat* for *pettycoat* (Leopold 1949: 115). Likewise, constructional transparency (i.e. rule-based relation between form and meaning) is probably aimed at, but rarely achieved, as in the example “it is called *mushroom*, because it has rooms in it” (Fill 1976: 14). Social aspects of remotivation, which concern for instance its particular frequency in non-standard social and regional varieties of a language, have received attention from the very beginning (Förstemann 1852: 20–22; Andresen 1876). More recently, it has been shown that remotivation and the processes related to it are subject to variation and fluctuation in the different dialects and sociolects, and that no dividing line can be drawn between accidental formations due to carelessness or ignorance and intentional word associations created for comic and other effects (Miettinen 1965: 29 f.). Although dialects abound in remotivated formations, there is as yet no comprehensive study of the phenomena under discussion in specific dialects, let alone in larger groups of non-standard varieties.

2. Lexicalization
3. Demotivation
4. References

### 1. Terminology

#### 1.1. Lexicalization

The term **lexicalization** (Germ. *Lexikalisiierung*) is of relatively recent origin; according to the OED (²1989) (see verb *lexicalize*, from which *lexicalization* has probably been derived) it was first attested in 1949. It has been used more widely from the 1960s onwards, but it is apparently still confined to the language of linguists. On its history see, e.g., Grimm (1991: 57–70) and Lipka (1992: 2–6). I shall briefly present some of the more important definitions that have emerged in the discussion.

##### 1.1.1. Accepting into the lexicon

The OED (²1989) defines *lexicalize* (1) as ‘to accept into the lexicon, or vocabulary, of a language’, and *lexicalization* as ‘the action or process of lexicalizing’. In this sense simple and complex words, native as well as loanwords can be lexicalized. Thus, Lyons (1968: 352) says “that the relationship of the transitive to the intransitive is ‘lexicalized’” in pairs like *kill* and *die* (*Bill died – John killed Bill*), i.e. the transitive (and causative) concept of ‘to cause someone to die’ is expressed by a separate word, *to kill* (*someone*). Quirk et al. (1985: 1525 f.) restrict lexicalization to words formed by word-formation processes, explaining it as the process of creating a new word (a complex lexical item) for a (new) thing or notion instead of describing this thing or notion in a sentence or with

a paraphrase. The use of words is more economical because they are shorter than the corresponding (underlying) sentences or paraphrases, and because they can be more easily used as elements of sentences. Thus one does not say ‘someone who writes a book [...] for someone else, who then often pretends it is their own work’, one says *ghost-writer* instead (see the definition in DCE ²1987). Quirk et al. (1985) also point out that the precise form of the lexicalization often cannot be predicted. Sometimes there are competing patterns: ‘to make national’ has been lexicalized as *to nationalize*, but ‘to make beautiful’ as *to beautify*, ‘to make broad(er)’ as *to broaden*, ‘to make narrow(er)’ as *to narrow*; sometimes different formations (synonyms) are used for the same concept, often with regional or stylistic differentiation: ‘a track round which horses race’ is a *race-track* in American English, but a *race-course* in British English (according to the DCE ²1987); ‘Saturday’ is *Samstag* in Southern German, but *Sonnabend* in Northern German.

##### 1.1.2. Replacement of a semantic configuration by a lexeme

Within the framework of generative semantics, lexicalization (or lexical insertion) refers to “a process in which a configuration of semantic elements in an abstract representation is replaced by a lexeme” (Lipka 2002: 111), e.g. [CAUSE BECOME NOT ALIVE] is lexicalized as *kill*, and in German [BEWIRKEN WERDEN SAUBER(ER)] is lexicalized as *säubern*, but I shall not pursue this aspect here.

##### 1.1.3. Formal and/or semantic changes

The third sense of lexicalization is now probably the most usual one; it is also the one which will be discussed in greater detail in

this article. It presupposes the first sense (inclusion of a word into the lexicon), however. Broadly speaking, lexicalization refers to the phenomenon that complex words and expressions are often not identical with the sum of their parts; instead they show idiosyncratic properties, i.e. formal (phonological, morphological) and/or semantic peculiarities which cannot be explained from their constituents or from the word-formation pattern. As Quirk et al. (1985: 1526) put it, the meaning of lexicalized words “is not recoverable from the form”, i.e. it cannot be deduced from the constituents, or at least not entirely. Thus *holiday* originally referred to a ‘holy day’, i.e. a church festival, but in Modern English it refers to ‘a day free from work (or school)’; Germ. *Hochzeit* originally referred to ‘any kind of festival’ but in Modern German it refers specifically to a ‘wedding’. Lexicalization in this sense is a complex phenomenon, and accordingly much more detailed definitions are possible (see Lipka 2002: 113; 1992: 7 f.).

Lexicalization overlays regular word-formation processes; Bauer says that a lexicalized lexeme has taken on a form “which it could not have if it had arisen by the application of productive rules” (Bauer 1983: 48). Lexicalization thus is a diachronic process.

Even though they did not use the term lexicalization, the phenomenon referred to here was known to and at least partly described by earlier scholars, in particular by Paul (1880) and Brugmann (1900).

Lexicalization stands in relation to a number of terms from which it is not always easy to distinguish. Therefore **idiomatization** and **institutionalization** must also be briefly discussed.

## 1.2. Idiomatization

Idiomatization (or its result, idiomaticity) also refers to semantic peculiarities of a complex word or a phrase which cannot or only partly be explained from its constituents, but whereas lexicalization can include phonological and morphological differences, too, idiomatization refers to semantic differences only. Moreover, lexicalization implies a diachronic process, e.g. change of meaning (cf. the examples of *holiday* and *Hochzeit* given in 1.1.3) or the addition of meanings, leading to polysemy, e.g. *reader* (a) ‘a person who reads (something)’, (b) ‘a person who reads books to put mistakes right before printing [i.e. a proofreader], or to decide whether to print them’; (c) ‘a senior British university

teacher just below the rank of professor’ (cf. DCE<sup>2</sup>1987), whereas idiomatization can refer to a synchronic process, whereby complex words or expressions are coined so as to present a specific meaning. Middle English *loveday*, for example, was probably coined to mean ‘day for the settlement of quarrels out of court’ (presumably as a loan translation of Lat. *dies amoris*) and did not mean something else first; the same applies to *ghostwriter* (see 1.1.1), also to phrasal idioms such as *golden wedding*/Germ. *goldene Hochzeit* ‘50th wedding anniversary’, *ins Gras beißen* ‘to die’. It is, of course, not always easy to ascertain whether a word or phrase was coined with a specific meaning or whether it developed this meaning only later; accordingly the distinction between lexicalization as a diachronic change of meaning and idiomatization as a synchronic specialization of meaning is sometimes difficult. Scholars are therefore not always consistent in their use of these terms. Consistency is especially difficult because idiomatized formations can then also be lexicalized in other ways: *chairman* /tʃeəmən/, for example, was probably coined to mean ‘a person who is in charge of a meeting’ or ‘a person who is the head of a large organization’ and did not simply have ‘man who sits in a chair’ as its original meaning, but rather ‘man who sits in a chair of authority’ (see OED<sup>2</sup>1989), but its second element *man* was, probably subsequently, weakened from /mæn/ to /mən/. But it is perhaps going too far to doubt the value of the distinction altogether, as Kastovsky (1982: 164 f.) seems to do.

Formations which are similar on the surface can nevertheless be idiomatized quite differently: *callgirl* ‘prostitute’ has the meaning ‘girl who is called (by men on the phone asking for paid sex)’, whereas the original meaning of *callboy* was ‘boy who calls (actors onto the stage)’ see, e.g., Kastovsky (1982: 165).

## 1.3. Institutionalization

This term was apparently made popular in morphology by Bauer (1983: 48). It also relates to the history of vocabulary items, but refers to an earlier stage than lexicalization. Bauer distinguishes three such stages, namely **formation**, **institutionalization**, and **lexicalization**.

### 1.3.1. Formation

Words are usually first coined in a particular context and in order to name a specific (new) thing or concept. Many are never taken over

by the speech community, they remain nonce-formations (**ad-hoc formations**, **hapax legomena**, Germ. **Augenblicksbildungen**, **Einzelprägungen**).

### 1.3.2. Institutionalization

Words are institutionalized when they enter the common vocabulary or at least the vocabulary of a certain group of speakers. The term institutionalization is thus roughly equivalent to (synonymous with) the definition of lexicalization as ‘accepting into the lexicon’ (see 1.1.1). Institutionalization can also be connected with the change from **type-familiarity** (recognizing a particular pattern of word-formation) to **item-familiarity** (knowing a particular word). In institutionalized words, possible ambiguity (polysemy) is often ignored and their use is restricted to one of their possible meanings. *Almsman*, for example, usually meant ‘man who receives alms’ and not ‘man who gives alms’, Germ. *Schüler* ‘pupil’ refers to ‘someone who is taught at school’ and not to ‘someone who teaches at school’ (the latter meaning is institutionalized as *Lehrer* in German).

On the other hand, formations with similar or partly identical elements can be institutionalized (and idiomatized) in different ways, as shown in 1.2 for *callboy* and *callgirl*, cf. also pairs such as *pork butcher* and *family butcher*, Germ. *Brillenträger – Hosenträger*, etc. But even in institutionalized formations, polysemy is sometimes retained (or re-introduced), e.g.: *fireman* can refer to ‘a person whose job is putting out fires’ or to ‘a person who looks after the fire in a steam engine or furnace’ (DCE 2<sup>1987</sup>); Germ. *Holzschuppen* can refer to a ‘shed made of wood’ or a ‘shed where wood is stored’ (or both at the same time).

### 1.3.3. Lexicalization

The third stage in the development of a lexical item is then lexicalization (in the sense of developing idiosyncratic formal and/or semantic features, i.e. change of meaning and/or form), as in *bonfire* ‘fire made for pleasure etc.’ (originally *bone-fire*), or Germ. *Drittel* (< *Dritteil* (der dritte Teil)). Not all institutionalized complex words become lexicalized, however: words such as *goldsmith*, *stone wall*, etc. have existed since Old English without any apparent change of meaning, and have undergone regular sound changes only, which affected the compounds as well as their ele-

ments. To cover both institutionalized and lexicalized formations Bauer (1983) also uses the term **established formations**.

### 1.4. Obscuration

This term refers primarily to the formal side of lexicalization. In **obscured** compounds, the elements show a different phonological (and consequently often also morphological) development in the compounds and in independent use. *Holiday* /hɒlədɪ/, /hɒlɪdeɪ/ is, for example, slightly obscured from its constituents *holy* /həʊlɪ/ and *day* /deɪ/, whereas *gospel* (from Old English *gōd* > Modern English *good* /gʊd/ and Old English *spell* > Modern English *spell* /spel/) is totally obscured (/gospɪl/) and has become monomorphemic. Obscured compounds often show semantic changes, too. On obscured compounds in English, see, e.g., Götz (1971), Faiß (1978), and Sauer (1992: 345–358).

### 1.5. Other terms

Some authors use terminologies quite different from the one favoured here. Lyons (1977: 535 ff.) calls the stage of the formation of words lexicalization (see 1.1.1). **Syntactic compounds** is his term for completely regular, non-lexicalized compounds which can be explained according to productive patterns of compounding. **Compound lexemes** is his term for semantically lexicalized compounds (i.e. with idiosyncratic semantic features) which he also terms petrified (1977: 547 f.) – for a similar use of petrification see Leech (1981: 225–227). From these Lyons distinguishes **fossilized compounds**; they are derived according to rules that are no longer productive in the language system (such as the so-called imperative compounds like *pick-pocket*, *turnkey*) – these are called morphologically lexicalized in our terminology (see 2.3.3). Lyons’s terminology does not seem very clear, however; for criticism see also Bauer (1983: 49 f.).

## 2. Lexicalization

### 2.1. Causes of lexicalization

Lipka (1981: 131) mentions several possible causes of lexicalization, which often work hand in hand. Lexicalization stresses the unified character of complex words and at the same time diminishes their character as syntagms. It should be borne in mind, however, that phenomena such as word-character,

naming function, and frequency of use can lead to lexicalization, but do not necessarily do so: Old English formations such as *grass-green* (Old English *gærsgrene*), *Sunday* (Old English *sunnandæg*) are still used in their original meaning and show only regular sound-changes which also affected their constituents; therefore they can be regarded as institutionalized, but not as lexicalized.

### 2.1.1. Word-character

In compounds unification of the constituents starts with the imposition of compound stress: syntactic group *bláck bóard* vs. compound *bláckbóard*, cf. Germ. *bláue Béere* vs. *Bláubéere*; this is, however, a fairly regular process and therefore not yet a case of lexicalization in the stricter sense. But unification can end in the coalescing of originally bimorphemic compounds into monomorphemic words, i.e. in total obscuration, e.g. Old English *scīrgerēfa* > Modern English *sheriff* (but Old English *scīr* > *shire*; *gerēfa* > *reeve*).

### 2.1.2. Naming function

A consequence of the naming function is **hypostasation** (Germ. *Hypostasierung*), i.e. the phenomenon that the existence of a (simple or complex) word makes people assume that there is a referent (thing, person, etc.) in reality (in the world) which the word refers to. Often this assumption is, of course, correct; there exist things or persons to which words like *bookcase*, *bookseller*, etc. refer. But this is not always the case – authors of science fiction stories, for example, invent new worlds with things and actions that do not exist in our world, such as to *uncreate*, to *unmurder* (cf. Kastovsky 1982: 152).

### 2.1.3. Frequent use

It can be assumed that frequent use was the reason for the lexicalization and eventual obscuration of a number of original compounds such as *daisy*, *gospel*, *lord*, *lady*, *sheriff*, *woman*, etc. It seems, however, impossible to decide precisely how often a formation must be used in order to become lexicalized, and, as stated in 1.3.3, there are a number of Old English compounds which are still commonly used in Modern English without having been lexicalized.

## 2.2. The scope of lexicalization

The majority of the examples given so far were compounds, but lexicalization can also occur with other types of word-formation,

for example: prefix-formations such as Germ. *abkratzen* in the sense ‘to die’; suffix-formations such as *reader* (see 1.2) or *sleepier* in the sense ‘heavy piece of wood, metal, etc., supporting a railway track’, Germ. *Zeitung* ‘newspaper’ (originally ‘message, news’); zero-derivations (conversions), e.g., *to corner someone* ‘to put someone into a corner so that he cannot escape’ (Leech 1981: 226), onomatopoeic formations such as Lat. *cuculus* ‘cuckoo’ > Fr. *cocu* ‘cuckold’, clippings such as *vamp* ‘seductive woman’ (from *vampire*). Syntactic groups (phrases) can be lexicalized, too; in this case they are usually called idioms. Examples are (cf. also 1.2): adjective + noun groups (*public school*, in British English ‘private school’; Germ. *geheimer Rat* [as a title]); groups of noun + preposition + noun (*man in the street*/Germ. *der Mann auf der Straße* ‘average person’); verb + object groups (*kick the bucket*/Germ. *ins Gras beißen* ‘to die’); verb + particle constructions (phrasal verbs: *to bottle up* ‘keep (one’s feelings) under control’; *to do in* ‘to kill’). The borderline between syntactic groups (phrases) and complex words (generated through word-formation processes) is not always easy to draw, anyway: syntactic groups can, for example, coalesce into complex words (e.g. Germ. *geheimer Rat* to *Geheimrat*; Old English *dōmes dæg* to Modern English *doomsday*); combinations with the first element in the genitive are regarded as compounds by some scholars but as syntactic groups by others (*craftsman*, *driver’s seat*, *bull’s-eye*, etc.); phrasal verbs are certainly lexical units, but since they are separable (*they done the old woman in* [Pygmalion]), they cannot be regarded as complex words.

## 2.3. Types of lexicalization

Lexicalization can affect all linguistic levels, see, e.g., Bauer (1983: 50–61), Grimm (1991: 71–121). Often, several of these types co-occur in a formation.

### 2.3.1. Graphemic lexicalization

Graphemic lexicalization usually reflects phonological changes, e.g. *tuppence* /tʌp(ə)ns/ for *twopence*.

### 2.3.2. Phonological lexicalization

This can be divided into segmental and suprasegmental.

(a) Segmental lexicalization: Lexicalization of segmental features occurs when the elements of a complex word develop phoneti-

cally different in independent use. This is especially frequent in compounds; here the causes may be loss of stress, shortening of an element, assimilation, etc.; often two or more of these factors are combined and lead to obscuration (opacity). *Woman* (from Old English *wif* > Modern English *wife* and *man* /man/ > *man* /mæn/), for example, shows shortening of the first element (before two consonants), loss of stress on the second element, and assimilation of the end of the first element to the beginning of the second element (regressive assimilation): Old English *wifman* > *wifman* > *wimman* > Modern English *woman* /womən/; Germ. *hohe Zeit* vs. *Hochzeit*. As stated in 1.4, there is a scale from slight obscuration (e.g. *cupboard* /kʌbəd/ vs. *cup* /kʌp/ and *board* /bɔ:d/) to total obscuration; totally obscured compounds such as *barn* (< Old English *bere-ern* ‘barley-house’), *lord*, *lady* (< Old English *hlāfweard*, *hlæfdige*), *lammas*, *gospel*, *gossip*, etc. have become monomorphemic, whereas partly or slightly obscured compounds can still be regarded as bimorphemic, e.g. *holiday*. Sometimes the pronunciation is obscured, but not the spelling, e.g. in *breakfast* (/brekfəst/ vs. /breɪk/ and /fə:st/). Phonological lexicalization can also occur with suffixes; in most of the formations with the (no longer productive) suffix *-th*, the underlying simplex has been changed in the derivation: *broad – breadth*, *deep – depth*, etc. (which can be explained historically as *i*-mutation caused by the suffix *-iθə* > *-th*). For words to take on a different form as the basis of derivations was relatively frequent in Old English, while it is rare in Modern English, apart from derivative alternants due to loan-influence, e.g. *consume* /kən'sju:m/ – *consumption* /kən'sam(p)fən/, *decide* /dɪ'said/ – *decision* /də'sizən/.

(b) Suprasegmental (prosodic) lexicalization: Compounds often have a different stress pattern from corresponding syntactic groups; in English and German, for example, syntactic groups typically have double stress (i.e. two main stresses), whereas compounds typically have a main stress on their first element and a secondary stress on their second element, e.g. *blåck båord* vs. *blåckbåord*, Germ. *schönes Wetter* vs. *Schönwetter*. Some loan suffixes retract the accent, e.g. *-átion* (*declaráre* /dɛkl're/ vs. *declarátion* /dɛklə'reiʃn/), *-ée* (*train* vs. *trainée*), Germ. *-ieren* (*Lack* – *lackieren*, *Marsch* – *marschieren*). Nouns de-

rived from phrasal verbs by zero-derivation (conversion), on the other hand, change the main accent from the second to the first element: *to pick up* > *a pickup*; *to lèt down* > *a létdown*. But all these phenomena are apparently synchronically productive processes and thus do not yet lead to lexicalization in the stricter sense. The stage of phonological lexicalization is reached, however, if, for example, the second element of a compound loses its secondary stress and is also reduced phonetically as a consequence, e.g. in some institutionalized compounds with *man*, such as *chairman* /tʃeəmən/, where the second constituent is pronounced as /mən/ instead of /mæn/ and thus approaches the character of a suffix. But *-man* is not a genuine suffix yet, because the weakening of /mæn/ to /mən/ probably took place after the formation of these compounds. In some cases, however, suffixes originated from the weakened second elements of compounds, e.g. the suffix *-ful* /f(ə)l/ from the word *full* /fʊl/ (*careful*, *grateful*, *thankful*); frequently lexicalized elements thus became productive in a different function. In other cases weakening of the second element due to loss of the (secondary) stress apparently was the first step to obscuration, especially in a number of older compounds.

### 2.3.3. Morphological lexicalization

This type of lexicalization can also be classified into a number of subtypes.

(a) Linking elements, e.g. Germ. *Arbeit* but *Arbeitsvertrag*. Bauer (1983: 53 f.), who regards the insertion of linking elements as one kind of morphological lexicalization, points out that often their addition follows synchronically productive rules and thus cannot be regarded as lexicalization in the strict sense, but there can also be diachronic changes resulting in genuine morphological lexicalization: Germ. *Schwanenhals*, for example, retains the old form of the genitive, whereas in independent use *Schwan* now has the *s*-genitive (*des Schwans*); something similar applies to Lat. *pater familias*, which also retains the old genitive, whereas in classical Latin, the genitive of *familia* is *familiae*. While linking elements are fairly frequent in German, they are rare in English (*-in-* in *nightingale* < Old English *nihtegale*, cf. Germ. *Nachtigall*), apart from the *-s*, which can, however, usually be regarded as the genitive *-s*, sometimes combined or merged with the plural *-s*, cf. *ladies' room*, *salesman*, *townsman*, etc.

(b) Unproductive word-formation patterns or elements: Words formed according to unproductive patterns or containing unproductive affixes are also morphologically lexicalized. In English this applies to the so-called imperative compounds (*pickpocket*, *dolittle*, *speakeasy*), cf. (Lyons 1977: 547f.), or to derivations with the suffix *-th* (*warmth*, *growth*) – formations like *length*, *strength* are thus lexicalized phonologically as well as morphologically.

English moreover has a large number of loan-words where the suffix then also became productive in English. Words with these suffixes fall into two groups: (i) loans where the base does not occur independently in English, e.g. *atheism*, *atheist* (but no \**athe-*), *baptism*, *baptist* (but no \**bapt-*), – these could be regarded as lexicalized, but usually they are just regarded as loan-words; they show, however, that the distinction between loan-words and English word-formation is also sometimes blurred. (ii) Formations where the base also occurs independently in English, e.g. *escape* > *escapism*, *escapist*, but these are not lexicalized (at least not morphologically).

(c) Blocked morphemes: Blocked (unique) morphemes are elements of compounds which occur just in one compound and which do not or no longer occur as independent words, e.g. many first elements of the days of the week such as *Tues-* in *Tuesday*/Germ. *Dienstag*, or *rasp-* in *raspberry*, Germ. *Brom-* in *Brombeere*, -*galel-gall* in *nightingale*/Germ. *Nachtigall* (cf. also Sauer 1992: 340–345). Blocked morphemes are frequent in English place-names, e.g. the first elements of *Manchester*, *Gloucester*, *Worcester*, *Salisbury*, etc.

(d) Obscured compounds: Morphological lexicalization has, of course, also taken place in obscured compounds which have become monomorphemic, e.g. *nostril* (< Old English *nos-hyrel*, lit. ‘nose-hole’), see 2.3.2(a).

(e) With partly obscured compounds the question arises of whether the obscured elements should still be regarded as allomorphs of the corresponding independent words, e.g. whether *Mon-* /mʌn/ in *Monday* should be seen as an allomorph of *moon* /mu:n/. The answer probably depends on whether the speakers still feel a semantic connection between the forms, which is probably not the case in *moon* and *Mon(day)*, while it is probably true (due to the spelling) in *cup(board)* /kʌ-/ and *cup* /kʌp/.

### 2.3.4. Semantic lexicalization

Semantic lexicalization entails change of meaning. This is often subdivided into addition of semantic features, which results in restriction (narrowing) of meaning, loss of semantic features, which conversely results in extension (widening) of meaning, and a mixture of both. These changes also happen in simplex words, e.g. *fowl* (Old English *fugol* ‘bird’ > Modern English *fowl* ‘farmyard bird’) and conversely *bird* (Old English *bridd* ‘young bird’ > Modern English *bird* ‘bird’), but in connection with lexicalization we are only concerned with semantic changes in complex words. Examples are:

(a) Addition of semantic features, e.g. Germ. *Hochzeit* (see 1.1.3). Here belong probably also formations containing implied features in addition to the stated features (in the terminology of Warren 1978): Middle English *hand-whil* means ‘time needed to turn one’s hand’, i.e. ‘very short time, moment’; Germ. *Augenblick* has the same implied feature ‘very short time’. Strictly speaking, *hand-whill* Germ. *Augenblick* are probably rather cases of idiomatization than of lexicalization. Addition of features also occurs if one element of a phrase is lost through ellipsis and the remaining element in addition takes on the meaning of the lost element, e.g. *private (soldier)*, Germ. *Süddeutsche (Zeitung)*. For the distinction between general (systematic) features such as in *sleepwalker*/Germ. *Schlafwandler* [+HABITUAL] and idiosyncratic features such as in *pushchair* [+FOR CHILDREN], see also 2.4.

(b) Loss of semantic features, e.g. *arrive* (< Fr. *arriver* < Lat. \**adripare*, \**arripare*) ‘come to a place’, originally ‘land at the shore’. Cases where a constituent loses its meaning entirely are treated under demotivation.

(c) Mixture (combination) of addition and loss of features, e.g. *holiday* (has lost the feature ‘religious’ and added the feature ‘free from work or school’), *blackboard* (has lost the feature ‘black’, because *blackboards* are nowadays usually green or white, and added the feature ‘made to write upon’). This phenomenon seems to be more frequent than simple loss or addition of features. Here belong probably also instances of metaphoric transfer, e.g. the use of *bottleneck* ‘neck of a bottle’ for ‘narrow part of a road which slows down traffic’ (DCE 21987). Demotivation can also result in change of semantic features:

a *Junggeselle* (Germ.) usually is no longer young, but he is unmarried.

(d) As pointed out in connection with *reader*, the same formation can be semantically lexicalized in several ways. Examples are numerous among the phrasal verbs, e.g. *to hold out* 'to offer', 'to continue to exist', 'to continue in spite of difficulties, endure'.

The examples discussed so far seem fairly clear, but semantic description in connection with the question of lexicalization and idiomatization also has to face a number of problems (cf. Bauer 1983: 56–59); I shall mention two of them.

(e) In connection with added semantic features it is sometimes unclear where the borderline between a semantic (linguistic) description of a word and an encyclopedic description of the thing or being concerned lies. A *typewriter* can be linguistically explained as an 'instrument that writes with types' and as such is not lexicalized (but rather institutionalized), but of course a typewriter has many more elements to it than just types. The same problem often arises with plant and animal names: There are many animals that hop around in the grass (e.g. hares), but only a certain kind of insect is called *grasshopper*/Germ. *Grashüpfer*.

(f) In other cases the distinction between semantic processes (lexicalization or idiomatization) and word-formation processes is not easy to make. The so-called **exocentric compounds**, with the subgroups of **bahuvihi (possessive) compounds** like *redcoat* 'person who has/a red coat', *paleface*/Germ. *Bleichgesicht*, etc. and of **imperative compounds** like *dolittle*, *pickpocket*, Germ. *Vergißmeinnicht*, *Fürchtegott* 'person who performs the action indicated by the verb' all contain the element 'person' (or 'animal' as in *stickleback*, or 'thing' as in *greenback*, *scarecrow*), which is, however, not expressed on the surface. There are two possible explanations for this, one in semantic terms and one in terms of word-formation: These formations could be seen as a kind of **metonymy** with a part standing for the whole, or the action standing for the agent, and the feature 'person' (or 'animal' or 'thing') could then be regarded as an additional semantic feature, which would make them lexicalized (or idiomatized) compounds. But since this added feature can also be regarded as typical of the entire patterns of word-formation concerned, it could be ar-

gued with Kastovsky (1982: 167 f.), who follows Marchand (2<sup>nd</sup> 1969), that all formations based on these types (*paleface*, *pickpocket*) are regular formations with a complex determinant and a zero-morpheme as a determinatum, e.g. *redskin*/ $\emptyset$  'someone who has a red skin' *pickpocket*/ $\emptyset$  'someone who picks (other people's) pockets'. Marchand (2<sup>nd</sup> 1969) and Kastovsky (1982) classify the zero-morpheme as a zero-suffix with the systematic meaning 'person' (or 'animal' or 'thing'), apparently as a parallel to explicit suffixes such as *-er* (with the systematic meaning 'person', as in *baker*, or 'instrument', as in *bottle-opener*). This would, moreover, classify the exocentric formations as (zero) derivations rather than as compounds.

### 2.3.5. Syntactic lexicalization

This is the most problematic of the types. At least in English and German, there are fewer clear cases of syntactic lexicalization than of semantic, phonological and morphological lexicalization.

(a) Bauer (1983: 59) says that syntactic lexicalization occurs when a syntactic pattern according to which complex lexemes have been formed falls into disuse. An example of this would be Germ. *Vergißmeinnicht* 'forget-me-not', derived from the sentence *vergiß mein(er) nicht*, whereas in Modern German the construction is *vergiß mich nicht*. In this connection Bauer also mentions the so-called imperative compounds (*pickpocket*, *scarecrow*, to which *Vergißmeinnicht* belongs, too). As stated in 1.5, this pattern seems to be unproductive in present day English and is thus morphologically lexicalized, but it is not syntactically lexicalized (*Vergißmeinnicht* being an exception) because the underlying sentence pattern verb + object, e.g. '(to) scare crows (away)' is still usual in Modern English.

(b) Many compounds show a change of word order as compared with the underlying (or paraphrase) sentence or phrase, e.g. *as green as grass* → *grassgreen*, *the door at the front* → *the front door*. But since this change of word order is a fairly regular phenomenon in compounding, it should not be regarded as indicative of lexicalization.

### 2.3.6. Mixed lexicalization

Often two or more types of lexicalization are combined in one word. This has become clear from some of the examples given above: *holi-*

*day* and Germ. *Hochzeit* (see 1.1.3, 1.2, 2.3.4) show phonological as well as semantic lexicalization (different pronunciation of at least one constituent and change of meaning). Bauer points out “that once a form is lexicalized in one way it is easier for it to become lexicalized in others” (Bauer 1983: 61). This is certainly true for many of the totally obscured English compounds (*barn*, *lord*, *lady*, *lammas*, *gospel*, *sheriff*), which show phonological changes with resulting morphological changes (originally bimorphemic, now usually monomorphemic), and semantic changes (idiomatization or semantic lexicalization).

#### 2.4. Degrees of lexicalization

There is a gliding scale from slight lexicalization to total obscuration (or demotivation). Examples of phonological and morphological obscuration have been given in 1.4 and 2.3.2 (relatively slight: *cupboard*, *holiday*; medium: *bonfire*; total: *lord*, *lady*). Here I want to concentrate on degrees of semantic lexicalization (idiomatization). Usually, a distinction is made in the literature between the addition of general and systematic semantic features and the addition of specific and idiosyncratic features (see, e.g. Lipka 1981: 125–129; Kastovsky 1982: 195 ff.; Sauer 1992: 46–50, 384–388).

(a) General (systematic) additional features: Here belong, e.g., [+HABITUAL], e.g. *crybaby*, [+PROFESSIONAL], e.g. *baker*/Germ. *Bäcker*. Instruments as a rule have the feature [+PURPOSE] and they can be paraphrased as ‘B is (made) for A’, e.g. *bottle-opener*/Germ. *Flaschenöffner*, *candlestick*/Germ. *Kerzenständer*.

This kind of analysis is not without its problems, however. Features like [+HABITUAL] and [+PROFESSIONAL] are certainly inherent in some formations, e.g. [+PROFESSIONAL] in *baker*, *miller*/Germ. *Bäcker*, *Müller*, whereas in others they seem to depend on the context. *Writer*/Germ. *Schreiber* in *the writer of this letter*/*der Schreiber dieses Briefes* is a pure agent nominalization (‘the person who writes or has written this letter’) without any additional semantic features; in *she is a regular letter-writer (or writer of letters)* the feature [+HABITUAL] is indicated by *regular*. Authors like G. B. Shaw and Hemingway were professional writers, but Caesar and Chaucer were writers in their pastime.

(b) Specific (idiosyncratic) additional features: The elements of the historical term

Germ. *Morgengabe*/Old English *morgengifu* just state that it is ‘a gift given in the morning’, but the precise meaning is ‘a gift (present) given by the husband to his wife in the morning after the wedding night’. Cf. also examples discussed in 1.2, such as *ghostwriter*, *reader*, etc. Leech (1981: 225–227) calls the addition of such specific and unpredictable semantic features petrification. As far as I can see they are impossible to classify.

(c) Additional semantic features can, of course, be combined: Compounds like *crybaby* and *sobsister* have [+HABITUAL, +DE-ROGATORY]. There are also combinations of added general features and added specific features: In formations like *playboy*, *callgirl* the general features [+HABITUAL] or [+PROFESSIONAL] are combined with added (or deleted) specific features: a *playboy* is usually not a boy, but a man; he plays in a very special way, he is rich and does not work. A *crybaby*, moreover, usually is no longer a baby, a *sobsister* is not necessarily a sister, etc.

(d) As has been shown before (cf. *reader*), the same formation can also be non-lexicalized (have no additional semantic features) in one sense and be heavily lexicalized (have specific features) in another sense.

(e) It is not always clear where the general additional features end and the specific (idiosyncratic) features begin. *Crybaby*, *sobsister*/Germ. *Heulsuse* also have the feature [+DE-ROGATORY], which, according to Marchand (1969: 73 f.), occurs relatively frequently in formations of the type verb + noun. [+DE-ROGATORY] could therefore be regarded as a fairly general semantic feature, too, but it is not usually mentioned as such in the literature, although it is usually given as a stylistic label in dictionaries.

(f) It is not even always clear where exactly lexicalization (or idiomatization) begins. If one follows the distinction made by Bauer (1983), the use of a formation in just one of its possible meanings to the exclusion of others is a case of institutionalization but not yet of lexicalization. Institutionalization entails that in the paraphrase only one verb (or a group of synonymous verbs) can be used, e.g. for *stone wall* ‘the wall consists/is made of stone’, and not, e.g. \*‘the wall produces stone’ or \*‘the wall resembles stone’. Lipka (2002: 114) mentions the historical *highwayman* among the unpredictable idioms with rather specific semantic features. It can, how-

ever, be paraphrased as ‘man who robs (others) on the highway’ (cf. DCE 2<sup>1987</sup>), and according to this analysis it would be a simple case of institutionalization, excluding meanings such as \*‘man who meets others on the highway’ or \*‘man who helps others on the highway’. On the other hand, while one author listed *country house* among the compounds without additional features, Lyons (1977: 535–544) spends several pages to point out that, at least in British English, it means not just ‘house in the country’, but rather ‘large house in the country owned by a member of the aristocracy, as opposed to his town house’ (cf. Sauer 1992: 119).

(g) Features which are additional in some formations can already be part of an element in others. [+DEROGATORY] or [+NEGATIVELY EVALUATED] is additional in *crybaby*, *playboy*, etc., but in Middle English *flescheslust*/Germ. *Fleischeslust* it is probably inherent because the flesh was (is) regarded as inherently weak and sinful by the church. Similarly, in formations such as Germ. *Langweiler*, *Trödler*, the feature [+DEROGATORY] is not added but inherent in one of the constituents (*Langeweile*, *trödln*).

### 3. Demotivation

Demotivation has been described as the loss of the sign-character of one or both constituents of a complex lexeme. Seen from the semantic aspect it indicates that one or both elements have lost their original meaning (and in some cases have acquired a new meaning). Thus demotivation partly overlaps with the phenomenon of semantic lexicalization. But before discussing demotivation in some more detail, the underlying and antonymous term **motivation** should be briefly explained.

#### 3.1. Motivation

Since F. de Saussure it has been fairly generally accepted that the linguistic sign is on principle arbitrary, i.e. unmotivated, because as a rule there is no natural connection between the *signifiant* (expression side, phonetic form) and the *signifié* (content side, meaning). This is clear from several facts: Both sides can change, the expression side through sound-changes (e.g. Old English *stān* > Middle English *stōn* > Modern English *stone* / *stəʊn/), and the content side through semantic change, i.e. change of meaning (e.g.*

Germ. *Gift*, originally ‘gift, present’ [as still in *Mitgift* ‘dowry’] → ‘poison’). Moreover, the same meanings or denotata can be expressed by different *signifiés* in different languages, e.g. Lat. *arbor*, Eng. *tree*, Germ. *Baum*, as well as in the same language; in the latter case they are called synonyms and are often dialectally or stylistically differentiated, e.g. *begin*, *commence*, *start* or British English *railway* vs. American English *railroad*. But there are a number of exceptions to this general principle; words can be phonetically, morphologically or semantically motivated (see Ullmann 1962: 82–93; Fill 1980: 14–16).

(a) Phonetic motivation: Onomatopoeic words, such as *miaow*/Germ. *miauen*, are imitations of animal cries and thus phonologically motivated; phonological motivation also plays a role in words formed with the help of sound-symbolic elements, such as Eng. -ash (indicating quick movement (ending suddenly)) in *clash*, *crash*, *dash*, *flash*, *lash*, etc.; for details see Marchand (2<sup>1969</sup>: 397–428).

(b) Morphological motivation: Complex words, especially compounds, prefix- and suffix-formations are morphologically motivated, i.e. if one knows the meaning of the constituents (which are unmotivated in themselves), one can predict or at least make an informed guess at the meaning of the entire combination. If the speaker/hearer knows for example, that *re-* means ‘again, once more’ and *tell* ‘narrate’ he will also know that *retell* means ‘to tell again’; this aspect has been called type-familiarity.

(c) Semantic motivation: This applies in cases of semantic transfer by metaphor or metonymy; if one speaks, for example, of *the foot of a mountain*/Germ. *Fuß des Berges*, or if one calls a narrow part of a road a *bottle-neck*. Compounds used metaphorically are thus morphologically and semantically motivated; the same applies to metaphorically used syntactic groups like *wet blanket* (cf. Lyons 1977: 548). As stated earlier, exocentric nouns (bahuvrihi nouns such as *paleface* and imperative nouns such as *dolittle*) can generally be seen as metonymic formations (‘person with a pale face’, ‘person who does little’, etc.). Semantic transfer, of course, also occurs in simplexes, e.g. in *fox*/Germ. *Fuchs* ‘clever person full of tricks’ (in Germ. also ‘horse with a reddish colour’, in Eng. also ‘sexually attractive woman’).

### 3.2. Loss of motivation

Motivation on all the levels mentioned can also be lost; I shall concentrate on loss of morphological motivation. There are several ways of classifying this phenomenon, e.g. according to extralinguistic/intralinguistic changes or according to the number of constituents affected (cf. Lipka 1981: 127f.; Sauer 1992: 49f.).

(a) Extralinguistic changes are changes in the cultural background or in our knowledge of the world. *Shoemakers/Germ. Schuhmacher, Schuster* and *watchmakers/Germ. Uhrmacher* usually no longer make shoes or watches, but repair them; *blackboards* were originally black, but are nowadays usually green or white; a *Schreibfeder* (Germ.) is now usually made of steel and no longer of feathers (quills). Strictly speaking, in all these cases it is not the meaning of the compounds or derivations that has changed, but the activity or structure of the referent; *shoemaker* can still be paraphrased as ‘someone who makes shoes’, as opposed to Germ. *Junggeselle*, which cannot be paraphrased as \*‘der Geselle ist jung’ or \*‘junger Geselle’.

(b) Intralinguistic changes are due to a change of meaning in one or both constituents. In *mincemeat* ‘mixture of fruit and spices ...’ *meat* does not have its modern meaning ‘edible flesh’, but retains the older meaning ‘food in general’. Germ. *Mitgift* ‘dowry’ retains the old meaning of *Gift*, namely ‘gift, present’, whereas the modern meaning of *Gift* is ‘poison’.

(c) Loss of meaning in one constituent: The first constituent has lost its original motivation and therefore its original meaning in, e.g. *blackboard*, *Whitsunday* (originally, white garments were worn on this Sunday), Germ. *Bockbier, Bockwurst*, the second constituent in *bluebottle* (a kind of blue fly), *mincemeat, sweetmeat*, Germ. *Handschuh, Bahnhof, Lehrkörper*. The original motivation has often been lost in plant and place names: speakers usually do not know what, for example, horses have to do with *horse-chestnuts* or *horsetistles*; many towns are still called *Newtown, Newton/Germ. Neustadt*, although many of them were founded in the Middle Ages. A routine formula such as *how do you do* has also partly lost its motivation.

Here belong also blocked morphemes, which do not (or no longer) carry any meaning in themselves, but serve to differentiate

one compound from another; *Tues-/Germ. Diens-* differentiate *Tuesday/Dienstag* from other days of the week, *rasp-/Germ. Him-* differentiate *raspberry/Germ. Himbeere* from other berries (*blueberry, blackberry, Germ. Blaubeere, Stachelbeere*).

(d) Loss of meaning in both constituents: Here belong, e.g., animal names such as *butterfly* (which is neither a fly nor is it known what its connection with butter should be), *understand* (connected neither with *under* nor with *stand*), Germ. *Junggeselle* (who is neither young nor a *Geselle* ‘companion’, but unmarried), *Schornstein* (with a blocked morpheme as its first element) – cf. phrases like *alter Junggeselle*. A French example is *beaucoup* ‘a lot’ (no longer ‘a nice blow’). It has been said that formations such as *butterfly, Junggeselle, etc.* have a misleading motivation (cf. Fill 1980: 70). A number of place names and surnames have also lost their original motivation: *Oxford/Germ. Ochsenfurt* were originally settlements at a ford where oxen could cross; the towns are still there, but the fords for oxen have gone. People called *Fowler, Forester, Germ. Bartenschlager, Strohschneider* have quite different occupations or professions than their ancestors had. Obscured compounds which have become monomorphemic (*barn, gospel, lord, sheriff*) have, of course, also lost their motivation completely. Loss of motivation in both elements is furthermore frequent in phrasal idioms, e.g. *white elephant, red tape*, including phrasal verbs such as *to do in* ‘to kill’, etc.

### 3.3. Degrees in the loss of motivation

As with lexicalization in general, there are also degrees in the loss of motivation. Formations such as *shoemaker/Germ. Schuhmacher*, are still analyzable and probably represent only slight cases of demotivation, since we still know about the cultural background that existed during their formation. Formations with blocked morphemes or where one constituent has lost its meaning (*raspberry, Germ. Brombeere, Handschuh*) show a middle degree of demotivation, and formations where both elements have lost their meaning as well as entirely obscured compounds show total loss of motivation (*butterfly, Germ. Junggeselle; lord*), cf. Fill (1980: 69–73). The loss of motivation and accordingly the degree of idiomatization is stronger in *Großmutter* than in *Großstadt*: a *Großstadt* is a large city (although the minimum size of a *Großstadt*

has been officially defined), whereas the *groß* in *Großmutter* has lost the meaning ‘large’ (see Fleischer<sup>5</sup> 1982: 13). There will probably always be difficult or disputed cases. Some dictionaries say that the reason for (i.e. the motivation of) the plant name *strawberry* is not known, which would make it a partly demotivated compound (with loss of meaning in *straw*). I believe, however, that strawberry fruits were (as they still are) protected from decay by surrounding them with straw or fine shavings, which would make *strawberry* a fully motivated compound (‘berry which is protected with straw’).

### 3.4. Remotivation

Native as well as loan words that have partly or entirely lost their motivation are sometimes remotivated.

(a) If the spelling is still intact this can happen through spelling pronunciation, e.g. in *waistcoat* /'weskət/ > /'weirstkəut/; this seems to be frequent in place-names, e.g. *Cirencester* /'sɪsɪtə/ > /'saɪrənsestə/.

(b) In other cases it can happen through popular etymology (folk etymology, secondary motivation; cf. Olschansky 1996). Here an unmotivated word or the unmotivated part of it (e.g. a blocked morpheme) is changed so as to coincide with existing morphemes. This can be done with loan-words which were never motivated in the receiving language: Lat. *levisticum* became *Liebstöckel* in German and *lufestice* ‘love-stitch’ in Old English, cf. Modern English *lovage*; *asparagus* (monomorphemic) was turned into *sparrowgrass* (bimorphemic). It can also happen with native words which lost their motivation partly or entirely: The second element of Old English *brydguma* lit. ‘bride-man’ was exchanged so as to yield *bridegroom*; the first element of Germ. *Sintflut* (‘big flood’ with blocked *Sint*-) was exchanged so as to yield *Sündflut* (‘flood [as a punishment] for the sins’). But the new morphological motivation is often just superficial, once more a kind of misleading motivation: *aspargus/sparrowgrass* is neither a kind of grass nor have sparrows anything to do with it.

(c) Sometimes the same combination survives in different stages of transparency or lexicalization: the Old English syntactic

group *hālig dæg* ‘holy day’ survives as syntactic group *holy day*, as lexicalized compound *holiday* and as still more lexicalized (obscured) compound *Halliday* (only used as a surname).

## 151. Change in productivity

1. Introduction
2. Types of changes in productivity
3. Synchronic vs. diachronic productivity
4. Linguistic factors affecting the productivity of bases
5. References

### 1. Introduction

Most languages reveal fluctuations in the **productivity** of word formation patterns over time. Despite this, the diachronic aspect of productivity has been little investigated in a systematic fashion. A discussion of changes in productivity depends, first of all, however, on a coherent definition of the notion of productivity (cf. Art. 33). Different scholars have used the term in different ways (cf. Botha 1968: 149), although common to most definitions is an implicit notion of **frequency** of occurrence, as in Bauer (1983):

“Basically, any process [...] is said to be productive if it can be used synchronically in the production of new forms, and non-productive if it cannot be used synchronically in this way.” (Bauer 1983: 18)

Thus, in order for some process to be productive, new words must be generated. It follows that a greater degree of productivity should be reflected in a greater number of new forms. Thus, in German, for instance, the suffix *-bar* ‘able’ is both productive and frequent, e.g. *trinkbar*. Forms that are non-productive or lexically idiosyncratic must be listed in the lexicon, and appear before the level of lexical insertion.

### 2. Types of changes in productivity

Within the group of productive processes, some are more productive than others, while non-productive processes can be accounted for in terms of a list of the bases to which they have applied. Changes in productivity may affect roots as well as affixes. It is well known that in English, for instance, a number of new affixes not existing in Old English were borrowed, e.g. *-ment* as in *involvement*, *-ity* as in *purity*, *mal-* as in *malformed*, etc., while other native ones disappeared or declined in use. Although words containing the suffix *-ment* are still analyzable, the suffix is no longer productive as can be seen from the fact that new words are not being coined. Other nominalizing suffixes are preferred instead and existing forms with *-ment* have become lexicalized. Similarly, all nominalizations from adjectives which end in *-th* are now lexicalized, e.g. *warmth*, *depth*, *length*, etc., and most also have unproductive root forms. No new forms can be created with *-th* so that *\*realth*, for instance, is not synchronically possible. Moreover, new suffixes are created all the time by analysis of existing lexemes, e.g. *forecast* led to *funcast* (i.e. the weather outlook for sporting activities), *quickcast* (i.e. a brief summary of the weather), *travelcast* (i.e. forecast for travellers), etc.

Productive processes may become less productive over time, while non- or semi-productive processes can become more productive. The upper limits on productivity are

vague. Gruber (1976: 322) has suggested that to be fully productive, an affix must be usable with all [bases] definable by some semantic, syntactic or phonological property. Few, if any, affixes would meet this criterion.

Many scholars have, however, suggested that the suffix *-ness* is fully productive (cf. Jespersen 1924). Its productivity extends to both major and minor categories:

- major categories: *goodness*, *jackassness*, *wellness*;
- minor categories: *muchness*, *threeness*, *betweeness*, *whyness*;
- phrasal/semi-phrasal: *broken-heartedness*, *fed-up-ness*, *up-to-dateness*, *know-nothingness*.

Some of these formations provide counterexamples to generalizations about word formation, namely that only major categories can be the product of word formation rules and that only form classes can be used as bases in the formation of derivatives (cf. Aronoff's principles of word formation; cf. Aronoff 1976: 21). In addition, however, *-ness* managed to attach itself to native as well as non-native roots and therefore was able to compete with French suffixes such as *-ity*, cf. e.g. *stableness* vs. *stability*; *oddity* vs. *oddness*, etc.

Looking at the cognate suffix *-nis* in the history of German, we see that the opposite state of affairs prevails in the modern language, where many of the Old High German formations have disappeared, and most of the modern formations were established by 1800. As in English, there is a competing French suffix *-ität*, which applied mainly to foreign bases. Unlike English, however, *-nis* never really extended itself to foreign bases and most of the formations are deverbal. There are a total of 428 derivations in Matter's (1971) reverse dictionary, more than 3/4 of which are compounds or derivatives of only 29 bases. Word forms ending in *-ität* account for nearly as many of the total abstract noun formations (48 percent in *-ität* as compared to 52 percent in *-nis*), as shown in Table 151.1.

	<i>-ness/-nis?</i>	<i>-ityl/-ätäl/-i)té</i>
English	33 percent	67 percent
German	52 percent	48 percent

Tab. 151.1: Formations in *-ness/-nis* and *-ityl/-ätäl/-i)té* in English and German

From a comparative historical perspective it is clear that not only has *-ness* met a more productive locus in English, but the same is true of English *-ity* compared with the productivity of its cognate in French. In French there is a total of 797 words ending in the suffix *-ité/té*. In English there is a total of 1926. Nouns ending in *-ity* in English account for 33 percent of the total number of *-ness* and *-ity* formations, while those ending in *-ness* account for 67 percent (cf. Lehnert 1971; Juilland 1965). The difference between English and French on the one hand and English and German on the other is quite striking.

Scholars such as Thompson (1975: 347) have drawn a distinction between **productivity** and **analogy**. An analogical formation is a new formation clearly modelled on one already existing lexeme and does not give rise to a productive series. The problem in drawing an absolute distinction between productivity and analogy is that an analogical formation may provide the impetus for a series of formations. Thus, at one extreme would be cases which are more clearly analogical formations resulting in the creation of only one new form which cannot be accounted for by rule, e.g. *wargasm*, from *war* + *orgasm* (see Bauer 1983: 96, 100). This would be the limiting case of productivity. At the other end, however, are cases such as *sit-in* providing the model for *teach-in*, *swim-in*, and *hamburger* providing the model for *cheeseburger*, *fishburger*, etc. (see Art. 148).

A somewhat different example of a change in word formation patterns which involves an alteration in productivity can be seen in German. In Middle High German compounds with first elements ending in *-keit* were formed without any linking element by adding one stem to another, e.g. *Gerechtigkeitsliebe* 'love of justice' consists of *Gerechtigkeit* 'justice' + *Liebe* 'love'. In modern German, however, all words ending in *-keit* add a linking element *-s* (i.e. Kompositionsfugenelement) when they enter into compounds. Lexemes which were institutionalized before the change in linking element either have now added *-s* in modern German, e.g. *Gerechtigkeitsliebe*, or have become lexicalized in their old form since they can no longer be generated by synchronic productive rules. It is also possible for the same two lexemes to form compounds at two different time periods with different linking elements. In such cases the compounds may constitute minimal pairs

which differ in meaning, e.g. *Wassernot* ‘drought’ vs. *Wassersnot* ‘flood’ (cf. Bauer 1983: 53 f.).

### 3. Synchronic vs. diachronic productivity

The extent to which it is possible to distinguish between synchronic and diachronic productivity depends at least partly on maintenance of a distinction between synchrony and diachrony which has become increasingly less tenable. Most scholars recognize that a rigid boundary between the two is difficult to defend and that synchronic speech forms reflect diachronic processes. Matthews (1972: 191, n.2) notes that the “introduction of diachronic evidence ... in no way implies that it is a diachronic and not a synchronic fact that it is evidence for.” If this view is accepted, then there can be no clear-cut boundary between diachronic and synchronic productivity. Words occur all the time with varying degrees of probability in both speech and writing. A large proportion of complex word forms heard everyday are nonce formations, and do not become established in the language. It is only with hindsight that we can determine if a word has become established and thus contributed to the productivity of a morphological process over the long term rather than just momentarily. The rules allowing speakers to create new words by applying patterns of word formation can be thought of as a matter of synchrony while the subsequent fate of established lexemes is a matter for diachrony. Although some have said that processes such as **back formation** are strictly diachronic (cf. Art. 60), there must be some synchronic rule which allows analogies to be made between apparently complex forms with other cases where the suffixed and non-suffixed forms are both lexemes, e.g. *laze* is derived from the earlier form *lazy*, possibly by analogy with forms such as *craze* and *crazy* (cf. Bauer 1983: 64 f.).

It is possible to gain some retrospective idea of productivity, and hence some insight into its diachronic dimension by looking at a dictionary, as in the comparisons made above among German, French and English with respect to *-ität*, *-ité/té* and *-ity* (cf. 2). In providing a list of the established lexemes of a given language, a dictionary includes the existing products of various word formation rules which have applied in the past to produce conventionalized and accepted words.

One way to study productivity diachronically is to look at the output of various word formation rules as recorded in dictionaries at different points in time. It is particularly instructive to compare word formation processes which compete for the same bases. In such cases the factors constraining productivity become clearer, and it is evident that synchronic restrictions on productivity are essentially the result of diachronic changes.

Romaine (1983: 186 f.) examined a list of 100 adjectives in the contemporary *Oxford English Dictionary* (OED) and compared these with lists obtained from two earlier dictionaries, Samuel Johnson’s *Dictionary of the English Language* (1755) and Thomas Sheridan’s *A General Dictionary of the English Language* (1780) to see how many *-ity* and *-ness* formations were listed, e.g. *pompous*: *pomposity/pompousness*. Over time there has been an increase in the number of words taking both suffixes. For example, the OED records 60 words out of the list of 100 which may take either *-ity* or *-ness*, compared to only 22 for Johnson’s dictionary and 18 for Sheridan’s. Similarly, more words take neither suffix in Sheridan’s and Johnson’s dictionaries (15 and 21, respectively) than in the OED (1). There are only minor differences among the dictionaries with regard to those words which are listed as taking *-ness* only. The OED records 32, Samuel Johnson’s dictionary, 35, and Thomas Sheridan’s, 42. The differences are greater for *-ity*. The OED lists only seven words which can take *-ity* only, while Sheridan has 25 and Johnson, 20. This method could be used with other affixes, and to look at individual authors writing in earlier time periods.

This procedure, however, gives only a partial glimpse of productivity because dictionaries list only actual, attested and not possible words (cf. Art. 171). It must not be forgotten that dictionaries are in some sense arbitrary collections of the words in a language at a given time and will not necessarily reflect the actual written or spoken usage of a speech community (cf. Mugdan 1984: 240–259). Thiel (1973: 379) found that 62 percent of the compound words in an issue of the German popular news magazine, *Die Zeit*, were not listed in dictionaries. Morphological processes may be exceedingly productive and never result in established lexemes which are recognized by a dictionary as being legitimate words of the language. One well known example is found in the English use of infixes

Base Type	Formations in <i>-ness</i>		Formations in <i>-ity</i>	
	Number	Example	Number	Example
<i>-ous</i>	<i>generousness</i>	514	<i>generosity</i>	94
<i>-ive</i>	<i>transitiveness</i>	391	<i>transitivity</i>	96
<i>-able</i>	<i>reasonableness</i>	346	<i>reasonability</i>	200
<i>-al</i>	<i>musicalness</i>	169	<i>musicality</i>	315
<i>-ible</i>	<i>fallibleness</i>	99	<i>fallibility</i>	156
<i>-ile</i>	<i>fragileness</i>	17	<i>fragility</i>	75
<i>-ic</i>	<i>domesticness</i>	15	<i>domesticity</i>	63

Tab. 151.2: Formations in *-ness* and *-ity* in relation to base type

forms such as *absobloodylutely*. Here the **in-fixes** are potential word forms rather than bound morphs like most other English affixes. Although infixated forms such as these have been in colloquial use for some time, it is unlikely any of them will ever appear in a dictionary due to their taboo status. Just because such words do not appear in the dictionary, this does not mean that infixation is non-productive, or that the forms resulting from them are not established lexemes in the mental lexicon.

#### 4. Linguistic factors affecting the productivity of bases

Just as it is impossible to talk about productivity in a meaningful sense synchronically without taking into account other factors, e.g. phonological, syntactic, it is impossible to do so diachronically. Although some have assumed that the morphological form of the base is the most important factor affecting productivity (cf. 4.1), for others, semantic considerations are primary (cf. 4.4). The successful spread and productivity of certain suffixes such as *-ness* can be accounted for in terms of the interaction of these factors (see also Baayen 1989).

##### 4.1. Morphological form of the base as a factor restricting productivity

It is obvious that the morphological form of the base plays an important role in determining productivity (cf. Aronoff 1976: 53 f.). Compare the difference in the number of *-ness* and *-ity* formations which obtain when the suffixes are attached to two distinct classes of adjectives, those ending in *-ive*, and

those ending in *-ile*. There are approximately five times as many words ending in *-iveness* as there were ending in *-ivity*. The second base, however, yields different results. The number of words ending in *-ility* overwhelmingly exceeded those ending in *-ileness*. Table 151.2 shows some results for different base types from Romaine (1983: 182) using Lehner's (1971) dictionary. The boxes indicate where the locus of productivity lies for each suffix. Nouns ending in *-ness* are most productively formed with bases ending in *-ous*, *-ive*, and *-able*, while *-ity* occurs most frequently with *-al*, *-ible*, *-ile*, and *-ic*.

Although a consideration of the morphological type of base imposes a considerable refinement on the analysis of productivity, it still does not deal with the issue of recurrent vs. possible lexemes, and whether the productivity of existent types bears a regular relationship to that of possible types. Aronoff (1976: 37) claims that speakers of a language have intuitions about productivity which entail the notion 'likelihood of being a word of the speaker's active vocabulary'. He furthermore speculated that if pairs such as *perceptiveness* and *perceptivity* are presented to native speakers of English, they will say that although both are possible, *perceptiveness* is preferable. Romaine (1983), however, did not find this to be the case in an experiment conducted to test speakers' intuitions about the productivity of *-ness* and *-ity* formations.

Comparing the results with those from Table 151.1 based on the dictionary, Romaine found that in all cases where we would expect *-ness* to be more productive than *-ity*, it was not; nor was *-ity* more productive than *-ness* in all those cases where we would expect it

to be. This indicates a significant discrepancy between productivity measured in terms of existent lexemes as recorded by dictionaries and possible lexemes as indicated by speaker judgements. The suffix *-ity* turned out to be more productive than *-ness* over all the base types. These results suggest that the factor of morphological type of base is itself a dependent and not an independent variable in productivity. There is also wide variation among the words belonging to a particular type, which indicates a greater degree of lexical idiosyncrasy than Aronoff allows.

#### 4.2. Lexical restrictions on productivity

Productivity may also be affected by idiosyncratic lexical restrictions. For example, the suffix *-ric* occurs only with *bishop*, e.g. *bishopric* (cf. Bauer 1983: 93). In some *-ity* nominalizations from adjectival bases ending in *-ous*, the *-ous* becomes *-os-*, e.g. *curiosity*, while in others it is deleted, e.g. *voracity* from *voracious* (cf. Aronoff 1976: 40). Because these processes are not predictable, these exceptions must be dealt with on an ad hoc basis in the lexicon.

Another type of conditioning can be seen in the preference of suffixes such as *-ee* to apply more productively to transitive verb bases, e.g. *employee* (cf. Bauer 1983: 98).

#### 4.3. Phonological restrictions on productivity

Phonological factors affecting the productivity of bases include stress shift and vowel and consonant alternations. Speakers tend not to use words whose pronunciation they are unsure of. In order to add the suffix *-ity* to the base *electric* to produce the derived form *electricity*, a speaker must apply rules of stress shift and velar softening. In experiments testing the alleged psychological reality of these kinds of processes as formulated by Chomsky & Halle (1968) in their generative model of English phonology, it was found that when speakers were asked to apply such rules to bases which normally did not undergo them, e.g. *methanity* (*methane* + *-ity*), they did not use them (cf. Steinberg & Krohn 1975; Baldi et al. 1985).

In other cases the phonological shape of the base determines whether it may be used as the input to a word formation rule. In French the diminutive suffix *-ette* is not normally added to bases ending in /t/ or /d/, while in English the adverbial suffix *-ly* is not productively added to adjective bases already

ending in *-ly*, e.g. *\*sillily*. The suffix *-eer* shows a preference for bases ending in /t/, e.g. *profiteer*, *racketeer*, etc.

In still other cases productivity is sensitive to syllable structure. Thus, the English prefix *mal-* may apply only to polysyllabic bases such as *adapted*, e.g. *maladapted*. Another case where syllable structure impedes productivity can be found in the infixes mentioned earlier. In most cases the infixes must be inserted immediately before the syllable of the base which bears the lexical stress so that forms such as *\*abbloodysolutely* are ruled out. Stress is also a relevant conditioning factor since it is difficult to insert such infixes in words with stress falling on the first syllable with no subsequent subsidiary stress, e.g. *solid*. Most commonly infixes occur in words of three or more syllables (cf. Bauer 1983: 89–91).

#### 4.4. Semantic restrictions on productivity

There is one general semantic factor which limits the productivity of word formation rules, which can be called **hypostatization**. This means that words will not be formed to denote non-existent entities (cf. Bauer 1983: 85; Art. 80). The use of a word presupposes the existence of a relevant category.

Some have suggested there is a simple relationship between productivity and meaning: a morpheme whose meaning is more semantically coherent will be more productive (cf. Aronoff 1976: 39). Comparing *-ness* and *-ity*, it can be easily shown that the semantics of *-ness* nominalizations has been highly coherent throughout history. The meaning of X-ness can be stated in terms of a choice among three operations on the base X:

- (a) ‘the fact that someone/something is X’, e.g. *His kindness* (‘the fact that he is kind’) *amazes me*.
- (b) ‘the extent to which someone/something is X’, e.g. *His kindness* (‘the extent to which he is kind’) *amazes me*.
- (c) ‘the quality or state of being X’, e.g. *Kindness is a virtue*.

By contrast, the semantics of *-ity* derivatives is not nearly so coherent. Many of the established lexemes ending in *-ity* have strayed from their original abstract sense to denote concrete objects and now have a collective or technical sense (cf. Romaine 1985). The root sense of many *-ity* formations is abstract, i.e. a noun denoting a state, quality or condition,

e.g. *nobility* in the sense of ‘nobleness’, the quality or state of being noble. Some of these formations then became used as nouns denoting occupations, offices, positions or titles signifying the abstract qualities of the occupations, e.g. *nobility* in the sense ‘class of nobles’. Many of the formations ending in *-ty* (from French *-té/té*) denote offices or titles of occupations, e.g. *royalty*, *admiralty*, *mayorality*, etc. A number of these denote occupations or offices associated with feudalism and are no longer in use, e.g. *squiralty*, *vassality*, etc. Some *-ity* formations developed a sense of collectivity or totality of people belonging to an occupation or who have the quality of being associated with it, e.g. *humanity*, *Christianity*, *polity*, *society*, *nationality*, *fraternity*, etc. Some also came to be used as scientific or technical terms, e.g. *gravity*, *velocity*, and others to denote things having the abstract quality of the adjective base associated with them, e.g. *oddity*, *antiquity*, *curiosity*, etc. Thus, nouns ending in *-ity* have drifted away from the semantics of their derivational base.

This semantic itinerary is established diachronically for *-ness* too, although the number of *-ness* formations which have strayed from their original sense is far smaller. In Old English there were some cases where a noun ending in *-ness* denoted something concrete, e.g. *smirines* ‘oil’, or the still surviving *wilderness* or *witness* used to refer to both the person offering evidence and the evidence or testimony itself. There is an inverse relationship between **productivity** and **lexicalization**: the most productive patterns are not lexicalized and fully lexicalized processes are not productive (cf. Bauer 1983: 88). Formations such as *witness*, *business*, *wilderness* and *likeness* are examples of this. There were also cases where *-ness* formations became used as titles connected with occupations, e.g. *highness*, *holiness*. The meaning of *-ness* in this sense is apparently still available to speakers synchronically since it is used humorously in Agatha Christie’s novel *Death on the Nile*, when an Indian character addresses the famous detective as “Your Sleuthness”. Finally, the word *business* refers to a collectivity.

Where competing *-ness* and *-ity* nominalizations exist, they occupy different semantic spaces. Thus, *nobleness* refers only to the capacity or state of being noble, while *nobility* also refers to the capacity or state of being noble. *Humanness* refers to the quality of being human, while *humanity* refers to the col-

lectivity of humans; *antiqueness* refers to the state of being antique, while *antiquity* refers to an old object or time period, etc. Lexicalized *business* referring to a collectivity has the counterpart *busyness* denoting the state of being busy. The semantic lexicalization of *business* is accompanied by phonological lexicalization in that the final vowel of *busy* is lost. Many words spread themselves over more than one slot in semantic space. For example, *curiosity* can denote both the condition or state of being curious and also an object having the quality or state associated with the adjective but *curiousness* can be used only to denote the quality or state of being curious. *Oddity* and *oddness* contrast in the same way. The fact that the semantics of *-ity* formations is less predictable and less regular is implicated in productivity since speakers will tend not to use words whose meaning is unclear to them.

Van Marle (1988: 141 f.) has discussed a similar case in Dutch, where the greater semantic heterogeneity of deverbal adjectives ending in the suffix *-lijk* has led to its decline in productivity, while *-baar* has increased its domain of application. He also suggests that the loss of productivity of one of two competing word formation rules must be explained by internal factors, i.e. in terms of factors pertaining to the properties of the category of formations produced by that process. In Dutch it seems that there are non-standard dialects where *-lijk* has declined in productivity, but has not been replaced by *-baar*. Thus, *-baar* has not been responsible for the decline in productivity of *-lijk*. An important factor in this case is the large-scale occurrence of non-literal, metaphorical readings of words ending in *-lijk*, e.g. *onberispelijk* ‘perfect’ from the verb *berispen* ‘to rebuke, reprehend’. The meaning of the underlying verb has completely disappeared and the derivative occurs only in combination with the negative prefix *on-*. This represents a drift away from the core or inherent properties of the verbs to which the suffix is attached (cf. van Marle 1988: 144 f.). Once this happens, the semantics of the derivatives becomes less transparent.

Semantic considerations are also probably responsible for the recent increased productivity of *-free* over *-less* (cf. Slotkin 1990). Originally, *-free* and *-less* were semantically equivalent, and in some formations, still are, e.g. *sugarfree* and *sugarless*. However, in other formations they are not, e.g. *childless*

vs. *childfree*. The adjective ending in *-less* has negative overtones, while the one in *-free* is positive. Thus, to describe someone as *childless* implies that having children is desirable, but to be *childfree* imputes a positive value of being free from the burden of having children. The negative connotations of *-less* may have been acquired through the conventionalization of compounds such as *feckless*, *hopeless* and *ruthless*, which denote undesirable qualities. The original meaning of *careless* to indicate someone free from care is now expressed by *carefree* and *careless* has undergone pejoration. Thus, *careless* means ‘not taking care’ and the result of carelessness is generally negative. Now *-less* seems to be attached primarily to nouns to indicate undesirable connotations and has declined in productivity. The suffix *-free*, however, has increased its productivity and is used increasingly in a variety of nonce denominal adjective formations.

**Blocking** conditions on productivity have been formulated in terms of meaning so they too may be seen as a type of semantic constraint. Aronoff (1976: 56) predicts that it will be impossible for there to be two words with the same meaning and the same root in one person’s lexicon at the same time. Others have also suggested that some possible formations will be blocked if there is already an existing lexeme with that meaning (e.g. *Regel der besetzten Stelle*, or preemption by synonymy; cf. Art. 85). Thus, we would predict that *stealer* is not likely to become conventionalized due to the existence of *thief*. There is no nominalization ending in *-eur* from *voler* ‘to fly’ in French due to the prior existence of a homophonous form *voleur* meaning ‘thief’. Similarly, the presence of nominals such as *glory* and *fury* blocks the application of a word formation rule suffixing *-ity* to the adjectives *glorious* and *furious*. Despite this, however, nominalizations ending in *-ness* are possible, i.e. *furiousness*, *gloriousness*. Blocking does not in any case prevent coining. It acts only as a brake on conventionalization. Formations in *-ness* often appear in the semantic slots of nouns formed with other abstract deadjectival noun forming suffixes. The individual limits and differences in semantic distinguishability between pairs such as *sincereness/sincerity*, *chasteness/chastity*, *stability/stableness*, etc. remain to be investigated.

#### 4.5. Pragmatic factors restricting productivity

Closely related to such meaning considerations affecting changes in productivity are pragmatic factors having to do with non-referential associations such as the stylistic and social connotations associated with a particular pattern of word formation. Since they are optional, word formation rules may be sensitive to the same kinds of constraints which affect other sociolinguistic variables, e.g. age, sex, social class, region, etc. From a diachronic perspective it is possible to establish that certain patterns of word formation vary with time-depth and style.

Nonce formations are often glossed as such in written texts. In modern writings new terms are often put in inverted commas. When new formations are introduced, they may be glossed, e.g. *cherite þet is lufe* (Ancrene Riwle) or used with a synonym, e.g. *sikernesse and surete*. The repetition of two synonymous forms, one native and one foreign, is still used in legal registers, where there is a high proportion of Latin and French vocabulary, e.g. *life and limb*, *break and enter*, *legal and lawful*, etc.

Whether a new term gains in currency will depend on many factors, one of which is the status of the person who uses it. Where new concepts are concerned, e.g. upon the invention of the television or internet, new words are required, but prestige is often a factor in motivating new formations. Nowadays popular media, in particular, the world wide web, are an important influence. Historically speaking, almost as soon as French and Latin words were introduced into English, native prefixes and suffixes were added to them, e.g. *stableness*. As soon as sufficient lexical material was borrowed for foreign word formation patterns to be transparent and isolable, they could be used productively with both native and newly borrowed words, e.g. *oddity*. For the educated in society, knowing the derivational systems of both French and English made mixing foreign and native systems of derivational morphology possible. Authors such as Chaucer and Wyclif experimented with these types of formation very early. Wyclif, for example, uses doublets such as *feersness* (cf. Modern English: *fierceness*) and *feerste* (cf. Modern English: *fiercity* and *ferocity*) and *bareyness* (cf. Modern English: *barrenness*) and *bareynte* (cf. Modern English: *\*barrenty*). Once massive borrowing in the Middle English period had disrupted the

prevailing native patterns of word formation, there were numerous derivatives which are closely related semantically and possibly also etymologically, but which have different roots, e.g. *regal* and *royal*, *eat* and *edible*, etc. In many cases only one member of these sets of roots remains productive in modern English. It does not seem possible to create new lexemes in English by adding suffixes to the root *ed-*, but *eat* has been productive in new forms such as *eater*.

English is remarkable in its ability to accommodate and integrate the derivational morphological systems of Romance with its own native Germanic one. Neither Czech nor German normally mixes native bases with foreign affixes or foreign bases with native affixes. Thus, German *\*Sterbation* is ungrammatical, while English *starvation* is not. In so far as there are some restrictions on the compatibility of foreign and native elements, these can be considered to be of the same type as others which are due to the morphological form of the base (cf. 4.1). Aronoff (1976: 51 f.) proposes that bases have to be marked as [+latinate] or [-latinate]. Some foreign suffixes have never combined with native roots, but over time such restrictions have been relaxed. It is not clear what factors are responsible for this diachronic change in status.

Speakers' reactions to novel expressions may also affect productivity. When speakers notice a new form, they often oppose it and write letters to the newspaper complaining about the use of the new form on etymological, grammatical, semantic or aesthetic grounds. One example is *Time* magazine's article (cf. *Time* 1962) entitled "The Nesselrode to ruin" complaining about the productivity of *-ness*. The article regarded the prolifness of *-ness* formations such as *inwardness*, *thereness*, *matter-of-factness*, etc. as a dangerous tendency which was bringing about a decline in standards of English usage. English speakers have also complained about the extension of *-wise* meaning 'with respect to' or 'in regard to' in formations such as *moneywise*, *I'm o.k.* which means 'I have enough money' (cf. *Houghton* 1968). This increase occurred sometime around the middle part of this century. Earlier in the century, it looked as if this suffix was unproductive since it existed primarily in a few lexicalized forms such as *likewise*, *otherwise* and *clockwise*.

#### 4.6. Other factors restricting productivity

Among the other possible factors limiting the productivity of word formation processes is simply time itself. The longer a process of word formation has been used productively, the more likely it is that a sizable number of the bases to which the rules can be applied will become institutionalized lexemes. This means that over time there will be fewer bases available for the process to apply to productively (see Bauer 1983: 98). The relationship between productivity and lexicalization is still not well understood. Nor is the interaction of all the factors already discussed. Bauer (1983: 99) speculates that potential formation of a particular word is blocked by a cumulation of factors whose precise weightings we are not in a position to assess at the moment. Van Marle (1988: 147) however, argues that semantic factors are primary and are in effect the root cause of productivity. Semantic coherence is a requisite for productivity. This implies that all word formation processes which are productive are semantically coherent, while those which display semantic coherence are not necessarily productive. This is supported by the existence of non-productive processes such as the denominal female personal suffix *-in* in Dutch. All existing formations in Dutch are regular, e.g. *leeuw* 'lion' and *leeuwin* 'lioness', etc., but newly coined formations are decidedly jocular in character.

## 152. Morphologische Entlehnung und Lehnübersetzung

1. Zum Gegenstandsbereich
2. Die außersprachlichen Bedingungen für Interferenz
3. Grundtypen der Interferenz
4. Gliederung der Phänomene
5. Zitierte Literatur

### 1. Zum Gegenstandsbereich

Die Veränderung natürlicher Sprachen ist nicht nur eine Angelegenheit der betreffenden Sprachen selbst, sie geht zu erheblichen Teilen auf den Kontakt mit anderen Sprachen und die dadurch ausgelösten Interferenzen zurück (einen allgemeinen Überblick geben Boretzky & Igla 1994). Im folgenden sollen einige Begriffe eingeführt werden. Leider muß man sagen, daß es keine allgemein akzeptierte Terminologie gibt und teilweise auch verschiedene Ansichten über den Cha-

rakter der im Kontakt auftretenden Prozesse bestehen, bedingt auch dadurch, daß manches nicht mehr empirisch zugänglich ist. Wir wollen uns deshalb auf das Notwendigste beschränken.

Viele Linguisten meinen mit **Interferenz (interference)** die in der *parole* zweisprachiger Individuen zustandegekommenen Abweichungen von der intendierten Sprache. Wir wollen im folgenden darunter die Gesamtheit der durch Sprachkontakt bewirkten Phänomene verstehen. Die aktuelle Übertragung von Elementen aus einer Sprache in die andere, also den Prozeß selbst, nennen wir **Transfer (transfer)**, den Übergang von transferierten Elementen und Relationen aus der *parole* in die *langue* aber **Entlehnung (borrowing)**. Im folgenden wird in der Sache fast nur von Entlehnung die Rede sein. Wie die empirische Forschung gezeigt hat, bleibt

grundsätzlich keine Ebene oder Unterebene der Sprache von fremden Einflüssen ganz verschont. Es gibt also kaum absolute universale Restriktionen für Interferenz; Versuche, solche Beschränkungen zu formulieren (vgl. Moravcsik 1978: 110–113), haben die außersprachlichen Umstände der jeweiligen Situation zu wenig berücksichtigt.

Interferenzphänomene fallen uns vor allem im Bereich der Lexik und in etwas geringerem Umfang im Bereich der Wortbildung (s. 4.1) auf, aber auch die Übertragung von Lauten (mit oder ohne Konstituierung neuer Phoneme) und von syntaktischen Regeln ist nicht ungewöhnlich. Viel seltener begegnet uns die Übertragung von Flexionsmorphologie (s. 4.2.3), weshalb auch schon früh die Behauptung ausgesprochen wurde, diese Art von Interferenz existiere so gut wie nicht (Meillet 1921: 82; auch noch Oksaar 1972: 492). Die Erfahrung zeigt jedoch, daß auch Flexionsmorpheme übertragbar sind, wie bereits Schuchardt (s. Spitzer 1928: 195) betont hat. Häufiger finden wir jedoch im engeren grammatischen Bereich, also dem Bereich der grammatischen Kategorien und ihrer Ausdrücke, andere Interferenzphänomene: Entlehnung grammatischer Partikeln oder (flektierter) Auxiliare (s. 4.2.1); **Lehnübersetzungen (loan translations, calques)** von Partikeln, Auxiliaren (s. 4.2.2) bzw. umfangreicheren peripherastischen grammatischen Konstruktionen, d. h. sinngemäße Wiedergabe, sofern die genannten Elemente eine eigenständige Bedeutung erkennen lassen. Auch Entlehnungen aus dem Bereich der kleinen Wortklassen beinhalten mehr als syntaktische Phänomene, ohne doch direkt die Morphologie zu berühren. Sie können hier jedoch nicht behandelt werden. Dies alles sind interferenzbedingte **Aufbauprozesse**. Morphologie kann aber auch unter fremdem Einfluß abgebaut werden (s. 4.2.2).

Es sei noch angemerkt, daß mit Entlehnung gebundener Morphologie am ehesten in solchen Sprachen zu rechnen ist, die selbst schon vergleichbare Morphologie haben.

Von Transfer und Entlehnung gebundener Morphologie ist zu unterscheiden die **morphologische Adaptation** lexikalischer Elemente. Im ersten Fall werden gebundene Flexions- und Wortbildungsmorpheme entlehnt und mit Erbwörtern kombiniert, im zweiten Fall werden Wörter entlehnt und in der Regel mit ererbter Flexionsmorphologie versehen bzw. mit ererbten Wortbildungsmorphemen kombiniert. Hierbei ist z. B. zu untersuchen:

bis zu welchem Grad morphologische Adaptation erfolgt; nach welchen Kriterien Nomina in Genussprachen ein Genus zugeordnet wird; in welche Flexionsklassen die Nomina eingeordnet werden; welche Form der Verben (Wurzel bzw. Stamm, Präsensstamm, Präteritalstamm usw.) als Grundlage der morphologischen Adaptation dient; ob für Lehnwörter besondere Flexionsklassen entwickelt werden (wie z. B. im europäischen Romani; vgl. Boretzky 1989), u. a. m. Auch diese Thematik kann aus Raumgründen hier leider nicht weiter verfolgt werden.

## 2. Die außersprachlichen Bedingungen für Interferenz

Interferenz zwischen zwei oder mehreren Sprachen verläuft normalerweise nicht ungesteuert, sondern in einer bestimmten Richtung, die durch das Verhältnis der am Kontakt beteiligten Gruppen diktiert wird. Die Qualität sprachlicher Strukturen ist dabei von geringer Bedeutung, entscheidend sind vielmehr außersprachliche Faktoren, die man grob mit dem Stichwort ‚Prestige‘ umreißen kann – jedenfalls, soweit Entlehnung im engeren Sinne gemeint ist. Entlehnungen können nützlich sein, indem sie im Sinne einer Sprachökonomie (s. Martinet 1955) dazu beitragen, Lücken im grammatischen System zu füllen, Strukturen zu parallelisieren u. a. m., als notwendig wird man sie jedoch kaum je bewerten können. Zwar trifft es sehr oft zu, daß Wörter aus einer Kultur entlehnt werden, die neue Begriffe zu bieten hat, die in gewissem Sinne also notwendig sind; für die anderen Ebenen, insbesondere für die Morphologie, kann man dies jedoch schwerlich behaupten.

Als Voraussetzung für die Entlehnung von Wortbildungsmorphemen und noch mehr von Flexionsmorphemen gilt, daß vorher bereits Interferenz auf anderen Ebenen stattgefunden hat, zunächst auf der lexikalischen, dann auf der syntaktischen und phonologischen (vgl. Moravcsik (1978: 110); auch von Thomason & Kaufman (1988: 20 f.) für normale Entlehnung, nicht für Substratwirkung akzeptiert). Wie mir scheint, darf man dies jedoch weniger als eine linguistisch-strukturelle Voraussetzung verstehen. Eher sind hier Faktoren wie Kulturgefälle, Intensität und Dauer des Kontakts und wohl auch die Frequenz der verschiedenen Morphemtypen entscheidend, die den Boden für weitergehende

Entlehnungen psychologisch vorbereiten. Der durch solche Faktoren begünstigte hohe Grad an Zweisprachigkeit nimmt den fremden Strukturen viel von ihrer Fremdartigkeit. Es sei eingeräumt, daß es auch rein linguistische Vorbedingungen für Entlehnung von Morphologie gibt: Wenn Wortbildungsmorpheme übernommen werden, dann ist diesem Prozeß gewöhnlich die Entlehnung von Wortmaterial, in dem solche Morpheme vorkommen, vorausgegangen. Für reine Flexionsmorphologie gilt dieser Gesichtspunkt in viel geringerem Maße, denn der Transfer von Wörtern mit ihrer Flexion ist nur selten zu beobachten, am ehesten im Stadium des **Sprachverfalls** (*language decay*; s. Sasse (1990: 45); Art. 153; vgl. auch Problem "Mischsprachen" 3.3).

### 3. Grundtypen der Interferenz

Verschiedene Arten von Interferenz haben unterschiedliche Konsequenzen für die beeinflußten Sprachen (s. Thomason & Kaufman 1988). Entlehnung als Übergang einzelner Elemente und Relationen aus einer Sprache in eine andere ist verständlicherweise überall beteiligt, wir können aber je nach Art und Ausmaß vier Typen von Interferenz unterscheiden:

#### 3.1. Entlehnung

Der bekannteste Typ ist die **Entlehnung** oder, wie wir in Ermangelung eines besseren Terminus sagen wollen, die normale Entlehnung, bei der keine der beteiligten Sprachen ihre Identität verliert. Die beeinflußte Sprache, die **Kopiesprache** (*replica language*) übernimmt Elemente verschiedener Ebenen aus der **Modellsprache** (*source language, model language*). Wenn die Interferenz größeren Umfang annimmt, kann sich der Charakter der Sprache wesentlich ändern; es können Strukturen akzeptiert werden, die den ererbten Strukturen zunächst durchaus fremd waren. Die Sprache bleibt jedoch "dieselbe", sie wird in ununterbrochener Folge im natürlichen Spracherwerbsprozeß tradiert.

#### 3.2. Sprachwechsel

Interferenz kann auch durch **Sprachwechsel** (*language shift*) zustandekommen. Eine Sprechergruppe wechselt ihre Sprache, meist innerhalb eines relativ kurzen Zeitraumes, und nimmt aus ihrer Muttersprache oder ihrer ersten Sprache verschiedene Phänomene mit in die neu angenommene Sprache (**Zielsprache**,

**target language**) hinüber. Die aufgegebene Sprache wird dabei gewöhnlich als **Substrat** (**substratum**) bezeichnet. Gibt eine Gruppe ihre Sprache auf, ohne die Chance gehabt zu haben, die Zielsprache ausreichend zu erlernen, entstehen **Kreolsprachen** (v. a. in der Kolonialzeit entstandene Sprachen mit gebrochener Entwicklungslinie und Zügen aus verschiedenen Sprachen, deren genaue Entstehung umstritten ist; s. auch Art. 153). Die Unterscheidung zwischen normaler Entlehnung und Interferenz durch Sprachwechsel ist deshalb wichtig, weil sich die Ergebnisse deutlich unterscheiden: Nur im ersten Fall sind viele Lehnwörter aus der Modellsprache zu erwarten, im zweiten Fall findet man eher Lehnübersetzungen nach dem Muster des Substrats, gerade auch für den grammatischen Bereich. Dies hat vielleicht damit zu tun, daß Lehnwörter für die sprachwechselnden Sprecher leichter als fremde Elemente zu erkennen sind als die viel weniger als solche ins Bewußtsein tretenden Lehnübersetzungen und deshalb besser eliminiert werden können.

Bezüglich der Morphologie und der grammatischen Kategorien kann man konstatieren, daß bei normaler Interferenz sowohl Morpheme als auch abstrakte Strukturen von grammatischen Kategorien übertragen werden, während beim Sprachwechsel zwar mit der Nachahmung von grammatischen Kategorien, aber kaum mit dem Transfer von morphologischem Material zu rechnen ist. Die Gründe scheinen dieselben wie bei der Vermeidung von Lehnwörtern zu sein.

#### 3.3. Mischsprachen

Ein weitreichender Fall von Interferenz, der früher in Abrede gestellt wurde, hat zu **Mischsprachen** (*mixed languages*; s. auch Bakker & Mous 1994, eds.) geführt. Im Unterschied zu normaler Entlehnung handelt es sich hier um Sprachen, die genetisch verschiedenen Wurzeln entspringen, also keine eindeutige Abstammungslinie haben. Sie gleichen darin den Kreolsprachen, zeichnen sich zusätzlich aber dadurch aus, daß einzelne Sprachebenen, ja selbst Unterebenen der Morphologie, verschiedener Herkunft sein können. Im Gegensatz dazu beziehen Kreolsprachen ihre Lexik im wesentlichen aus einer Sprache, ihre Kategorien bauen sie jedoch selbst (zum Teil unter Substrateinfluß) neu auf.

Beispiele für Mischsprachen:

- (a) In Europa gehören dazu verschiedene, von Zigeunern gesprochene Idiome wie Angloromani und Caló (in Spanien). Hier

ist die Lexik zum überwiegenden Teil erbt, fast die gesamte Grammatik, Morphologie wie Syntax, entstammt aber dem Englischen bzw. dem Spanischen. Hier ein Beispielsatz aus dem Angloromanen, der keine Abweichungen von der englischen Morphosyntax zeigt (englische Elemente fett; zu diesem Typ s. Hancock 1984; Boretzky 1985):

- (1) *once apre a chairus a*  
 einmal auf INDEF Zeit INDEF  
*Rommany chal chor-ed a*  
 Roma Kerl stehl-PRÄT INDEF  
*rani chillico.*  
 Frau Vogel  
 'Es war einmal ein Rom, der einen Truthahn stahl (vgl. engl. *once upon a time a Romany guy stole a turkey*)'

- (b) In Kanada wird das Mitchif oder Métif von Indianern und Mischlingen gesprochen. Das Nominalsystem stammt oberflächenstrukturell aus dem Französischen, das Verbsystem aber oberflächlich wie tiefenstrukturell aus dem Cree (s. Bakker 1989).
- (c) Die Media Lengua aus Ecuador kombiniert spanische Lexik mit gebundener Quechua-Morphologie und -Syntax (s. Muysken 1981).
- (d) Im Ma'a oder Mbugu aus Kenia und Tansania ist ein südkuschitischer Grundwortschatz mit einer durchweg bantuierten Grammatik vereint (s. Thomason 1983).

### 3.4. Diffusion

Die Verbreitung bestimmter grammatischer Phänomene über große geographische Regionen, in denen miteinander nicht verwandte Sprachen gesprochen werden und die auch kaum durch lexikalische Entlehnung verbunden sind, läßt die Existenz einer weiteren Art von Interferenz vermuten. Wir stellen z. B. fest, daß die meisten afrikanischen Sprachen den Komparativ semantisch einheitlich mithilfe eines Verbs 'passieren; übertreffen' ausdrücken. Hier muß es eine Art **Diffusion** (Sapir 1921: 203, 206) abstrakter grammatischer Strukturen geben, die möglicherweise ohne lexikalische Entlehnung abläuft. Vielleicht ist eine Bedingung für diese Art von Interferenz, daß es zwischen den Sprechergruppen kein nennenswertes Prestige- und Kulturgefälle gibt. Dieser Typ kann als eine Unterart von Entlehnung (s. 3.1) angesehen werden.

## 4. Gliederung der Phänomene

Zunächst werden die Phänomene behandelt, die häufiger vorkommen und weniger gravierende Einbrüche fremder Strukturen darstellen, es folgen dann die selteneren und ungewöhnlicheren. Die Entlehnung von Wortbildungssuffixen ist insgesamt häufiger anzutreffen als die von Flexionsmorphemen, offenbar weil erstere eher konkrete Bedeutungen haben und kaum in festgefügte Paradigmata eingebunden sind. Wenn ganz neue Affigierungstypen entlehnt werden, stellt dies bereits einen stärkeren Eingriff in die vorhandene Sprachstruktur dar. Beispiele für die Entlehnung von Flexionsmorphologie finden sich eher in kleinen Sprachen oder in Randdialekten von geringer sozialer Bedeutung, die uns besser bekannten westeuropäischen Sprachen sind fast frei davon.

### 4.1. Wortbildung

Die Übertragung von Wortbildungssuffixen auf muttersprachliches Material wird meist als mittelbare oder vermittelte Entlehnung rekonstruiert: Die Affixe gelangen mit Lehnwörtern in die Replika, werden dort abstrahiert und dann mit Erbwörtern kombiniert (Weinreich 1970: 31). Dies mag in der Mehrzahl der Fälle so sein; man sollte die Vorstellung jedoch nicht auf alle Fälle verallgemeinern, denn es gibt Kontaktsituationen, für die dieses Szenario eher unwahrscheinlich ist. Das Albanische hat z. B. eine große Zahl von Suffixen aus dem Slawischen entlehnt, z. B. *-ac*, *-aq*, *-ak*, *-icë*, *-ik*, *-inë*, *-ishtë* u. a. (s. Xhuvani & Çabej 1962), ohne daß sich slawische Lehnwörter in nennenswertem Umfang finden würden. Meines Erachtens reicht weitgehende **Zweisprachigkeit** oder **Bilingualismus** (**bilingualism**) aus, um solche Phänomene zu erklären. Die Entlehnung von Wörtern mit solchen Suffixen und die Übertragung von diesen Suffixen auf ererbtes Wortmaterial können parallel ablaufen, die Sprecher brauchen nicht unbedingt auf Lehnwörter zurückzugreifen, wenn ihnen die Kontaktsprache voll zugänglich ist. Wir sollten uns nicht nur den strukturellen, sondern auch den psycholinguistischen Aspekt solcher Situationen klar machen. Wenn es bereits eine große Menge von Lehnwörtern mit den entsprechenden Morphemen gibt, die wichtige Begriffe besetzen und frequent sind, dann ist die Annahme gerechtfertigt, die Morpheme seien von diesen Lehnwörtern auf ererbtes Wortmaterial übertragen worden. Wo es jedoch nur eine

Handvoll von Lehnwörtern des entsprechenden Typs gegeben hat, die u. U. eher *ad hoc* gebraucht werden, ist es unwahrscheinlich, daß sich die Sprecher an ihnen ausgerichtet haben. Bei Lehnübersetzungen oder semantischen Nachbildungen von Wortbildungs- und Flexionsmorphemen (s. 4.2.2) wäre die hier in Zweifel gezogene Position ohnehin schlecht haltbar; wir müßten ja dann mit innersprachlichen Übersetzungen rechnen.

Beispiele für Präfixe: englisch *re-* < französisch/lateinisch *re-*: *re-write*, *re-draw*, *re-ify*, evtl. über Fälle wie *re-turn* < französisch *retourner*; schwedisch *be-* < deutsch *be-*: *be-vittna* ‘bezeugen’, *be-gagna* ‘gebrauchen’, *be-teende* ‘Verhalten’, evtl. über Lehnwörter wie *be-fria*, *be-döva* ‘betäuben’ vermittelt.

Rumänische und slawische Verbpräfixe sind in verschiedene Romanidialekte eingedrungen; vgl. *do-lav* ‘nehmen’ < slawisch *do-* ‘zu-’, *za-bistrava* ‘vergessen’ < slawisch *za-*. Hierbei ist das Romaniverb nach serbisch *zaboraviti* geformt worden. Es handelt sich um eine **Verstärkung (reinforcement)**, da *bistrava* bereits ‘vergessen’ bedeutet. Weiter *des-mekljol* ‘auftauen’ < rumänisch *des-* ‘ent-’ u. ä. (eigene Erhebungen).

In diesen Fällen haben wir es eher mit Innovationen, Bereicherungen zu tun, da vor der Entlehnung keine direkten Entsprechungen vorhanden waren. Bei den neuen Präfixen im Romani ist sogar eine neue Wortbildungsklasse mit einem neuen Morphemtyp entstanden, denn Romani kannte keine Präfigierung.

Anders verhält es sich in Fällen, in denen ein neues Suffix ein altes substituiert, z. B. bei deutsch *-er* < lateinisch *-arius*, in *Bäck-er*, *Töpf-er* usw., wofür es ältere Bildungen wie mittelhochdeutsch *becke*, neuhochdeutsch *Beck* gab; oder bei dem maskulinen Deminutivsuffix *-ici* im Romani < griechisch *-ítsi*, z. B. in *bobici* (eine Bohnensorte) zu *bobo* ‘Bohne’. Hier gibt es ein ererbtes Äquivalent *-oro*, das allerdings meist nur an Erbwörter tritt (eigene Erhebungen).

Eine Besonderheit bietet der folgende Fall: das Istrorumänische, eine dem Rumänischen nahestehende Sprachform auf Istrien, hat aus dem Kroatischen eine Reihe von Verbaffixen übernommen. Dieser Vorgang geht jedoch über bloße Wortbildung hinaus und betrifft grammatische Kategorien, denn die Affixe dienen dem Aufbau eines Aspektsystems, also der Schaffung von imperfektiv-perfektiven Verbpaaren nach slawischem Muster, (zu den Details und weiterer Literatur s. Sala 1988).

Zwischen Wortbildung und Flexionsmorphologie stehen die folgenden, in der Geschichte des Romani zu beobachtenden Phänomene. Lehnwörter werden im Romani anders als die voreuropäischen Erbwörter, und zwar meist nach griechischen Mustern, flektiert; so gehen ererbte Maskulina mehrheitlich in der Grundform Nominativ Singular auf *-ó* aus, z. B. *čav-ó* ‘Junge’, entlehnte Maskulina aber mehrheitlich auf unbetontes *-os*, das aber als *-ós-* auch in den obliquen Kasus erhalten bleibt, weshalb *-os* nicht einfach als Morphem ‘NOM.SG.M’ bezeichnet werden kann, sondern auch Wortbildungsfunktion hat. Als Beispiel sei *dúb-os* < slawisch *dub* ‘Eiche’ genannt. Dieses *-os* geht auf griechisch *-os* und *-ós* zurück, die im Griechischen gleich häufig sein mögen. Aus diesem Fall ersieht man, daß die Replika hier eine aktive Auswahl getroffen hat, indem sie ein Allomorph gewählt hat, das von dem ererbten *-ó* möglichst verschieden ist. Interessanterweise finden sich unter den Gräzismen des Romani außerhalb Griechenlands so gut wie keine Wörter, die im Griechischen selbst auf *-os* oder *-ós* ausgehen. Das deutet darauf hin, daß sich die Roma bei solchen Entlehnungen am ehesten nach Frequenzverhältnissen des Griechischen und anderen Faktoren gerichtet haben.

Auch bei den Affixen gibt es neben der direkten Entlehnung von Morphemen als lautive Gebilde den Fall der Übersetzung bzw. semantischen Nachformung. So ist schwedisch *genom-* ‘durch-’ nach deutsch *durch-*, z. B. in *genom-föra* ‘durch-führen’, geprägt worden; *genom* war im Schwedischen zunächst nur Präposition. Das Sorbische hat Verbalpartikeln (Präverbien) nach deutschem Muster entwickelt (s. Schuster-Šewc 1977: 466), obwohl es als slawische Sprache über eine große Zahl von Verbpräfixen verfügt. So finden wir das Element *horje* als Entsprechung von deutsch ‘hinauf’ in *horje-nosić* ‘hinauftragen’. Wie im Deutschen kommt es aber auch in der Position am Ende des Prädikats vor:

- (2) *ja nošu te měchi horje*  
ich trage die Säcke hinauf

#### 4.2. Flexionsmorphologie und Syntax

##### 4.2.1. Entlehnung grammatischer Partikeln und Auxiliare

Solche Prozesse betreffen zunächst die Morphosyntax, teilweise aber auch die Morphologie. Auch wenn diese Elemente unmittelbar

bei dem Wort stehen, das sie determinieren, sind sie leichter isolierbar als echte Flexionsmorpheme, denn sie haben oft eine gut greifbare Bedeutung und werden wohl deshalb leichter entlehnt. Zunächst ein Fall aus dem Anglo-Irischen (Hibernian English), einer vom irischen Substrat beeinflußten Variante des Englischen. Hier ist ein Element *be* [bi] < irisch *bí* übernommen worden, das zum Ausdruck eines habituellen Präsens dient (s. (3)).

- (3) *we be often wondering where he gets the money*  
 ‘wir pflegen uns (oft) zu wundern, woher er das Geld nimmt’ (Henry 1957: 170)

Wie man sieht, steht *be* nicht unmittelbar beim Verb, hat also nicht den Status eines Flexionsmorphems angenommen.

In Romanidialekten des Kosovo ist *tuj/tyj* u. ä. < albanisch *tuel/tye* u. ä. für den Ausdruck des Progressivs übernommen worden. Anders als im Albanischen verbindet sich *tuj* mit dem finiten Verb, nicht mit einem Partizip oder sonstigem Infinitum.

- (4) *avel tuj rov-ol*  
 er.komm PART wein-3.SG  
 ‘er kommt weinend’ (Boretzky 1989: 367)

Hier ist der Marker bereits zu einem Verbpräfix und zu einem Flexionsmorphem geworden, obwohl er dies im Albanischen nicht war. Da ältere indogermanische Verbflexion normalerweise suffigierend ist, werden solche Fälle oft falsch kategorisiert.

Auch bereits bestehende Kategorien können auf diese Weise eine Ausdruckerneuerung erfahren. Nicht selten tritt dann die Partikel an die Stelle älterer suffigierter Flexion. So hat das Albanische lateinisch *magis* als *mâ/më* zur Bildung des Komparativs übernommen (Meyer 1881); vgl. *mâ (i) mirë* ‘besser’ (bzw. ‘der bessere’). Zwischen Partikel und Adjektiv können Artikelformen treten, so daß hier kein Flexionsmorphem entstanden zu sein scheint. Es ist aber auch möglich, Komparativmarker und Artikel als präfigierte Flexionskette zu interpretieren. Vor dem lateinischen Einfluß muß es synthetische Bildungen für die Komparation gegeben haben. Hier dürfte nicht nur das Komparationselement, sondern das ganze Verfahren aus einer spätlateinischen Vorlage stammen (vgl. auch rumänisch *mai* für den Komparativ).

#### 4.2.2. Entlehnung grammatischer Strukturen durch Lehnübersetzung

Möglicherweise noch häufiger als die Entlehnung von Partikeln, Auxiliaren u. a. in ihrer lautlichen Form ist die **Lehnübersetzung (loan translation, calque)**, die Nachahmung fremder Kategorien mit eigenen Mitteln. Naturgemäß läßt sich hier der Beweis für Interferenz weniger leicht führen als bei direkter Entlehnung von Morphemen, weshalb solche Fälle oft von Verfechtern eines (nur) innersprachlich bedingten Wandels in Zweifel gezogen werden. Wo aber eine innersprachliche Erklärung mit einer kaum wahrscheinlichen Häufung von Zufällen rechnen müßte, sollten wir doch Entlehnung annehmen. Kategorien, die auf diese Weise eingeführt werden, haben eher peripherastische als morphologische Struktur. Im Gefolge einer innersprachlichen Entwicklung kann der Ausdruck aber morphologisiert werden. Als Beispiel für letzteres kann z. B. der bulgarische postponierte Artikel *-āt, -ta, -to, -te* dienen, der von einem Demonstrativpronomen stammt. Das Verfahren dürfte aus balkanromanischer (und evtl. albanischer) Quelle stammen; vgl. bulgarisch *žena-ta*, rumänisch *femei-a*, albanisch *grua-ja* ‘die Frau’ (s. Sandfeld 1930: 165–173). Wir wissen nicht genau, wie und wo die Artikelformation im Bulgarischen eingesetzt hat, fest steht jedoch, daß das Altbulgarische keinen Artikel hatte. Der Artikel ist heute im Bulgarischen eine echte Flexionskategorie.

Im Neopersischen finden sich Possessiv-Suffixe (neben selbständigen Elementen) statt -pronomina wie sonst im Indogermanischen; vgl. *pidar-am, -at, -aš* usw. ‘mein, dein, sein Vater’ usw. wie türkisch *baba-m, -n, -sı* usw. (s. Doerfer 1967: 59). Die persischen Suffixe stammen von enklitischen Pronomina. Auch hier ist echte Flexion entstanden. Entlehnung ist sehr wahrscheinlich, weil das Persische noch viele andere türkische Einflüsse aufweist (s. Doerfer 1967).

Diese Art von Interferenz reicht verschieden weit, je nachdem ob sie nur das morphologische Muster betrifft oder die Übernahme einer Kategorie zusammen mit dem morphologischen Muster. Im Prinzip ist es nicht einmal ausgeschlossen, daß fremder Druck zur Entwicklung einer Kategorie führt, ohne daß im Ergebnis eine strukturelle Ähnlichkeit zwischen Modell und Replika zu erkennen ist. Der Beweis für Interferenz ist hier besonders schwer zu erbringen. Fremder Einfluß wird dann wahrscheinlicher, wenn es sich um eine in den Sprachen der Welt selten anzu-

treffende Kategorie handelt, die in zwei nicht näher verwandten Nachbarsprachen vorkommt. So muß beim bulgarischen Narrativsystem (System der indirekten, wiedergegebenen Rede) mit türkischer Herkunft gerechnet werden, obwohl die Ausdrücke nur schwache strukturelle Ähnlichkeit miteinander aufweisen (zu den Details s. Roth 1978: 55 ff.)

Bisher sind nur Fälle angeführt worden, in denen durch Interferenz neue Strukturen geschaffen wurden. Interferenz kann sich aber auch negativ auswirken und zur Beseitigung ererbter Strukturen führen. Naturgemäß ist auch hier der Interferenzbeweis nicht leicht zu führen, weil Kategorien auch im Zuge von internem Sprachwandel schwinden können. Bei einem Fall aus dem baltisch-finnischen Sprachkontakt dürfte aber Interferenz die Ursache sein: in den livonischen (tamischen) Dialekten des Lettischen, die auf livischem, also finnischem Substrat erwachsen sind, gibt es starke Tendenzen, das Femininum und damit das ganze 2-Genus-System zu beseitigen. Dies wirkt sich nicht nur dahingehend aus, daß die Kongruenz maskulin wird, sondern daß die ursprünglichen Feminina direkt maskuline Kasusformen annehmen; vgl. *saimniec laimig-s* (statt fem. *laimig-a*) ‘die Wirtin ist glücklich’; *vist-s* ‘Huhn’ (statt *vist-a*); im Dativ Plural *mät-am* statt *mät-em* ‘Mutter’ (s. Endzelin 1922: 342). Da dieser Prozeß nur in Mundarten auf finnischem Substrat zu beobachten ist, kann bloßer Zufall als Erklärung kaum herhalten.

#### 4.2.3. Entlehnung von Flexionsmorphemen

Flexionsmorpheme werden zugegebenermaßen recht selten übernommen. Sprachen unterziehen sich diesem Einfluß wohl am ehesten, wenn sie unter besonders starkem fremdsprachigen Einfluß stehen. Solche Fälle werden auch deshalb so selten entdeckt, weil man eher in den Standards und zu selten in der *parole* nach ihnen sucht (Weinreich 1970: 33). Es hat den Anschein, als ob bei dieser Art von Interferenz meist fremde an die Stelle eigener Morphologie tritt, also die Zahl der Allomorphe eines Flexionsmorphems vermehrt wird, ohne daß irgendwelche zusätzlichen Funktionen ausgedrückt oder gar neue grammatische Kategorien eingeführt würden. Strukturelle Faktoren können allenfalls da eine Rolle spielen, wo in einer Kategorie ein schwächer markiertes Allomorph durch ein stärker markiertes ersetzt wird (vgl. Weinreich 1970: 33) und dadurch im Sinne der Natürlichkeitstheorie (Prinzip des Konstruk-

tionellen Ikonismus; vgl. Mayerthaler 1981: 23) innerhalb einer Kategorienopposition die stärker markierte Kategorie auch den merkmahaltigeren Ausdruck erhält.

Recht häufig finden wir die Entlehnung fremder Pluralmorphe. Der folgende Fall ist wahrscheinlich anders, nämlich als ein Wandel in der Flexionsklasse, zu verstehen. Im Jiddischen wird der maskuline Plural *-im*, der hebräischer Herkunft ist, auf einige Nomina deutscher Herkunft übertragen; z. B. *pojer-im* ‘Bauern’, *doktojr-im* ‘Doktoren’ (s. Weinreich 1970: 31). Da es im Jiddischen aber hebräische Wörter in großer Zahl gibt und diese dahin tendieren, die hebräische Flexion zu behalten, muß man *-im* als ein zum System des Jiddischen gehöriges Allomorph betrachten und den Fall als innersprachliche Expansion eines Allomorphs interpretieren.

Auch der nächste Fall könnte eine ähnliche Geschichte haben. In einem türkisch beeinflußten Romanidialekt, der heute in Athen gesprochen wird, sind die 1. und 2. Person Plural durch türkisch *-muz* bzw. *-nuz* verstärkt worden; z. B. *gel-am* ‘wir gingen’ zu *gela-mus*, *gel-en* ‘ihr gingt’ zu *gela-nus*. Dieser Dialekt weist aber türkische Lehnverben in großer Zahl auf, die durchweg türkische Präsens- und Präteritalflexion beibehalten. Es ist daher wahrscheinlich, daß es sich hauptsächlich, wenn auch nicht ausschließlich, um einen innersprachlichen Übertragungsprozeß handelt. Die Übertragung ist wohl auch durch die Ähnlichkeit der Morpheme begünstigt worden (ausführlicher s. Igla 1996).

Die weiteren Fälle lassen sich eher nicht in der Weise deuten. Das ambigene Plural-Allo morph des Rumänischen *-uri* wird in Romanidialekten an Lehnwörter verschiedener Herkunft angefügt, und zwar in der Form *-ur(j)* oder *-ur(j)-a*, d. h. um das Plural-Allo morph *-á* des Romani erweitert; vgl. *taljanurja* ‘Italiener’. Wie das Beispiel zeigt, tritt das Allomorph anders als im Rumänischen auch an Belebte, was wieder eine innersprachliche Expansion ist. Es ist aber weniger sicher, daß *-urj(a)* an sich aus rumänischen Lehnwörtern isoliert worden ist, denn die Roma folgen im allgemeinen konsequent der Regel, Lehnwörter grammatisch voll zu adaptieren und fremde Flexionsmorpheme nur dort beizubehalten, wo sie ganze Syntagmen aus der Kontaktsprache ad hoc übernehmen. Solche Prozesse fallen unter Interferenz, sind aber nicht als Entlehnung zu werten. Es wäre wohl eine verkürzte strukturalistische Sicht, wenn man bei allen diesen Fäl-

len den Faktor Wortentlehnung allein in Betracht zöge, ohne den Faktor der geläufigen Zweisprachigkeit zu berücksichtigen. Das deutsche Plural-Allomorph *-en* ist in rätoromanische Dialekte eingeführt worden; vgl. *vacch-en* ‘Kühe’ (Sala 1988: 8). Im Albanischen tritt türkisch *-lar* in begrenztem Umfang an albanische Wörter, besonders an Familiennamen; vgl. *Belko-llarë* ‘die Belkos’ (s. Boretzky 1975: 238). Die Regeln der Modellsprache wurden also nur selektiv kopiert. Das Baskische bildet regelmäßig eine infinite Verbform auf *-tu*, für die allgemein lateinisch-romanische Herkunft (< *-tus*, *-ta*, *-tum*) angenommen wird (s. Hurch 1989: 12, mit weiterer Literatur). Der genaue Hergang des Prozesses ist leider nicht bekannt.

Im Fall des Meglenorumänischen aus Nordgriechenland, das vor allem slawische Sprachkontakte hatte, sind an die 1. und 2. Person Singular Präsens *-u*, *-i* einer Reihe von Verben die slawischen Morpheme *-m*, *-š* angefügt worden, z. B. *aflu-m* ‘ich finde’, *aflis-š* ‘du findest’ (s. Capidan 1925: 94; Weinreich 1970: 33). Da die ursprünglichen Morpheme nicht wegfallen, ist dies ein Fall von Verstärkung. Die eher seltenen slawischen Lehnverben werden in diesem Dialekt nicht in ihrer slawischen Form flektiert, weshalb die Verstärker-Elemente direkt aus dem Slawischen übernommen sein dürften.

Das Albanische hat vom Türkischen das Adverbmorphem *-çe* übernommen; vgl. *vend-çe* ‘nach heimischer Art’, *malcor-çe* ‘wie die Bergbewohner’ (s. Boretzky 1975: 268). Im Albanischen finden wir zwar *-aslazi* als Adverb-Marker, aber sie werden vornehmlich nicht mit Nomina kombiniert. Daher ist auch eine grammatische Bereicherung mit der Entlehnung verbunden.

Nordtadžikische (d. h. persische) Dialekte haben u. a. aus dem Özbekischen, einer Türkssprache, verschiedene Kasussuffixe übernommen, z. B. den Ablativ *-dan*, vgl. *yakom klasaš-dan* ‘aus der ersten Klasse’. Daneben besteht aber weiter die Möglichkeit, Präpositionalphrasen nach iranischem Muster zu bilden (s. Doerfer 1967: 54). Diese Dialekte nähern sich dem Typ der Mischsprachen (s. 3.3).

Im folgenden Fall ist die fremde Kategorie nur unvollkommen adaptiert worden; gleichwohl handelt es sich um eine funktionelle Neuerung: In 4.1 war die Entlehnung slawischer Verbalpräfixe in Romanidialekte erwähnt worden. Im Slawischen sind diese Präfixe nicht nur wortbildend, sondern liefern u. a. den Ausdruck für den perfektiven

Aspekt des Verbs. Nach diesem Muster ist in russischen Romanidialekten nun in Ansätzen ein Verbalaspekt, also eine neue Kategorie, entstanden. Es fehlt allerdings ein Imperfektivierungsverfahren (zu den Details s. Boretzky 1989: 367 f.).

Noch stärker als die Möglichkeit der Entlehnung einzelner grammatischer Morpheme ist die ganzer Paradigmata in Abrede gestellt worden. Indessen gibt es selbst für solch weitreichende Interferenz Belege.

Mednyj Aleut, eine ursprünglich aleutische, mit dem Eskimoischen verwandte Sprache, hat seine komplizierte Verbalflexion durch die des Russischen ersetzt; vgl. für das Präsens *ujuč-im*, *-iš*, *-jat* ‘sitz-PRÄS1.SG, -PRÄS2.SG, -PRÄS3.SG’, und für das Präteritum *ujuči-l* ‘sitz-PRÄT.M’ und *ujuči-la* ‘sitz-PRÄT.F’, d. h. es sind die Formantien der sog. *i*-Konjugation angetreten. In derselben Weise ist auch die Bildung des Infinitivs und des Futurs (mit *budu* + Infinitiv) auf das Aleut übertragen worden. Morphologisch haben hier russische Suffixe aleutische substituiert; man kann jedoch nicht sagen, daß die Strukturen des Aleut dabei wirklich erhalten geblieben sind (zu den Details s. Menovščikov 1969: 132 und Thomason 1986: 277 f.). Im Ergebnis hat sich hier eine Übergangsstufe zu den Mischsprachen eingestellt (s. 3.3).

## 153. Pidginization, creolization, and language death

1. Introduction
2. Reduction processes: pidginization and language death
3. Expansion processes: creolization
4. References

### 1. Introduction

In the field of pidgin and creole studies the main question is how exactly a new language can come into existence, and how the particular grammatical properties of the newly formed languages, **pidgins** and **creoles**, are related to the way in which they have emerged. A pidgin language is generally defined as a strongly reduced linguistic system that is used for incidental contacts between speakers of different languages, and that is the native language of nobody (DeCamp 1971). A creole language is a language that has emerged when a pidgin has acquired native speakers. The social circumstances that lead to the emergence of a **jargon** (a very primitive contact system) and consequently of a more stable pidgin generally involve the migration of a socially dominated group. This can be in the context of slavery or of contract labour in a colonial setting. Often trade carried out on an unequal footing is involved. A group of people is forced by the circumstances to develop a new communication system, to be used with foreigners who do not speak their own language.

Even though various languages are involved when a jargon or pidgin emerges, the vocabulary of a pidgin generally derives from one language: the language that is socially or politically dominant in the original contact situation. Because most pidgins have resulted from the European (and later more generally Western) colonial expansion, starting in the 15th century, the vocabulary of most pidgins and creoles is derived from a European language (Portuguese, English, Spanish, French, Dutch).

Most pidgins still in existence are spoken in Africa and in the Pacific Ocean. Creole languages are found predominantly in the Caribbean, in West Africa, in the Indian Ocean, and in the Far East. The most well-known of the creoles are spoken, of course, by the descendants of the black slaves who were brought to the Caribbean to work in the sugar plantations.

**Language death** is obviously the falling out of use of a language, either because its original speech community is dissolved or because the community shifts to another language. Language death may (but need not, this is a point of debate) involve gradual reduction of the resources of the language in question, lexical, morpho-syntactic, stylistic. Language death occurs in every part of the world; at present it is particularly frequent in the Americas and in Australia, where many native languages are in the process of disappearing.

When looking at pidginization, creolization, and language death from the perspective of morphology, it is necessary to consider both reduction and expansion.

### 2. Reduction processes: pidginization and language death

From the point of view of morphology, the most important question concerning pidginization and language death is: can morphological elements survive the processes of morphological reduction inherent in these developments, and if so, which ones? This question will first be discussed in relation to pidginization, and then to language death, before a more general, comparative perspective is introduced.

#### 2.1. Pidginization

Most Caribbean creoles appear to have lost the largest part of the suffixes of their lexical source languages. This is particularly true of inflection. A case in point is the Haitian Creole verb, which is invariant in form, whereas French, the lexical source language, has an extensive paradigm with tense, mood, and person inflections: invariant *reme* 'love' versus *ɛ:mə*, *ɛ:mõ*, *ɛ:me*, etc.

The Mediterranean contact language *Lingua Franca* (Schuchardt 1909) exemplifies a pidgin Romance with invariant verb forms:

- (1) *mi star contento mirar per ti*  
 I be glad see for you  
 "I am glad to see you"

Here the source language infinitive endings are generally used on the invariant verb forms. There is one exception to the invariance in verbal morphology:

- (2) *mi mira-to per ti*  
 I see-PF for you  
 "I have seen you"

Here the past participle is used to mark perfective aspect.

The loss of morphology in pidgins could result from a principle such as "Express each separately intuited element of meaning by a separate form" (Naro 1978) if speakers of the dominant languages are responsible for the reduction (in a kind of foreigner talk strategy), or from properties of early second language learning processes (in which words are acquired first in an invariant form), if the speakers of the subordinate languages are (Ferguson 1975; Andersen 1983, ed.).

Nonetheless, before attempting to explain this supposed absence of inherited morphology, one should ask whether it is real. It turns out that in the Caribbean creoles, many derivational affixes from the European lexical source languages did survive (Holm 1989; see also DeGraff 2001). An example is Papiamentu, spoken on some of the Netherlands Antilles and on Aruba, where the action nominalizer *-shon* (< Ibero-Romance *-ción*) and the agentive marker *-dō* (< Ibero-Romance *-dor*) are used productively.

Non-European-based pidgins and creoles (Heine 1978) provide further evidence against the supposed loss of morphology and show that it is risky to make generalizations on the basis of pidgin and creole derived from European colonial languages. Thus Nubi Arabic has lost the Arabic binyan system, but preserves a number of Arabic compounds, prefixes, and suffixes (Heine 1982). Similarly, in Kituba there has been loss of subject and object clitic pronouns and partial loss of tense/aspect morphology, but preservation of derivational morphology.

What explains this partial loss and partial retention? Consider first some data from Amazon Quechua (Ecuador). Later a tentative general answer in terms of morphological typology will be given. A simple example can be used to illustrate some of the properties of Amazon Quechua, a resultant of ethnolinguistic restructuring concomitant with colonization and drastic population decline in the Amazon basin. Many different small groups of Indians are forced to disband and they form new, more stable, communities in which the peasant language of the Andean highlands is adopted.

- (3) *riku-u-ni yura-ma pishku-una*  
 see-PRES-1 tree-to bird-PL  
*tiya-nau-nga-chu ni-sha*  
 be-PL-3.FUT-INT say-SR  
 'I am looking at the trees to find out if there are any birds (lit. saying: will there be any birds).'

Amazon Quechua presents many features that may be attributed to pidginization and creolization:

- (a) the loss of morphophonemic adjustment rules such as the vowel lowering rule (Adelaar 1977);
- (b) loss of nominal person marking;
- (c) reduction from 17 to 7 modal suffixes on the verb;
- (d) formation of a periphrastic future/modal;
- (e) reinterpretation of the subordinator *-pti-* as *-k-pi* 'agentive-locative', and extension to other nominalizers, yielding *-shka-pi* and *-na-pi*;
- (f) development of a periphrastic construction involving the complementizer *ni* + *sha* 'saying' (this may be due to Jivaroan substrate influence).

Nonetheless, morpheme counts (for 100 words of text) suggest that Amazon Quechua is morphologically less complex than e.g. Cuzco Quechua (Peru), but certainly has not lost all of its morphology:

	traditional narrative	syntactic field notes
Cuzco Quechua:	2.01	2.54
Amazon Quechua:	1.74	2.20

Tab. 153.1: Morpheme/word proportions in two Quechua varieties

To comprehend that the pattern of reduction is not random, consider the set of Quechua person markers in Cuzco Quechua and Amazon Quechua (see Table 153.2).

A perusal of the forms that have survived shows that: (a) the first person plural inclusive/exclusive distinction has been lost for subjects; (b) the only object forms that have survived are those that can be fit into the scheme {1.SG OBJECT} – {SUBJECT}. The syntactically irregular forms have disappeared.

The fact that so many affixes have survived at all in pidgin/creole varieties of languages such as Quechua as well as in Swa-

Tab. 153.2: Quechua person markers

hili, for instance, no doubt has to do with their agglutinative character. This leads to the issue of morphological typology (cf. Anderson 1985).

At least five dimensions need to be distinguished in a morphological typology, with respect to the survival of specific morphological patterns:

- (a) The type of concept that can be expressed by morphemes (Sapir 1921). In most of the pidgin and creole languages only derivational concepts are expressed morphologically, but it is not clear whether these are inherited morphemes.
- (b) The extent to which words are complex. Complexity by itself does not determine whether a form is maintained or lost in pidginization processes.
- (c) The extent to which there are morphophonological relations between the components of a word. Consider in this respect **allomorphy**, the type of fusion found in Semitic systems, etc. It will be clear that this dimension plays an important role. Only morphological patterns that rate low on this dimension can survive a process of reduction.
- (d) The extent to which there are non-syntactic selectional restrictions between the

components of a word. Relevant in this respect are elements sensitive to the declension class of their base, or subject to lexical specification. Again, elements low on this dimension have a better chance to survive a process of reduction, and **agglutination** can be defined as the absence of morphological selectivity.

- (e) The extent to which the meanings of complex forms are paradigmatically rather than syntagmatically defined. The case of Amazon Quechua person marking suggests that paradigmaticity could play a role: only those elements that are syntagmatically interpretable survive. The loss of Indo-European inflectional morphology in the Caribbean creoles can be interpreted in the same light: involved are highly paradigmatized morphological subsystems.

It is beyond the scope of this article to further develop the notions sketched here. What is important is the need for a much more differentiated view of the process of morphological reduction (see Kusters 2003).

## 2.2. Language death

Although highly frequent, the processes of language **attrition**, language **obsolescence**, and **language death** have been little studied. In part this is because it is a subject fraught with methodological problems. To mention but two: (a) what is the reference point for the process of loss or decay investigated; and (b) how to account for the discrepancy that many speakers show between active and passive competence in the language undergoing loss?

What follows is based on two of the best-known studies in this field: one on Scottish Gaelic (Dorian 1981) and one on the Australian aboriginal language Dyirbal (Schmidt 1985). The studies compare the speech of the older, more traditional speakers with that of the younger speakers, primarily using oral sentence translation tasks.

Although the differences between East Sutherland fishing communities and the Jambun communities in northeast Queensland, Australia, could not be larger, there are some striking similarities in the results of the two studies. Language death is not directly apparent in a decreasing fluency, but rather in morphological and syntactic changes, which could also have been the result of ordinary linguistic change, but are more numerous

and proceed at a faster rate. Both studies document a gradual decrease in use of some traditional morphological elements of the language, though not of others (Dorian 1981: 146–151; Schmidt 1985: 76–78). For both languages, case endings are highly unstable; it may well be that the alternative signalling function of word order and borrowed prepositions (both languages are giving way to varieties of English) is a factor here.

For the rest, typological differences make a detailed comparison impossible. In Gaelic verbal number is also unstable as a category, but nominal number and gender are stable. Tense and passive morphology are maintained by younger fluent speakers but decline in frequency in the speech of semi-speakers of Gaelic. In young people's Dyirbal, almost all derivational affixes survive, as well as some mood and aspect markers. Consider an example such as (Schmidt 1985: 217):

- (4) *oh she baji-baji-yarra-nyu down*  
*oh she fall-RDP-ASPECT-NFUT down*  
 “Oh! she started to fall down!”

In addition to case markers, some tense markers and other verbal inflectional affixes tend to disappear.

Both studies stress the role of **borrowing** in language attrition and death, but borrowing is not a reliable diagnostic for it. What makes a fragment of spoken Quechua, for instance, show signs of attrition is not the amount of Spanish borrowing: much more fluent speakers also use many Spanish words. Rather it is the lack of variation in the syntax and morphology: only a few suffixes are used, even if they are used frequently.

What is urgently needed is a comparative and controlled study of morphological loss and reduction in the context of language death, where the relative weight of formal linguistic factors (e.g. the dimensions referred to in 2.1), frequency, phonological saliency, functional load, etc. is studied.

### 2.3. A comparison between reduction due to pidginization and to language death

Both studies of language death briefly discussed stress the differences between language death and pidginization (Dorian 1981: 152–156; Schmidt 1985: 214–218). In addition to the numerous functional differences, the main difference mentioned is the amount of morphology retained from the source language.

As seen in 2.1, morphological simplicity *per se* is not a necessary concomitant of pidginization, when the source language is agglutinative, for instance. Indeed, one could imagine a morphologically complex pidgin-Dyirbal, given the transparent suffixal nature of its morphology. For Gaelic, the situation is quite different, however. Here the morphological distinctions are highly fusional and allomorphic, involving initial lenition and nasalization, and final consonant mutation as well. It is hard to conceive of a pidgin that would have maintained even a small portion of Gaelic morphology.

We may conclude that the evidence points to a qualitative difference between the two processes: the type of disruption in the transmission of linguistic forms is much more radical in the case of pidginization.

### 3. Expansion processes: creolization

The creole languages that emerged out of pidgins with various degrees of elaboration and complexity reconstituted the lexical richness characteristic of the native language of a speech community in various ways. Here several of the **lexical expansion** strategies used will be surveyed: compounding, phrasal compounding, affixation, reduplication, tone- or stress-shift, conversion. The survey can only be preliminary because creole morphology is a sorely neglected area of study (due to the wide-spread belief that creoles have no morphology to speak off).

Three preliminary general remarks are in order. First, the reconstituted system is neither in its organization nor in its formal aspects necessarily a replica of what is found in the European colonial lexical source language. A case in point is Papiamentu, where no less than seven different forms replaced the Ibero-Romance “reflexive” clitic *se* (Muysken 1993; Muysken & Smith 1994: 285 f.):

- (5) *paña* (< Port. *pano*, Span. *pañ* ‘cloth’)  
*mi ta bisti paña* (< Span. *vestirse*)  
 ‘I dress (myself)’
- (6) *kurpa* (< Port. *corpo*, Span. *cuerpo*  
 ‘body’)  
*lanta kurpa* (< Span. *levantarse*)  
 ‘get up’
- (7) null reflexive  
*diskulpá* (< Span. *disculparse*) ‘excuse oneself’

- (8) possessive + *kurpa*  
*skonde su kurpa* (< Span. *esconderse*)  
'hide'
- (9) object pronoun  
*sinti e tristi* (< Span. *sentirse*) 'feel sad'  
*haña e* (< Span. *hallarse*) 'find oneself'
- (10) object pronoun + *mes* (< Port. *mesmo*  
'self')  
*e ta komport'e (mes)* (< Span. *comportarse*) 'he behaves himself'
- (11) possessive pronoun + *mes*  
*hasi su mes malu* (< Span. *hacerse mal*)  
'hurt oneself'

Examples like these illustrate the morpho-lexical autonomy of the creoles with respect to their lexical source languages, even in a case such as Papiamentu, which would seem to be rather close to its lexical source languages Spanish and Portuguese.

Second, particularly in the domain of tense/mood/aspect, European verbal affixes have been replaced by separate, grammaticalized, pre-verbal particles (Holm 1989). Thus the progressive marker *ta*, as in *mi tā hóndi pingo* 'I hunt boar' in the Surinam maroon language Saramaccan derives from Eng. *stand* (Smith 1987). These particles have a fixed position, but may not be considered verbal prefixes. When subject to sandhi rules, they tend to form a unit with the preceding subject rather than with the following verb.

Third, lexical expansion also occurs in pidgins, to some extent. Consider the question words of Chinese Pidgin English:

	forms	analysis
WHO	<i>who (-man)</i>	'who (-man)'
WHAT	<i>wat ting</i>	'INT-thing'
WHEN	<i>wat-time</i>	'INT-time'
WHERE	<i>wat-side</i>	'INT-side'
WHY	<i>wat-for</i>	'INT-for'
HOW	<i>how (-fashion)</i> <i>wat-fashion</i>	'how (-fashion)' 'INT-fashion'

Tab. 153.3: The question words of Chinese Pidgin English (Bisang 1985, as analyzed in Muysken & Smith 1990)

This system is highly transparent in that there is a stable question particle derived from English *what*.

### 3.1. Compounding

The primary means of lexical expansion in almost all, if not all, creoles is compounding, which tends to be highly productive. Com-

pounding is used for all word classes. The creole language of coastal Surinam Sranan has *mofoneti* 'mouth night (midnight)' and *bobimofo* 'breast mouth (nipple)', Haitian has *bouch kabrit* 'mouth goat (Cassandra)' (Hall 1953: 41). Where Papiamentu has *bula bay* 'fly go (fly away)', a compound derived from a serial verb construction, Haitian has *magne manje* 'touch eat (just eat a little)' (Hall 1953: 42). Serial verbs are verbs that can be concatenated within a single clause.

Compounding is also used to form new function words. Some examples from Papiamentu and Chinese Pidgin English were already given in 3. Compounding is also illustrated in an example from the reflexives in Saramaccan and Sranan (cf. Muysken & Smith 1994: 276):

	Saramaccan	Sranan
myself	<i>mi-séei</i>	<i>mi-srefi</i>
yourself	<i>juli-séei</i>	<i>ju-srefi</i>
himself	<i>en-séei</i>	<i>en-srefi</i>
ourselves	<i>wilu-séei</i>	<i>wi-srefi</i>
yourselves	<i>unu-séei</i>	<i>unu-srefi</i>
themselves	<i>den-séei</i>	<i>den-srefi</i>

Tab. 153.4: Reflexives in Saramaccan and Sranan

At first sight, it would seem that these forms are direct reflexes of the English forms. Notice, however, that they are directly based on Saramaccan and Sranan pronouns, respectively. Only for the third person forms a direct inheritance could be postulated.

We find that quantifiers, different kinds of pronouns, question words, complex prepositions, etc. are all formed through compounding in many creole languages.

### 3.2. Phrasal compounding

Very common in some creole languages is **phrasal compounding**. It involves (a) cases where one of the members of the compound (in fact, the non-head) is a phrase rather than a word, and (b) cases where the structure of the compound itself reflects a syntactic rather than a morphological pattern.

An example of the first type is Saramaccan agentive compound formation, involving the noun *ma* 'man'. It is attached to verbs or verbal complexes:

- (12) *pai-ma*  
bear-man 'pregnant woman'

- hóndi-ma*  
hunt-man ‘huntsman’  
*tjá-búika-ma*  
carry-mouth-man ‘messenger’  
*pai-ku-mujée-ma*  
bear-with-woman-man ‘midwife’

Notice first of all that the meaning of *ma* is no longer exclusively masculine but rather ‘person that ...’, i.e. the form is somewhat grammaticalized (cf. 3.3). Second, the left-hand member can contain nouns (*búika* ‘mouth’), prepositional phrases (*ku mujée* ‘with woman’), and even clauses and serial constructions.

Similar perhaps are cases in Haitian where verb + object noun combinations function as nouns (Hall 1953: 41) (cf. 3.6):

- (13) *pase raj* pass rage ‘exotic dance’  
*lävi mouri* want die ‘imprudent person’  
*pote mak* bear mark ‘he who is scarred’

An example of the second type is Papiamentu, where most compounds include a linking morpheme *dili* ‘of’ (Dijkhoff 1987):

- (14) *palu di garganta* stick of neck ‘neck bone’  
*kabes di boto* head of boat ‘lift’  
*barba di yònkuman* beard of young.man ‘herb’

It can be shown that these forms, in spite of their syntactic appearance, behave as lexical islands for pluralization, adjectival modification, extraction, etc. (Dijkhoff 1987).

### 3.3. Affixation

Affixation is more limited in the morphological systems of creoles. It is not easy for a language to develop new affixes. There are two ways in which this can be done:

- (a) by borrowing; in 2.1 the case of Papiamentu nominalizers was mentioned as an example of retention from the source language;
- (b) reanalyzing part of a compound; it is possible that the righthand member of a compound is semantically bleached and phonologically weakened so that it can develop into a suffix.

A possible example may be Saramaccan *ma* mentioned in 3.2. Similar Saramaccan examples are *fási* compounds:

- (15) *tjalí fási* sorrow fashion ‘sorrowful’  
*tooká fási* change fashion ‘change in appearance’  
*bínu fási* good fashion ‘generous’

Other Saramaccan nouns which may be turning into affixes in a similar way are *se* ‘side’, *kamia* ‘place’, *libi* ‘life’, *sembe* ‘somebody’, *soni* ‘something’, and *te* ‘time’.

Another way to introduce affixation is through borrowing. Two nominal affixes in Berbice Dutch creole are borrowed from the African language Eastern Ijo: *-je* ‘NR’ and *-apu* ‘PL’ (Kouwenberg 1991; Smith et al. 1987). The form *-je* occurs in forms such as:

- (16) *di kalijé* ‘the small one’  
*en gu seteje* ‘a big fat one’  
*di eshtije* ‘the first one’

Notice that the category plural, when attached to terms for individuals (‘Hilda’ below) can have the meaning of an associative plural (see Art. 100), something common in creoles:

- (17) *matj-ap* ‘friends’  
*gugu-j-apu* ‘the big ones’  
*hild-apo* ‘Hilda and her family’

The nominalizing element *-je* in Berbice Dutch may be an enclitic noun, or a phrasal affix with nominal status. It is possible to add this element more than once, as can be seen from:

- (18) *kali-je-apu-je-apu* [kalijapjapu]  
 small-NR-PL-NR-PL  
 ‘the ones that belong to the small ones’

A more complex form of borrowing involves cases where the lexical source language and a substrate donor language have a morpheme similar in form in both languages. The adoption in the creole has been analyzed as the result of conflation (Kihm 1988) or convergence (Kouwenberg 1992). In Guinea-Bissau Portuguese Creole pairs occur such as:

- (19) (a) *firma* ‘stand’  
*firma-n-ta* ‘raise, put on its base’  
 (b) *sibi* ‘go up’  
*sibi-n-ti* ‘make go up’  
 (c) *yentra* ‘go in’  
*yentra-n-da* ‘make go in’

The causative ending could have two sources (Kihm 1988): (i) the rather unproductive Portuguese derivational suffix *-nt-* ‘causative, inchoative’ that occurs in:

- (20) (a) *ferver* ‘boil/be boiling’  
*aserve-nt-ar* ‘boil/bring to boil’
- (b) *quebrar* ‘break’ *quebra-nt-ar* ‘break something’

(ii) a causative suffix in the neighbouring West-African languages:

- (21) (a) Manjaku:  
    *-lenp* ‘work’  
    *-lenpandan* ‘make work’
- (b) Mandinka  
    *sonka* ‘quarrel’  
    *sonkandi* ‘cause to quarrel’

The process of conflation would involve a mutual reinforcement of these two.

The Berbice Dutch Creole perfective marker *-te* (Kouwenberg 1992) can be linked both to a similar Ijo form and to the Dutch past tense suffix *-ta*. Again, presumably its presence in both contributing languages favored its adoption in the Creole.

### 3.4. Reduplication

Many Europeans will immediately associate **reduplication** with pidgins and creoles, because it is part of stereotypical foreigner talk, “primitive” language use. However, the idea of reduplication as an iconic means of intensification or pluralization, still adopted by Schuchardt (1914), for instance, does not necessarily correspond to the way this device is used in most creoles. Reduplication occurs frequently with adjectives and verbs in Berbice Dutch (Kouwenberg 1991), but it has different meanings with each category. With adjectives it can be:

- (22) (a) intensifying  
*kal-kali* ‘tiny’
- (b) emphatic  
*eshti-eshti* ‘the very first’
- (c) distributive  
*do pote-pote kenap* ‘the old people (one by one)’

With verbs it is iterative, which has a different nuance of interpretation with different examples of verbal usage:

- (23) (a) iterative-habitual  
*futel-futel* ‘converse regularly’
- (b) iterative-aimlessness  
*kap-kap* ‘cut here and there’

- (c) iterative-repetitive  
*mu-mu* ‘to keep going (step by step)’
- (d) iterative-distributive  
*findi-fint* ‘to open one by one’

Reduplication is recursive, as can be seen from examples such as:

- (24) (a) *eni bu-bu-bu-bu-te wer*  
they drink-RDP-RDP-RDP-PF again  
‘they kept drinking on and on again’
- (b) *ek hafu*  
I have.to  
*bjonto-bjonto-bjonto-bjonto*  
remember-RDP-RDP-RDP  
‘I have to keep on remembering’

In this case reduplication does have its iconic intensifying meaning. It may be the case that reduplication has two sources: as an iconic device, not fully grammaticalized, and as a special type of affixation, in which an unspecified affix is added which is then spelled out as a copy of the base form.

In Saramaccan there are many kinds of reduplication (Bakker 1987). Productive, grammaticalized reduplication can have a meaning completely different from the iconic one. With verbs it is used to form resultative adjectives:

- (25) *di lai-lai goni* ‘the loaded gun’  
(*lai* ‘to load’)
- di dee-dee koosu* ‘the dried cloth’  
(*de* ‘to dry’)

Adjectives and nouns can also be reduplicated, yielding the meaning ‘X-ish’ or ‘X-like’:

- (26) *geligeli* ‘yellowish’ (*geli* ‘yellow’)  
*baafubaafu* ‘soup-like’ (*baafu* ‘soup’)

### 3.5. Stress and tone shift

Though not as common as other morphological devices, there are instances of **stress-** and **tone-shift** in creoles. One illustration is the verb *duna* ‘give’ in Papiamentu. Its citation form has penultimate stress and a low-high tone pattern. In the imperative, however, there is high-low stress with bisyllabic verbs of the *duna* class (Römer 1983). The past participle form has shift of stress to the last syllable, but maintains low-high tone.

The same shift pattern occurs with some deverbal nouns:

- (27) (a) *piska* ‘to fish’  
*piská* ‘a fish’
- (b) *pika* ‘to stab, to burn’  
*piká* ‘a stab, a burn’

### 3.6. Multifunctionality

In all creoles lexical items are multifunctional in that they can belong to several word classes at a time. Assuming there to be a base category for each item, a morphological process of **conversion** or **zero-derivation** can be postulated (cf. Art. 90).

Voorhoeve (1981) has studied this problem in some detail for Sranan. He posits rules of conversion, on the basis of regular patterns of correspondence. Thus the word *siki* can be the adjective 'ill', the noun 'illness', the transitive verb 'make (someone) ill' and the intransitive verb 'be ill'. The same pattern holds for *hebi* 'heavy', *blaka* 'black', etc. while *dede* 'dead', *bigi* 'big', and *bun* 'good' cannot have the interpretation of being a transitive verb, while sharing the other three options. *Wasi* 'wash' can only be a transitive and an intransitive verb, but not a noun.

The major problems posed by forms such as these are (a) how to establish a base form; (b) how to formulate rules that account for the regularities in what is possible and what is not?

A complex case of **multifunctionality**, where the category of the element involved is contextually determined, involves adjectives /stative verbs in Sranan. These elements function as stative verbs when used predicatively and cannot have a preceding copula (*de* in Sranan):

- (28) (a) *a liba bradi*  
‘the river is wide’
- (b) \* *a liba de bradi*

*Bradi* is a verb, and hence a copula is not allowed, presumably. Consider now a case where *bradi* is preceded by the adjectival modifier *so*:

- (29) (a) \* *a liba so bradi*
- (b) *a liba de so bradi*  
‘the river is so wide’

Here the copula suddenly is obligatory. The same holds when *bradi* is question with the particle *o* 'how':

- (30) (a) \* *o bradi a liba*
- (b) *o bradi a liba de*  
‘How wide is the river?’

When *bradi* has a pre-head specifier, it is an adjective. Similar, it must be viewed as an adjective in attributive position:

- (31) *a bradi liba*  
‘the wide river’

### 3.7. Concluding remarks

Almost the full spectrum of morphological techniques or strategies available has been called upon in the process of morphological expansion, even if compounding, reduplication, and multifunctionality play a more central role than affixation or stress-shift, for instance.

## 154. Morphological reconstruction

1. Introduction: basic questions and methods
  2. Reconstruction: The first steps
  3. Further guiding principles
  4. Going beyond simple reconstruction of forms
  5. Pushing the limits: reconstructed states as real languages
  6. Conclusion
  7. References
1. Introduction: basic questions and methods

Morphology is above all concerned with the forms (morphemes and words) of a language. These forms include roots and affixes, as the

basic building blocks of words, as well as the patterns of combination – both derivational and inflectional – by which words are built up with these elements, and the phonological adjustments that apply within words as part of the overall word-formation process. Moreover, of interest too are the categories that these forms express and mark, e.g. gender, number, person, animacy, tense, mood, etc. All of these aspects of morphology can be reconstructed for earlier stages of a language and/or proto-language, once one has appropriate data and methods to work with and some guiding principles.

The basic methods are those that serve reconstruction in other domains (especially

phonological). That is, they include primarily the **Comparative Method** and **Internal Reconstruction**, as well as whatever other means one can employ to reach a reasonable set of assumptions about the paths of development from reconstructed elements to attested outcomes (e.g., observation of attested changes and models derived from them). These methods are illustrated, and expanded upon with other useful principles, in the sections that follow.

## 2. Reconstruction: The first steps

For the most part, the **reconstruction** of the formal side of morphological units can be fairly straightforward, drawing on the successes linguists have had with the reconstruction of sounds and sound systems. That is, once a set of valid sound correspondences holding among (related) languages have been worked out, and phonological units for a proto-language for those languages have been reconstructed based on those correspondences, one can exploit those reconstructions in the reconstruction of the form of morphemes. Essentially, all one has to do is observe the sound correspondences in a comparison of actual morphemes – as opposed to simply matching up sounds that are, so to speak, disembodied – and string together the reconstructible segments to give whole reconstructed forms (a practice Anttila 1972: 351 has called doing morphological reconstruction by “applied phonology”). This is a reasonable step to take, since the correspondences themselves emerge out of a comparison of morphemes in the first place.

For example, the comparison sets *p/p/p/f*, *īlālālā*, *t/t/t/d*, etc. across Sanskrit, Greek, Latin, and Gothic, respectively, in *pitar-/pater-/pater/fadar*, and the recognition that each set is a regular, i.e. valid and well-established, sound correspondence that licenses the reconstruction of a Proto-Indo-European phonological unit, together allow one to put the reconstructed segments together sequentially to yield a Proto-Indo-European form *\*pəter-*. Similarly, putting *a/eleli* and *s/s/s/s* together across these same languages, along with *t/t/t/t* (in the environment *s\_*) and *i/i/Ø/Ø* (in the environment *\_#*), in *astil/éstilest/ist* warrants a reconstruction for Proto-Indo-European of word *\*esti* (actually, more properly *\*H<sub>1</sub>esti* in laryngealistic terms). With a less obvious but no less compelling set of cor-

respondences, the equation of Skt. *ch*, Hittite *sk*, Lat. *sc*, and Alb. *h* in verbal forms permits one to reconstruct a Proto-Indo-European morpheme *\*-sk'*, given that the sound correspondences in evidence here are impeccable (cf. Skt. *chāya-* and Alb. *hije* ‘shadow’, where Gk. *skia* gives a clear indication of *\*sk'* as the starting point for this set).

Within the individual languages, several of the forms that these reconstructions are based on fall into paradigmatic sets with other forms that are equatable across the languages, e.g. along with *asti* in Skt. there is *asmi*, along with Gk. *esti*, there is *emmi* (in the Aeolic dialect), and so on, and these together license a reconstruction *\*esmi* (actually *\*H<sub>1</sub>esmi*). To the extent that these reconstructed forms *\*esmil/\*estii* constitute members of the same paradigm – as their outcomes in the various languages do – segmentation of the forms into constituent morphemes *\*es-* and *\*-til/\*mi* is possible, and thus inferences about the order of morphemes in the reconstructed words become possible.

What has not been addressed here is the meaning to be assigned to these reconstructed forms, yet that is a crucial step in morphological reconstruction, to the extent that morphemes are seen to be pairings of both form and meaning. In the simplest case, involving lexical items with a clear meaning, as with *pitar-*, etc. above, all of which mean ‘father’, or *as-*, etc., all of which mean ‘be’, the decision is straightforward; thus a form-meaning nexus *\*pəter-* ‘father’ or *\*es-* ‘be’ can safely be assumed for Proto-Indo-European. Similar considerations also hold for non-root elements, so that the observation that the reflexes of *\*-ti* all mark third person singular and those of *\*-mi* all mark first person singular forms in their respective languages licenses one to assign those values to the proto-morphemes in question. It is also therefore safe to assume that the person markings were suffixes, since they are suffixal in all of the languages represented.

In somewhat trickier cases, the meanings of the elements in the comparison set do not match perfectly, and thus more difficult decisions need to be made. To some extent, reconstruction in such cases becomes a matter of historical semantics and semantic reconstruction, not morphological reconstruction per se, but the ramifications for reconstructed proto-morphemes should be clear. Thus, Skt. *mātar-/Gk. māter-/Lat. māter*, etc. mean ‘mother’ but reconstructing

that meaning for the Proto-Indo-European word must take the Alb. cognate *motēr*, meaning ‘sister’, into account; conceivably the original of the word was broader (e.g. ‘female in nuclear family’) or else Albanian alone innovated (perhaps through the involvement of an original *dvandva* (coordinative) compound ‘sister-and-mother’ as a merism (defined by Watkins 1995: 9 as “a two-part figure which makes reference to the totality of a single higher concept”) for female kin). At the grammatical level, semantic/functional mismatches for cognate markers can pose problems for reconstruction, especially in the absence of clear bases for understanding how category markings can themselves mutate and be altered. Thus, in the *\*-sk'*-case mentioned above, the Hittite morpheme marks iterative action, the Latin morpheme marks inchoative (beginning) action, the Sanskrit morpheme is simply one of several markers for present tense system stems, and the Albanian morpheme marks non-active voice (with passive, reflexive, reciprocal, and stative functions) but only in the present tense system. Thus there is an element of presentability in most of the reflexes of *\*-sk'*-, but one needs to ask whether the original function of this morpheme was just to mark present, or instead was more specific, with one of the attested values as the starting point in Proto-Indo-European. Any answer here runs the risk of seeming to be arbitrary, but without an answer, the reconstruction for this morpheme is incomplete; reconstructing the form alone without the meaning or function is satisfying only half of the burden.

The above cases draw on the Comparative Method, the mainstay of historical reconstruction for nearly two centuries, but other methods can be employed as well in reconstructing morphology. In particular, Internal Reconstruction can be used, where, in essence, alternations within a single synchronic stage of a language are “undone” as it were, and an earlier state without the alternation is reconstructed. Morphological reconstruction in such a case consists in the positing of a unique form for a given alternation found in a later stage, generally taking the later allomorphy to be the result of conditioned sound changes. Thus the allomorphy seen in the Modern English plural marker *-s/-z/-əz* allows for a hypothesis of an earlier marker with a single undifferentiated form, e.g. *-əz*, with the variants having arisen, as is so often the case, via sound changes, e.g. syncope and

voicing assimilation. But even this method can break down; there is no way to reconcile the plural marker *-en* (restricted in Modern English just to *oxen* and *brethren*, though *children* contains it too) with the *-sl/-z/-əz* forms, and that is as it should be, given that its distribution is lexically idiosyncratic and not rule-governed and not tied to phonological conditioning in any way. But even cases involving clear phonological conditioning of the allomorphy can be problematic for reconstruction; for instance, the Korean nominative markers are in complementary distribution: *-i* occurring after a consonant-final noun, *-ka* after a vowel-final stem, but the phonetic distance between the two forms makes a reconstruction of a single nominative marker that gave rise to both of these alternants most unlikely. The third method, or rather a principle (cf. 1), namely ensuring that there is a reasonable path of development from the earlier reconstructed stage to the attested ones, must be invoked here, so that one does not take *-i* and *-ka* back to the same proto-form, internally reconstructing by brute force, as it were. Presumably they each have an independent origin and have come, by various developments, to stand as phonologically distributed functionally equivalent alternants.

### 3. Further guiding principles

More can be said about these methods and principles. Critical to positing a reconstruction that requires only a reasonable set of changes for the development of any given element is an understanding of what the expected processes of language change are. What is thus especially important here, besides recognizing the regular nature of sound change (which gives the regular sound correspondences drawn on in doing morphological reconstruction as “applied phonology”, as above, cf. 2), is allowing for the workings of other processes of change, such as analogy. For instance, the consonantal matchings between the root nouns (where the root with nothing added constitutes the stem) seen in Gk. *pod-* and Lat. *ped-*, both meaning ‘foot’, are perfectly regular, but the vowels do not match up as expected, as Gk. *o* usually corresponds to Lat. *o* (reflecting PIE \**o*) and Lat. *e* usually corresponds to Gk. *e* (reflecting PIE \**e*). Armed with the knowledge that there are Indo-European languages in which

reflexes of \**e* and reflexes of \**o* alternate in grammatically determined environments (e.g. English present tense *sing* from \**sengʷʰh-*, versus past tense *sang* from \**songʷʰh-*), rather than reconstructing a different vowel for the *o* ~ *e* correspondence, a step which would ultimately lead one to reconstruct a different vowel for every such correspondence (and there are others, especially when languages other than Greek and Latin are included), one can instead reconstruct a process by which \**o* and \**e* alternate within the grammatical forms of ‘foot’ in the proto-language. One can then treat the Greek and Latin forms with fixed vowels as the result of analogical change within the paradigm as the individual languages took shape. The exact conditions for the \**e* /\**o* alternation may be unclear, but the method of allowing for the “undoing” of the potential effects of analogy leads one to the reconstruction of a morphological process (of vowel gradation) for the proto-language, that is, an aspect of a Proto-Indo-European word-formation process. It can be noted as well that the inferences about morpheme order derivable from the comparison of \**esti* and \**esmi* similarly reflect reconstructive assumptions made about word-formation processes of the proto-language, i.e. suffixing (at least for person/number marking).

Moreover, another useful principle can be invoked to illuminate the nature of the reconstructed \**e*/\**o* alternation. In particular, it is known that the relics of processes or earlier states that were once productive can be found embedded in compounds; for instance, English *with-* retains its original adversative meaning (‘against’) only in composite forms such as *withstand* (‘stand against’, not ‘stand alongside of’) with the synchronically regular comitative meaning of *with*). Therefore, one can look to compounds for some insights into aspects of earlier formations. The occurrence of \**e* in the genitive case of an old root noun found in the Greek composite form *des-pótēs* ‘master, owner’, from \**dems-potēs*, literally ‘dwelling:GEN-master’ as opposed to the consistent \**o* found in derivatives related to the root nouns, such as Lat. *domus* ‘house’, invites the suggestion that \**e* was proper, originally, to the oblique cases (e.g. genitive) whereas \**o* was found in the direct cases (e.g. nominative) of root nouns in the proto-language. Therefore, one can infer an original paradigm with nominative stem \**pod-* and genitive (oblique) stem \**ped-*.

A corollary of the use of relic forms for guidance in reconstructing earlier states is what can be called the **Meillet Principle** (after Antoine Meillet, based on work discussed in Arlotto 1981: 144 f.), namely to reconstruct from synchronic irregularities and isolated forms, that is any sort of unproductive material present in a language at a given time. The rationale is that synchronically unproductive material is exactly what demands a historical explanation, whereas synchronically productive forms could in principle have been created at any time by means of the productive and regular processes, and thus are not an indicator of the presence of some element in the proto-language. For example, when confronted with Skt. *bhr-ta-* and Old Irish *breth* as past passive participles of \**bher-* ‘carry’, one can mechanically reconstruct \**bhr-to-* as a Proto-Indo-European pre-form underlying them historically, even though the \*-*to-* participle formation is clearly the productive one for Proto-Indo-European and on into the offspring languages, to judge from its widespread occurrence in all of the branches of the family. Adding in Lat. *lā-tus* and Gk. *ois-tós* as the participles to the outcomes of \**bher-* in these languages (present tense *ferō/phérō*, respectively) complicates the picture somewhat, though. The Latin form seems clearly to be an import from the regular participle of a semantically related verb *tollō* ‘pick up; take on’ (*lātus* from \**tlātus*, formed regularly with \*-*to-* from a root \**telH₂-*) and thus presumably simply shows the substitution of a participle form from a different paradigm; such a substitution is understandable, as *tollō* supplied the form *tult* that functions as the perfect tense associated with *ferō*. However, which form did *lātus* replace, an outcome of \**bhr-to-* or something else again? Gk. *oistós* provides the answer, since it is synchronically isolated within Greek (the root *ois-* occurs elsewhere only in a suppletive future of *phérō*) and thus can only be explained historically, as a relic of an earlier irregular (i.e., suppletive) state. We thus reconstruct the Proto-Indo-European participle as \**oistos* and explain the Sanskrit and Irish forms as simply creations within those branches using the productive pattern.

Meillet’s Principle thus licenses the reconstruction of suppletion, that is, a proto-language morphological irregularity, and in that sense can lead to a different solution than one might reach with internal reconstruction

where irregularities are taken back to earlier regular states. Similarly, allowing for the reconstruction of suppletion means that not every paradigm that one might want to reconstruct has to be fully articulated, with all members intact (i.e., all cells filled), in keeping with the observations from attested language states that there can be defective paradigms and that paradigms can be built up piece-meal (see Watkins 1962 for discussion of how paradigms can be reconstituted).

The overriding factor here, as always, is to give the best account of the facts. In a sense, then, Meillet's Principle is akin to the **Accountability Principle**, known from sociolinguistics (cf. Labov 1982: 30; Winford 1990: 227), in that it requires that all the forms in a set of comparanda be accounted for – in this case it is not enough to account for just the Sanskrit and Old Irish forms with a Proto-Indo-European form that does not allow for a straightforward account of the Greek suppletion. That is, an explanation is possible for why *bhrta-* is to be found in Sanskrit or Celtic: at any time due to productivity of \*-to- participial formation, such a form could have come into being; the Gk. *ois-*, on the other hand, demands a different kind of account, e.g. continuing an inherited suppletive paradigm, as suggested above.

#### 4. Going beyond simple reconstruction of forms

What else can be reconstructed of the morphology in a proto-language? Clearly, once one makes assumptions about the functions of particular reconstructed items, one has also made inferences about the relevant grammatical categories for the proto-language, e.g. number, person, tense, etc., based on \*-ti and \*-mi in Proto-Indo-European. However, it is also possible to go beyond these categories, and engage in some internal reconstruction on the value of categories reconstructed for a proto-language.

For example, the suppletion that was reconstructed in the paradigm of \**bher-*, as discussed above (cf. 3), is found with other verbs in Proto-Indo-European, most often focusing on present versus past tense forms (as with Lat. *ferō/tulī*, noted above (cf. 3), or Alb. *ha* ‘eats’, from a root \*(*H<sub>1</sub>*)*ed-* vs. (*hēn*)*gra* ‘ate’, from the root \**gʷʰrō-* (with prefixes \**Ho-en-*). One way to make sense of the relatively widespread occurrence of apparent present/past

suppletion is to assume that it has to do with some inherent properties of the roots in question, derivable from their respective basic meanings. However, present versus past seems to be an unlikely distinction to be associated with the lexical meanings of particular roots (after all, how could an action be inherently associated with past time). Thus, it is more likely that the original distinction was aspectual in nature, e.g. imperfective (durative) versus perfective (completive), since that is a lexically encodable property (what is sometimes referred to as “Aktionsart”). Presumably, these aspectual distinctions were rearranged and altered somewhat on the way to the attested languages. Internal reconstruction, therefore, attempts to rationalize the irregularity of reconstructed suppletion by projecting it back to a previous state where it is not unmotivated but rather follows from some other property, in this case, aspect as determined by the semantics of a given root. This exercise thus leads to some reasonable inferences about the pre-Proto-Indo-European state of affairs regarding verbal categories.

Internal reconstruction can also be carried out on the reconstructed morphemes themselves. For instance, the relation between the reconstructed third person singular present ending \*-ti for Proto-Indo-European (as above, 2) and the comparable past ending \*-t (cf. Skt. -t# = Lat. -d#), as well as \*-mi vs. \*-m in the first person, invites the analysis that the \*-i itself marks present time, and that moreover the present ending was diachronically derived from the endings \*-t and \*-m through the addition of the \*-i. It would follow, therefore, that the original value for \*-t and \*-m was just to mark person (and number), not to mark past time reference directly; only once the opposition of \*-ti with \*-t emerged was a present/nonpresent distinction relevant.

Hypotheses such as these made by internally reconstructing from reconstructed proto-language elements are not subject to confirmation the way that internal reconstruction on an attested state is (e.g. reconstructing /-əz/ for the English plural allomorphy is verified by examining earlier English s-plurals). However, they are compelling scenarios to the extent that they are based on what is known about language in general.

In a similar vein, and as noted above, to the extent that one can be sure of various trends in language change in general, they

can be employed in reconstruction. Thus, although it is not impossible for affixes to turn into full-fledged words (see Joseph & Janda 1988, Campbell 1991, and Janda 2001 for discussion), it is nonetheless true that the opposite development, in which words develop into affixes, is by far the more common direction for changes involving words and bound morphemes. That is, examples such as Old English *hād* ‘condition/state’ giving the Modern English derivational suffix *-hood* (cf. *child/child-hood*) from original compounds (‘the state of being X’) or the English negative adverb *not* giving, at least in part via phonological reduction in an unstressed position, the inflectional affix *-n’t* (see Zwicky & Pullum 1983), are relatively common, while examples such as the Old English bound genitive case-suffix *-(e)s* giving, via a reanalysis and aligning with the pronoun *his*, the less-bound and somewhat word-like possessive marker *’s* in Modern English (less bound in that it attaches at the end of a phrase, as in *the King of England’s hat*) are significantly rarer, though definitely attested.

This observation means that in some cases, we can reasonably locate the history of a given affix in a word, and this holds whether the basic methodology being employed is the Comparative Method or Internal Reconstruction. For instance, an internal comparison of the English adjectival and adverbial suffix *-ly* with the similarly used and phonologically similar free word *like*, as in *quickly/quick-like, friendly/friend-like*, might suggest an historical derivation of the suffix from a reduction of the free word, perhaps under conditions of low accentual prominence, and a cross-linguistic comparison of the French adverbial suffix *-ment* with the more word-like element in Spanish, *-mente* (word-like in that a single instance is distributable across two conjoined adverbs, e.g. *clara y rápidamente* ‘clearly and rapidly’), permits the reasonable inference that the suffix derives from a once less-bound element. In the case of *-ly/like*, earlier English evidence confirms the reconstruction (cf. the use of *-lic* in Old English), as does Latin evidence in the case of *-ment/mente* (regarding the use of the ablative *mente* of the noun ‘mind’ in adverbial phrases, e.g. *obstinatā mente* ‘with an obstinate mind’, i.e. ‘obstinately’). Still, such hypotheses are not iron-clad, and synchronic resemblances can be misleading – the *-less* of *friendless*, for instance, has nothing to do

with the independent word *less* (from Old English *lēs(sa)*) deriving instead from the Old English preposition *lēas* ‘without’.

### 5. Pushing the limits: reconstructed states as real languages

Some of the successes of morphological reconstruction discussed in the previous sections involve simply applying analytic techniques that are well-known in linguistics, and in some instances, applying them to a reconstructed proto-language, essentially treating it as just another language, a synchronic state that can be analyzed and, among other things, subjected to internal reconstruction. As a final example of morphological reconstruction, an example is presented of how one can reconstruct morphophonemic rules for a proto-language, based on the Proto-Indo-European paradigm for the present of the verb ‘be’. This example serves as a suitable conclusion, as it draws on comparative methodology, internal reconstruction, and Meillet’s Principle, as well as general principles of morphological analysis.

Besides the first and third person forms *\*esmi* and *\*esti*, it is possible to reconstruct a second person form as well in the singular. The comparison can be made of Skt. *asi* ‘you are’ with Gk. *ei* ‘you are’, both of which are irregular within their respective languages (e.g., the non-occurring *\*\*assi* might be expected in Sanskrit, all things being equal). The “applied phonology” methodology (cf. 2) leads to a reconstruction for Proto-Indo-European of *\*esi*, and the shared irregular status of the Sanskrit and Greek forms ensure that this form is to be posited for the proto-language; that is, the paradigm was not a defective one in Proto-Indo-European lacking a second person singular form. Moreover, this form itself is an irregularity within the Proto-Indo-European verbal system, since *\*\*essi* would be expected, based on the secure reconstruction of a root *\*es-* (cf. 2)) plus the second person singular ending *\*-si* (seen, for instance, in Skt. *bhara-si* ‘you carry’, Gothic *bairi-s*, etc.). Given the difference between the form expected on morphological grounds, *\*essi*, and the reconstructed form based on the comparative evidence, *\*esi*, it is reasonable to reconcile the two forms by treating *\*essi* as the (morphologically motivated) underlying form for Proto-Indo-European and *\*esi* as the surface form,

also for Proto-Indo-European; this step means that a morphophonemic rule converting an underlying /-ss-/ into a surface [-s-] must be posited for the proto-language. Moreover, it licenses the inference that the underlying form was the actual pre-Proto-Indo-European form, and that a (sibilant) degemination sound change operated between pre-Proto-Indo-European and Proto-Indo-European to give the surface form \**esi*, and create the reconstructed irregular singular paradigm with \**esmilesilesti*.

## 6. Conclusion

In a sense, then, morphological reconstruction is not significantly different in its goals, methods, and guiding principles from phonological reconstruction. It is thus not surprising that the topic (often under the rubric of “grammatical reconstruction”) is not discussed at great length in any standard textbooks, except insofar as internal reconstruction leads to results that have consequences of a morphological (most usually morphophonological) nature; still, interested readers should consult Anttila (1972; 1989), Fox (1995), Hock (2<sup>1991</sup>), and Trask (1996) for additional general discussion and examples.

## XVIII. Morphologischer Wandel II: Fallstudien

### Morphological change II: Case studies

#### 155. From Old English to Modern English

1. Introductory remarks
2. Inflection
3. Word-formation
4. References

##### 1. Introductory remarks

###### 1.1. Language periods

The linguistic history of English may be divided into the following periods: Old English from the 7th century to about 1100, Middle English from ca. 1100 to ca. 1500, Early Modern English from ca. 1500 to ca. 1700, Late Modern English covering the 18th and 19th centuries, Modern English leading to Present-Day English.

###### 1.2. Dialects

Four Old English dialects can be distinguished: West Saxon, Kentish, Mercian, Northumbrian. The last two are called Anglian. In the Middle English period, they roughly correspond to Southern (or Southwestern), Kentish (or Southeastern), Midland and Northern respectively. Northern is also referred to as Northumbrian, the others as Southumbrian. The Midland area may be further subdivided into West and East, the East itself into North and South. Additional subdivisions, like Northwest Midland, are applied when necessary.

The variety of English spoken in Lothian and Lowland Scotland developed from Northumbrian, being originally called *Inglis*, renamed *Scottis* in the 15th century.

The dialect which came to be accepted as standard in Early Modern English was that of the London area, where political, military and economic factors contributed to its acquisition of this status. But most important was William Caxton's publication in 1477 of the first book to be printed in England. He

based his spelling on that of manuscripts which had previously appeared there, particularly official documents, thus helping to spread the use of this dialect into other areas of England.

##### 2. Inflection

###### 2.1. From inflection to non-inflection

Old English is highly inflected, whereas Middle English shows the transition to a nearly non-inflected language, which was gradually reached in Early Modern English, Middle English being the time-span when the language changed from a (relatively) synthetic to a (relatively) analytic one. This will be illustrated by outlining the history of the inflectional systems of the noun and the verb. For adjectives and pronouns cf. Faß (1989: 128–214; 1992: 21–38).

###### 2.2. Nouns

###### 2.2.1. Gender, Number, Case, Declension

Like the German **noun**, the Old English one has three grammatical genders, i.e. masculine, feminine, neuter. The grammatical gender disappeared in the 14th century. Again, like in German, Old English nouns have the number-distinction singular – plural and four cases: nominative, genitive, dative, accusative. The instrumental, which differed occasionally from the dative in the earliest texts only, may be disregarded.

Both languages, German and Old English, share two main **declensions**, strong (or vocalic) and weak (or consonantal), according to whether the stem originally ended in a vowel or *-n* respectively. Stems originally ending in other consonants than *-n* are usually subsumed under minor declensions (cf. Wright & Wright 1908: 160).

Map 155.1: Old English Dialects

### 2.2.2. Strong declensions

An example of the strong masculine declension is OE. *eorl* 'nobleman', one of the strong feminine declension OE. *ār* 'honour' (see Table 155.1).

The strong neuter declension is different from the strong masculine one in that it has *-ul-o* in the nominative/accusative plural, if the noun has a short stem-syllable like *hof* 'dwelling', *scip* 'ship', but *-Ø*, if it is long as in *bān* 'bone', *hors* 'horse', *nett* 'net' (cf. Faiß 1992: 16f.).

### 2.2.3. Weak declensions

An example of the weak masculine declension is OE. *lida* 'sailor' (see Table 155.2).

	masculine		feminine	
	sing.	plural	sing.	plural
nom.	<i>eorl</i>	<i>eorlas</i>	<i>ār</i>	<i>āre, -a</i>
gen.	<i>eorles</i>	<i>eorla</i>	<i>āre</i>	<i>āra, -(e)na</i>
dat.	<i>eorle</i>	<i>eorlum</i>	<i>āre</i>	<i>ārum</i>
acc.	<i>eorl</i>	<i>eorlas</i>	<i>āre</i>	<i>āre, -a</i>

Tab. 155.1: Strong masculine and feminine declensions

Weak feminine and neuter nouns like *tunge* 'tongue' or *ēage* 'eye' are inflected the same way.

Map 155.2: Middle English Dialects

	singular	plural
nom.	<i>lida</i>	<i>lidan</i>
gen.	<i>lidan</i>	<i>lidena</i>
dat.	<i>lidan</i>	<i>lidum</i>
acc.	<i>lidan</i>	<i>lidan</i>

	singular	plural
nom.	<i>fōt</i>	<i>fēt</i>
gen.	<i>fōtes</i>	<i>fōta</i>
dat.	<i>fēt</i>	<i>fōtum</i>
acc.	<i>fōt</i>	<i>fēt</i>

Tab. 155.3: Minor declensions

#### 2.2.4. Minor declensions

An example of one of the minor declensions is OE. masculine *fōt* ‘foot’ (see Table 155.3).

The morphonemic alternation /fō:t/~/fe:t/ is due to *i*- (or palatal) **mutation**, cf. the original Germanic forms of the dative singular,

\**fōti*, and of the nominative plural, \**fōtiz*, whence the *i*-mutated vowel spread into the accusative plural, whose original form was \**fōtunz* (cf. Brunner 1965: 226; Wright & Wright 1908: 192).

### 2.2.5. Plural and genitive

The Old English inflectional system of the noun was significantly reduced on its way to Present-Day English (cf. Faiß 1989: 109–127). The only markers to have been retained for inflection are in fact *-(e)s* for plural and genitive as well as *-(e)n* and vowel change (or /replacive/) for plural as, e.g., in *oxen* and *feet* (cf. Faiß 1992: 15f.). The other markers had been dropped by the 14th century. Since then the noun has had a two-case system with a common (or unmarked) case and a genitive (or possessive or marked) case together with the important number-distinction singular – plural.

Among the inflectional suffixes retained, *-(e)s* has become productive. As a plural indicator it goes back to *-as* of the Old English strong masculine declension. *-as* yielded ME. *-es*, which was common by the end of the 14th century. It was gradually replaced by *-s* from about 1500 onwards except after sibilants. The modern distribution of the phonemically conditioned allomorphs of {PLURAL}, /ɪz, z, s/, established itself during the 17th century. Genitival *-(e)s* stems from the genitive singular of the Old English strong masculine and neuter declensions and became generalized in the 14th century. The ousting of the Middle English successors to the Old English genitive plural markers came to an end in the 14th century too, so that, apart from a few exceptions, *-(e)s* expressed both singular and plural genitive. The tendency towards generalisation proved stronger than the resistance of individual nouns. As to the spelling, <’s> was not fixed until the 1690s. Obviously, <’s> is not attested before the 2nd half of the 18th century. The pronunciation and the allomorphic distribution of the *s*-genitive are identical to the *s*-plural. (For the history of mixed plurals like *loaf-loaves*, *house-houses*, *mouth-mouths*, which show voicing of the final consonant of the singular, and for plurals of nouns from Greek and Latin such as *alumnus*, *alga*, *velum*, *crisis*, *oxymoron* and many others cf. Faiß 1992.)

### 2.2.6. *of*-Genitive, *to*-Dative

Clear signs of the language’s adoption of an **analytic** character are the *of*-genitive and the *to*-dative. They originated in Old English from constructions consisting of the prepositions *of* and *tō* plus noun phrase, which were preferably used to denote origin and direction/goal respectively. Yet it was not before

the Middle English period that they took over the syntactic-semantic functions of the inflected (or synthetic) genitive and dative. The question remains whether French constructions with the prepositions *de* and *à*, which had replaced the Latin synthetic genitive and dative, encouraged the expansion of the corresponding English ones.

### 2.3. Verbs

Old English **verbal inflection** may be compared to that of German, Greek, Latin, Italian, Spanish, to a lesser extent to that of French, with respect to the number of inflectional signs denoting person, number, tense and mood. The verb in Present-Day Standard English, on the contrary, has but one such sign at its disposal, i.e. *-(e)s* for 3rd person singular present indicative as in *he pull-s /he push-es*.

Old English strong verbs comprise eight classes. The two last ones are generally put together in one with a subdivision into a) and b) or 1. and 2. Old English weak verbs are generally grouped in three classes.

#### 2.3.1. Old English strong verbs

A characteristic feature of the Old English strong verbs is **ablaut**, representing some kind of internal inflection which has been retained in the corresponding modern stem-forms. They were reduced from four to three in the course of time, with but one exception: the verb *be* has still four, namely *be-was-were-been*. The Old English forms which are usually adduced are: infinitive – 1st/3rd person singular preterite indicative – plural preterite indicative – past participle (cf. Tab. 155.4)

#### 2.3.2. Preterite and past participle

The nowadays common distribution of the phonemically conditioned allomorphs of {PRETERITE} and {PAST PARTICIPLE}, /ɪd, d, t/, gradually established itself in Early Modern English. The usual Middle English ending was *-ed*. It is the merger of OE. *-ed(-)*, which indicates **preterite** and **past participle** of certain members of the 1st weak class, and of West Saxon *-od(-)*, non-West Saxon *-ad(-)*, as typical indicators of the 2nd weak class.

The Old English strong verbs were marked by *-en* for past participle and also by *-anl-onl-un* in the non-West Saxon dialects. These suffixes merged into ME. *-en*. *-n* denoted the past participles of *bēon* ‘be’, *dōn* ‘do’, *gān* ‘go’. Middle English is characterized by a

	PrE.	infinitive	preterite		past participle
			singular	plural	
1st class		<i>rīdan</i>	<i>rād</i>	<i>ridon</i>	<i>ridden</i>
2nd class	PrE.	<i>ride</i>	<i>rode</i>	<i>sc(e)uton</i>	<i>ridden</i>

		<i>cnāwan</i>	<i>cnēow</i>	<i>cnēowon</i>	<i>cnāwen</i>
	PrE.	<i>know</i>		<i>knew</i>	<i>known</i>

Tab. 155.4: Strong verbs

high degree of variation between past participles with and without *-n*, cf. *iwurden*, *ihalde*, *ofslage*, *idon*. Variation between *-(e)n* and *-Ø* still existed in Early Modern English. From the 17th century onwards, the present distribution has been established, but not obligatorily, as is proved by modern variants like *beaten/beat*, *bidden/bid* and others.

The prefix *i-* is descended from OE. *ge-*, cf. Germ. *ge-*, which was optionally attached to past participles. Also written <y> in Middle English, it disappeared towards the end of that period, lingering on, however, as an archaism in the following periods, above all in poetry.

### 2.3.3. Present participle

The common marker for **present participle** in Old English was *-ende*, varying with *-ande* in Northumbrian, which mainly occurred with verbs of the 2nd weak class. *-ende* continued to exist in Middle English, especially in the Southeast Midland. *-ande* appeared as *-and* in Northumbrian and Scottish after the loss of unstressed final *-e* in Northern Early Middle English. A third form arose in the 12th century, *-inde*, showing [ɪ] through the raising

of unstressed [e] before [nd]. This suffix was widely used, yet most frequently in the West Midland and the South. PrE. *-ing*, though, does not go back to any one of them. In Old English the predecessor of this suffix, *-ing*, served as a means of deriving mostly feminine abstract nouns from verbs belonging to the 1st weak class such as *nering* ‘protection, defence’ from *nerian* ‘save’. The first instances of present participles with *-ing* can be detected about 1200 in some southern regions. It was rapidly spreading becoming generalized in the whole Southumbrian area at the end of the 14th century, with some sporadic *-inde* relics surviving in 15th century texts. It was in this century that *-ing* entered into Northumbrian and Scottish, there competing with *-and*, which was eventually ousted except for some dialectal traces in Southern Scots.

### 2.3.4. Infinitive

Old English {INFINITIVE} has the allomorphs /an/, ian, n/. /an/ occurs with weak verbs of the 1st and 3rd classes and with strong verbs, cf. *dēman* ‘deem’, *libban* ‘live’, *rīdan* ‘ride’, /ian/ with weak verbs of the 1st class having stem-final *-r* and with those of the 2nd class,

cf. *nerian* ‘save’, *endian* ‘end’, /n/ with contracted verbs such as *tēon* ‘draw’ (strong), *bēon* ‘press’ (weak) and with *bēon* ‘be’, *dōn* ‘do’, *gān* ‘go’. /an/ and /ian/ generally merged into /ən/ <en> in the 12th century, while /n/ remained as such.

There was a great deal of variation between *n-* and *n-less* infinitives in Early Middle English. Owing to the loss of final *-n* already in Late Old Northumbrian, followed by that of final *-e* in the 13th century in its dialectal successors, the inflectionally unmarked infinitive was the rule in 14th century Northumbrian and Scottish, cf. *accord*, *disclar*, *suceid*. In Southumbrian the infinitive grew unmarked in the 15th century, cf. *do*, *reduce*, *translate*.

### 2.3.5. Person, number, tense, mood

Old English verbs are inflected for **person**, **number**, **tense**, and **mood**, often showing a combination of internal and external inflection, as do German verbs. In keeping with Verner’s Law stem-final consonants can alternate, and so can the stem-vowels in the 2nd and 3rd persons singular present indicative on account of *-i-* in the original inflection of these forms. An example of this kind of verbs is *cēasan* ‘choose’ (cf. Tab. 155.5; imperative singular *cēos*, plural *cēosab*).

Some peculiarities need explaining: *-t* in *cīest* and *-þ* in *cīesp* came into existence through vowel deletion in *-est* and *-eþ* respectively, cf. *dēm(e)st*, *dēm(e)þ* (1st weak class). *-est*, Northumbrian *-es*, is also present in the 2nd person singular preterite indicative of weak verbs as in *pū dēmdest*. The verbs of the 2nd weak class have *-ie* in the 1st, *-ast* in the 2nd, *-aþ* in the 3rd person singular and *-iaþ* in the plural present indicative, cf. *lōcie*, *lōcast*, *lōcap*, *lōciap* of *lōcian* ‘look’.

During the Middle English period, the rather sophisticated inflectional system, which, by the way, was still more complex on account of marked dialectal variation, became radically simplified (cf. Faib 1989: 215–297). The only overt person-denoting inflectional signs typical of Early Modern English were in fact *-(e)st* and *-(e)þl-(e)s* for the 2nd person singular present and preterite and 3rd person singular present indicative respectively. In the standard language *-(e)st* dropped out in the 18th century, when *thou* became replaced with *you*. *-(e)th* yielded to *-(e)s* around the middle of the 17th century, being distributionally equal to plural and genitive *-s*. With the exception of the *were*-subjunctive in the 1st and 3rd persons singular, *-Ø* in the 3rd person singular and *be* for all persons in the present subjunctive, this mood is no longer recognizable formally, cf. if *I/he were, he goes* vs. *he go, I ... be*.

The history of *-s* for 3<sup>rd</sup> person singular present indicative has been long debated. Yet the following may be rather safely concluded. The starting-point is the Late Northumbrian dialect (2nd half 10th century). Here the 2nd person present indicative is mainly marked by *-s*, which is a general characteristic of early texts but became superseded by *-st* in other dialects. *-s* first spread into the plural present indicative gradually replacing *-þ*, before it appeared in the 3rd person singular present indicative (cf. Berndt 1956: 184–196, 202–213). The linguistic fact itself is best explained by a vivid tendency towards the generalization of one single inflectional sign, which is not only obvious in this case, but is also illustrated by, e.g., the *s*-plural and the *s*-genitive. In Middle English, *-s* dominated in Northumbrian and Scottish, whence it made its way slowly via the Midlands to the

	present		preterite	
	singular	plural	singular	plural
<b>indicative</b>				
1st person	čc cēose	wě cēosab	čc cēas	wě curon
2nd person	pū cīest	gě cēosab	pū cure	gě curon
3rd person	hē cīesp	hīe cēosab	hē cēas	hīe curon
<b>subjunctive</b>

Tab. 155.5: Inflection

South. There, however, it had to fight it out against *-th*, even in London, where the latter persisted to the middle of the 17th century. After being ousted from the standard language by *-s*, *-th* has survived in literary style and dialectally, as has *-st* for the 2nd person singular. In contrast to *-st* or *-s* as the successor to Northern *-s* of the 2nd person singular present indicative as well as to Early Modern English reduced *-st*, *-th* is practically restricted to Eastern Cornwall and Southern Devonshire.

#### 2.4. Conclusion

Unlike that of German and to a lesser extent those of the Romance languages the inflectional history of English is characterized by a clear-cut tendency towards generalization. This necessarily means a radical minimizing of inflectional signs of the parts of speech discussed. Thus *-s* for plural, genitive and 3<sup>rd</sup> person singular present indicative, *-ing* for present participle/gerund, *-ed* for preterite and past participle have become generalized. As a consequence new devices had to be invented to express syntactic relations. This was, on the one hand, the fixing of word-order and on the other the use of prepositions, as is proved by the *of*-genitive and the *to*-dative.

The developments described set in mostly in Middle English. Some of them can first be detected in the northern dialects making their way more or less rapidly to the South and into the standard language.

### 3. Word-formation

The instances below have been mainly selected from BT (1976), BTS (1973) (Old English), MED (1954 ff.) (Middle English), Marchand (1969), OED (1989), more recent ones from Ayto (1989), Barnhart et al. (1990) as well as from newspapers and the like (cf. also Faiß 1992: 54–111).

#### 3.1. Old English

Old English basically shares the word-formation types of the Germanic languages: affixation (prefixation and suffixation), compounding and zero-derivation (cf. Krahe & Meid 1967; Art. 37, 87, 89, 90).

##### 3.1.1. Affixation

Some Old English **prefixes** can still be observed in Present-Day English.

*for-* ‘forward, away’ (often intensifying) as in *forbærnan* ‘burn (away)’, *forheard*

‘very hard’, though no longer productive, has been retained, as in *forbid*, *forget*.

*un-*<sub>1</sub> with negative meaning as in *unfæger* ‘not fair, ugly’, *unfrif* ‘unpeace, war’ is highly frequent in Old English (cf. Marchand 1969: 201), yet only few coinages have survived, like *unclean*, *unripe*.

*un-*<sub>2</sub> with reversative and privative meaning as in *unfealdan* ‘unfold’ and *ungeocian* ‘unyoke’ respectively formed a lot of verbs in Old English, of which but a few still exist such as *undo*, *untie*.

Old English **suffixes** have been preserved to a greater extent.

*-ed* ‘provided with, having’ as in *hilted* ‘hilted’, *hringed* ‘ringed’ has gained nearly unlimited productivity with bases consisting of, e.g., adjective + noun: *beautiful-gowned*, *high-heeled*, and noun + noun: *diesel-engined*, *eagle-eared* (cf. Faiß 1987: 124–129). Many were coined in Early Modern English. Shakespeare has, among others, *light-winged*, *nimble-footed* and *honey-tongued*, *iron-witted* (cf. Scheler 1982: 118).

*-er* ‘one having to do with’ used to form agent nouns (cf. Kastovsky 1971) such as *bæcere* ‘baker’ from *bacan* ‘bake’ (de-verbal) and *bōcere* ‘scribe’ from *bōc* ‘book’ (denominal). Predominantly from the 16th century onwards, *-er* has come to derive instrument nouns like *blotter*, *nutcracker*, *sailer*. The suffix is extraordinarily productive in Present-Day English owing to its capability of being appended to practically any base (cf. Faiß 1987: 118–121).

*-isc*, PrE. *-ish*, ‘belonging to’ originally derived ethnic adjectives with *i*-mutated stem-vowels, such as *frenscisc* ‘French’, *englisc* ‘English’, *scytisc* ‘Scottish’. The meaning of the suffix changed to ‘nature of, condition’ as in OE. *ceorlisc* ‘churlish’, *cildisc* ‘childish’. In Middle English, it developed a disparaging tinge as in *foolish* (before 1300), *swinish* (ca. 1200). Nowadays *-ish* is widely used in colloquial and journalistic language (cf. Faiß 1987: 124).

*-nes*, PrE. *-ness*, ‘state, condition’ mainly derived adjectives and participial adjec-

tives as *æbelnes* ‘nobility’ from *æbele* ‘noble’, *cýþnes* ‘testament’ from *cýþed*, past participle of *cýþan* ‘make known’. In Present-Day English, the suffix may be appended to almost any base except verbs, thus to adjectival composites as in *selfconceitedness*, *square-tonguedness*, adjectival compounds as in *airsickness*, *homesickness*, and adjectival phrases as in *get-at-ability*, *little-boyishness* (cf. Faiß 1987: 123).

### 3.1.2. Compounding

**Compounding** is a productive process not only in Old English but in all Germanic languages. Old English compounds are predominantly nouns. The majority of them follow the patterns noun + noun: *níht-waco* ‘night-watch’, *scip-ráp* ‘ship-rope’; adjective + noun: *eald-fáder* ‘grandfather, ancestor’, *héah-clif* ‘high cliff’; verb(-stem) + noun: *ete-lond* ‘pasture land’, *hwet-stán* ‘whet-stone’; verbal noun in -ungl-ing + noun: *langung-hwíl* ‘time of longing, weariness’, *stemping-ísern* ‘stamping-iron’.

Old English has its share of compound adjectives as well. Productive patterns are: noun + adjective: *ælmes-georn* ‘alms-eager, generous’, *mere-wérig* ‘sea-weary’; adjective/adverb + adjective: *wíd-cúb* ‘widely known’, *wís-hygende* ‘wise-thinking’.

Additive copula compounds are rare in Germanic in general, being still rarer in Old English. The numerals *thirteen* to *nineteen*, e.g., belong here: *þréotýne*, *féowertýne*, *fiftýne*, *siextýne*, *siofontýne*, *eahtatýne*, *nigon-týne*. Productivity has considerably increased in recent years: *poet-critic-humanist*, *saxo-phonist-composer-bandleader*, *soldier-statesman-author-orator*.

The development of *þréotýne* to *thirteen* and *fiftýne* to *fifteen* leads to the problem of obscured compounds (cf. Faiß 1978), meaning that original compounds can no longer be analyzed as such from the point of view of modern English.

### 3.1.3. Zero-derivation

Derivation by means of a **zero-morpheme** is a productive process in Old English. It occurs most often with verbs yielding nouns (cf. Kastovsky 1968) and with nouns yielding weak verbs of classes 1 and 2. Examples of deverbal nouns are: from strong verbs: *drinc* ‘drink, draught’ from *drincan* ‘drink’, *stand* ‘stand, pause, delay’ from *standan* ‘stand’; from weak verbs: *hete* ‘hatred’ from *hatian*

‘hate’, *ræd* ‘council, advice’ from *rædan* ‘advise’. Denominal verbs are: class 1 (with *i*-mutation): *blēdan* ‘bleed’ from *blōd* ‘blood’, *dēman* ‘deem’ from *dōm* ‘doom’, *fēdan* ‘feed’ from *fōda* ‘food’; class 2: *beddian* ‘prepare/make a bed’ from *bed(d)* ‘bed’, *cealfian* ‘calve’ from *cealf* ‘calf’, *horsian* ‘provide with (a) horse(s)’ from *hors* ‘horse’.

Verbs from adjectives are: class 1 (with *i*-mutation): *fýlan* ‘befoul’ from *fūl* ‘foul’, *syl-lan* ‘fill’ from *full* ‘full’; class 2: *deorciān* ‘grow dark’ from *deore* ‘dark’, *ealdian* ‘grow old’ from *eald* ‘old’. Class 2 verbs from particles are: *forbiān* ‘send forth’ from *forb* ‘forth’, *in-nian* ‘get within’ from *in* ‘in, within’; from verbs: *fandian* ‘examine’ from singular preterite *fand* of *findan* ‘find’, *lifian* ‘live’ from preterite stem *lif-* of *libban* ‘live’.

The productivity of zero-derivation has been on the constant increase throughout the history of English. This was favoured by the fact that, with no grammatical suffixes to denote infinitive since around 1500 at the latest, words easily shifted from one lexical category to the other.

Mention has to be made of exocentric or pseudo-compounds, i.e. zero-derived composites (cf. Marchand 1969: 386–389). Most Old English formations of this type are adjectival **bahuvihi** compounds with the patterns adjective + noun, numeral + noun and noun + noun like *bær-fót* ‘barefoot(ed)’, *ān-ēage* ‘one-eyed’; *wulf-heart* ‘wolf-hearted’. Already in Old English -ed coinages were strong competitors. They succeeded in replacing those patterns in Early Middle English, generally speaking, with the exception of *barefoot*. Concerning nominal bahuvihis, Old English has some loan-translations of Latin animal and plant names: *ān-horn* for *unicornis*, *fíflēaf* for *quinquefolium*, genitival *hundes tunga* for *cynoglossum*, to which may be added *dæges-ēge* ‘daisy’, *oxan-slyppe* ‘oxlip’ (plants) and coinages such as *lady’s bedstraw*, *lady’s finger* (plants), *bull’s-eye*, *cat’s-eye* (objects), which are paralleled by genuine compounds like *doomsday* and *driver’s seat* (cf. Marchand 1969: 65–69). They are equally attested in Old English: *Tíwes-dæg* ‘Tuesday’ and *Wōdnes-dæg* ‘Wednesday’ are but two instances.

## 3.2. Middle English

### 3.2.1. Affixation

Many **prefixes** which are still productive like *de-*, *dis-*, *in-*, *non-* came over from French during the Middle English period. Among

them *non-* ‘not’, which represents Lat. *nōn*, Anglo-Norm. *noun-*, Central Fr. *non-*, has developed a combinatory flexibility which is unequalled by other prefixes. Although having achieved its full productivity after the middle of the 17th century, it can be regarded as fairly productive in the 15th and 16th centuries. The first instances are direct borrowings from French: *noumper* ‘umpire’ (ca. 1350), *nonpower* ‘non-power’ (before 1387) (nouns), *noncerteyn* ‘non-certain’ (probably before 1400), *nounparalle* Fr. ‘non-pareil’ (ca. 1450) (adjectives), and from Latin: *noun laudabile* (before 1398).

As to Eng. *non-*, the following may be observed. In the 15th century, it predominantly combines with deverbal nouns denoting action, activity, condition, quality. The pattern has been documented by numerous examples to the present day, with the exception of nouns in *-ing*, whose connection with *non-* obviously dropped out of use in the 19th century. Some instances are: *non-Punyshyne* (1422), *Non-finding* (1525), *non-syllogizing* (1651), *non-repealing* (1791), *non-understanding* (1833), *non-labelling* (1901); *noun obeisance* (1447), *non-distribucioun* (1540), *non-committance* (1650), *non-submission* (1763), *non-pronunciation* (1842), *nontransitivity* (1974). Combinations with agent nouns have become frequent since the 19th century, some instances being: *non housholder* (1439), *non-subscribers* (1599), *Non-contributors* (1643), *Nonjuresses* (1723), *non-smoker* (1846), *non-achiever* (1972). Coinages with other nouns are not as frequent: *noncredibility* (before 1450), *non-religion* (1600), *non-freemen* (1760), *non-form* (1886), *nonfriends* (1971). If used attributively, though, the pattern appears to be rather free from restrictions, which is corroborated by lots of examples from the 19th and 20th centuries like *non-factory* (1835), *non-market* (1884), *Nonkernel* (1963), *nontitle* (1973). These centuries also abound with adjectival coinages: *non-adherent* (1870), *non-analytic* (1890), *nonearthly* (1970), *nonpermissive* (1972). *non-* has easily combined with adjectival present and past participles since the 17th century: *Non-preaching* (1622), *non-reading* (1797), *non-enquiring* (1864), *non-fattening* (1971); *Non-incarnated* (1671), *non-perforated* (1776), *non-galvanized* (1849), *non-palatalized* (1956). Since the 19th century, it has been attached to adjectival compounds whose determinata are present participles, such as *non-officeholding* (1888), *non-English-speaking* (1949).

It has been used with adverbs since the 17th century: *non-attendingly* (1678), *non-voritically* (1882), *nonbiologically* (1974). Though reluctantly, it has been prefixed to verbs since the 17th century as well: *Non-act* (1645), *non-concur* (1703), *non-apply* (1846), *non-intervene* (1969); with infinitives it has been employed since the 1920s to form an attributive phrase as in *non-crush* (1924), *non-shrink* (1962). Since the late 1960s it has acquired the additional meaning ‘not being true, genuine; pseudo-’ as in the nouns *non-actor* (1970), *non-newspaper* (1973).

The impact of French on English **suffixes** is about the same as that on prefixes (cf. Kastovsky 1985: 227). Among those arising in Middle English can be found *-able* and *-ess*.

*-able* ‘fit for doing, fit for being done’, with the variant *-ible*, forms adjectives from verbs and nouns like *determinable*, *understandable*; *honourable*, *pesible* ‘peaceable’. Deverbal adjectives have always been more frequent than denominal ones, in Middle English as well as in later periods. Instances are: *bombable* (1930), *demountable* (1909), *flyable* (1936); *carriageable* (1702), *fissionable* (1945).

*-esse*, PrE. *-ess*, forms [+female] nouns parallelly to [+male] personal nouns such as *charmeresse*, *daunceresse*, *frendesse*. The suffix is most productive in the 16th and 17th centuries slowly declining afterwards. The 19th century has *squires*, *visitress*, *waitress*; *rebeless* dates from 1912.

### 3.2.2. Compounding

Early Middle English continues the **compounding** traditions of Old English, with new types and patterns emerging (cf. Sauer 1992).

In inversion compounds the usual sequence determinant – determinatum is permuted under French influence: *knight erraunt* (ca. 1400) from *chevalier errant* ‘knight errant’, *herbe Ive*, *herbe Robert* (plant names; before 1300). Further instances are: *court-martial*, *cousin german*, *heir apparent*.

Gender-denoting attributive copula compounds with *he-* and *she-* as determinants came into being about 1300, originally designating but animals: *hee-catte* ‘he-cat’, *he lambe* ‘he-lamb’; *she-as* ‘she-ass’, *shee ape* ‘she-ape’. Words for persons have been recorded since the 16th century, those with *she-* being more frequent: *he-friend*, *he-lover*; *she-*

*baker*, *she-favorite*, *she-friend*, 20th-century being: *he-male* (1909); *She Guardian* (1937), *she-robot* [+human] (1991).

Compounds with particles like *over*, OE. *ofer*, as in *overlord* or *overbysy* ‘overbusy’, and *out*, OE. *ut*, as in *outerie* ‘outray’, *outlep* ‘outleap’ remain common in Middle English.

### 3.2.3. Zero-derivation

In Middle English, the number of nominal bahuvrihi-compounds increases considerably. The paraphrase of such a combination is usually ‘X has/is characterised by what is expressed by the composite’. Instances include *Curtmauntel* ‘C(o)urtmantle’ (surname of Henry II), *long-here* ‘person with long hair’, *redrest* ‘redbreast’ (bird), *stykylbak* ‘stickleback’ (fish). Person names and nicknames are most frequent: *Henheued* ‘hen-head’, *Hertblod* ‘heart-blood’, *Irnefot* ‘iron-foot’ (cf. Jönsjö 1979: 111, 115; Erlebach 1979: 71–87, 93–99 for names of French origin such as *Bonquer* ‘bon cœur’ and *Cordelion* ‘œur de lion’, i.e. ‘Lionheart’). In the following centuries, many [+human] as well as [−human] nouns have been coined. The meaning of the former is mainly pejorative, that of the latter only occasionally. As in Middle English, the patterns adjective + noun and noun + noun occur most frequently, cf. *wetback* ‘illegally immigrated Mexican’, *whitethorn* (plant), *whitethroat* (bird); *bricktop* ‘red-haired person’, *cottontail* ‘rabbit’, *paperbelly* ‘person unable to drink much’. This highly restricted selection may be completed by the weak patterns numeral + noun as in *four-eyes* ‘person wearing glasses’, *four-wheel* (vehicle) and reduced adjectival past participle + noun as in *crackbrain*, *scatterbrain* ‘stupid person’. The latter obviously did not come into existence before the 16th century.

A different pattern originating in Middle English consists of verb and complement. It arose under the influence of French imperative phrases and is hence sometimes termed **imperative compound** (but cf. Giurescu 1975: 69–71). Early Middle English coinages follow French conventions in that they mostly denote personal agents: *pyke-purs* ‘pickpurse’, *trayle-bastoun* ‘s.o. who carries a club or a cudgel’ (a criminal), *wesche-disch* ‘dishwasher’. Numerous person names and nicknames, a few attested in the 2nd half of the 11<sup>th</sup> century already (cf. Reaney 1976: xi), are formed this way, like *Schaketaille* ‘shake-tail’, *Schaketrot* ‘shake-trout’, *Schakspær* ‘shake-spear’ (cf. Jönsjö 1979: 156). All

of them have a pejorative tinge, which is not inherent in the rare [−animate] nouns dating from the 14th and 15th centuries such as *breakfast* and *turnpike*.

### 3.3. Early Modern English and Later

The transition from Middle to Early Modern English and then to Late Modern English was not as drastic as that from Old to Middle English. No significant breaks occurred in word-formation processes, which nonetheless were enriched by new concepts.

#### 3.3.1. Affixation

Some modern affixes of note became productive in Early Modern English. Among the **prefixes** are *counter-*, *de-*, *inter-*, *pre-*, *re-*; **suffixes** include *-ation*, *-ee*, *-ive*, *-ment*, as in *counterevidence* (1665), *depopulate* (1545), *intermarry* (1574), *pre-elect* (1570), *reconsider* (1571); *derivation* (1530), *debtee* (1531), *trustee* (1647) (patient nouns, agent nouns such as *escapee* (1875–76) are later and particularly of American origin), *persuasive* (1589), *retirement* (1596).

Besides, Early Modern English experienced the rise of combining forms, which have become highly productive. They combine not only with free morphemes, but also with other combining forms. Early instances are: *-cacy* ‘rule, power’ from *aristocracy* (1561), *-logy* ‘doctrine, study of’ from *theology* (as early as 1362), *poly-* ‘many’ from *poly-tragick* (1605), some current formations being: *Eurocracy*, *mediocracy*, *meritocracy*; *escapology*, *mafiology*, *urbanology*, with reference made to the study of political situations or events as in *Kremlinology*, *Pekin(g)-ology*, *Sovietology*; *polydrug*, *polymorphous*, *polynuclear*.

Further combining forms being productive nowadays are: *bio-* ‘life’ as in *bio-ethics*, *biometric*; *eco-* ‘ecology, ecological’ as in *ecotourist*, *ecotoxicology*; *Euro-* ‘Europe, European’ as in *Europerson*, *Euroslit*; *mega-* ‘extremely; very large; one million’ as in *megaboring*, *mega-busy*; *megastore*; *megatanker*.

#### 3.3.2. Compounding

*Fowel of flight* (ca. 1300) is the first instance of a new **compound** pattern the determinant of the inversion compound being a prepositional phrase with *of*. Productivity is achieved in Early Modern English with instances like *Bill of Exchange* (1579), *House of Commons* (1621), *House of Lords* (1672).

### 3.3.3. Zero-derivation

The pattern verb + complement has become frequent since Early Modern English (cf. Uhrström 1918), although, in our century, it has lost much of its productive force. Person nouns are: *lack-love*, *mumble-news*, *please-man* from Shakespeare, further instances being *killjoy* (1776), *turnkey* (1654), *turn-penny* (1824). Animal nouns are: *shearwater* (ca. 1671), *shufflewing* (1829), *wagtail* (1510), plant names *catch-fly* (1597), *cover-shame* (1693), *heal-all* (1853), others (tools, devices, garments, etc.) *breakwater* (1721), *cover-shame* (1629), *stopgap* (1533).

A different kind of zero-derivation is represented by the patterns *showoff* and *blackout*. Both gave rise to numerous coinages especially in the 19th century and afterwards, the frequency of non-animate *blackout* nouns being higher than that of mainly [+human] *showoff* nouns, which did not come into existence till the 2nd half of the 16th century, while members of the other group, though rarely, appeared a century earlier. Some instances are: *go-between*, *look-alike*, *runabout*, *runaway*; *build-up*, *cutback*, *cut-down* (cf. Marchand <sup>2</sup>1969: 380–386).

### 3.3.4. Shortening

The shortening processes clipping and blending (cf. Art. 91; 92), developed to a certain degree in Middle English, intensified during the centuries to follow. Together with acrony whole (cf. Art. 92) they have become outstanding features of the modern language.

**Clipping** got firmly established in Early Modern English. Examples comprise: *mere* ‘siren, mermaid’ (1225) from *mere-min*, *gent* (1564) from *gentleman*, *mas* (1575) from *master* (back-clippings); *lepi* ‘single’ (ca. 1303) from *onlepi*, *wig* (1675) from *periwig*, *winkle* (1585) from *periwinkle* (fore-clippings). Back-clipping has turned out to be the most productive among clipping processes. Some instances are: *celeb* from *celebrity*, *cig* from *cigarette*, *fax* from *facsimile machine* (back-clippings); *burger* from *hamburger*, *liner* from *airliner* (fore-clippings); *fridge* from *refrigerator*, *Soo* from *Lake Superior* (fore- and back-clippings, rare); *Ten-Tom* from *Tennessee-Tombigby-Waterway*, *Tex-Mex* from *Texas-Mexican* (multiple back-clippings). Clipping also affects compounds. Consisting of one clipped and one non-clipped free constituent (either the first or the last), they are called “clipping compounds”. An early instance is

*blatterature* (ca. 1512) from *blatter* and *literature*. From various spheres are: with the first free constituent clipped: *compucenter*, *docudrama*, *helihop*; with the second one clipped: *beefalo*, *happenseance*, *steelionaire*.

**Blending** does not seem to be frequent until the 19th century: *lemeren* ‘glisten, glimmer’ (probably before 1400) from *lemen* ‘glow, shine’ and *glimeren* ‘gleam’, *blurt* (1573) from *blow* and *spurt*, *Barsolistor* (1888) from *barrister* and *solicitor*, *clantastical* (1803) from *clandestine* and *fantastical* are some instances (cf. Bergström 1906: 51–70). In Present-Day English, though, blending is a productive means of expressing the mixture of two concepts, such as languages in contact: *Engdish* from *English* and *Yiddish*, *Frenglish* from *French* and *English*, *Japlish* from *Japanese* and *English*.

**Acrony whole** is the latest addition to shortening in the English language. It obtained some productivity in the 19th-century special language of chemistry (cf. Marchand <sup>2</sup>1969: 453), but the first real surge of acronyms did not come before World War I: *ANZAC* ‘Australian New-Zealand Army Corps’, *DORA* ‘Defence of the Realm Act’ are but two examples.

### 3.3.5. Back-derivation

Often considered a sub-class of shortening, **back-derivation** (or back-formation) is the coining of new words by the deletion of actual or supposed suffixes in longer ones (cf. Marchand <sup>2</sup>1969: 391–395). Most back-derivations are verbs, as *laze* (before 1592) from *lazy*, *dizz* (1632) from *dizzy*; *infract* (1798) from *infraction*, *book-keep* (1886) from *book-keeping*, *caretake* (1893) from *caretaker*; *team-teach* (1976) from *team-teaching*, *back-calculate* (1987) from *back-calculation*.

### 3.3.6. Reduplication

Being sparsely attested in Middle English, **reduplication** (cf. Art. 57) has become more common since Early Modern English and is highly productive in the modern language.

Rhyming combinations are: *handy-dandy* ‘covert bribe or present’ (1362); *hocus-pocus* ‘jugglery, trickery’ (1624), *hurly-burly* ‘tumult, confusion’ (1539); *hubble-bubble* ‘confused talk’ (1720), *mumble-jumble* ‘speak indistinctly’ (1833), *quavery-wavery* ‘undecided’ (1749). The 20th century has *clankie-tankies* ‘members of the Royal Tank Regiment in the Gulf War’, *heeble-jeebies* ‘state of being scared’, *hotsy-totsy* ‘fine’.

Ablaut combinations have quickly gained ground: *pitter-patter* ‘rapid repetition of words’ (ca. 1425); *bibble-babble* ‘idle talk’ (1532), *clitter-clatter* ‘chatter’ (1535), *dilly-dally* ‘waste time’ (before 1610); *twiddle-twaddle* ‘foolish chatter’ (1798). From the 19th century onwards have been coined *drizzle-dazzle* ‘continuous rain’, *fizz-fuzz* ‘Coca-Cola’, *rickety-rackety* ‘unsteady’.

Reduplicative compounds (or repetitions), infrequent in Middle English, remained rare to the 18th century. Since the 19th, however, their frequency has been increasing considerably (cf. Thun 1963: 49–200 *passim*). Some sound-imitating coinages are: *cuccu* ‘cuckoo’ (ca. 1240); *diddle-diddle* (fiddle) (1523), *jingle-jingle* (jingling sound) (1664); *tick-tick* (1774) (clock), *too-too* (flute) (1812), *woo-woo* (wind) (1841), *zip-zip* (light sharp sound) (1875). *choo-choo* (train), *chuff-chuff* (engine), *clop-clop* (hooves/wooden sandals) are 20th century.

### 3.4. Conclusion

The basic Old English word-formation types affixation, compounding and zero-derivation have generally persisted to the present day. As in the case of inflection, Middle English takes a crucial position. Not only did it experience the influx of French prefixes and suffixes and the coming out of use of Old English ones, but it also laid the foundation for new patterns such as the zero-derivations *cutpurse* and *blackout*, new compound types and the shortening processes clipping and blending. The most important contribution of Early Modern English to word-formation is doubtless the combining form, which has gained high productivity during the following centuries showing an ever-increasing frequency in Present-Day English. Of Early Modern English origin is furthermore the zero-derivational pattern *showoff*, whereas acronyms was not en vogue until World War I. Since then, however, its productivity has been growing steadily, as is illustrated by numberless coinages.

5. Flexion
6. Wortbildung
7. Zitierte Literatur

### 1. Periodisierung der deutschen Sprachgeschichte

Der theoretischen Vielfalt der Kriterien für eine sprachgeschichtliche Periodisierung entspricht die tatsächliche Vielfalt der Periodisierungsversuche der deutschen Sprachgeschichte (vgl. die Zusammenstellung bei Roelcke 1995; 2001). Oberhalb aller Feindifferenzierungen gilt seit Wilhelm Scherer vor allem eine Unterteilung in die vier Sprachstufen Althochdeutsch (Ahd.), Mittelhochdeutsch (Mhd.), Frühneuhochdeutsch (Frnhd.) und Neuhochdeutsch (Nhd.) (vgl. Scherer ²1878: 13–15). Soweit die Unterteilung erststellig durch innersprachliche Kriterien begründet wird, handelt es sich dabei zumeist um Kriterien phonetisch-phonologischer Art; in nur einem Fall wird eine (flexions)morpho-

logische Entwicklung als für die Periodisierung wesentlich benannt: die den Übergang des Frühneuhochdeutschen in das Neuhochdeutsche markierende Ausgleichung des präteritalen **Numerusablauts** (**Ablautausgleich**) bei den starken Verben (ahd./mhd./frnhd. *fand – funden* > frnhd./nhd. *fand – fanden*; vgl. Behaghel ⁵1928: 149; Moser 1929: 1). Diese primäre Orientierung an phonologischen Prozessen zeigt die weiterwirkende **junggrammatische** Bindung der Sprachgeschichtsschreibung: Aufgrund vorgängig physiologisch-lautgesetzlicher Veränderungen werden auch grammatische Strukturen zerstört; erst in der Folge werden die defekten Strukturen aufgrund von Assoziationen der Sprecher (als **Analogie**) wieder in eine sinnvolle, neue Ordnung gebracht (vgl. Kohrt 1984: 392; Werner ²1998: 575). Damit ist eine erste Ursache auch des morphologischen Wandels primär physiologisch-lautgesetzlich erklärt, die im Bereich der Morphologie wirksame Analogie bekommt “eine nachgeordnete komplementäre Erklärungsfunktion” (Putschke ²1998: 476). Es folgt somit der junggrammatischen Logik, die wesentlichen Periodengrenzen über die als Ursache der grammatischen Veränderungen gedachten Lautveränderungen zu markieren.

Im Althochdeutschen (frühes 7. Jahrhundert bis Mitte 11. Jahrhundert) beginnt die geschichtliche und d.h. schriftsprachliche Zeit des Deutschen (vgl. Wolf 1981: 66). Da als sprachgeschichtlich wesentliche Entwicklung die „Transponierung und Bewältigung der Latinität in die Volkssprache“ gilt, meint „Althochdeutsch“ in erster Linie „die Sprachverwendung und erst in zweiter Linie das Sprachsystem“ (Wolf 1981: 72). Als innersprachliches Abgrenzungskriterium gegenüber dem chronologisch vorausliegenden Südgermanischen gilt die **2. oder althochdeutsche Lautverschiebung**, bei der u.a. aus germanischen Tenues neue Spiranten/Affrikaten entstanden. Da die Lautverschiebung nicht alle (süd)germanischen Stammesdialekte des späteren deutschen Sprachraumes ergriffen hat (Ausnahme besonders das Sächsische), liefert sie zugleich auch das bis in die Gegenwart hinein gültige Kriterium zur dialektgeographischen Abgrenzung eines hochdeutschen (hd.) und eines niederdeutschen (nd.) Sprachraums.

Als wesentliches Abgrenzungskriterium des Mittelhochdeutschen (Mitte 11. bis Mitte 14. Jahrhundert) gegenüber dem vorausliegenden Althochdeutschen gilt die in einheitlicher Graphie -e- aufscheinende Abschwächung der vollen Endsilbenvokale (ahd. *ich bitt-u* > mhd. *ich bitt-e*, ahd. *er bitt-it* > mhd. *er bitt-et*), daneben auch die Durchführung des Sekundärumlauts (ahd. *wahsit* > mhd. *wähset*; vgl. Wolf 1981: 64); die jüngere Grenze zum Frühneuhochdeutschen hin markieren weitere Lautwandel, so besonders die sogenannte (früh)neuhochdeutsche Diphthongierung/Monophthongierung (z.B. mhd. *wīn* > nhd. *Wein*; mhd. *bruoder* > nhd. *Bruder*). Zum ersten Mal in der deutschen Sprachgeschichte wird im schriftsprachlichen Bereich eine funktional (literarisch) wie diastratisch (höfisch-ritterlich) bestimmte Vorbild-Varietät herausgebildet. Diese als höfisches – klassisches – und auch als Normalmittelhochdeutsch bezeichnete Sprachform (vgl. Sondergger 1979: 167) stellt jedoch nur einen regional wie funktional begrenzten Ausschnitt der Sprachwirklichkeit des Zeitraumes dar, so daß in neuerer Forschung der Sprachbegriff Mittelhochdeutsch teilweise bewußt vermieden wird (vgl. Wells 1990: 106).

Im Frühneuhochdeutschen (Mitte 14. bis Übergang 18. Jahrhundert; vgl. besonders Reichmann 1988) tritt die Varietätenvielfalt des Deutschen erstmals deutlich in die Überlieferung ein. Die schriftdialektale Bindung und d.h. eine in unterschiedlicher Ausprägung bestehende landschaftliche Variation auch in der Schriftlichkeit wird zum charakteristischen Merkmal der gesamten Periode (vgl. Penzl 1984: 12 f.). Im Neben- und Miteinander der verschiedenen Varietäten findet im Verlauf des 14. bis 18. Jahrhunderts auf der Ebene der Schriftlichkeit ein in Stufen verlaufender Aus- und Angleichungsprozeß statt: Klar bestimmbare sonderlandschaftliche Schreibsysteme werden in eine überregionale und oberhalb der gesprochenen Mundarten liegende Schriftsprache überführt; dabei sind im Verlauf des 15./16. Jahrhunderts mindestens 12

verschiedene Schreib-/Kanzlei- und Druckersprachen unterscheidbar (vgl. Besch 1980: 590–592). Diese Schriftsprache wird zur Grundlage der in der Folge einsetzenden Kodifizierung und Normierung: Das Frühneuhochdeutsche wird zur entscheidenden Phase für die Herausbildung der neuhochdeutschen Schriftsprache. Da insbesondere im 16. Jahrhundert die eigenständige niederdeutsche Schriftsprache des norddeutschen Raumes durch die hochdeutsche Schriftlichkeit verdrängt wurde (vgl. Sodmann 2000), ist damit erstmals in der deutschen Sprachgeschichte eine oberhalb aller dialektalen Differenzierungen liegende schriftsprachliche, überdachende Varietät des gesamten deutschsprachigen Raumes herausgebildet: Die die historische Einzelsprache *Deutsch* ausmachende Existenzform eines differenzierten Diasystems ist in seinem Grundgerüst herausgebildet.

## 2. Synchrone Heterogenität und historische Homogenität

Die sprachgeschichtliche Skizze zeigt, daß eine geschichtliche Morphologie des Deutschen bereits hinsichtlich des Sprachbegriffs ambivalent ist: So meint „Deutsch“ eine konkrete Sprachform, die innerhalb eines historisch-sozial bestimmten Kommunikationsraumes eine allgemeine Geltung besitzt, konkret die (neu)hochdeutsche Schrift- oder Hochsprache; diese Sprachform ist erst seit dem 18. Jahrhundert entwickelt. Zugleich eint „Deutsch“ eine abstrakte und inner- wie außerlinguistisch bestimmte Zusammengehörigkeit einer Reihe konkret vorhandener Sprachformen innerhalb des Gültigkeitsbereichs der Standardsprache (z.B. Dialekte), die eine jede nur über eine eingeschränkte Geltung verfügt. Innerhalb der unterscheidbaren Varietäten/Subsysteme ist die Standardform (das „Hochdeutsche“) selbst nur eine Varietät neben anderen. Ihre Bedeutung liegt jedoch u.a. darin, daß erst ihre (geschichtliche) Herausbildung und Stabilisierung die zu ihr komplementäre Bestimmung der Varietäten ermöglicht. Der Zustand dialektischer Gliedertheit sowie das konkrete Varietätengefüge sind Ergebnis einer insbesondere im Frühneuhochdeutschen vollzogenen Entwicklung, die in besonderer Weise mit dem neuzeitlichen Prozeß der Herausbildung nationalstaatlicher Verkehrs- und Kommunikationsräume verbunden ist. Dabei zeigt sich, daß die mundartlichen Grundlagen der überdachenden Standardvarietät allein innerhalb des südlichen, hochdeutschen Sprachraums liegen (Teilhabe an der 2. oder ahd. Lautverschiebung), daher die in den Epochen-

bezeichnungen (z. B. "Althochdeutsch") vorliegende Eingrenzung. Somit ist der Begriff "Hochdeutsch" innerhalb des Varietätsystems ebenfalls doppeldeutig: normativ im Sinne der Normvarietät, historisch und sprachgeographisch im Sinne der durch die Lautverschiebung definierten Sprachstufen und Mundarten des Deutschen (vgl. Sonderegger 1979: 166). Gemäß der **Varietätendifferenzierung** stellt auch das historisch entwickelte System der gegenwärtigen standardsprachlichen Flexions- und Wortbildungsmorphologie nur eines unter anderen deutschen Systemen dar. Dabei hat die Morphologie jeder der unterscheidbaren Varietäten ebenso ihre eigene Geschichte wie auch die besondere diasystemische Gegliedertheit der deutschen Morphologie insgesamt. Damit ist das grundlegende Problem der diachronen Betrachtung des Deutschen angesprochen: Es geht um ihre Identität in Geschichte und Raum (vgl. Mattheier 1998: 825). Tatsächlich kann von einem "Wandel" sprachlicher Einheiten/Strukturen nur innerhalb eines als identisch zu bestimmenden funktionalen, sozialen und regionalen Gültigkeitsbereichs gesprochen werden. Das System der Flexions- wie Wortbildungsmorphologie der im späten 18. Jahrhundert schon weitgehend erreichten "Normalvarietät" des Neuhochdeutschen wäre somit zu vergleichen mit dem System entsprechender Varietäten der vorausliegenden Sprachstufen: Eine "Normalvarietät" ist aber weder für das Althochdeutsche, noch für das Mittelhochdeutsche oder das Frühneuhochdeutsche anzunehmen; entsprechende Paradigmen der historischen Grammatiken, auf denen der sprachgeschichtliche Überblick gründen muß, haben ausschließlich heuristischen Wert. Die relativierende Formulierung erweist sich besonders bezüglich der geschichtlichen Genese der neuhochdeutschen Standardvarietät als bedeutsam. Denn im Unterschied zu anderen europäischen Kultursprachen weist das Deutsche nur begrenzt eine historische Homogenität auf: Im deutschen Reich fehlte ein klar bestimmbarer Zentrum, dessen Varietät sich im sprachgeschichtlichen Prozeß zur allgemeinen und d. h. Standardvarietät hätte qualifizieren können. Somit ist auch das im Neuhochdeutschen entwickelte morphologische System in wesentlichen Teilen nurmehr ein Produkt der Überlagerung und eklektizistischen Addition verschiedener und varietätendifferenziert herausgebildeter Teilsysteme/-strukturen/-prinzipien. Auch und gerade außersprachliche Ur-

sachen haben in der Sprachgeschichte des Deutschen eine wesentliche Rolle gespielt (zur strukturellen Disposition sowie den weiteren Prinzipien des im Frühneuhochdeutschen erfolgten Sprachausgleichs vgl. Besch 2003).

Die Berücksichtigung der Varietätendifferenzierung hat Folgen für die sprachgeschichtliche Argumentation: Die gemeinhin als "Wandel" oder "Fortentwicklung des Systems" klassifizierte Veränderung z. B. mhd. *gabe* > nhd. *gebe* (1. Sg. Ind. Präs.) ergibt sich nur aus dem unmittelbaren Vergleich der neuhochdeutschen Standardvarietät mit der in den entsprechenden Grammatiken ausgewiesenen mittelhochdeutschen "Normalform". Tatsächlich kann die Entwicklung adäquater beschrieben werden als Perpetuierung und anschließende Verallgemeinerung einer schon in mittelhochdeutscher Zeit neben *gabe* im mitteldeutschen Sprachraum parallel existierenden Form *gebe*. Damit ist *gabe* nicht durch einen "Wandel" verändert, sondern aufgrund einer sprachlandschaftlich veränderten Fokussierung nurmehr innerhalb der Schriftlichkeit verdrängt; die Form *gabe* ist in oberdeutschen Mundarten unverändert bis in die Gegenwart hinein gebraucht.

Die deutsche Sprachgeschichte und damit auch die Geschichte des morphologischen Systems erweist sich zu einem nicht unbedeutenden Teil als die chronologisch aufeinanderfolgende Fokussierung mal der einen, mal der anderen Varietät; insofern liegt nicht zwingend eine Entwicklung des Systems, sondern die unterschiedliche Wirksamkeit varietärer Ausprägungen vor.

### 3. Forschungsgeschichte

Der wesentliche Aspekt der Forschungsgeschichte liegt in der Ausdifferenzierung der **Wortlehre** (i.e. Morphologie) in eine jeweils eigenständige Flexions- und Wortbildungslære (Solms 1998). Für die Frühphase einer Grammatikographie des Deutschen, die der geschichtlichen Herausbildung einer Standardvarietät im Übergang des Frühneuhochdeutschen zum Neuhochdeutschen parallel geht (im 17. Jahrhundert insbesondere Justus Georg Schottel, im 18. Jahrhundert besonders Johann Christoph Gottsched und Johann Christoph Adelung), gilt eine noch weitgehend undifferenzierte Thematisierung der Wortlehre. Eine solche Differenzierung gelang erst durch eine adäquate Berücksichtigung der Funktion und d. h. der durch Flexion und Wortbildung jeweils realisierten spezifischen "Bedeutung": Während die Fle-

xionslehre “es der Syntax überlässt, die Bedeutung und Verwendung” der Flexive zu bestimmen, ist jene der Wortbildungsmittel allein durch eine eigene, die Wortbildungslehre zugleich unmittelbar konstituierende “Funktionslehre” zu beschreiben (Paul 1981: 17 f.).

Den Weg zu einer solchen Unterscheidung wies zuerst Jacob Grimm, indem er die Differenzierung von Wortbildung und Flexion als eine im Fortgang der sprachgeschichtlichen Entwicklung erst herausgebildete erkannte: Grimm erkannte innere Wortbildung (*trinken, der Trank*) und Wurzelflexion (*trinken – trank*) als ursprünglich ungeschieden. Im darin wirksamen Ablaut sah Grimm das wesentliche und d. h. historisch wie genetisch grundlegende Form- und Bauprinzip der deutschen Sprache: er erkannte es als ihr ältestes Prinzip, wobei die Wurzeln aller Wörter mit dem Grundsatz des Ablaut sowie “dieser mit der natur der wurzeln wesentlich in gemeinschaft” stehen (Grimm 1826: 4–7). So wenig somit innere Wortbildung und Wurzelflexion zu unterscheiden sind, so wenig kann man “die flexion, d. h. die dem verbum anwachsende pronominalform, die dem nomen anwachsenden geschlechtszeichen und partikeln strenge nicht vom begriffe der wortbildung ausschließen” (Grimm 1826: 86). Erst in der geschichtlichen Entwicklung werden die formalen Ausdrucksmittel und -muster funktional profiliert und als Kategorie faßbar, so z. B. die von Grimm so bezeichneten “eigentlichen” Komposita (z. B. *Berg-werk* ohne Fugen-element versus *Krieg-s-geschrei* mit Fugen-element):

“Zur charakteristischen Compositionsform wurden diese altertümlichen Gefüge [erst] durch die Ausbildung der Flexion. Denn eben dadurch, dass man sich gewöhnte, die Beziehungen zwischen Wörtern durch Flexionen zu bezeichnen, erschienen die Verbindungen mit der reinen Stammform als Composita.” (Wilmanns 1906–1909: 4)

Eine konsequente Berücksichtigung des damit formulierten relationalen Charakters der Unterscheidung von Wortbildung und Flexion und ihrer historischen Entwicklung ist bisher nicht geleistet. Für Grimm gehört die Morphologie neben der Lautlehre zum Kern von Sprachvergleichung wie Sprachgeschichte. Diese Gegenstandskonstitution bleibt auch im späteren junggrammatischen Sprachwandelkonzept bestehen (vgl. Eichinger 1984: 436). Indem nun jedoch die bei Grimm vorherrschende Überzeugung, Sprachgeschichte erweise in ihren historischen Stu-

fen/Epochen den fortschreitenden “Verfall” der ursprünglichen Klarheit und Systematizität, überwunden wird, werden nun durch den junggrammatischen Ansatz eines zu allen Zeiten “nach denselben strengen phonetischen und psychologischen Regeln” (Werner<sup>2</sup> 1998: 575) erfolgenden Sprachwandels alle Sprachstufen als prinzipiell gleichwertig erkannt; auf der Grundlage eines jeweils reichen empirischen Materials eröffnet dies grundsätzlich die Möglichkeit zum Systemansatz und d. h. für eine Beschreibung der jeweiligen Sprachstufen als eigenständiger und hinsichtlich übereinstimmender Merkmale homogener Synchronien (vgl. Eichinger 1984: 436). Der junggrammatische Ansatz führt zu einer Reihe historischer Grammatiken (nicht nur zum Deutschen), die bis heute ihren Wert als Standardwerke nicht eingebüßt haben (vgl. zusammenfassend Werner 1998: 575 f.); einige Grammatiken beschreiben den Gesamtzusammenhang der geschichtlichen Entwicklung des deutschen Flexionssystems vom vorgermanischen Ausgangspunkt bis in das Neuhochdeutsche hinein (Wilmanns 1906–1909; Paul 1916–1920), andere bleiben auf jeweils eine der definierten Sprachstufen begrenzt (Braune<sup>14</sup> 1987; Weinhold<sup>2</sup> 1883; Paul<sup>24</sup> 1998; Michels<sup>5</sup> 1979). Mit Ausnahme der periodenübergreifenden Darstellungen gerät die Wortbildung nicht in den Blick, unter der Formenlehre wird nun ausschließlich Flexionslehre betrieben. In eben dieser Begrenzung hatte auch Virgil Moser (1929: XII) seine “frühneuhochdeutsche Formenlehre” geplant; die Gleichsetzung von Morphologie und Flexion gilt auch für neuere Darstellungen als eine gegebene (vgl. Kern & Zutt 1977: 1; vgl. auch Kienle<sup>2</sup> 1969 und Russ 1978). Der Schwerpunkt der epochenbezogenen Grammatiken liegt in der Dokumentation der jeweiligen Zustände; auf systematische Umstrukturierungen, auf mögliche Ursachen oder funktionale Verschiebungen wird kaum eingegangen. Damit geht für das Alt- und Mittelhochdeutsche eine mehr oder weniger konsequente Konzentration auf ein hypothetisiertes “Normalsystem” und damit eine nur ansatzweise Berücksichtigung u. a. der diatopischen Varietäten einher. In der jüngeren und einem nicht mehr junggrammatischen, sondern strukturalistischem Ansatz verpflichteten Frühneuhochdeutschen Grammatik ist der Versuch einer Korpusgrammatik unternommen, bei der die Varietätendifferenzierung zum Prinzip der Darstellung geworden ist; ein Normalsystem wird nicht

mehr konstruiert. Eine nur annähernd entsprechende Darstellung der Wortbildung, die zudem die funktionalen Verschiebungen innerhalb des Inventars der Wortbildungsmittel erfaßt, steht jedoch auch für das Frühneuhochdeutsche noch aus. Hier muß man bis auf weiteres auf schon ältere und zumeist etymologisch orientierte Darstellungen von Willmanns (1906–1909), Paul (¹1920), Kluge (²1925) und Henzen (³1965) zurückgreifen. Aus der Vielzahl einzelner Untersuchungen und epochenbezogener Überblicksdarstellungen sei zusätzlich zu den historischen Grammatiken verwiesen auf die einschlägigen Beiträge in Besch et al. (²1998; ²2000, Hrsg.), Schwarz (1986), Bergmann et al. (1987, Hrsg.), Müller (1993), Habermann (1994), Winkler (1995), Joeres (1995), Prell & Scheben-Schmidt (1996); zur bibliographischen Erschließung vgl. Ronneberger-Sibold (1989).

#### 4. Entwicklungsgeschichtliche Grundzüge

Der geschichtliche Zeit- und Varietätenraum des Deutschen zeigt eine Vielzahl morphologischer Einzelveränderungen: Einige davon profilieren wortartübergreifende und die Wortbildungs- und/oder Flexionsmorphologie insgesamt prägende Prozesse; andere prägen nurmehr die Flexion/Wortbildung einer Wortart; wiederum andere zeigen sich als wesentlich in der **Profilierung** klar(er)er subsystemischer Flexionsstrukturen innerhalb einer Wortart, z. B. nur der sogenannten **starken Verben** oder nur der sogenannten **schwachen Substantive**; andere schließlich fügen sich nur schwer in einen überordnenden Zusammenhang und bleiben als Einzelveränderung singulär. Oberhalb der Vielzahl einzelner Veränderungen ordnet die sprachgeschichtliche Perspektive die Einzelercheinungen zu Entwicklungstendenzen, die sich als historisch konstante (in allen Sprachstufen und bis in die Gegenwart wirkende) oder als inkonstante (historisch nur teilweise aufscheinende) zeigen (vgl. Sonderegger 1979: 241–255, 340–345). Vom neuhighochdeutschen Ausgangspunkt geurteilt werden die Einzelergebnisse zu Indizien einer auf das Neuhighdeutsche ziellenden Teleologie, sie werden entsprechend als “entwicklungsgeschichtliche Grundzüge” bestimmt (Hotzenköcherle 1962). Solche erweisen sich im Ab- sowie dem paradigmatisch verbleibenden Aus- und Umbau des flexivischen Materials:

#### XVIII. Morphologischer Wandel II: Fallstudien

- (a) Als eine konstante und in allen Sprachstufen beobachtbare Entwicklungstendenz erweist die Flexionsgeschichte eine “kontinuierliche Reduktion und Umstrukturierung der Flexionsmorpheme” (Sonderegger 1979: 243); die Umstrukturierung erfolgt paradigmatisch sowie durch Ausweichen auf die syntagmatische Ebene. Indem eine Konzentration der flexivischen Ausdrucksmittel auf bestimmte morphosyntaktische Kategorien erfolgt, werden diese flexivisch profiliert. Wortartbezogen ergibt sich somit bei den Verben eine “Profilierung der Tempuskategorie” (Besch 1980: 594; vgl. Hotzenköcherle 1962: 331), eine “Numeruskristallisierung beim Substantiv” (Hotzenköcherle 1962: 331), eine “Genusprofilierung beim Adjektiv” (Solms & Wegera 1991: 317f.). Bei der Flexion der Adjektive zeigt sich zudem die Durchsetzung einer syntaktisch vom bezogenen Substantiv und vom sonstigen Substantivbegleiter aus organisierten “Formregel” (Hotzenköcherle 1968: 3).
- (b) Strukturelle Konsequenz einer **flexivischen Profilierung** ist eine entsprechende Nivellierung bestimmter Kategorien: insbesondere die des Kasus bei den Substantiven (vgl. Sonderegger 1979: 248f.), insbesondere die des Modus bei den Verben.
- (c) Eine gänzliche oder teilweise Ersetzung von Formativen durch markanter ausgezeichnete Formen tritt bei “funktionaler Untauglichkeit” ein (vgl. Wegera & Prell ²2000: 1594). Eine solche ist primär phonetisch-phonologisch verursacht: vom Althochdeutschen zum Mittelhochdeutschen die in einheitlich -e- aufscheinende Abschwächung der vollen Nebensilbenvokale, vom Mittelhochdeutschen zum Frühneuhochdeutschen eine Fortsetzung der Nebensilbenabschwächung in der Apokope. So geht z. B. in der Wortbildung die althochdeutsche Möglichkeit zur ausdrucksseitig eindeutigen Markierung der **Nomina-agentis-Bildung** durch das Derivationssuffix -o (z. B. kebo, ‘der, der gibt’) verloren, es wird durch das lat. Lehnsuffix -ari (nhd. -er) ersetzt; so wird in der Flexion die vokalisch volle Endungsflexion des Althochdeutschen zerstört, Oppositionen werden aufgehoben (z. B. ahd. Nom. Sg. hirti, Nom. Pl. hirta > mhd. Sg./Pl. hirte). Dadurch kommt es zum Mittelhochdeutschen hin zu eingreifenden morphemischen Strukturveränderungen (vgl. Wolf 1981: 202), die sich in einer paradigmatischen Umstrukturierung des Systems oder auch einer verstärkten Nutzung entsprechender Peripherasen zeigen. Die über das Mittelhochdeutsche hinaus weitergehende Apokope erzeugt bei den Substantiven schließlich den gänzlichen Zusammenbruch des alten Flexionssystems, das im Frühneuhochdeutschen neu aufgebaut wird.
- (d) Die Funktionsverlagerung in die **Periphrase** (Wandel vom synthetischen zum analytischen

- Prinzip) erscheint in Flexion wie Wortbildung. So werden die semantisch-syntaktischen Wortbildungsfunktionen der germanischen Ableitungssuffixe **schwacher Verben** sowohl durch die **Präfigierung** als auch durch entsprechende Peripherasen übernommen: Es erscheinen z. B. statt der im Germanischen möglichen Wortbildung mittels eines Suffixes \*-jan, das ein kausatives Verb deriviert (z. B. gotisch *diupjan* ‘vertiefen’ aus Adjektiv *diups* ‘tief’ + Wortbildungssuffix -jan), seit dem Althochdeutschen sowohl Präfixbildungen z. B. mit *ir-* (*irtrocknen* ‘trocknen machen’) als auch Peripherasen des Basiswortes mit *tuon* oder *machen*. Als dann weitergehende Tendenz zur ‘Periphrase in der Morphemstruktur’ zeigt sich die Funktionsablösung von Simplicia durch Präfixverben seit dem Mittelhochdeutschen (z. B. *jmdn. weinen* > *jmdn. beweinem*). Bei der Flexion weist die Tendenz zu periphrastischen Umschreibungen auf die kontinuierliche Veränderung innerhalb der im Deutschen genutzten drei **Flexionsprinzipien**: die aus dem Vordeutschen übernommene “**regressive**” (von der Endung her erfolgende Steuerung mittels **Relationsmorphen**, z. B. 3. Sg. Ind. Präs. *suo-ch-it* vs. 3. Sg. Konj. *suo-ch-e* im Althochdeutschen), die ebenfalls vordeutsche Stamm- oder Wurzelflexion (untrennbarer Einheiten lexikalischer und grammatischer Bedeutung, besonders der **Vokalwechsel** “**Umlaut**” und “**Ablaut**; Ablaut als morpholexische Erscheinung, vgl. Durrell 1980:23; ähnlich Simmler 1987:121 f.; z. B. 1. Pl. Präs. *geben* vs. 1. Pl. Prät. *gäben* im Mittelhochdeutschen), die “**progressive**” Steuerung durch vorangestellten Begleiter (z. B. 1. Pl. Ind. Prät. *wir gäbun* vs. 3. Pl. Ind. Prät. *sie gäbun* im Althochdeutschen). Ein jedes dieser Prinzipien erscheint nur selten ausschließlich, zumeist kommen sie in Kombination miteinander vor (z. B. ahd. Nom. Sg. *gast* vs. Pl. *ge-sti*; nhd. Nom./Akk. Sg. *das Rad* vs. Pl. *die Räder*). Die deutsche Sprachgeschichte zeigt eine jeweils unterschiedliche und die einzelnen Sprachstufen charakterisierende Nutzung dieser genannten drei Prinzipien: vorwiegend “**regressive**” oder Endungsflexion im Althochdeutschen, vermehrter Ausbau von Wurzelflexion und progressiver Steuerung im Mittelhochdeutschen, entscheidende Verlagerung im Neuhochdeutschen zur progressiven Steuerung (vgl. Sonderegger 1979: 243). Peripherasen werden vor allem bei den Verben für Perfekt, Futur, Passiv und auch Konjunktiv genutzt; sie finden sich besonders seit dem 15. Jahrhundert mit einem Schwerpunkt im oberdeutschen Sprachraum.
- (e) Der tendenzielle Ausbau der Wurzelflexion mittels Wechsel des Wurzelvokals zeigt die **Morphologisierung** und dann auch Systematisierung phonetisch-phonologisch bedingter und schon im Voralthochdeutschen eingetretener **Alternationen** (i. e. regelmäßiger und syn-

chronisch funktionierender **Lautwechsel** in etymologisch verwandten Wörtern, hier besonders Umlaut) bei den Verben, den Substantiven sowie auch den Adjektiven (Komparation). Der Vokalwechsel wird besonders zum Mittel der Flexionsmorphologie entwickelt, weniger zu einem der Wortbildung.

- (f) Die phonetisch-phonologische Verursachung überlagernd, verstärkend und ersetzend sind weitere Entwicklungsmotive abzuleiten: so ein Streben nach Ökonomie, Redundanzsteuerung (vgl. Koenraads 1953; Lüdtke 1988: 1633). Dazu gehört, daß isolierte/lexemspezifische Besonderheiten innerhalb einer Gruppe/Klasse von Lexemen oder einer Wortart (nicht zwingend) abgebaut werden: der **grammatische Wechsel** bei der Flexion der Verben (z. B. Sg./Pl. Prät. *was* – *wären* > *war* – *waren*; vgl. Sonderegger 1979: 253), **suppletive Formen** bei den Pronomen (*dirre* > *dieser*; vgl. Ebert et al. 1993: § M60), die **rückumlautende Verbflexion** (*stellen* – *stalite* > *stellen* – *stellte*), die starke Verbflexion sowie ein Teil der ehemaligen **Präteritopräsentien**. Tendenzielles Ergebnis eines Abbaus von “Besonderheiten” ist die weitere Profilierung und Bestätigung einer “Normalität”. Ein markantes Beispiel für den Abbau systemischer und lexemdistribuierter Varianz ist die Herausbildung der ehedem schwachen und somit spezifischen Verbalflexion zur allgemeinen und somit “Normalflexion” des Verbs im Deutschen.
- (g) In der Profilierung spezifischer Flexionsweisen erweist sich auch der besondere Einfluß, den die Erweiterung des Wortschatzes durch Entlehnung oder Wortbildung auf die Entwicklung des (geschlossenen) Flexionssystems hat. Denn jedem neu in den Wortschatz aufgenommenen Wort wird unmittelbar eine der möglichen Flexionsweisen zugeordnet. In diesem konkreten Sprachverhalten erweist sich die Produktivität (Analogie) bestimmter Muster (Art. 148). Insofern solche Muster somit durch zusätzliche Wortschatzelemente gestützt werden, kann der Sog dieser Muster so weit verstärkt werden, daß variante Muster ihre Wirkung verlieren. Die ehemals schwachen Verben sind auch hier ein Beispiel; mit ganz wenigen Ausnahmen (z. B. *schreiben* im Althochdeutschen oder *preisen* im Mittelhochdeutschen) sind alle entlehnten Verben automatisch als schwache Verben in den Wortschatz integriert worden; auch dadurch ist der Wortschatzanteil starker Verben relativ gesunken.
- (h) Eine “Tendenz zur formalen Trennung von Flexions- und Derivationsmorphemen” (Wegera & Prell 2000: 1594) und damit auch eine Tendenz zur Trennung von Flexion und Wortbildung zeigt sich sowohl hinsichtlich bestimmter Prinzipien morphologischer Informationsbindung als auch hinsichtlich der funktionalen Trennung der Relationsmorpheme. Der in der vordeutschen Wortbildung wesent-

liche Vokalwechsel (z. B. Ablautbildungen *Trunk* oder *Trank* zu *trinken*, *Fluss* oder *Flotte* zu *fließen*) wird seit dem Althochdeutschen primär flexivisch genutzt (Ausbau der Umlautnutzung bei den Substantiven). Bis zum Neu-hochdeutschen hin verläuft ein Prozeß der deutlichen Trennung einzelner Flexions- und Wortbildungsmorphe (vgl. Erben<sup>2</sup>1983: 138): z. B. ist das in der Wortbildung ehedem produktive und inzwischen nurmehr aktive Wortbildungssuffix *-e* (Femininabstrakta z. B. *Rinne*) nurmehr als Flexiv produktiv (dient insbesondere der Markierung des Plurals bei den Substantiven); z. B. hat sich das Präfix *ge-*, das bis in das Mittelhochdeutsche hinein aspektuelle Differenzierungen ermöglichte (z. B. 3. Sg. Ind. Präs. *er geas* mit perfektiver Bedeutung ‘er hatte gegessen’) und daneben als ein die Verbseman-tik modifizierendes Präfix (“Aktionsartenaus-fächerung”) fungionierte (z. B. Präfixverb *ge-heilen* ‘gesund werden’ zum Simplexverb *heilen* ‘gesund machen’), im Verlauf des Frühneu-hochdeutschen nurmehr zum Bestandteil des diskontinuierlichen Part. Prät.-Morphems her-ausgebildet (vgl. Solms 1991).

- (i) In der morphologischen Profilierung und funktionalen Bindung von Flexiven und Formativen zeigt sich eine “Tendenz zur deutlichen strukturellen Trennung der Wortarten” (Wegera & Prell<sup>2</sup>2000: 1594), “unverkennbar” zwischen Substantiv und Adjektiv (Erben<sup>2</sup>1983: 138).

## 5. Flexion

### 5.1. Flexion der Verben

Die diachron motivierte Klassifizierung der deut-schen Verben unterscheidet neben den schon im Germanischen ausdifferenzierten Hauptklassen der “starken” und “schwachen” Verben eine weitere Gruppe flexivisch heterogener **besonderer Verben**. Kriterium der Unterscheidung der zwei Hauptklassen ist die ohne oder mit einem Dentalsuffix *-t-* er-folgende Flexion des Präteritums (schwach: ahd. *suothen* – *suocta*; stark: ahd. *grifan* – *graiflgrifen*). Daneben werden als ebenfalls eigenständige Gruppe die sogenannten “Präteritopräsentien” (Prät. Präs.; z. B. mhd. *wizzen* oder *gunnen*) unter-schieden, ursprünglich entstanden aus dem indo-germanischen Perfekt, der teils Vergangenheit und teils Gegenwart bezeichnete (aus letzteren Fällen entstehen Präteritopräsentien, aus ersten “nor-male” starke Verben; vgl. Hirt 1932: § 115). Ent-sprechend zeigen die Präteritopräsentien im Präsens (ablautende) Präteritalformen, zu denen dann schwache Präteritalformen neu gebildet sind. In ei-ner synchronen Klassifizierung gilt die Flexion der Präteritopräsentien schon seit dem Althochdeut-schen als Besonderheit nur weniger Lexeme. Dies rechtfertigt ihre Gruppierung zusammen mit einer nur kleinen und hinsichtlich ihres Inventars nicht konstanten Restgruppe auffälliger und individuell

## XVIII. Morphologischer Wandel II: Fallstudien

flektierter Verben: ahd. *uuellen* ‘wollen’, *tuon* ‘tun’, *sîn* ‘sein’, *gân/gênl/gangan* ‘gehen’ und *stân/stênl/stantan* ‘stehen’. “Restgruppe” wie “Präteritoprä-sentien” werden in den historischen Grammatiken zumeist in einer nicht für jede Sprachperiode iden-tischen Gruppe “besonderer Verben” gefaßt (vgl. Braune<sup>14</sup>1987: § 370–385; Paul<sup>24</sup>1998: § 267–288): ihre Flexion ist als jeweils einzellexematische Kom-bination verschiedener Stamm- (teilweise supple-tiv) wie auch Relationsmorphie zu beschreiben.

Die vom Alt- bis zum Ausgang des Frühneu-hochdeutschen strukturell wirksamen Veränderungen zeigen sich teilweise als Fortführun-gen schon im Germanischen begonnener Tendenzen, zum Teil als später einsetzende Entwicklungen; die Veränderungen bleiben partiell subsystemisch, z. B. nur auf die star-ken Verben begrenzt, partiell führen sie in ihrer Gesamtheit zur Veränderung des gesamten verbalen Flexionssystems: zur Herausbil-dung der schwachen von einer germanisch besonderen zu der neu-hochdeutsch regelmäßi-geen Normalflexion. In diesen Zusam-menhang gehören Angleichungen innerhalb der schwachen Flexionsklassen, Angleichungen der Endungsflexivik der starken an die der schwachen Flexion, der Wechsel zahlreicher starker zu den schwachen Verben, die Über-nahme der schwachen Flexionsweise auch bei einigen besonderen Verben sowie auch die automatische Übernahme der schwachen Flexionsweise bei neu in den Wortschatz auf-genommenen Verben. Die Entwicklung der schwachen zur neu-hochdeutsch “regelmäßi-geen” oder “Normalflexion” bedeutet für den im Frühneu-hochdeutschen vollzogenen Pro-zeß bei den starken Verben, daß es sie als ei-genständige Klasse spätestens seit der Auf-klärung nicht mehr gibt (vgl. Augst 1975: 263); sie haben als Ausnahmen zu gel-ten. Die noch alt-/mittelhochdeutsche For-menvielfalt der besonderen Verben wird im Frühneu-hochdeutschen reduziert, in einigen Fällen wird auch die schwache Flexion durchgesetzt (bei mhd. *tugen*, *gunnen*, *sollen*), teilweise werden die Besonderheiten in ande-rer Weise aufgegeben (*beginnen* ist nurmehr stark). Besonders die Veränderungen bei den besonderen Verben sowie auch die Reduktion des “Grammatischen Wechsels” und stärkere Systematisierung des Ablauts bei den starken Verben zeigt eine (partielle) Aufhebung von Suppletion zugunsten geregelter Alternatio-nen; hier liegt ein als Stamm- oder **morpholo-gisches Prinzip** bezeichneter Prozeß zur ein-heitlichen Wurzel-/Stammstruktur in allen Flexionsformen vor.

Die Herausbildung einer schwachen Verbflexion ist eine das Germanische vom Indo-germanischen typologisch unterscheidende Neuerung (vgl. Schmidt 2<sup>1998</sup>: 995 f.). Das schwache (endungsflexivische) Prinzip wird zum Merkmal der zumeist derivierten Verben; das starke (wurzelflexivische) Prinzip des Ablauts (seltener auch der Reduplikation) erweist sich als das zunehmend abgebaute Prinzip des zumeist schon dem Indo-germanischen angehörenden Grundbestandes an Verben. Die (Wort)Bildung der neuen und schwach flektierten Verben des Germanischen erfolgt suffixal: Die ausdrucksseitig unterschiedenen **Stämme** (durch die stammbildenden Suffixe \*-ja, \*-ō, \*-ē, \*-na) definieren im Germanischen vier Klassen schwacher Verben. Dabei ist jedoch schon für das Althochdeutsche fraglich, inwieweit dieses “Stammelement” noch “als Kennzeichen einer paradigmatischen Struktur” (Simmler 1987: 135) segmentierbar ist. Wenn für das Althochdeutsche trotzdem noch schwache **Stammklassen** (vgl. Sonderegger 1979; <sup>2</sup>2000; Braune <sup>14</sup>1987) unterschieden werden, dann zeigt sich das deliminative Kriterium (Übereinstimmung in der phonologischen Substanz des Auslauts, d.h. des ursprünglichen Stammelements in allen Wortformen) jedoch nur noch teilweise; die übliche Klasseneinteilung des Althochdeutschen ist somit vorwiegend historisch und nicht synchron motiviert. Es werden unterschieden: die -ien/-en-Verben (< germ. \*-jan) als schwache Verben der Klasse I (z.B. deverbal-kausativ: *se(z)zen* zu *si(z)zen*), die -ōn-Verben als Klasse II (z.B. denominal-instrumental/ornativ: *salbōn* zu *salba* ‘Salbe’), die -ēn-Verben (unter Einschluß der germanischen \*-nan-Verben) als Klasse III (z.B. denominal-ingressiv/inchoativ: *altēn* ‘alt werden’). Dabei erweisen einzelne Oppositionen das noch teilweise Funktionieren der alten Stammklassenelemente (vgl. Wolf 1981: 200): ahd. *rōten* ‘rot machen’ (< \*rōt-jan) neben *rōtēn* ‘rot werden’ (< \*rot-ē-n); darüber hinaus zeigen sich die einzelnen Klassen als mehr oder weniger produktiv: Alle lateinischen Lehnwörter schließen sich der Klasse II an (vgl. Russ 1987: 336). Möglicherweise begründet hier die hohe Type-Anzahl dieser Verben ihre historische Produktivität: Von den ca. 1798 althochdeutsch schwachen Verben (vgl. Russ 1987: 336) gehören zu Klasse I 860 Lexeme, zu Klasse II 660 Lexeme, zu Klasse III nur 278 Lexeme. Formalmorphologisch scheinen die ursprünglichen Ableitungs- oder Stammsuffixe

im Althochdeutschen eindeutig: -i-, -ō-, -ē gelten als jeweiliger Bindevokal (vgl. Braune <sup>14</sup>1987: § 306) zwischen der nur historisch/etymologisch zu fassenden Wurzel und dem jeweiligen Endungsflexiv. Diese Wertung enthält jedoch ein Problem, da -ō/-ē in allen Formen des jeweiligen Verbs erscheinen; sie erweisen sich als Bestandteile eines paradigmatisch nicht mehr in Wurzel oder Stamm (bzw. Stammelement oder Flexiv) segmentierbaren Morphs. Gegenüber dem Germanischen wird die Klassifizierung im Althochdeutschen verkompliziert, da aufgrund phonologisch zu fassender Veränderungen bei einem Teil der Verben aus Klasse I der “Bindevokal” (-i-) innerhalb des Präteritums und des flektierten Part. Prät. zum Althochdeutschen hin ausgesunken ist; als Folge daraus (nicht eingetretener Umlaut) hat sich der einige schwache Verben bis heute charakterisierende “Rückumlaut” (*brennen* vs. *brannt*) herausgebildet. Aus der (sekundären) Berücksichtigung dieser **apophonischen** Varianten (mit Vokalwechsel) sowie in erster Linie der historisch/etymologisch bestimmten Stammklassen und der ihnen entsprechenden Bindevokale (im Präteritum und flektierten Part. Prät.) wird für das Althochdeutsche ein Fünfklassensystem der schwachen Verben definiert (vgl. Sonderegger 1985: 1023), die sich jedoch endungsflexivisch, von wenigen Ausnahmen abgesehen, identisch verhalten:

- I.1: mit Vokalwechsel/ohne Bindevokal (*brennen*, *branta*);
- I.2: ohne Vokalwechsel/ohne Bindevokal (*hören*, *hōrtā*);
- I.3: ohne Vokalwechsel/mit Bindevokal -i- (*legen*, *legita*);
- II.: ohne Vokalwechsel/mit Bindevokal -ō- (*machōn*, *machōta*);
- III: ohne Vokalwechsel/mit Bindevokal -ē- (*tagēn*, *tagēta*).

Die zum Mittelhochdeutschen eintretende Abschwächung der vollen Nebensilbenvokale verändert die Klassifizierung; das -e- der Nebensilbe wird als Bestandteil des Flexivs gewertet. Das Vorhandensein/Fehlen dieses Bindevokals im Präteritum wird zum zentralen Klassifizierungskriterium (vgl. Paul <sup>24</sup>1998: § 265):

- I.1: mit Vokalwechsel/ohne Bindevokal (*brennen*, *branta*);
- I.2: ohne Vokalwechsel/ohne Bindevokal (*teilen*, *teilte*);
- II: ohne Vokalwechsel/mit Bindevokal (*legen*, *legete*).

Da ein ausdrucksseitiges Kriterium für den Gebrauch des *-e-* nicht vorliegt (mit Ausnahme der Kopplung an den Vokalwechsel), ist das mittelhochdeutsche Inventar beider Klassen nur noch partiell durch die althochdeutsche Zugehörigkeit bestimmt. Dies ergibt sich allein schon durch das immense Anwachsen des schwach flektierten Verbwortschatzes (durch Wortbildung, Entlehnung) auf mehr als 5000 Verben (vgl. Sonderegger 1979: 258). Doch auch das jeweils ererbte Flexionsverhalten der einzelnen Lexeme ist aufgrund mehrerer Ursachen nicht klassenstabil. Zwar wird als maßgeblich für das mittelhochdeutsche Vorhandensein des Bindevokals die Quantität der Silbe genannt (vgl. Hempen 1988: 254), doch wird unabhängig davon *-e-* „vielfach“ synkopiert (Paul<sup>24</sup>1998: § 265). Dies führt zur Vermischung der althochdeutsch getrennten Klassen I.2. und II. Auch das Inventar der apophonisch funktionierenden Lexeme stimmt aufgrund der Wirkungen des „Sekundärumlauts“ sowie „anorganisch“ eintretender Rückumlauten (z. B. *kēren – karte* oder *enden – ante*) nicht mehr mit dem der althochdeutschen Gruppe überein (vgl. Paul<sup>24</sup>1998: § 259–266). Obwohl die Gruppe der Verben mit einer apphonischen Wurzelflexion im Mittelhochdeutschen stark anwächst (über 200), nimmt ihr relativer Anteil am Gesamt aller schwachen Verben stark ab. Dieser Prozeß wird im Frühneuhochdeutschen noch wesentlich verstärkt. Es verschmelzen während des Frühneuhochdeutschen auch die im Mittelhochdeutschen noch hinsichtlich des Bindevokals unterschiedenen Klassen. Die Entwicklung verläuft wiederum über eine Vermischung der historischen Gruppen, so z. B. *teilete* (mittelhochdeutsch ohne Bindevokal), aber *legte* (mittelhochdeutsch mit Bindevokal). So erweist sich schon zu Beginn des Frühneuhochdeutschen der Gebrauch des Nebensilben-*e* nurmehr deutlich phonologisch distribuiert. Trotz eines deutlichen Anstiegs in der Verwendung des *-e-* vor allem im Oberdeutschen des 16. Jahrhunderts ist die neuhochdeutsch gültige Regelung eines beibehaltenen *-e-* nur nach Dental in der zweiten Hälfte des 17. Jahrhunderts usuell (vgl. Ebert et al. 1993: § M90.2.); es gibt nurmehr eine Klasse schwacher Verben (mit nach Dental eintretendem Bindevokal *-e-*). Die (neuhochdeutschen) Ausnahmen innerhalb der schwachen Flexion bestimmen sich durch den als Rückumlaut bezeichneten Vokalwechsel z. B. *brenn-* (Inf./Präs./Part. Präs.) zu *brann-*

(Prät./Part. Prät.). Im ausgehenden Frühneuhochdeutschen funktionieren gemäß diesem Muster zusätzlich zu den neuhochdeutsch erhaltenen (*denken* und synchron analog auch *bringen, brennen, nennen, rennen, senden, wenden*; daneben einige semantisch isolierte und erstarre Formen, z. B. *abgeschmackt* zu *schmecken, behaftet* zu *heften, getrost* zu *trösten*) auch noch z. B. *legen, trennen, schenken, schätzen, setzen, zerren* (vgl. Hoffmann & Solms 1987: 53 f.). Innerhalb des **Ausgleichsprozesses** zugunsten der stamminvarianten Flexion ist in nur wenigen Fällen ein Ausgleich auch zugunsten der (rückumlautenden) Prät./Part. Prät.-Form eingetreten (z. B. mhd. *bestellen* – *bestalte* > nhd. Inf. *bestallen* neben *bestellen*). Das Gesamtinventar der mittelhochdeutsch rückumlautenden Verben umfaßt noch zum mindesten 221 Lexeme (vgl. Weinhold<sup>25</sup>1883: § 383). Die Ausgleichung findet dann erst im Frühneuhochdeutschen statt, begünstigt durch die schon im älteren Mittelhochdeutschen und in der ersten Hälfte des Frühneuhochdeutschen gültige sprachlandeskundliche Differenzierung (vgl. Stärck 1912: 308): *brennen – brante – gebrant* im Mitteldeutschen versus *prennen – prant – geprennet* im Oberdeutschen. Insbesondere vom Oberdeutschen ausgehend („oberdeutscher Präteritumschwund“, d. h. Rückgang des Gebrauchs finiter Prät.-Formen und Zunahme der periphrastischen Tempusform) greift im Verlauf des Frühneuhochdeutschen der Ausgleich zugunsten der Form des Inf./Präs. (und oberdeutsch auch Part. Prät.). Die Entwicklung zeigt sich als Rückbau einer flexivischen „Übercharakterisierung“ (durch Dentalsuffix und zusätzlichen Vokalwechsel) des Präteritums (Schirmunski 1962: 501) zugunsten einer als morphologisches Prinzip bezeichneten Stabilität des Stammes in allen Positionen des Paradigmas.

Das im Althochdeutschen paradigmatisch wie regional noch differenzierte System der Flexionssuffixe erfährt bis zum ausgehenden Frühneuhochdeutschen eine Vereinfachung, die eine Tilgung teils paradigmatisch und teils auch regional isolierter Flexive darstellt. Die differenzierte Flexivik des Althochdeutschen bestimmt jedoch keine ausgeprägten klassenbezogenen und/oder morphosyntaktisch bezogenen Paradigmen: So liegen einzelne klassenbezogene Unterschiede z. B. bei der 1. Sg. Ind. Präs. vor (starke sowie schwache Verben der Klasse I mit *-u*, schwache Verben der Klassen II/III mit *-m*); klassenindifferente Unterschiede hinsichtlich der morphosyntak-

tischen Merkmale liegen z. B. bei der Modusdifferenzierung der 1. Sg. Präs. vor (Ind. *-u/-m* zu Konj. *-e*); klassendifferente Unterschiede hinsichtlich der morphosyntaktischen Merkmale liegen z. B. vor bei der 2. Pl. Präs. (Variation *-etl/-ent* bei starken sowie schwachen Verben der Klasse I, *-t* bei schwachen Verben der Klassen II/III). Dabei zeigt schon das Althochdeutsche klassen- wie merkmalsübergreifenden Ausgleich, so z. B. von der Konjunktivform schwacher Verben ausgehende Verallgemeinerung von *-st* in der 2. Sg. (beibehaltene Besonderheit: *-i* im Präteritum starker Verben). Die Entwicklung zum Mittelhochdeutschen ist einerseits geprägt durch den Zusammenfall der Nebensilbenvokale in *-e* (Aufhebung der ausdrucksseitigen Oppositionen z. B. 1. Sg. Ind. Präs. *-u* und 1. Sg. Konj. Präs. *-e*); andererseits kommt es zur An- und Ausgleichung innerhalb der wenigen eine Variation aufweisenden morphosyntaktischen Merkmale (z. B. 1. Sg. Ind. Präs.): So weit es sich um eine auch klassendifferente Variation handelt (1. Pl. *-mēs, -en*), ist die Variation schon zum Ende des Althochdeutschen aufgegeben; dort, wo die Variation zugleich eine Klassendifferenzierung berührt, verläuft die Entwicklung bis in das Frühneuhochdeutsche hinein (z. B. flexivische Besonderheit der 2. Sg. Ind. Prät. bei den starken Verben). Bis auf wenige Positionen (3. Pl. Ind. Präs. *-ent* zu 3. Pl. Konj. Präs. *-en* sowie bis in Neuhochdeutsche erhaltener Unterschied bei 1./3. Sg. Ind. Prät. starker/schwacher Verben: z. B. *gab-* versus *sagt-e*) erscheint die Endungsflexivik im Normalmittelhochdeutschen sowohl zwischen starken und schwachen Verben als auch hinsichtlich Präs./Prät. oder Ind./Konj. weitgehend ununterscheidbar (vgl. Paul<sup>24</sup>1998: § 239, 257). Eine notwendige Berücksichtigung der Varietäten in mittelhochdeutscher Zeit erweist die Verhältnisse jedoch als nicht ganz so eindeutig (z. B. erscheint Flexiv-*n* der 1. Sg. Ind. Präs. besonders westoberdeutsch und -mitteldeutsch klassenunabhängig und schwindet weitgehend erst im 16. Jahrhundert; vgl. Paul<sup>24</sup>1998: § 367, 395; Ebert et al. 1993: § M88). Im Verlauf des Frühneuhochdeutschen werden durch Ausgleicherscheinungen die schon im Mittelhochdeutschen (paradigmatisch oder regional) isolierten Endungsflexive aufgegeben. Gänzlich erfolgt dies hinsichtlich der Flexion der 2. Sg. Ind. Prät. starker Verben durch einerseits *-e* und andererseits die (umgelautete) Wortform des Prät. Pl. (*gaeb-e* > *gab-st*); nurmehr zeitlich und regional be-

grenzt hinsichtlich der 1./3. Sg. Ind. Prät. der starken Verben, die insbesondere in der zweiten Hälfte des Frühneuhochdeutschen oft mit Relationsmorph *-e* erscheint ("lutherisches *-e*"; vgl. Hoffmann & Solms 1987: 42–46). Die Flexion der 3. Pl. Ind. Prät. (mittelhochdeutsch *-ent*) ist überlagert von einer bis in das 17. Jahrhundert reichenden Entwicklung "mit sprachlandschaftsinterner und teilweise erheblicher zwischenlandschaftlicher Variation", durch die spezifisch landschaftliche Paradigmen herausgebildet werden (Ebert et al. 1993: § M74; Tendenz z. B. zum Einheitsplural *-et*).

Schon für das Althochdeutsche zeigt sich die definierende Eigenschaft des starken Verbs, seine "Tempusstämme nur durch den Vokalwechsel zu unterscheiden" (Braune<sup>14</sup>1987: § 324), als Ergebnis einer vorausliegenden Entwicklung. Während die Unterscheidung im Indogermanischen und partiell noch im Germanischen auch aufgrund konsonantischer Variationen des Stammes, suffizialer und auch präfixaler Elemente erfolgt, sind solche Möglichkeiten im Althochdeutschen weitgehend geschwunden. Entsprechend den vier überkommenen Ablautstufen werden für den Großteil starker Verben vier primäre Tempusstämme ("Stammformen", bei Berücksichtigung der indogermanischen/germanischen Sprachgeschichte ist statt vom Stamm besser von "Wurzel" zu sprechen) unterschieden: z. B. *rītan* (Präs./Inf.) – *reit* (1./3. Sg. Ind. Prät.) – *riten/riti* (1. Pl. und 2. Sg. Ind. Prät.) – *giritan* (Part. Prät.). Innerhalb des Präteritums der Klassen I–V dient der qualitative/quantitative Ablaut zusätzlich auch als Numerusablaut; Klasse VI und VII (ehemals **reduplizierende Verben**) haben im Singular und Plural einen jeweils identischen Stamm (z. B. VI: ahd. *wahsan* – *wuohs* – *wuohsun/wuohsi* – *giwahsan*). Die Divergenz zwischen 4 Ablaut-, aber nur 3 Zeitstufen stellt ein funktionales Mißverhältnis dar (vgl. Augst 1975: 251), das über das Althochdeutsche hinaus bis in das Frühneuhochdeutsche vorliegt. Eine Entwicklung setzt erst im Frühneuhochdeutschen ein, es werden die jeweiligen Numerusablauten weitgehend seit der zweiten Hälfte des 15. Jahrhunderts zumeist zugunsten einer der beiden Tempus-Alternanten ausgeglichen: z. B. ahd./mhd. (Sg./Pl.) *reit/riten* wird nhd. *ritt/ritten*, ahd./mhd. *fand/funden* wird nhd. *fand/fanden*. Der Ablaut hat nun erst zum Neuhochdeutschen hin "seine wahrhaft funktionelle Geltung erlangt" (Paul<sup>5</sup>1920: 211): Die morphologische Kategorie

des Tempus erscheint flexivisch profiliert. Eine über den Ablautausgleich bestimmte Periodengrenze des Frühneuhochdeutschen zum Neuhochdeutschen hin ist nicht eindeutig zu ziehen, da der konkrete Ausgleichsprozeß durch mehrere chronologisch versetzt wirksame Prinzipien gesteuert ist. Während der Ablautausgleich bei den starken Verben der Klassen I (z. B. *rīten*) und II (z. B. *bieten*) schon zum Ende des 17. Jahrhunderts lange abgeschlossen ist, bleibt die Entwicklung bei Klasse III und hier vor allem bei Verben mit Nasalverbindung nach dem Wurzelvokal (Subklasse IIIa, z. B. *finden*) zum Ende des 17. Jahrhunderts noch unabgeschlossen. Für den raschen Ausgleich in Klasse I und II wird eine strukturelle Disposition darin gesehen, daß der Stammvokal des Partizip Präteritums mit jenem des Singular oder Plural Präteritums übereinstimmte. Hier liegt ein **intraparadigmatischer Ausgleich** vor, der ohne Einfluß seitens einer anderen Ablautmöglichkeit eintrat (vgl. Behaghel 1928: §436). Eine identische Disposition weisen auch die Verben der Klasse IIIa auf (mhd. *finden* – *fand* – *fund* – *gefunden*). Ihr Ablautausgleich ist jedoch zum Ende des Frühneuhochdeutschen nicht nur nicht entschieden, sondern die Richtung des im Neuhochdeutschen letztlich erreichten Ausgleichs (*fand* – *fanden* statt *\*fund* – *\*funden*) widerspricht vielmehr auch der Annahme einer wirksamen und das Part. Prät. einschließenden strukturellen Disposition: Die zugunsten des Sg. Prät.-*a* ausgleichende Entwicklung ist als eine interparadigmatische und an das Ablautmuster der starken Verben der Klasse IV/V (z. B. *nēmen/gēben*) angelehnte Ausgleichung zu werten. Das Ergebnis ist jedoch weniger das Ergebnis eines unbewußt vollzogenen Wandels, als vielmehr des bewußten und die Entwicklung beeinflussenden Eingreifens der normierenden und einem Konzept der Analogie verpflichteten Grammatiker des 18. Jahrhunderts (Gottsched und Adelung; vgl. Solms 1993). Im Rahmen dieses schon intentionalen Prozesses werden weitere, im fröhneuhochdeutscher Zeit begonnene und das Flexions- und Klassifikationssystem der starken Verben verändernde Entwicklungen weiter forciert. So kommt es insbesondere zum ausgehenden Frühneuhochdeutschen zum internen **Klassenwechsel** einiger starker Verben; es erscheinen dominante Ablautmuster herausgebildet (**interparadigmatischer Ausgleich**), wodurch die noch althochdeutsche Systematik der starken Verben endgültig aufgehoben ist.

Über den Ablautausgleich hinaus findet in einigen Fällen ein Ausgleich zugunsten der -o- aufweisenden Stammform des Part. Prät. statt, z. B. bei *melken*, *fechten*, *glimmen*. Hier erscheint die Reduzierung und Konzentration auf nurmehr eine Stammform für die Tempusinformation „Vergangenheit“ (sei es finit oder periphrastisch mittels des Part. Prät.) konsequent fortgesetzt; vor dem Hintergrund des im Oberdeutschen seit dem 15. Jahrhundert beobachteten „Präteritumswundes“ zugunsten der Peripherase ist die intraparadigmatische Orientierung am Part. Prät. nur die konsequente Fortsetzung der flexivischen Profilierung des Tempus. Darüber hinaus verlieren einige weitere Lexeme ihren ursprünglichen und partiell bis über das 18. Jahrhundert erhaltenen Ablaut und übernehmen in einem interparadigmatischen Ausgleich ebenfalls den Stammvokal -o- (z. B. mhd. *heben* – *huob* – *geheben* > nhd. *heben* – *hob* – *gehoben*). Zum ausgehenden Frühneuhochdeutschen werden somit dominante Ablautungen herausgebildet, die ihrerseits zum Zielpunkt von Veränderungen werden: Die dominanten Ablautungen mit -i/e- (z. B. *schreiben* – *schrieb* – *geschrieben*) oder -o- umfassen zum Neuhochdeutschen hin ca. 51 Prozent aller starken Verben (vergleichsweise mittelhochdeutscher Anteil ca. 31 Prozent; vgl. Solms 1984: 71 f.).

Eine Vereinfachung sowohl hinsichtlich der Anzahl flexivischer Muster als auch hinsichtlich der Verallgemeinerung des einfachsten Musters zeigt die Stammalternation in der Präsensflexion der starken Verben. Die aufgrund vorgängig phonologischer Entwicklungen zum Althochdeutschen hin entstandenen drei Muster „sekundärer“ und d. h. nicht durch Ablaut erzeugter Stämme (ohne Alternation; Vokalwechsel im Ind. Sg., z. B. Inf. *wērdan* mit 1. Sg. Ind. *wirdū*, 2. Sg. Ind. *wirdis*, 3. Sg. Ind. *wirdit*; Vokalwechsel nur in 2./3. Ind. Sg., z. B. *varan* mit *varu*, *veris*, *verit*) wird im Verlauf des Frühneuhochdeutschen auf nurmehr zwei Muster reduziert (ohne Alternation; Vokalwechsel in 2./3. Ind. Sg, z. B. auch *werden* mit 1. Sg. Ind. *werde*, *wirdest*, *wirdet*).

Während die Anzahl starker Verben vom Althochdeutschen (349) bis zum Mittelhochdeutschen (339) weitgehend gleich bleibt, ist zum Neuhochdeutschen (169) hin ein deutlicher Schwund eingetreten (vgl. Solms 1984: 23, Anm. 33): starke Verben gehen zum Neuhochdeutschen hin unter (z. B. *biten*) oder nehmen schwache Flexion an (z. B. *gīgen*; vgl.

Solms 1984: 27 f.). Die Übernahme der schwachen Flexion zeigt sich strukturell disponiert bei Identität des Stammes von Inf./Präs. mit dem des Part. Prät., so z. B. bei Verben der Klasse VII wie *valten* – *vield* – *gevalten* (*falten* – *faltete* – *gefaltet*) (vgl. Schirmunski 1962: 504; Solms 1984: 323 f.).

## 5.2. Flexion der Substantive

Die diachron motivierte Klassifizierung der deutschen Substantiv unterscheidet seit dem Althochdeutschen „starke“ (differenzierte flexivische Realisierung der morphosyntaktischen Kategorien) und „schwache“ (flexivisch weniger differenziert, im Neuhochdeutschen nur -en in allen obliquen Kasus) Substantiv. Die Unterscheidung überlagert die für das Germanische über Stammsuffixe definierte Stammklassengliederung, deren Gültigkeit das Inventar der althochdeutsch vollvokalisch erhaltenen Endungsflexive sowohl am partiell markierten Nom. Sg. (z. B. kann Endung -o nur mask. n-Stamm sein, z. B. *hano*) als auch über zahlreiche paradigmatische Oppositionen (z. B. Instr. Sg. *tagu* zu Gen. Pl. *tago* beim mask. a-Stamm) noch erweist.

Bereits im Althochdeutschen sind genusbezogene Hauptklassen profiliert: die „schwache“ n-Deklination (alle Genera), die „starke“ a-(Maskulinum, Neutrum), ô- (Femininum) und i-Deklination (Maskulinum, Femininum); neben den Hauptreihen existieren einige kaum repräsentierte Restklassen, deren Inventar zumeist bereits von den Hauptreihen aufgesogen ist (besonders -iz/-az-Stämme in die a-Deklination; vgl. Wolf 1981: 197). Über die flexivische Angleichung verschiedener Klassen ist im Althochdeutschen gegenüber dem Germanischen zugleich die Tendenz deutlich, flexivische Kasusunterscheidungen einzubauen, z. B. in der weitgehenden Aufhebung der Distinktion Nom. versus Akk. Sg. bei den germanischen a-Stämmen (gotisch Nom. Sg. *dag-s* und Akk. Sg. *dag*, ahd. Nom./Akk. *tag*; vgl. Hirt 1932: § 38), z. B. auch in der weitgehenden Aufgabe des Instrumentals. In der Folge erweisen die weiteren flexivischen Entwicklungen eine vorwiegende **Numerusprofilierung** bei gleichzeitiger **Kasusnivellierung**; dabei wird die Wurzelflexion aus-, die Möglichkeit der regressiven Flexion stark abgebaut. Die Flexion bleibt im Althochdeutschen noch weitgehend regressiv gesteuert, der (Primär)umlaut erscheint lautgesetzlich verteilt und somit stammklassenbezogen sowohl im Singular als auch im Plural (z. B. Dat. Sg. und auch Nom./Akk. Pl. *ensti* zum fem. i-Stamm *anst* ‘Gunst’). Die Umlautformen werden teilweise schon im Verlauf

des Althochdeutschen aufgegeben, so daß die für das Deutsche formulierte Tendenz zu umlautlosem Singular und allenfalls umgelautesem Plural bereits im Althochdeutschen greift (vgl. Sonderegger 1979: 309). Die wesentliche Umgestaltung des althochdeutschen Flexionssystems wird dann durch den zum Mittelhochdeutschen eingetretenen Zusammenfall der vollen Nebensilbenvokale in -e bewirkt, wodurch ein strukturell grundsätzlich neues Flexionssystem entsteht (vgl. Stopp 1974): Es werden die meisten paradigmatischen Distinktionen eingeebnet (z. B. Zusammenfall der Plural-Flexivreihe der a- und i-Deklination, z. B. Nom/Akk. Pl. *tag-/gest-e* aus *-a/-i*), so daß das Inventar der segmentierbaren Flexive von 52 auf 16 im Mittelhochdeutschen reduziert ist (vgl. Sonderegger 1979: 246). Strukturell wirkt sich dieser Vorgang in mehrfacher Weise aus. Einerseits wird nun zusätzlich zur regressiven Endungsflexion auch die Wurzelflexion (Umlaut) genutzt. Der Umlaut erscheint analog übertragen auch bei Lexemen, bei denen er historisch nicht entwickelt ist, so z. B. bei mask. a-Stämmen (z. B. Nom. Pl. *nagele* neben *negele*) oder den angegliederten Restgruppen (z. B. r-Stamm *veter(e)* neben *vater(e)*; vgl. Paul<sup>24</sup> 1998: § 177; Wolf 1981: 198); damit erhält der Umlaut eine deutlichere flexivische Signifikanz als Kennzeichen des Plurals. Andererseits ist durch die eingetretene Uniformierung der Nebensilbe “automatisch die Grenze zwischen Stamm und Flexionsendung hinter die alte Flexionsendung” (Wegera 1987: § 11) verschoben: Es kommt zu der für das Mittelhochdeutsche wesentlichen Veränderung einer nurmehr zweigliedrigen Wortstruktur von Stamm und Flexionszeichen, durch die der Nom. Sg. zur unmarkierten Grundform wird (vgl. Paul<sup>25</sup> 1989: § 174; Klein 1987: 155). Relational dazu wird das ursprüngliche Stammbildungssuffix -er (germ. \*-iz/-az) zum Plural-Kennzeichen profiliert und nun auf eine Reihe weiterer, zum Teil im Mittelhochdeutschen erstmals belegter Lexeme übertragen (z. B. *cleid* – *cleider*). Ebenso wird nun bei allen Substantiven, deren Plural im Althochdeutschen durch vokalisches Flexiv gebildet wird (z. B. Nom. Pl. *taga*, *gebâ*, *listi*), das -e zu einem der vorwiegenden mittelhochdeutschen Plural-Flexive, das insbesondere im Mitteldeutschen auch auf bisher nicht markierte Fälle übertragen wird (besonders neutr. a-Stämme, z. B. Nom./Akk. Pl. *wort* > *worte*). Damit ist schon im Mittelhochdeutschen die Tendenz zur eindeutigen

Kennzeichnung der Numerusopposition deutlich (vgl. Wolf 1981: 199). Dieser Prozeß wird allerdings durch die seit dem 13. Jahrhundert zuerst im Oberdeutschen eintretende Apokope und die damit eintretende Zerstörung der über -e geleisteten Plural-Kennzeichnung überlagert. Dies prägt die schreibsprachliche Entwicklung bis in das 16. Jahrhundert hinein. Dabei lassen sich die fröhneuhochdeutschen Entwicklungen insgesamt als zwei Großprozesse beschreiben: Über eine Umorganisation vorhandener flexivischer Mittel (z. B. -er, -en, Umlaut; vgl. Wegera 1987: § 63) wird der bisher unbezeichnete (mittelhochdeutsche neutr. a-Stämme, z. B. *wort* – *wort*) oder durch Apokope unbezeichnet gewordene Plural „durch deutliche und sichere Flexive“ markiert (Wegera 1987: § 11); durch eine (flexivische) Nivellierung der Kasus (z. B. Abbau der -en-Flexive in obliquen Kasus bei Feminina oder gegenläufig auch Übertragung des -en in den Nom. Sg.; vgl. Wegera 1987: § 48), die über andere analytisch-syntaktische Möglichkeiten zum Ausdruck gelangen, erfolgt paradigmatisch eine Profilierung des Numerus (Plural). Da beide Prozesse (zumindest teilweise) genussgesteuert verlaufen, zeigt sich neben Kasusnivellierung und Numerusprofilierung im Verlauf des Fröhneuhochdeutschen implizit ebenfalls eine **Genusprofilierung** (vgl. Wegera 1987: § 11, 18). Schon im 16. Jahrhundert deutet sich aus dem von der Apokope weitgehend unberührt gebliebenen Obersächsischen kommend eine Restituirung des Plural-e an, das im 17. Jahrhundert zunehmend wieder in der Schriftsprache verwendet wird. Hier spielt die Bibelübersetzung Luthers und ihre Verbreitung eine herausragende Rolle („lutherisches -e“); es wirkt jedoch auch die „strukturelle Überlegenheit des omd. Systems“: Hinsichtlich einer „konsequenteren Numerusmarkierung durch das Plural-e“ entsprach dieses schreiblandschaftlich ausgebildete System „der Tendenz zur Numerusprofilierung besser als die nur ansatzweise durchgeführten Numerusunterscheidungen mit Hilfe anderer Flexive“ (Wegera 1987: § 95). So wird das Plural-e „vielfach wieder zur bevorzugten Pluralbildung bei Lexemen, die in davorliegenden Zeiträumen andere Pluralbildungen angenommen hatten“ (Wegera 1987: § 72). Zum Neuhochdeutschen hin ist -e zum wichtigsten Numerusflexiv innerhalb des Kernwortschatzes herausgebildet (vgl. Augst 1975: 37). Daneben hat die Kombinierbarkeit des Umlauts mit suffixalen Flexiven zum

Neuhochdeutschen deutlich zugenommen (vgl. Sondergger 1979: 246); mit dem Umlaut nicht kombinierbar sind neuhochdeutsch allein die nicht-fremdsprachlichen Pluralflexive -s und -en.

### 5.3. Flexion der Adjektive

Die Flexionsgeschichte der Adjektive ist insbesondere innerhalb der gesamten Substantivgruppe als Durchsetzung einer Artikel- sowie **Gruppenflexion** zu beschreiben, die sich sowohl an konkreten flexivischen Veränderungen als auch in der Aufgabe einer Flexion des prädikativen Adjektivs zeigt: **Artikelflexion** meint einerseits die grammatische Abhängigkeit vom und andererseits die Funktionalisierung auf das bezogene Substantiv hin (das Adjektiv realisiert die morphosyntaktischen Merkmale des Substantivs); dabei wird das Adjektiv in Abhängigkeit von der ausdrucksseitig vorhandenen Markiertheit der Substantivgruppe „determinierend“ (genusdifferenzierend im Nom. Sg.: *ein lieber Junge*, *ein liebes Kind*) oder „indeterminierend/attribuierend“ (genusindifferent im Nom. Sg. -e: *der liebe Junge*, *das liebe Kind*) flektiert. „Gruppenflexion“ meint die tendenzielle Flexivdistribution in Abhängigkeit besonders von der Markiertheit des Substantivs selbst: „starke“ Adjektivflexion bei fehlendem substantivischem Kasusflexiv (*groß-er Liebe fähig sein*), „schwache“ Adjektivflexion bei vorhandenem substantivischem Kasusflexiv (*groß-en Mutes fähig sein*).

Die das Adjektiv innerhalb der Hauptwortarten charakterisierende Artikelflexion ist bereits im Althochdeutschen usuell, die Regelung wird im Fröhneuhochdeutschen endgültig fest. Diese „Formregel“ („mechanische Regelung“, Behaghel 1923: § 10) löst eine frühere „Sinnregel“ ab, bei der über die Flexion des Adjektivs primär eine ko- oder kontextuelle (Un)Bestimmtheit signalisiert wurde. Dabei stimmen die vordeutschen Flexionsparadigmen der Adjektive weitgehend mit denen der Substantive überein (vgl. Kern & Zutt 1977: 109). Aufgrund jedoch einer den Pronomen identischen Verwendungsweise treten schon im Germanischen zunehmend auch pronominale Formen neben die ursprünglichen nominalen (vgl. Kern & Zutt 1977: 110 f.). Die Durchsetzung dieser pronominalen Flexive ist beim Adjektiv mit dem 16. Jahrhundert abgeschlossen; sie führt zur flexivischen Angleichung von Adjektiv und Pronomen, die sich ähnlich auch bei den Pronomen zeigt, z. B. Dat. Pl./Gen. Pl. des Per-

sonalpronomens *in* > *inen*, *ir* > *irer* oder Gen. Sg./Pl. *des* > *dessen*, *der* > *deren*, *wes* > *wessen* (vgl. Walch & Häckel 1988: § 12.2., Anm. 34). Eine Angleichung der adjektivischen und pronominalen Flexion erweist sich schließlich insbesondere “in der Durchsetzung der Regelung des grammatisch determinierenden/indeterminierenden Flexionsprinzips auch beim Poss. Pron., den Pnominaladj. (und sehr selten auch Pnominalsubst.)” (Ebert et al. 1993: § M60). In diesem Zusammenhang ist die Adjektivflexion als eine Gruppenflexion herausgebildet, für die im Verlauf des 16. Jahrhunderts ein “monoflexivisches Prinzip” usuell wird (vgl. Brinkmann 1964: 96; Solms & Wegera 1991: § 143): Die morphosyntaktischen Kategorien des Substantivs werden tendenziell nur an einer Stelle der gesamten Substantivgruppe ausdrucksseitig signalisiert (*der großer Mut* > *der groß-e Mut*; *groß-es Mutes fähig sein* > *groß-en Mutes*); eine ähnliche Entwicklung zeigt sich im Frühneuhochdeutschen vereinzelt auch beim Pronomen: *meinen Wissens*. Parallel der flexivischen Entwicklung wird die Flexionsmöglichkeit bis zum 16. Jahrhundert auf nurmehr die attributive/substantivierte Verwendung begrenzt; die bis in die erste Hälfte des Frühneuhochdeutschen noch mögliche Flexion auch des prädikativen Adjektivs (*ein Baum ist größer*) wird aufgegeben; damit werden prädiktives und adverbiales Adjektiv formal ununterscheidbar.

Markanter noch als beim Substantiv wird das Flexivinventar beim Adjektiv vom Althochdeutschen (47 unterscheidbare Flexive) über das Mittelhochdeutsche (24) zum Neuhochdeutschen hin (6) reduziert (vgl. Sonderegger 1979: 246). Die stufenweise zu verfolgende Reduzierung sowie die beobachtbare Verwendung der jeweiligen Flexive erweist mehrere Tendenzen:

- (a) Es wird eine tendenzielle 1:1-Zuordnung (Form:Funktion) auf der Ebene der “morphosyntaktischen Position” (gemeint ist z. B. ‘Nom. Sg. Mask. nach best. Art.’ oder ‘Dat. Sg. Fem. nach Präposition’; vgl. Solms & Wegera 1991: § 12) herausgebildet. Aufgrund der flexivischen Reduzierung stehen nur noch maximal zwei Flexive je morphosyntaktischem Merkmalbündel zur Verfügung, die auf der Ebene der morphosyntaktischen Position dann eindeutig disambiguierbar werden. So sind z. B. für Nom. Sg. Neutr. -(e) und -(e)s möglich, nach dem bestimmten Artikel kann jedoch nur -(e) (*das liebe Kind*), nach dem unbestimmten Artikel nur -(e)s (*ein liebes Kind*) erscheinen.

- (b) In keinem Fall wird im Frühneuhochdeutschen das flexivische Inventar der Singular-Kasus so verändert, daß eine bestehende Genusdifferenzierung aufgehoben würde. Vielmehr wird dort, wo flexivisch eine Genuspolysémie vorliegt, im Frühneuhochdeutschen eine Eindeutigkeit erreicht: “Genusprofilierung” (z. B. Profilierung des -o im Nom./Akk. Sg. zum genusmarkierenden Flexiv des Neutr. bis ins 16. Jahrhundert: Maskulinum *wahr-er Mut*, Femininum *wahr-e Liebe*, Neutr. *wahr Wort*; vgl. Solms & Wegera 1991: § 51–55).
- (c) Die im Nom./Akk. Sg. Neutr. zum späten Frühneuhochdeutschen erfolgte Verdrängung der unflektierten Form zugunsten der Flexion mit pronominalem -es liegt innerhalb des Prozesses der zwischen dem 14. und 16. Jahrhundert erfolgten formalen Ausdifferenzierung der Substantiv- und Verbalgruppe: die flexionslose Form kommt der nicht substantivischen Komponente der Verbalgruppe (als prädiktives Adjektiv), die flektierte Form der nicht substantivischen Komponente der Substantivgruppe zu.
- (d) Teilweise ergibt sich eine Kasusmarkierung im Zusammenhang der Markierungsfunktion des Adjektivs für die am Substantiv nicht markierten morphosyntaktischen Merkmale: Da sieht neben der “Kasusnivellierung” beim Substantiv eine gegensteuernde “systemerhaltende Tendenz” beim Adjektiv: Eine solche Kasus(gruppen)markierung (Nom./Akk. Pl. versus Gen./Dat. Pl.) zeigt z. B. die insbesondere im Oberdeutschen bis in das 18. Jahrhundert hinein übliche determinierende Flexion mit -e im Nom./Akk. trotz vorausgehenden bestimmten Artikels (*die liebe Kinder*) gegenüber Dat./Gen. mit -en (*den/der lieben Kinder(n)*). Eine generelle Tendenz zur Kasusmarkierung liegt jedoch nicht vor, analog zu den Pronomen (*diu, die* > *die*) wird z. B. die formale Kasusunterscheidung Nom./Akk. Sg. Fem. aufgehoben.

## 6. Wortbildung

Die geschichtliche Ausdifferenzierung von Flexion und Wortbildung erweist sich auch in der funktionalen Profilierung der formalen Ausdrucksmittel. Zwar werden bereits im Germanischen **Komposition**, **Derivation** und auch “innere Wortbildung” genutzt, doch sieht Grimm in letzterer, durch Ablaut erfolgender Wortbildung die älteste Möglichkeit, z. B. erkennbar in ahd. *faran* ‘fahren’, *fuora* ‘Fahrt’ (vgl. Grimm 1826: 1). Dieses Prinzip ist im Althochdeutschen schon nicht mehr produktiv, sondern nurmehr “aktiv” (die Wortschatzeinheiten sind morphologisch-relational motiviert); der Lautwechsel ist seitdem primär flexivisch produktiv; ausgebaut werden die Möglichkeiten der Komposition

und affixalen Wortbildung (als explizite Ableitung durch Suffixe oder als Präfigierung). Aufgrund der in den verschiedenen Wortarten unterschiedlichen Nutzung sind die einzelnen Wortbildungsarten schon im Althochdeutschen als wortartcharakteristisch ausgewiesen: Komposition bei den Substantiven, Derivation bei Substantiven und Adjektiven, Präfigierung bei den Verben (eine wortartbestimmte Bevorzugung erweisen mittelhochdeutsche Texte im Verhältnis von Ableitungen zu Komposita mit 3 : 2 bei Substantiven und 3 : 1 bei Adjektiven; vgl. Zutt 1985: 1160). Dabei zeigt sich in der parallelen Existenz einiger Morphe als noch selbständige Lexeme (z. B. starkes Maskulinum/Neutrum *tuom* ‘Urteil, Gericht, Macht, Fähigkeit’), als erster oder zweiter Teil entsprechender Determinativkomposita (*tuomtac* ‘Gerichtstag’, *cheisertuom* ‘Herrschaft des Kaisers’) sowie auch schon nurmehr als Suffix (*altruom* ‘Alter’) die ursprüngliche Herkunft affixaler Elemente: Es handelt sich um Lexeme, die aufgrund häufiger und reihenhaft empfundener Komposition ihre Selbständigkeit verlieren und zum Affix werden (z. B. auch Präfix *be-* aus der Präposition *bei*). Ähnliche Entwicklungen zeigen sich in allen Sprachstufen des Deutschen, so z. B. auch in *-zeug* (*Nährzeug*, *Werkzeug*).

Die Wortschatzerweiterung durch Wortbildung wird in der geschichtlichen Entwicklung des Deutschen zunehmend genutzt, wobei die deutlichste frequentielle Zunahme im Frühneuhochdeutschen und hier insbesondere im 16. und 17. Jahrhundert stattfindet: So liegt z. B. der Anteil derivierter/zusammengesetzter Nomen in exemplarisch ausgewählten mittelhochdeutschen Texten bei unter 10 Prozent, in entsprechenden Texten des Neuhochdeutschen dagegen bei über 50 Prozent (vgl. Zutt 1985: 1160); allein der Anteil von Komposita am Gesamt des jeweiligen Substantivwortschatzes wächst von ca. 7 Prozent in Texten des 12. und 13. Jahrhunderts auf über 18 Prozent in Texten des späten 17. Jahrhunderts. Im Bereich der Derivation wächst der Bestand desubstantivischer Verben zwischen der Früh- und Spätzeit des Frühneuhochdeutschen um ca. 125 Prozent (vgl. Prell & Scheben-Schmidt 1996: 386–388). In solchen Verhältnissen erweist sich die im Frühneuhochdeutschen konstitutive Offenheit der schriftsprachlichen Entwicklung für varietäre Einflüsse, insbesondere auch die fröhneuhochdeutsche Ausbildung und Entwicklung von Fachsprachen.

Das Inventar der Wortbildungsmittel sowie auch die semantisch-funktionalen wie morphologischen Typen der jeweiligen Wortbildungsmuster sind im wesentlichen bereits im Althochdeutschen ausgebildet (vgl. Prell & Scheben-Schmidt 1996: 380) (z. B. nominale Verbableitung des Typs ‘ornatives Verb’ mittels Verbalisierungsmorphs, z. B. *salb-ōn*). Allerdings finden wesentliche Veränderungen statt, die sich derzeit (möglicherweise nur aufgrund der Forschungslage) als Entwicklungen insbesondere der frühneuhochdeutschen Zeit zeigen: Entwicklungen des Lexembestandes erkennbarer Wortbildungsmuster/-typen und auch des Inventars der genutzten Affixe, sowie Veränderungen der morphologischen Struktur und Basisbeziehungen. So handelt es sich bei der Mehrzahl mittelhochdeutscher Präfixverben (zu ca. 70–90 Prozent) um “untrennbare Präfixverben” (z. B. *be-*, *ent-*; “trennbare Präfixverben” z. B. mit *an-*, *aus-*), wohingegen diese im Neuhochdeutschen nurmehr ca. 30 Prozent ausmachen (vgl. Solms 1990: 118; Herbers 2002: 107 f.). Dem veränderten Wortbildungsmuster geht eine Verschiebung der Wortbildungsbasis der vorhandenen (un)trennbaren Präfixverben parallel. Der Anteil der sogenannten “Präfix-Suffix-Ableitungen” (mit nominaler Basis, z. B. *bebilden*) beträgt neuhochdeutsch knapp 40 Prozent; der mittelhochdeutsche Anteil solcher Bildungen liegt bei höchstens 12 Prozent. Der Umschwung zugunsten einer verstärkten Verbableitung auch aus nominalen Basen wird schon im späten Mittelhochdeutschen bemerkbar und setzt vor allem seit dem 16. Jahrhundert ein (vgl. Prell & Scheben-Schmidt 1996: 388).

Die fortschreitende Verbalisierung nominaler Basen zeigt für die Verben eine den Nomen identische Tendenz: die **Univerbierung** umständlicherer Syntagmen in Komposita und Derivaten, nach Wegera ein Moment sprachlicher Ökonomie des Deutschen (Erben<sup>2</sup> 1983: 122; vgl. Wegera & Prell<sup>2</sup> 2000: 1594).

Die Verbpräfigierung zeigt vom Mittel zum Neuhochdeutschen eine ähnlich auch im Englischen entwickelte Tendenz zur **Iso-Morphie** (vgl. Koziol<sup>2</sup> 1972: § 710). Das Mittelhochdeutsche kennt ebenso wie noch das frühe Frühneuhochdeutsche eine “Überproduktion von Präfixverben”, die zu semantischer Äquivalenz von Simplex und Präfixverb führen kann (vgl. Zutt 1985: 1163; Solms 1990: 122; Herbers 2002: 323 f.). Hier zeigt

sich in der Folge eine Informationsverlagerung vom Simplex auf das Präfixverb, auf die eine semantische Verengung oder der Untergang des Simplexverbs folgt. Der Wortschatz als Inventar der formalen Ausdrucksmittel wird erweitert, auf der Inhaltsseite aber ist nichts Neues entstanden. Die Präfigierung leistet hier einerseits eine Auflösung der bei Simplicia vorhandenen Polysemie. Zugleich erscheinen die Präfixverben als ausdrucksseitig deutlicher markierte Wortschatzeinheiten für gleichbleibende Inhalte. Es werden einzelne Sprachinhalte „reihenhaft gleichbleibend (‘iso-morph’) ausgeprägt“ (Erben 1964), das einzelne Präfix wird zu einem deutlichen Ausdrucksträger profiliert. Da hier eine dem Simplex inhärente Bedeutung durch ein zusätzliches, syntagmatisch gebundenes Element zum Ausdruck gebracht wird, steht auch diese Entwicklung im Zusammenhang einer Veränderung synthetischer zugunsten analytischer Ausdrucksmittel (vgl. Tschirch<sup>3</sup> 1989: 134).

## 157. From Latin to French

1. Introduction
2. Inflection
3. Word-formation
4. References

### 1. Introduction

There are few languages whose history has been studied in such depth as French. But though there are many excellent studies on single special issues, coverage is by no means complete and, most disappointingly, we still lack a thorough modern synthesis of the evolution of both inflection and word-formation from Latin to Modern French. It goes without saying that this article cannot fill such a gap. For word-formation, it still had to heavily rely on Meyer-Lübke's elegant monograph of 1921, whose reedition in 1966 by Piel has rightly been the object of severe criticism (see Bork 1968; Höfler 1967; Jänicke 1969). For inflection, the bibliographic situation is more satisfactory, since there exists a series of recent studies that have extended our knowledge of the data or at least reinterpreted well-known data in the light of modern historical linguistics. But we still lack satisfactory explanations for many changes, though there is no dearth of proposals for any single case.

As is well-known, the starting point for the development of the Romance languages is not Classical Latin, but "Vulgar", i.e. spoken Latin. Nevertheless in this article the Vulgar Latin forms are only used where the difference with respect to Classical Latin is significant for the problem under discussion. The length of Latin vowels is also indicated only where this is crucial for the argument.

### 2. Inflection

Ever since Schlegel (1818), the passage from Latin to French has been considered as a paradigmatic case for the evolution from an essentially synthetic language to a predominantly analytic one (cf. Art. 10; Schwesler 1990). **Synthetic** here means that grammatical categories such as gender, number, case, tense, mood, etc. are encoded in the words themselves *via* inflections, while **analytic** refers to situations where these grammatical categories are encoded in separate words or clitics. As we will see below, the analytical tendency has been particularly strong in the

nominal domain, while French verbs have remained closer to the Latin synthetic type, even though the French conjugation is also more analytic than that of other, more conservative Romance languages.

#### 2.1. Nouns and adjectives

Latin nouns and adjectives pertained to one of three genders (masculine, feminine, or neuter) and had to be inflected for number (singular, plural) and case (traditionally six: nominative, genitive, dative, accusative, vocative, and ablative). The categories gender, number, and case were represented by one single exponent (portmanteau-morph): thus, e.g., the ending *-i* of *muri solidi*, from *murus* 'wall' and *solidus* 'solid', encoded at the same time the categories masculine, singular, and genitive (or, alternatively, masculine, plural, and nominative). This single exponent, furthermore, varied according to the declension class the word pertained to. This Latin nominal system underwent dramatic restructuring at the level of morphological categories on its way to French: while the number categories remained unchanged, the genders were reduced to two (masculine, feminine), and so were the cases in Old French (rectus, oblique), before being totally abandoned during the Middle French period (roughly, the 14<sup>th</sup> and 15<sup>th</sup> centuries). The formal expression of the remaining categories has also been heavily changed.

Latin, as we have just seen, had three **genders**, masculine, feminine, and neuter, of which only the first two survived in French. Neuter nouns have joined either the masculine (article: *le*) or the feminine (article: *la*) class: Lat. *vinum* 'wine' > Fr. *le vin*, Lat. *gaudium* 'joy' > Fr. *la joie* (via the Latin plural *gaudia*), etc. We can also observe a number of exchanges between masculine and feminine: Lat. *porticus* (fem.) 'colonnade' > Fr. *le porche*, Lat. *dens*, *-tis* (masc.) 'tooth' > Fr. *la dent*, etc. Many of these changes were intended to make the Latin gender system more coherent by establishing a correlation between the final *-a* and feminine and the final *-us* (*-o* in Vulgar Latin) and masculine, a state of affairs still characteristic of most Romance languages. In French, however, the evolution of final vowels has blurred this Vulgar Latin/Romance correlation: on the one hand, due to the deletion of all final vowels

except *-a*, masculine nouns in *-o* merged with feminine nouns in *-e* (cf. V.Lat. *flore* ‘flower’ > Fr. *la fleur*, etc.), while on the other hand a final *-e* resulting from a Latin final *-a* was also added epenthetically to masculine nouns ending in difficult consonant clusters (cf. V.Lat. *comite* ‘count’ > *conte*, etc.). The gender of a non-derived noun is thus highly arbitrary in Modern French – except for animates, where it tends to coincide with sex – and only becomes apparent through anaphoric pronouns or agreement with determiners and adjectives.

Since **number** and **case** were intimately linked both in Latin and in Old French, it is convenient to deal with them together. The six cases of Classical Latin had already been reduced to two, a rectus and an oblique, in the popular speech of most parts of the Roman Empire, among them Gaul. The rectus formally and functionally corresponded to the classical nominative and also served as vocative, while the oblique, which formally goes back to the accusative, took over most functions of the other cases, either in isolation or in combination with a preposition. Prepositional phrases and cases, by the way, coexisted from the earliest times, but the former grew more and more important with the decline in the case system. The cases that resisted best were the most frequent ones, nominative and accusative (cf. Martínez Moreno 1993: 112–116). Number, on the contrary, was not paralleled by analytic constructions and encoded by inflections throughout the history of Latin.

This is essentially the situation that we still find in Old French, where most nouns obey one of the two patterns displayed in Tab. 157.1:

	singular	plural
	rectus oblique	rectus oblique
m. ‘wall’	<i>murs</i> <i>mur</i>	<i>mur</i> <i>murs</i>
f. ‘door’	<i>porte</i> <i>porte</i>	<i>portes</i> <i>portes</i>

Tab. 157.1: Case and number in Old French

As one can see, in the most frequent declension classes there was no one-to-one correspondence between form and function, so that listeners had to rely on syntactic context and encyclopedic knowledge in order to correctly determine the syntactic function of a noun. In Middle French, this shaky two-case-

system was abandoned, leading to a system where the final *-s* was interpreted as a plural marker, along the lines of the feminine: sg. *mur*/pl. *murs*, sg. *porte*/pl. *portes*. The break-down of the two-case-system has often been attributed to the deletion of final [s] in the Middle French period, but careful investigations (cf. Schöslar 1984) have shown that the break-down occurred slightly earlier, so that there can be no such causal link.

The deletion of the final [s], however, had important consequences for the expression of number in spoken Modern French. While the written language continues to signal plural by attaching *-s*, most nouns and adjectives have the same form for singular and plural in spoken French: *mur* and *murs* are both pronounced [myr], *porte* and *portes* both [pɔrt]. The only exception to this rule is a closed set of highly frequent irregular nouns and an open set of adjectives in *-al*, where plural is expressed by alternations – due to regular sound-change – as in *cheval* ‘horse’ [ʃval]/pl. *chevaux* [ʃvo], *travail* ‘work’ [travaj]/pl. *travaux* [travo], *national* ‘national’/pl. *nationaux*, etc. Apart from these cases, plural in spoken Modern French is indicated at the phrasal level, mainly by determiners (cf. *la porte* [la pɔrt]/pl. *les portes* [le pɔrt]), but also by the number of an agreeing verb (cf. *leur fils dort* ‘their son is sleeping’ [lœr fis dɔr] vs. *leurs fils dorment* ‘their sons are sleeping’ [lœr fis dɔrm]) or by “liaison” (cf. *leur enfant* ‘their child’ [lœr afɑ̃] vs. *leurs enfants* ‘their children’ [lœrz afɑ̃]).

The evolution of case and number in adjectives was essentially the same as in nouns. As far as gender is concerned, we also see the reduction to masculine/feminine: Lat. *bonus* ‘good’ > O.Fr. *bons*/Lat. *bona* > O.Fr. *bone*, etc. In Old French, though, the neuter was still preserved in predicative position after an impersonal pronoun (Lat. *bonum* > O.Fr. *bon*). In the main class of adjectives, feminine was signalled by a final *-e*, and in some cases co-signalled further by a consonantal alternation: V.Lat. *siccō* > O.Fr. *sec*/V.Lat. *sicca* > O.Fr. *seche*, etc. Furthermore, there were two classes without a gender difference in Old French: the class *aigre* ‘sour’ (from V.Lat. *acrolacra*, with an epenthetic *-e* in the masculine) and the class *grant* ‘big’ (from V.Lat. *grande*). During the Old and Middle French period, many members of the third class joined the first by taking *-e* as a feminine marker (masc./fem. *grant* > masc. *grand*/fem. *grande*, etc.), but at the same time some

members of the first class also joined the second (masc. *larc*, fem. *large* > masc./fem. *large*, etc.). All things considered, however, gender inflection has become more complicated in Old, Middle, and early Modern French, contrary to the general trend towards analyticity. At the written level, Modern French still presents an invariant class and a class characterized by the addition of *-e* in the feminine. In spoken Modern French, however, the situation has changed dramatically as a consequence of the deletion of the final schwa (-*e*) and many final consonants: masc. *petit* ‘small’ [pøti]/fem. *petite* [pøtit], masc. *gris* ‘grey’ [grι]/fem. *grise* [grιz], masc. *blanc* ‘white’ [blã]/fem. *blanche* [blãʃ], etc. This situation has led some linguists to consider the feminine form as the base and derive the masculine forms by deleting the final consonant, a solution that creates more problems than it solves. Semantically, the solution is awkward since the unmarked gender in French is clearly masculine. And formally it makes incorrect predictions with respect to the large group of consonant-final invariable adjectives (cf. masc. *clair* ‘clear’ [kler]/fem. *claire* [kler]) and the smaller group of adjectives where the gender distinction is expressed by a consonantal alternation (cf. masc. *vif* ‘lively’ [vif]/fem. *vive* [viv], etc.). Popular neologisms like *bleuse* [bløz] as a feminine form corresponding to invariable *bleu* ‘blue’ [blø] after the model of masc. *creux* ‘hollow’ [krø]/fem. *creuse* [krøz] seem to indicate that speakers take masculine as the unmarked category and consider the feminine to be formed by the addition of a consonant, where there is such a formal difference. Some generative analyses, on the other hand, consider spoken Modern French to be more or less like Middle French at the underlying level, deriving the surface forms by deletion of final schwa and some final consonants. The orthographic final consonant of *petit* and similar words, by the way, is pronounced not only in the feminine form *petite*, but also if the following word is vowel-initial (cf. *petit enfant* ‘small child’ [pøtit ãfã]). This phenomenon, called “liaison” in French grammar, is dependent in a highly intricate manner on context and register (cf. Encrevé 1988).

## 2.2. Determiners

In the determiner-system, the most drastic difference between Classical Latin and French is constituted by the introduction of the category (in)definiteness expressed with articles (Heinz 1982).

As in most other Romance languages, the French **definitive articles** go back to different forms of the Latin demonstrative pronoun *ille*. Old and Middle French still distinguished rectus and oblique forms in the masculine series (sg. *il/le*, pl. *il/les*), while Modern French has generalized the oblique forms (sg. *le*, pl. *les*). The feminine counterparts have always been *la* and *les*, and before vowel-initial words the singular article has always been simply *l'*. As far as the function of the definite articles is concerned, it should be noted that in Old French it mainly served to refer to somebody or something previously introduced or given by context or encyclopedic knowledge, while its generic use, its use with proper nouns, appositions and in several other contexts constitute secondary developments.

The **indefinite articles** go back to different forms of the Latin numeral *unus* ‘one’. Here too, Old French distinguished rectus (*uns* < Lat. *unus*) and oblique (*un* < V.Lat. *uno*) in the masculine series, of which the oblique form was generalized in Modern French. The feminine has always been *une* (< Lat. *una*). In early Old French the indefinite article was restricted to specific reference, but already around 1200 cases of unspecific reference may be found in certain constructions. Before some kinds of nouns, Old and Middle French allowed the plural indefinite articles *uns/unnes* (e.g., *uns guanz* ‘gloves’), which, however, eventually were replaced by *des* (cf. Mod.Fr. *des gants*). This latter form originally had a partitive meaning: *des guanz*, e.g., meant ‘some of the gloves mentioned’ before it simply came to mean ‘(some) gloves’. Such partitive constructions consisting of the preposition *de* ‘from’ and the definite article also existed in the singular: *manger du pain* in Old French meant ‘to eat from the bread in front of us or mentioned before’, while only later, during the Middle French period, it simply came to mean ‘to eat bread’, thus becoming a variant of the indefinite article before mass nouns (*du* is an amalgamated form of *de* and *le*). This so-called “partitive article” is an innovation that sets French apart from most other Romance languages.

The development of articles in Romance is often presented as proof of the general trend towards analyticity. This is awkward, since (in)definiteness was not expressed at all in Latin. Furthermore, one should not forget that a Modern French article like *la* is highly synthetic in itself, since it expresses at the

same time the categories singular, feminine, and definite.

The Latin system of **demonstratives** was characterized by three degrees of distance: near the speaker (*hic*), near the listener (*iste*), and further away (*ille*). While this system is preserved in several Romance languages, in Old French it has been reduced to a two-degree system: *cist* (< V.Lat. *ecce iste*) for proximity and *cil* (< V.Lat. *ecce ille*) for distance (*ecce* was an interjection meaning roughly 'look!'). Both forms could be used as adjectives and pronouns and had special forms for the expression of oblique and plural. The further evolution (cf. Dees 1971) was characterized by a reduction to a one-degree system and by a specialisation of the two formal series in adjectival (*cist*, Mod.Fr. *ce*) and pronominal (*cil*, Mod.Fr. *celui*) use. In the Middle French period, proximity and distance began to be marked by joining the adverbs *ci* 'here' and *là* 'there', which have become obligatory in Modern French with non-modified pronouns (*celui-ci* 'this one' vs. *celui-là* 'that one', etc.), while with demonstrative adjectives these adverbs are still facultative (*ce livre* 'this book', *ce livre-ci*, *ce livre-là*).

Latin had the following **possessives** (only the masculine singular nominative forms are given): 1. *meus* 'my', 2. *tuis* 'your', 3. *suus* 'his' (reflexive), *eius* 'his' (non-reflexive), 4. *noster* 'our', 5. *vester* 'your', 6. *suus* 'their' (reflexive), *eorum* 'their' (non-reflexive). In Vulgar Latin, *suus* was extended to cover the non-reflexive possessive corresponding to the third person singular and in some languages also to the third person plural, which in the Vulgar Latin of Gaul however was marked with *illorum* (> Fr. *leur*). *Vester* furthermore was changed analogically to *voster* (cf. Fr. *votre*, *vôtre*) after *noster* (cf. Fr. *notre*, *nôtre*). All in all, there were few functional changes on the way to Romance. The most important change from Latin to Old French was a formal one, viz. the rise of a stressed and an unstressed series of possessives: unstressed Lat. *meus/meum* (obl.) became O.Fr. *mes/mon*, while under stress it ended up in O.Fr. *miens/mien*, and similarly for the second and third person singular. In Modern French, the series arising from stressed possessives is only used with the article: *mon/ton/son livre* 'my/your/his book' vs. *le mien/tien/sien* 'mine/yours/his', etc.

### 2.3. Personal, relative, and interrogative pronouns

As we have seen in 2.1, with nouns and adjectives the six Latin cases were reduced to two in Old French and have completely disap-

peared in Modern French. **Personal pronouns**, on the contrary, have preserved three cases – nominative, dative, and accusative – up to this day. For the third person feminine, for example, Modern French distinguishes *elle* (subject, V.Lat. *illa*), *lui* (indirect object, < V.Lat. *illui*), and *la* (direct object, < V.Lat. *la*, Cl.Lat. *illam*). This conservative behaviour is probably due to the high frequency of the personal pronouns that have survived, and shows that for highly frequent units inflexion, especially in the form of suppletion, is the most economical way of achieving brevity (cf. Hunnius 1990: 64). Another conservative trait that distinguishes personal pronouns from nouns and adjectives is the conservation of the neuter in the Old French 3. sg. nom. form *el* (< V.Lat. *illu*, Cl.Lat. *illud*), later on replaced by masculine *il* (cf. *il pleut* 'it is raining'). But the pronoun system also shows some innovative aspects. A French innovation is the indefinite personal pronoun *on* 'one' (cf. *on dit* 'one says'), which has still other functions in colloquial French. *On* goes back to unstressed Lat. *homo* 'man', whose accusative form *hominem* is the ancestor of French *homme* 'man'.

Just like in the case of the possessives dealt with at the end of the last paragraph, Latin personal pronouns have also developed differently in Romance in stressed and unstressed positions (cf. Wanner 1987). So, for example, the Lat. 1. sg. acc. pronoun *me* [me:] remained *me* [mə] in the unstressed pre-verbal position (cf. *vous me regardez* 'You look at me'), while in the stressed final position it was diphthongized to *moi* (cf. *regardez-moi!* 'look at me!'). What distinguishes Modern French – together with some Rhoto-Romance and Northern Italian dialects – from the rest of Romance languages is the fact that it also has a stressed and an unstressed series for subject pronouns. In the other Romance languages – just like in Latin, and in Old French – the categories person and number in the verb are expressed by inflectional suffixes, as we are going to see in 2.4, and personal subject pronouns reserved for the expression of emphasis, contrast or disambiguation. But when subject pronouns became obligatory after the Old French period, the stressed direct object pronouns were extended to serve as stressed subject pronouns too. So, O.Fr. *chant* 'I sing' vs. *je chant* 'I sing' corresponds to Mod.Fr. *je chante* vs. *moi, je chante*.

**Relative and interrogative pronouns** also conserved a dative form up to the Old French period (Lat. *cui* > O.Fr. *cui*), later fused with the nominative form *qui*. The rectus/oblique distinction, on the other hand, has been conserved up to the present day in relative pronouns: Lat. *qui* > Fr. *qui*, Lat. *quem* > Fr. *que*. The Latin neuter interrogative pronoun *quid* became *que* in the unstressed position, while under stress it developed into *quoi*.

#### 2.4. Verbs

The Latin conjugation is much better preserved in Romance than the Latin declension (cf. Geckeler 1996: 213–220). So its four conjugation classes are all preserved in French, though many verbs changed class in Vulgar Latin or later on. The most spectacular innovation undoubtedly consisted of the replacement of many Latin synthetic categories, especially the less frequent ones, by analytical ones. Synthetic and analytic forms coexisted during many centuries, and if the latter eventually evinced the former this might be due to their greater simplicity, and hence learnability, a big advantage in the Roman Empire, where millions of non-Latin speakers had to learn the official language in precarious conditions (cf. Wuest 1997).

Latin verbs, in their finite forms, were inflected for person/number, tense/aspect, mood, and voice. In the following discussion, the fate of these categories in the passage from Latin to French will be outlined.

**Person** and **number** are realized by a portmanteau-suffix located at the end of the verb in Latin as well as in Romance (see Tab. 157.2). Written Modern French, which is by and large identical to Old French except for the obligatory presence of the personal pronoun, is still very similar to the Latin/Pan-Romance type, while spoken Modern French has person/number-endings only for the first and second person plural (4 and 5).

Latin	Modern French	
	written	spoken
1 <i>cant-o</i>	<i>je chant-e</i>	[ʒɔ̃ʃãt]
2 <i>canta-s</i>	<i>tu chant-es</i>	[tyʃãt]
3 <i>canta-t</i>	<i>il chant-e</i>	[i(l)ʃãt]
4 <i>canta-mus</i>	<i>nous chant-ons</i>	[nuʃãtõ]
5 <i>canta-tis</i>	<i>vous chant-ez</i>	[vuʃãtɛ]
6 <i>canta-nt</i>	<i>ils chant-ent</i>	[i(l)ʃãt]

Tab. 157.2: Person and number in Latin and French verbs

From a functional point of view, it might seem that the obligatory – if there is no subject noun – presence of the subject pronoun is due to the ambiguity deriving from the phonetic erosion of the person/number-endings in spoken French, but historians of the French language assure that chronology forbids postulating a relationship of cause and effect between the two. Another interpretation of the facts in Tab. 157.2, very popular in the sixties, also has to be rejected, namely the view that in French the Latin person/number-suffixes have been replaced by person/number-prefixes: in reality, *je*, *tu*, etc. do not have the behaviour of prefixes but of clitics, since they may be separated from the stem by other pronouns, as in *je vous la chante* ‘I sing it to you’, and have conserved a certain syntactic mobility, as in *je dis* ‘I say’ vs. *dis-je* ‘say I’ (cf. Hunnius 1977; Koch 1993).

The three-way distinction in past-present-future of the Latin **tense/aspect**-system has been preserved in French. There have been no changes in form (beyond, of course, the effects of regular sound-laws and occasional analogies) or function in the **present indicative** (Lat. *cantabat* > Fr. *il chantait*, etc.). As far as the **perfect indicative** (called “passé simple” in French grammar) is concerned, the most noteworthy development was its total abandonment in the spoken language. There is no agreement among specialists as to when and why this important change took place. In the spoken language, the **passé simple** has been totally replaced by the **passé composé**, a Vulgar-Latin and hence pan-Romance innovation. This periphrastic tense has arisen from Latin resultative constructions of the type *habeo litteras scriptas* ‘I have written letters’, where *scriptas* ‘written’ originally had an adjectival function before it was reanalysed as part of the verb phrase, with *habeo* ‘I have’ becoming an auxiliary verb. As a consequence, agreement in gender and number between the original adjective converted into a participle and the following noun was abandoned: *j'ai écrit* (and not: *écrîtes*) *des lettres* (cf. Loporcaro 1998). Of the Latin **pluperfect indicative** of the type *cantaveram* some traces can be found in Old French, but it has since been completely replaced by a periphrastic construction of the type *j'avais chanté*, composed of the auxiliary verb *avoir* ‘to have’ in the imperfect tense and the past participle. Immediate antRIORITY in the past is expressed

in literary French by the periphrastic **passé antérieur**, a Romance innovation consisting of the passé simple of the auxiliary and the past participle: *j'eus chanté*. If the auxiliary verb is put in the periphrastic past, one gets the **passé surcomposé**: *Je suis parti quand j'ai eu terminé* 'lit. I have gone away when I have had finished' (cf. Holtus 1984). The Latin **future** tense of the type *cantabo* had already been replaced by a periphrastic construction in Vulgar-Latin times, consisting of the infinitive followed by the present tense of *habere* 'to have' (Old French, though, still conserved synthetic future forms for the high-frequency verb 'to be': *(i)er*, *(i)ers*, etc.). This periphrastic construction was then again amalgamated to a synthetic conjugation, a process already completed in Old French (cf. Kuen 1952): V.Lat. *cantare habeo* 'lit. I have to sing' > V.Lat. *cantaraio* > O.Fr. *chanterai*. In Modern French, this synthetic future is again challenged by a new periphrastic future, consisting of the auxiliary verb *aller* 'to go' and the infinitive (*je vais chanter* 'lit. I go to sing'). The Latin **futurum exactum** (past in the future) of the type *cantavero* has also been abandoned and replaced by a periphrastic construction consisting of the future tense of *avoir* and the past participle (*j'aurai chanté* 'I will have sung'). A Romance innovation closely linked to the periphrastic future is the **conditional**, originally a kind of future of the past formed with the infinitive followed by the imperfect tense of *habere*, but later on amalgamated to a new synthetic conjugation along the lines of the future: V.Lat. *cantare habebat* > Fr. *il chanterait* (cf. *il a dit qu'il chanterait* 'He said that he was going to sing'). It is probably no coincidence that the only periphrastic forms which amalgamated were the ones where the auxiliary was postponed to the verb. The conditional later also developed a modal use unknown to Latin: *il chanterait* 'he would sing (if ...)'.

As far as **mood** is concerned, the four Latin subjunctives have been preserved in French as morphological categories, but only the **present subjunctive** still conserves the Latin forms: Lat. *cantem* > (*que*) *je chante* (O.Fr. *chant*, the *-e* is analogical), etc. The **imperfect subjunctive** in Modern French only survives in very stilted literary language and formally goes back to the Latin pluperfect subjunctive: Lat. *cantavissem* > Fr. (*que*) *je chantasse*, etc. The Latin **perfect subjunctive** of the type *cantaverim* has been replaced by a periphrasis composed of the present subjunctive of the

auxiliary and the past participle: (*que*) *j'aie chanté*, etc. The **pluperfect subjunctive**, whose forms, as we have seen, are used as imperfect subjunctive in Romance, is also expressed peripherastically in French, combining the imperfect subjunctive form of the auxiliary with the past participle: (*que*) *j'eusse chanté*, etc. It is as marginal in Modern French as the imperfect subjunctive.

Of the different Latin **imperatives**, only the imperative of the singular has conserved the Latin forms: Lat. *canta* > Fr. *chante*, etc. The imperative of the second person plural has been replaced by the corresponding indicative ending (cf. Lat. *cantate* vs. Fr. *chantez*, etc.), and the negative imperatives are formed with the negative particle *ne ... pas*: Lat. *ne cantaveris*, *ne cantes*, *noli cantare* vs. Fr. *ne chante pas*, etc. The Latin future imperative of the type *cantato* has disappeared completely.

Changes have been equally drastic in the domain of infinite verb forms. Latin had a wealth of **infinitives**: present, perfect, and future, all of them in an active and a passive variant. Of these, only the present active infinitive is conserved both in function and form: Lat. *cantare* > Fr. *chanter*, etc. The present passive infinitive has been replaced by a periphrastic form (Lat. *cantari* vs. Fr. *être chanté*), and so was the perfect active infinitive (Lat. *cantavisse* vs. Fr. *avoir chanté*). The perfect passive infinitive (*cantatus/atum esse* 'to have been sung') was already periphrastic in Latin, but has been adapted in French as *avoir été chanté(e)*, since the formal equivalent *être chanté(e)* means 'to be sung'. The future infinitives both disappeared. Of the three Latin **participles**, past, present, and future, the latter has disappeared completely. The past participle has been conserved and has even strongly extended its use due to the many periphrastic tenses: Lat. *cantatus/la* > Fr. *chanté(e)*, etc. The Latin present participle was replaced in Late Latin by the ablative of the gerund, which in French later on was used to translate Latin present participles and so got a participial character (cf. Lausberg 1962: 197): *ses mains tremblant de peur* 'his hands trembling with fear'. The Latin gerund is also conserved in the form V.Lat. *in cantando* > Fr. *en chantant*. The Latin future participle has disappeared completely, and so have the two forms of the Latin **supine**.

In the category **voice** Latin distinguished active and passive. **Passive** was expressed by special inflectional forms in the imperfect,

present, and future tenses, as well as in the infinitive present and perfect, as we have already seen. For the future infinitive as well as the perfect and pluperfect tense, passive was realized peripherastically. In French, as generally in Romance, synthetic passives have disappeared completely, maybe as a consequence of the phonetic erosion of some of the endings (Togeby 1980: 136). Thus, there are also no longer any deponent verbs in French, i.e. active verbs with passive inflection, typical of Latin. Passive now is formed peripherastically with *être* ‘to be’ and the past participle, the tense of the auxiliary being identical to the tense of the periphrastic construction: *la chanson est/la été/sera/etc. chantée* ‘the song is/was/will be/etc. sung’, etc. Alternatively, in certain contexts, the reflexive construction can be used instead of the periphrastic passive: *cette chanson se chante beaucoup* ‘lit. this song sings itself very much’, etc.

### 3. Word-formation

Word-formation has also undergone deep changes from Latin to French, but it cannot be said that word-formation is more analytic in French than in Latin. Though some patterns have remained more or less unchanged over the centuries, many others have been abandoned or have undergone semantic change or reanalysis, and some French patterns may be considered as innovations (see also Art. 121). From the Middle French period onwards, however, French and Latin word-formation have again become more similar as a consequence of massive borrowing of Latin words on the part of French. Besides Classical Latin, also Neo-Latin, English and, to a lesser extent, other European languages contributed to the renovation of French vocabulary, creating in this way many correspondences with word-formation in Latin and other European languages, to the extent that someone has even spoken of the emergence of a “euromorphology” (Schmitt 1996; Rainer 2002). Another general characteristic that sets Old and Middle French apart from Modern French is the wealth of synonymous derivations in the former stages of the language; this obviously is due to the fact that the language had not yet gained complete geographic homogeneity in those times and that normative pressure was much lower.

#### 3.1. Compounding

Latin had relatively few **compounds** in comparison to Greek or Germanic languages (cf. Lindner 2002). Only very few compounds, furthermore, were passed on to French directly and those that were often lost their transparency on the way, like Lat. *undecim* ‘eleven’ (*unus* ‘one’ + *decem* ‘ten’) > Fr. *onze*, etc. Modern French compound types are thus in general later innovations, due in many cases to loan-translations. Only the more important types can be mentioned here.

One of the most hotly debated questions in Romance word-formation is the origin of verb-noun compounds of the type *essuie-glace* ‘windshield-wiper’, lit. ‘wipe-windshield’ (cf. Bierbach 1982). Traditional wisdom attributes its origin to a reanalysis, in early Romance, of imperative sentences as proper names, whence the type is supposed to have been extended to common nouns. This developmental sequence, however, is purely speculative, since the first examples, going back to the 11<sup>th</sup> and 12<sup>th</sup> centuries in French, already show a great variety of semantic types. It has thus been recently proposed (cf. Bork 1990) to see in this Romance compound type the descendant of the Latin compound type *poscinummius* ‘money-asking’ (from *poscere* ‘to ask’ and *nummus* ‘coin’), which was influenced by the corresponding Greek type. Only sixteen, mostly marginal Latin compound words of this type, however, are documented, and none of them has directly survived in Romance.

Noun-noun compounds – where the first noun is the head, contrary to English – became more important in French only in the 19<sup>th</sup> century, but are quite frequent nowadays in the written language. They do not constitute one homogeneous type, but rather a conglomerate of subtypes with varying semantics and productivity. This synchronic heterogeneity reflects the different origin of the subtypes. *Hôtel-dieu* ‘main hospital’, e.g., goes back to an asyndetic Old-French genitive construction meaning ‘lodging (*hôtel*) of god (*dieu*)’. At least from the 16<sup>th</sup> and 17<sup>th</sup> centuries onwards we find copulative compounds of the type *imprimeur libraire* ‘lit. printer librarian’ or *comédie-ballet*. The Romantic poets liked compounds with a metaphor as second element: *cité-cadavre* ‘a town (*cité*) that is like a corpse (*cadavre*)’, etc. But the great vogue of noun-noun compounds and the diversification of their semantics in the 19<sup>th</sup> and 20<sup>th</sup> centuries is attributable to the influ-

ence of English and German, manifest in many loan-translations like *éetalon-or* ‘gold (or) standard (*éetalon*)’, etc. A thorough investigation of the history of this compound type is badly lacking.

The most frequent nominal compounds in French are the ones formed by noun-preposition-noun or adjective-noun/noun-adjective, like *pomme de terre* ‘potato, lit. apple-of-earth’, *moulin à vent* ‘windmill, lit. mill-by-wind’, *casque bleu* ‘blue helmet, lit. helmet blue’, etc. It seems better, however, to treat such sequences as essentially syntactical constructions.

Some subordinative adjective-adjective (or adverb-adjective) compounds may already be found in Old-French (*nouveau-né* ‘new-born’, *clair-voyant* ‘clear-sighted’, etc.), but the pattern has remained marginal. The copulative adjective-adjective compound type *aigre-doux* ‘sour-sweet’ was adapted directly from Greek by the Pléiade poets in the sixteenth century, but never did become very productive in standard French (Hatcher 1951: 11 f.). The copulative type *éthico-moral*, on the contrary, is due to adaptations of Neo-Latin compounds such as *ethico-moralis* from the 17<sup>th</sup> century onwards (Hatcher 1951: 135–137). As a consequence of its Neo-Latin origin, the first element of this type of compound is often a learned allomorph, like *franco-* for *français*, etc.

The Vulgar Latin noun-verb compound *\*manutenerē* ‘to hold (*tenere*) with the hand (*manu*)’ survived in French as *maintenir*, and so did some other compound verbs of this type (cf. Klingebiel 1989). In Old and Middle French, a few neologisms based on this model like *saupoudrer* (from *sau* (Mod.Fr. *sel*) ‘salt’ and *poudrer* ‘to strew over’) are attested, but the type never became really productive.

Many Latin compounds were borrowed by French in the late Middle Ages and even more Neo-Latin compounds during the Modern Times. Due to the changes in the vernacular language, most such compounds however have remained more or less opaque to the average speaker. While Latin speakers could easily analyse *agricola* ‘farmer’ into *ager* ‘field’ + linking vowel *-i-* + *colere* ‘to till’ + ending *-a*, Fr. *agricole* ‘agricultural’ is much more opaque for speakers of French, where ‘field’ now is *champ* and ‘to till’ *labourer*. Where many (Neo-)Latin compounds of the same make-up were borrowed, however, these sometimes have given rise to a

productive pattern in Modern French. Such was the case, e.g., with compounds with a second element *mania* (Höfler 1972), which entered the French language in loan-translations like *démonomanie*, *bibliomanie*, etc. and then came to be attached even to unequivocally French bases as in *bureaumanie*, *peinturomanie* (from *peinture* ‘painting’), etc. Elements like the *-omanie* of *peinturomanie*, however, should better be analysed as suffixes from a synchronic point of view (cf. also Rainer 2003 on the integration of the Latin type **aurifer**).

### 3.2. Derivation

#### 3.2.1. Prefixation

Latin had a rich system of **prefixes**, many of them with a clear link to corresponding prepositions or adverbs, which diachronically constitute the most important source for prefixes. It is interesting to note, however, that the opposite evolution, from a prefix to an adverb, is also possible. Lat. *trans-* ‘across’, e.g., has become the French adverb *très* ‘very’, and the same process of adverbialisation of a prefix may be observed in Old French *par* (Lat. *per-*, cf. *permagnus* ‘very big’) and *re* (Lat. *re-* ‘again, back’, cf. *revenire* ‘to come back’): *par est granz* ‘lit. very it-is big’, *r-est venuz* ‘lit. back he-has come’ (Meyer-Lübke<sup>2</sup> 1966: 139 f.). Due to this close relationship between prefixes on the one side and prepositions and adverbs on the other, it is not always easy to draw a neat borderline between prefixation and compounding.

Only relatively few deverbal verb-forming prefixes were passed on directly to French. The most productive ones are *re-* (< Lat. *re-*; *refaire* ‘to do again’, etc.) and reversative *dé(s)-* (< Lat. *dis-*; *défaire* ‘to undo’, etc.). The others are much rarer: Lat. *ad-* > Fr. *a-* (*apporter* ‘to bring; lit. here-carry’, etc.), *contra-* > *contre-* (*contredire* ‘to contradict’, etc.), *ex-* > *é-* (*s'écouler* ‘to flow off’, etc.), *in-* > *en-* (*enfermer* ‘to enclose’, etc.), *inter-* > *entre-* (*s'entreuer* ‘to kill each other’, etc.), *pro-* > *pour-* (*poursuivre* ‘to pursue’, from *suivre* ‘to follow’, etc.), *super-* > *sur-* (*surcharger* ‘to overload’, etc.). Lat. *sub-* is only present in some lexicalized forms like (*se*) *souvenir* ‘to remember’ (< Lat. *subvenire*), while in productive formations it has been replaced by *sous-* (*sous-estimer* ‘to underestimate’, etc.), the follower of *subtus*, or by Latinate *sub-* (*subdiviser* ‘to subdivide’, etc.). Other Lat-

nate deverbal prefixes are *post-* (*postposer* ‘to postpone’, etc.), *pré-* (*prévoir* ‘to foresee’, etc.), *super-* (*superposer* ‘to super(im)pose’, etc.), *trans-* (*transporter* ‘to transport’, – the popular outcome *tres-* is still present in lexicalized *trépasser* ‘to die’), and some others. For prefixes in parasynthetic verbs see 3.2.2.

Some of the Latinate prefixes just mentioned also occur before nouns and adjectives. Other Latinate denominal prefixes are *bis-* (*bisaïeu* ‘forefather’), *co-* (*copilote* ‘co-pilot’, etc.), *ex-* (*ex-mari* ‘ex-husband’, etc.), *non-* (*non-intervention* ‘non-intervention’, etc.), *vice-* (*vice-chancelier* ‘vice-chancellor’, etc.), etc. As far as the deadjectival prefixes are concerned, one must mention, among others, the negative prefixes *in-* (*incroyable* ‘incredible’, etc.) and *anti-* (*anti-atomique* ‘anti-atomic’, etc.), as well as the intensive prefixes *archi-*, *extra-*, *super-*, and *ultra-*. Many such “Latinate” formations, of course, were not borrowed directly from Latin but from other European languages, mainly English. Popular transmission, here too, is much rarer: *minus-* > *mé(s)-* (*mécontent* ‘discontent’, etc.), and some others. Some French prepositions and adverbs have also developed prefixal uses: *après-midi* ‘afternoon’, *arrière-garde* ‘rear guard’, *avant-garde* ‘vanguard’, *contre-sens* ‘nonsense’, *entretemps* ‘entremets; lit. between-dishes’, *sous-officier* ‘non-commissioned officer’. As one can see, such formations may be exocentric (the *après-midi* ‘afternoon’, for example, is not a *midi* ‘midday’). There is even one adjective that has been converted into a prefix: *meidius* > *mi-* (*la mi-février* ‘mid-February’, etc.).

All in all, one can see that French prefixation closely resembles that of Latin and other European languages due to intensive borrowing from Latin and other European languages.

### 3.2.2. Parasynthesis

**Parasynthesis** is a term used in Romance word-formation for what seems to be the simultaneous application of two word-formation rules to a base. *Enrichir* ‘to enrich’, e.g., where neither *\*enrich* nor *\*richir* are independently existing words of the language, is generally believed to be formed by the simultaneous adjunction of *en-* and *-ir* to the base *rīche* ‘rich’. Since *-ir* marks the infinitive and hence is an inflectional ending, some prefer to define this kind of formation as formed through the simultaneous application of *en-* prefixation and conversion, while others hold

that the whole derivational process is located in the – then category-changing – prefix. Under this last hypothesis, parasynthesis is reduced to simple prefixation.

Parasynthesis is most prominent in verbs. The type is already present in Old Latin and became particularly frequent in Late Latin (Crocco Galéas & Iacobini 1993): *clarus* ‘clear’ > *acclarare* ‘to clarify’, *uncus* ‘hook’ > *inuncare* ‘to hook’, etc. Originally the prefix of such verbs was a preposition, so that the whole could be viewed as a derivation on a phrasal base: *per noctem* ‘over night’ > *pernoctare* ‘to stay overnight’, etc. In the course of time, however, such formations were reanalyzed as consisting of nominal or adjectival bases “circumfixed” by a combination of a generally desemanticized prefix and conversion. In French, e.g., the prepositional phrase corresponding to *cadre* ‘frame’ > *encadrer* ‘to frame’ is (*mettre*) *dans un cadre*, not *en cadre*, that of *lune* ‘moon’ > *alunir* ‘to land on the moon’ is (*aborder*) *sur la Lune*, not *à la Lune*, and in *courage* ‘courage’ > *décourager* ‘to discourage’ or in deadjectival formations such as *long* ‘long’ > *allonger* ‘to make longer’ no plausible prepositional phrase is in sight anyway. Parasynthetic verbs have been very productive throughout the history of French.

### 3.2.3. Suffixation

French suffixation is so rich that it will only be possible to mention the most important categories and suffixes here.

Nominal derivatives are by far the largest group. In a first subgroup, the base is also a noun and the derivative only implies a slight modification.

**Collective nouns** did not form a well-established category in Latin. French (Baldinger 1950) inherited some Latin suffixes like *-alia* (Fr. *-aille*; *pierraille* ‘crushed stone’) or *-eta* (Fr. *-aie*; *hétraie* ‘beech forest’), but most formations in French arose through semantic extensions or reanalysis of other derivational patterns. Such was the case, among others, of *-age* (*feuillage* ‘leafwork’, etc.), which goes back to neuter nominalized adjectives in *-atium* and of extensions from deadjectival and deverbal abstracts (*argenterie* ‘silverware’, *gouvernement* ‘government’, etc.).

The characteristic Latin feminine ending *-a* (alternating with masculine *-us*) is reflected in French *-e*: Lat. *ursus* ‘bear’/*ursa* ‘she-bear’ > Fr. *ours/ourse*, etc. A suffix that gained great momentum in Old French was *-esse* (< Lat.

*-issa): comtesse* ‘countess’, etc. In the 16<sup>th</sup> century, however, *-eur* took over the feminine ending *-euse* from *-eux* instead of traditional *-eresse* (Lindemann 1977). For loan-words, the Latin feminine ending *-trix* was adapted as *-trice*. Many feminine forms can be expressed only in a rather roundabout way in French, such as *Madame le ministre*; feminists, however, insist that the corresponding feminine forms should be imposed.

One of the most salient traits of Romance word-formation, inherited from Latin, is its wealth of **diminutive suffixes** (cf. also Art. 99). Old French fits into this picture, while in Modern French only the diminutive suffix *-ette* is marginally productive in journalistic and commercial language, less so in spontaneous conversation. The abandonment of diminutive suffixes – augmentatives have never been very productive in French – and their substitution with the adjective *petit* ‘small’ was a process that began in Middle French and came to an end in the 17<sup>th</sup> century, after a short Renaissance in the poetry of the Pléiade (cf. Eckert 1986: 284–318). The reasons for the agony of diminutives in Middle and early Modern French are difficult to pin down and have been the subject of much debate: homonymy of *-et* with several other suffixes, after final consonants having become mute, may have been one decisive factor. It should not be forgotten, however, that French has created a new reduplicative diminutive type (see 3.2.5), and that popular French and slang have several “evaluative” suffixes of dialectal origin like *-uche* (Baldinger 1997), which do not have any denotative meaning but only serve to give the word a particular, often slang connotation.

Another group of denominal nouns is that of **status suffixes**, i.e. suffixes that express the status of the person referred to by the base. Latin had quite a number of suffixes with that function (*consulatus* ‘consulate’, etc.), but only very few were directly passed on to French, among them *-ia* (*mairie* ‘office of mayor’, etc.). French however created new status suffixes like *-age* (*baronnage* ‘barony’, etc.) or later on reintroduced some of the Latin suffixes (*professorat* ‘professorship’, *préfecture* ‘charge of a préfet’, etc.). Many such formations have locative, temporal or collective extensions; so the *préfecture*, nowadays, is more commonly the place where the *préfet* has his office.

**Personal nouns** also constitute an important class of denominal nouns. Among the

names for traditional social roles we find several suffixes that were passed on directly from Latin to French: *-ain* (< Lat. *-anus*; *châtelain* ‘lord of a castle’, etc.), *-on* (< Lat. *-o*, *-onis*; *charron* ‘cartwright’, etc.), *-eron* (from *-ier* + *-on*; *forgeron* ‘smith’, etc.), and, most important, *-ier* (cf. Roché 1998), which arose through an ellipsis in collocations such as *faber ferrarius* ‘smith’ (Lat. *carbonarius* > Fr. *charbonnier* ‘charcoal (*charbon*) burner’, etc.). In more modern professional spheres, *-ier* was ousted later on by learned *-iste* (< Lat. *-ista*): *tracteuriste* ‘tractor driver’, etc. Equally learned are *-ien* (< Lat. *-ianus*; *mathématicien* ‘mathematician’, etc.) and *-aire* (< Lat. *-arius*; *fonctionnaire* ‘civil servant’, etc.). The suffix *-iste* also commonly refers to the follower of a person or doctrine: *marxiste*, etc. The same holds for the more colloquial *-ard* (from Germanic *-hard*; *dreyfusard* ‘follower of Dreyfus’, etc.), in one of its several uses.

The last important group of denominal nouns is that of **instrumental** and **locative nouns**. The borderline between these two categories is not always very neat, especially with nouns referring to containers. We thus sometimes find the same suffix for both subgroups, as with *-ier* (masc.) and *-ière* (fem.), going back to Lat. *-arius* and *-aria*: *cendrier* ‘ashtray’, *cafetièr* ‘coffee-pot’, etc. The gender of the derivative is in most cases the opposite one of that of the base. Purely locative are Old Fr. *-oi* (< Lat. *-etum*; *sapinoi* ‘fir wood’, etc.) and synonymous *-aie*, which has already been mentioned under the collective suffixes. The most important locative suffix is *-ie*, originally an extension of the homonymous status suffix: *boulangerie* ‘bakery’, etc. Through the reanalysis of words like *tuilerie* ‘tilery’, which could not only be referred plausibly to *tuilier* ‘tile-maker’ but also to *tile* ‘tile’, a new suffix *-erie* was created.

In the class of **deverbal nouns** we again find many of the suffixes and categories just treated. The category of **agent nouns** is dominated by *-(at)eur* (< Lat. *-(at)or*): *vainqueur* ‘winner’, *exportateur* ‘exporter’, etc. The Latinate allomorph in *-ateur* is chosen if the corresponding action noun ends in *-ation*. From the 18<sup>th</sup> century onwards this suffix has also become by far the most important deverbal **instrumental suffix** (cf. Spence 1990): *condensateur* ‘condenser’, etc. The traditional instrumental suffixes like *-ail* (< Lat. *-aculum*; *épouventail* ‘scarecrow’, etc.), or *-oir* (< Lat. *-orium*; *rasoir* ‘razor’, etc.) have lost ground.

Here too we find the place/instrument ambivalence noted with respect to the denominal formations: *abrevoir* ‘watering place’, *baignoire* ‘bathtub’, etc.

The huge category of **action nouns** has undergone severe changes from Latin to French. The suffix *-(at)io*, *-onis* (applied to the past participle stem) survived as *-aison*, but was later on pushed aside by the learned *-ation* (cf. Schmitt 1988). Lat. *-ura* survives in Fr. *-ure* (*ouverture* ‘opening’, etc.). Latin action nouns in *-us* (attached to the past participle stem) survive in the feminine form (due to a reinterpretation as feminine singular nouns of neuter plurals; Alsdorf-Bollée 1970): *mise* ‘putting’, *entrée* ‘going in’, *sortie* ‘going out’, etc. French formations like *mise* are interesting examples of form-function-anisomorphism: they are action nouns, but have the form of feminine perfect participles. The most productive action noun suffix during the history of French has been *-ment*, whose Latin antecedent *-mentum* had been relatively rare in this function until Late Latin. French *-ance* (*naissance* ‘birth’, etc.) goes back to another Late Latin creation, *-ntia*, which was due to a coalescence of the present participle in *-nt-* + *-ia*. Old Fr. *-ëiz* (cf. Malkiel 1986), which survives in some Modern French derivatives like *clapotis* ‘ripple’, and Fr. *-age* (cf. Fleischman 1977) eventually go back to the Latin adjectival suffixes *-atīcius* and *-aticus*. Action nouns in *-erie* like *rêverie* ‘dreaming’ arose when speakers reanalysed denominal formations like *rêveur* + *-ie* as deverbal (*rêv(er)* + *-erie*). Another important means of forming action nouns is conversion (see 3.2.4).

Latin had a lot of suffixes for forming **deadjectival abstract nouns**. Unstressed *-ia* was subject to phonetic erosion and only survives in few words like *force* (from V.Lat. *fortia*) as well as with bases going back to present participles (*importance* ‘importance’, etc.). It has been replaced by the stressed *-ia*, which underlies Fr. *-ie*: *jalousie* ‘jealousy’, etc. Deverbal *-or*, which had already been reanalysed as deadjectival in Latin, was passed on to French as *-eur*: *hauteur* ‘height’, etc. Lat. *-tas* is present both in popular derivatives like *bonté* and in learned ones like *latinité* ‘latinity’. The same is true for *-itia*, which we find as *-esse* (*richesse* ‘richness’, etc.), *-ise* (*franchise* ‘exemption’, etc.), and *-ice* (*justice* ‘justice’). Lat. *-tudo* was changed to *-tume*, as in *amertume* ‘bitterness’. The extremely polysemous suffix *-erie* is also found with deadjecti-

### XVIII. Morphologischer Wandel II: Fallstudien

val abstracts like *pruderie* ‘prudery’. Last but not least, *-isme* (< Lat. *-ismus*) may also be used to form abstract nouns (*conservatisme* ‘conservatism’, etc.), besides its many other uses.

**Adjectival derivatives** (cf. Gawełko 1977) may be classified in deadjectival, deverbal, and denominal both in Latin and French. The latter group may again be subdivided into qualitative and relational adjectives, though the suffixes are partly the same.

Among the **denominal adjectives** the most important category is that of **relational adjectives**. Of the numerous Latin adjectives of this type only relatively few survived as such in Old French: Lat. *carnalis* > Fr. *charnel*, Lat. *aquaticus* > O.Fr. *evage*, Lat. *marinus* > Fr. *marin*, etc. Their decline was probably due, in part at least, to the fact that many adjectives had been converted into nouns. In the course of the centuries, and especially from the 18<sup>th</sup> century onwards, however, relational adjectives were borrowed massively from Latin, Neo-Latin, and other European languages, so that in present-day, particularly written French they again constitute a very prominent category. The same is true, essentially, for the subcategories of adjectives derived from place names (cf. Wolf 1964) and personal names (cf. Schweickard 1992). Non-relational denominal adjectives express resemblance (*-esque*, etc.), possession (*-u*, etc.), and support (*-iste*, etc.), among others.

**Deverbal adjectives** have witnessed great changes. Of Lat. *-abilis/-ibilis* only the former was passed on directly to Old French, while the latter was reintroduced later on through loan-words. The active sense of the suffix (*durable* ‘durable’, etc.) was more prominent in the old language, while later on it specialized in the passive meaning (*faisable* ‘feasible’, etc.), evincing completely the competing Old French suffix *-(e)is*. In Old French, denominal *-able* was also relatively prominent; this had arisen through the reanalysis of ambiguous formations like *taillable* ‘obliged to pay the *taille* (a tax)’, originally derived from the verb *tailler* ‘to subject to the *taille*’. Another prominent active deverbal suffix in Old French was *-eux* (Lat. *-osus*), later on reduced to a more marginal position by *-(at)eur* (Lat. *-(at)or*), which is the most important suffix with an active sense in Modern French, together with *-ant* (*important* ‘important’, etc.), which goes back to the Latin present participle. With respect to the originally deverbal *-(at)if* and *-(at)oire* it is noteworthy that

many formations were reanalysed as denominal, like *circulatoire*, which does not mean ‘that circulates’ but ‘related to circulation’. Among the suffixes of Germanic origin, *-ard* was the one that gained the greatest importance.

**Deadjectival adjectives** are rare in French. The Latin comparative suffix *-ior* has disappeared and has survived only in several residual forms like *majeur* (< Lat. *maior*), while the Latin superlative suffix *-issimus* has disappeared completely. Both have been replaced by analytic constructions: Lat. *grandior* ‘bigger’ ≈ Fr. *plus grand*, Lat. *grandissimus* ‘the biggest’ ≈ Fr. *le plus grand*, etc. The intensive use of Lat. *-issimus*, which was so firmly reestablished in Italian or Spanish, never became very productive in French (*richissime* ‘very rich’, etc.). Equally low is the productivity of approximative suffixes like *-ot* (*viellot* ‘a bit old’, etc.) or *-âtre* (< Lat. *-aster*; *blanchâtre* ‘whitish’, etc.).

Latin had four **adverbial suffixes** (cf. Karlsson 1981) and several adverbial phrases consisting of adjective + noun. None of the suffixes has remained transparent in French, but the adverbial phrase consisting of adjective (in the ablative) + *mente* ‘with an adj. mind’ gave rise to the very productive adverbial suffix *-ment*. In Old French, the possibility of omitting *-ment* after the first adjectival base of two coordinated adverbs (*humble et doucement* ‘lit. humb- and softly’) still betrayed the syntactic origin of the suffix.

Of the Latin **verbal suffixes**, *-icare* and *-iare* had to succumb to the erosive force of the sound-laws: Lat. *caballicare* ‘to ride’ > Fr. *chevaucher*, Lat. *acutiare* ‘to sharpen’ > Fr. *aiguiser*, etc. The intensive type *cantare* (Fr. *chanter*) also became opaque when the base *canere* ‘to sing’ went out of use. A verbal suffix, on the contrary, destined to a great future was *-idiarel-izare*, borrowed from Greek. In the popular transmission it became *-oyer*, a suffix quite productive in Old French (*guerre* ‘war’ > *guerroyer* ‘to make war’, etc.). It has gained much more importance in the modern language since its reintroduction as Latinate *-iser* ‘-ize’. The suffix *-ifier* ‘-ify’ has also been reintroduced through latinisms. Besides these denominal and deadjectival suffixes, French also has a small series of deverbal suffixes that modify the *Aktionsart* of the base: *sauter* ‘to jump’ > *sautiller* ‘to make small and repeated jumps’, *crier* ‘to shout’ > *criailler* ‘to shout continuously’, *tousser* ‘to cough’ > *toussoter* ‘to cough slightly’, etc.

### 3.2.4. Conversion

**Conversion**, i.e. the transposition of a word from one part of speech to another without formal change, was not unknown to Latin, but became even more important in French.

Most conversions yield a noun. Many Latin adjective-noun conversions – often of elliptical origin – survive in French as simple nouns, since the corresponding adjective has disappeared: Lat. *alba* ‘dawn’ (related to *albus* ‘white’) > Fr. *aube*, etc. In other cases, the conversion of relational adjectives into nouns has given rise to new nominal suffixes: Lat. *-arius* > Fr. *-ier*, Lat. *-aticus* > Fr. *-age*, etc. Adjective-noun conversions (cf. Malkiel 1938), of the type *le rouge* ‘lit. the red (colour)’, *l'essentiel* ‘lit. the essential (thing)’, *le ridicule de sa conduite* ‘lit. the ridiculous(ness) of his conduct’ or *un curieux* ‘a curious (person)’ have gained importance in Modern French, partly as a consequence of the imitation of Latin usage on the part of the Pléiade poets. As far as verb-noun-conversions are concerned, in Old French the infinitive could freely be used as a noun, while in Modern French the process has become unproductive and only few lexicalized conversions of this type like *un baiser* ‘a kiss’ have survived. Action nouns formed by conversion were already present in Latin (*pugnare* ‘to fight’ > *pugna* ‘a fight’, etc.), but became much more important in French (cf. Lené 1899); they can be masculine (*soutenir* ‘to support’ > *le soutien* ‘support’, etc.) or feminine (*chasser* ‘to hunt’ > *la chasse* ‘hunting’, etc.). Agent and instrument nouns like *le guide* ‘guide’ (from *guider* ‘to guide’) or *la bêche* ‘rake’ (from *bêcher* ‘to rake’) are probably off-shoots of the action nouns.

Noun-adjective conversion, which is also highly characteristic of French, is of Latin origin but has been greatly extended in French: *une adultère* ‘an adulteress’/*une femme adultère* ‘an adulterous woman’, *une orange* ‘an orange’/*une robe orange* ‘an orange dress’, etc. It is not always easy to distinguish such conversions from copulative noun-noun compounds.

There is also a conspicuous number of noun-verb and adjective-verb conversions (*-er* and *-ir* are infinitive endings) in French: *sel* ‘salt’ > *saler* ‘to salt’, *sale* ‘dirty’ > *salir* ‘to make dirty’, etc. Both types are of Latin origin and have given rise to many new formations during the history of French, but they are subject to heavy restrictions. Only

the first conjugation (-er) has remained productive.

Adjective-adverb conversions of the type *parler haut* ‘to speak loudly’ may be traced back to Latin adverbs in -e which came to coincide with adjectives when the final [e] became mute.

### 3.2.5. Reduplication

Latin used reduplication for the formation of the perfect tense of some verbs, but had no reduplicative word-formation rule. Reduplication is also unknown to Romance word-formation, with the exception of Portuguese and especially French, where a diminutive rule using partial reduplication has developed (cf. Rainer 1998). This rule, whose earliest traces may be found at the end of the Middle Ages or the beginning of Modern Times, developed through the imitation of child language in baby talk, but has since spread to colloquial language. It consists of the repetition of the onset and the nucleus of the base, which must always be a monosyllable or be shortened to a monosyllable: *patte* [pat] ‘paw’ > *papatte* [papat], *Pompidou* > *Pompom*, etc.

## 158. From Vedic to modern Indic languages

1. Introduction
2. Old Indo-Aryan
3. Middle Indo-Aryan
4. New Indo-Aryan
5. Transliteration and transcription
6. References

### 1. Introduction

Indo-Aryan, among the most richly documented of Indo-European language groups, is represented by Old, Middle and New Indo-Aryan languages (see Bloch 1965, Masica 1991, Cardona & Jain 2003 for historical surveys and Cardona & Jain 2003, eds. for sketches of individual languages). The oldest documents – composed centuries earlier than they are attested in writing – are the Vedas: the R̥gveda, the most ancient, certainly composed before the end of the second millennium B. C. and possibly in the third millennium; the Atharvaveda; the Sāmaveda; and the Yajurveda, this last in two major groupings, called *śukla* ('white') and *kṛṣṇa* ('black'), and various recensions. A variety of Old Indo-Aryan systematically close to a late Vedic stage is described by the grammarian Pāṇini (see Art. 5), who distinguishes between the spoken language (*bhāṣā*) and usage proper to Vedic (*chandas*). These and other early Indo-Aryan dialects are included in a language termed *sāṁskṛta* (Sanskrit, abbr. Skt.), the pure or polished language, opposed to other vernaculars, which were considered corruptions (*apabhrañśa*) of Sanskrit. These vernaculars make up the group of Prakrits (Skt. *prākṛta*- 'natural'), Middle Indo-Aryan languages and dialects (see Pischel 1965; Hinüber 2001). The earliest attested Prakrit (abbr. Pkt.) documents are the inscriptions of the emperor Aśoka (3rd c. B. C.), which are

especially valuable because they appear in the different dialects spoken in areas of Aśoka's empire (see Oberlies 2003). The major texts of Theravāda Buddhism are represented in the mixed language called Pāli; Jaina texts also are composed in Prakrit (see Geiger 1965; Hinüber 2001; Oberlies 2001). The exemplar of literary Prakrits, used in both Sanskrit dramas and independent works, is called Māhārāṣṭrī. The latest Middle Indo-Aryan stage is represented by various dialectal forms of Apabhrañśa (see Bubenik 2003). New Indo-Aryan documents date from approximately the twelfth century, and these languages cover the largest part of the Indian subcontinent, from Assamese, Bangla, and Oriya in the east, to Gujarati, Marathi, and Konkani in the west. Hindi, spoken in the midlands and used as a lingua franca, is one of the official languages of the Republic of India.

Indo-Aryan languages not only have an extremely rich store of literary sources from various eras, they have also been expertly described by grammarians of Sanskrit (see Art. 5) and of Middle Indo-Aryan dialects. The following sketch is meant to give an idea of the major developments in Indo-Aryan. Obviously, a great many details have been omitted, which are covered in grammars and studies of individual languages (for bibliography, see Masica 1991: 486–510 and the references given in individual chapters of Cardona & Jain 2003, eds.).

### 2. Old Indo-Aryan

Old Indo-Aryan morphology is fairly typical of early Indo-European inflectional languages. It is possible also to trace developments from early Vedic to later stages (see Cardona 2003).

## 2.1. Inflectional morphology

### 2.1.1. Nominal morphology

The Old Indo-Aryan **nominal system** has three **numbers** (singular, dual, plural), three **genders** (masculine, feminine, neuter), and up to seven **case** forms plus a vocative. Pronouns and pronominally inflected adjectives have special characteristics. The dual shows the least number of contrasts, with three distinct forms: ‘NOM/ACC’, ‘INSTR/DAT/ABL’, ‘GEN/LOC’. Nominative and accusative are identical for neuters; e.g. sg. *phalam*, du. *phale*, pl. *phalāni* ‘fruit’. Ablative and genitive singular are formally identical except for *a*-stems, and dative and ablative plural are identical for all stems.

In addition to a variety of endings, nominals can have vowel alternation (ablaut); there are also nouns with heterogeneous stems. The greatest number of formal contrasts occurs in *a*-stems (e.g., *deva-* ‘god’, *phala-* ‘fruit’). The forms of *deva-* and the consonant-stem *vāc-* are shown in Art. 5 (section 4.2.2, (9)–(10)). *senā-* ‘army’, *agni-* ‘fire’ (m. *i*-stem), *vāyu-* ‘wind’ (m. *u*-stem), *kṛti-* ‘deed’, (f. *i*-stem), *dhenu-* ‘cow’, (f. *u*-stem), *nadi-* ‘river’ (f. *ī*-stem), *vadhū-* (f. *ū*-stem) ‘bride’, *pitṛ-* ‘father’, *mātṛ-* ‘mother’, *kartr-* ‘doer, agent’, *rājan-* ‘king’, and *asthi-/asthan-* ‘bone’ (n. *i-/n*-stem) will illustrate further, as in Tab. 158.1.

In accordance with Pāṇini’s system, case forms are labeled as follows: 1. nominative, 1a. vocative, 2. accusative, 3. instrumental, 4. dative, 5. ablative, 6. genitive, 7. locative (cf. Art. 5, section 4.2.2).

Stems such as *agni-/agne-* (prevocalic *agnay-*), *vāyu-/vāyo-* (*vāyav-*), *pitṛ-* (*pitr-*) *lpitar-*, *kartr-/kartar-/kartār-*, *rājan-/rājān-/rājñ-/rāja-* show vocalic alternation.

The **pronominal system** includes personal pronouns (see Art. 5: 4.2.2, (29)–(30)), interrogative, relative, and demonstrative pronouns. Pronominals in *-a*, of the type *sarva-* ‘all’, *ka-* (interr.), *ya-* (rel.) have a particular set of forms:

- (1) (a) M. sg.: 4. *sarvasmai*, 5. *sarvasmāt*, 7. *sarvasmīn*; pl. 1. *sarve*, 6. *sarveṣām* (the rest like *deva-*, *phala-*);
- (b) F. sg.: 4. *sarvasyai*, 5–6. *sarvasyās*, 7. *sarvasyām*; pl. 6. *sarvāsām* (the rest like *senā-*).

A subset of pronominals in *-a* have a nominative-accusative singular neuter with *-at* instead of *-am*: *anyat* ‘other’, *anyatarat* ‘either

of two’, *itarat* ‘other’, *katarat* ‘which of two?’, *katamat* ‘which of many?’.

**Demonstrative pronouns** have degrees of deixis: *idam* ‘this’, *etat* ‘this, that’, *tat* ‘that’, *adas* ‘that (yonder)’ (all neuter nominative/accusative singular). There are alternating stem forms: *eṣa-*, *eṣā-*, *sa-*, *sā-* in the nominative singular non-neuter (m. *eṣas*, *sas* [*eṣa*, *sa* before consonant], f. *eṣā*, *sā*), *eta-*, *ta-* elsewhere, according to the model shown for *sarva-*. Forms for the proximate and distant demonstratives noted are as follows:

- (2) (a) M. sg. 1. *ayam* ‘this’ *asau* ‘that’, 2. *imam amum*, 3. *anena amunā*, 4. *asmai amusmai*, 5. *asmāt amusmāt*, 6. *asya amusya*, 7. *asmin amusmin*; du. 1–2. *imau amū*, 3–5. *ābhyām amūbhyaṁ*, 6–7. *anayoḥ amuyos*; pl. 1. *ime amī*, 2. *inān amūn*, 3. *ebhis amībhis*, 4–5. *ebhyas amībhayas*, 6. *eṣām amīṣām*, 7. *eṣu amīṣu*;
- (b) F. sg. 1. *iyam asau*, 2. *imām amūm*, 3. *anayā amuyā*, 4. *asyai amusyai*, 5–6. *asyās amusyāh*, 7. *asyām amusyām*; du. 1–2. *ime amū*, 3–5. *ābhyām amūbhyaṁ*, 6–7. *anayos amuyos*; pl. 1–2. *imāh amūh*, 3. *ābhih amūbhīh*, 4–5. *ābhyah amūbhyaḥ*, 6. *āsām amūṣām*, 7. *āsu amūṣu*;
- (c) N. 1–2 sg. *idam adas*; du. *ime amū*; pl. *imāni amūni*.

**Indefinite pronouns** are formed with elements postposed to formal interrogatives, as in *kaścit* (nom. sg. m.) ‘some one’, *kiñcit* ‘some thing’ (nom./acc. sg. n.), *ko’pi* ‘any one’.

Moreover, some pronouns have orthotonic and enclitic alternant forms (see Art. 5: 4.2.2, (29)–(30)). Anaphoric pronominal forms such as *anena* (3rd sg. instr. m./n.), *enam* (acc. sg. m.) ‘this one’ are also atonic.

### 2.1.2. Verbal morphology

The Old Indo-Aryan verb system distinguishes the following tense and modal forms: present, future, aorist, imperfect, perfect; indicative, optative, subjunctive, conditional. There is a subtype of optative used in wishes (termed precative, benedictive) and a variety of future that originally was periphrastic. Forms called injunctive – equivalent to unaugmented imperfects and aorists – were also used. Singular, dual, and plural are distinguished in all persons. There is also a contrast between active and medio-passive. Some verbs are activa tantum or media tantum; e.g., *as* ‘be’ and *ās* ‘be seated’ have

## (a) Singular

1	1a	2	3	4	5–6	7
<i>senā</i>	<i>sene</i>	<i>senām</i>	<i>senayā</i>	<i>senāyai</i>	<i>senāyās</i>	<i>senāyām</i>
<i>agnis</i>	<i>agne</i>	<i>agnim</i>	<i>agninā</i>	<i>agnaye</i>	<i>agnes</i>	<i>agnau</i>
<i>vāyus</i>	<i>vāyo</i>	<i>vāyum</i>	<i>vāyunā</i>	<i>vāyave</i>	<i>vāyos</i>	<i>vāyau</i>
<i>kṛtis</i>	<i>kṛte</i>	<i>kṛtim</i>	<i>kṛtyā</i>	<i>kṛtyail/kṛtaye</i>	<i>kṛtyās/kṛtes</i>	<i>kṛtyām/kṛtau</i>
<i>dhenus</i>	<i>dheno</i>	<i>dhenum</i>	<i>dhenvā</i>	<i>dhenvai/dhenave</i>	<i>dhenvās/dhenos</i>	<i>dhenvām/dhenau</i>
<i>nadī</i>	<i>nadi</i>	<i>nadīm</i>	<i>nadyā</i>	<i>nadyai</i>	<i>nadyās</i>	<i>nadyām</i>
<i>vadhūs</i>	<i>vadhu</i>	<i>vadhūm</i>	<i>vadhvā</i>	<i>vadhvai</i>	<i>vadhvās</i>	<i>vadhvām</i>
<i>pitā</i>	<i>pitar</i>	<i>pitaram</i>	<i>pitrā</i>	<i>pitre</i>	<i>pitur</i>	<i>pitari</i>
<i>mātā</i>	<i>mātar</i>	<i>mātaram</i>	<i>mātrā</i>	<i>mātre</i>	<i>mātur</i>	<i>mātari</i>
<i>kartā</i>	<i>kartar</i>	<i>kartāram</i>	<i>kartrā</i>	<i>kartre</i>	<i>kartur</i>	<i>kartari</i>
<i>rājā</i>	<i>rājan</i>	<i>rājānam</i>	<i>rājñā</i>	<i>rājñe</i>	<i>rājñas</i>	<i>rājñi</i>
<i>asthi</i>		<i>asthi</i>	<i>asthnā</i>	<i>asthne</i>	<i>asthnas</i>	<i>asthni</i>

## (b) Dual

1–2	3–5	6–7
<i>sene</i>	<i>senābhymām</i>	<i>senayos</i>
<i>agnī</i>	<i>agnibhymām</i>	<i>agnyos</i>
<i>vāyū</i>	<i>vāyubhymām</i>	<i>vāyvos</i>
<i>kṛtī</i>	<i>kṛtibhymām</i>	<i>kṛtyos</i>
<i>dhenū</i>	<i>dhenubhymām</i>	<i>dhenvos</i>
<i>nadyau</i>	<i>nadībhymām</i>	<i>nadyos</i>
<i>vadhvau</i>	<i>vadhūbhymām</i>	<i>vadhvos</i>
<i>pitaraū</i>	<i>pitrbhymām</i>	<i>pitros</i>
<i>mātarau</i>	<i>mātrbhymām</i>	<i>mātros</i>
<i>kartārau</i>	<i>kartrbhymām</i>	<i>kartros</i>
<i>rājānau</i>	<i>rājabhymām</i>	<i>rājños</i>
<i>asthīnī</i>	<i>asthibhymām</i>	<i>asthnos</i>

## (c) Plural

1–1a	2	3	4–5	6	7
<i>senās</i>	<i>senās</i>	<i>senābhīs</i>	<i>senābhīyas</i>	<i>senānām</i>	<i>senāsu</i>
<i>agnayas</i>	<i>agnīn</i>	<i>agnibhīs</i>	<i>agnibhīyas</i>	<i>agnīnām</i>	<i>agniṣu</i>
<i>vāyavas</i>	<i>vāyūn</i>	<i>vāyubhīs</i>	<i>vāyubhīyas</i>	<i>vāyūnām</i>	<i>vāyuṣu</i>
<i>kṛtayas</i>	<i>kṛtīs</i>	<i>kṛtibhīs</i>	<i>kṛtibhīyas</i>	<i>kṛtīnām</i>	<i>kṛtiṣu</i>
<i>dhenavas</i>	<i>dhenūs</i>	<i>dhenubhīs</i>	<i>dhenubhīyas</i>	<i>dhenūnām</i>	<i>dhenuṣu</i>
<i>nadyas</i>	<i>nadīs</i>	<i>nadībhīs</i>	<i>nadībhīyas</i>	<i>nadīnām</i>	<i>nadīṣu</i>
<i>vadhvas</i>	<i>vadhūs</i>	<i>vadhūbhīs</i>	<i>vadhūbhīyas</i>	<i>vadhūnām</i>	<i>vadhūṣu</i>
<i>pitaras</i>	<i>pitrīn</i>	<i>pitrbhīs</i>	<i>pitrbhīyas</i>	<i>pitrīnām</i>	<i>pitṛṣu</i>
<i>mātaras</i>	<i>mātrīs</i>	<i>mātrbhīs</i>	<i>mātrbhīyas</i>	<i>mātrīnām</i>	<i>mātrṣu</i>
<i>kartāras</i>	<i>kartīn</i>	<i>kartrbhīs</i>	<i>kartrbhīyas</i>	<i>kartīnām</i>	<i>kartṛṣu</i>
<i>rājānas</i>	<i>rājñas</i>	<i>rājabhīs</i>	<i>rājabhīyas</i>	<i>rājñām</i>	<i>rājasu</i>
<i>asthīni</i>		<i>asthibhīs</i>	<i>asthibhīyas</i>	<i>asthīnām</i>	<i>asthiṣu</i>

Tab. 158.1: Nominal system in Old Indo-Aryan

active and middle inflexion, respectively: 3rd sg. pres. indic. *as-ti*, *ās-te*; 3rd pl. *s-anti*, *ās-ate*. Other verbs can have both inflexions, with a semantic difference; e.g., *yaj-a-ti* ‘ven-

erates, performs a sacrificial rite on another’s behalf’; *yaj-a-te* ‘arranges for a sacrificial rite on his own behalf’, *kar-o-ti* ‘makes for someone else’, *kur-u-te* ‘makes for himself’ (see

Art. 5: 4.2.2, (11)). In addition, stems can have ablaut variants; e.g., *as/əs*.

**Tense stems** consist of bases alone or bases with affixes, either suffixed or infixated. In addition to the root type *as-ti s-tas s-anti* (impf. *āsīt* [archaic *ās*] *āstām āsan*) there are nine types of present-imperfect stems formed with different affixes, as follows (3rd sg., pl.):

- (3) (a) *bhav-a-ti bhav-anti* (*abhavat abhavan*) ‘be, become’: full-grade root with unaccented suffix *-a*.
- (b) *juho-ti juhv-ati* (*ajuhot ajuhavus*) ‘offer oblations’, *jihīt-e jih-ate* ‘flee’: reduplicated stem with ablaut.
- (c) *pus-ya-ti pus-yanti* (*apusyat apusyan*) ‘thrive’: suffix *ya*.
- (d) *su-no-ti su-nv-anti* (*asunot asunvan*) *su-nu-te su-nv-ate* (*asunuta asunvata*) ‘press juice out of’: suffix *-no-l-nu* follows zero-grade root.
- (e) *tud-a-ti tud-anti* (*atudat atudan*) *tud-a-te tud-ante* (*atudata atudanta*) ‘goad, wound’: zero-grade root with accented suffix *-a*.
- (f) *yu-na-k-ti yu-ñ-j-anti* (*ayunak ayuñjan*) *yu-ñ-k-te yu-ñ-j-ate* (*ayuñkta ayuñjata*) ‘join, connect, yoke’: zero-grade root with infixated *-na-/n-*.
- (g) *tan-o-ti tan-v-anti* ‘stretch’, *kar-o-ti*: suffix *-o-/u-* (see Art. 5: 4.2.2 (11)).
- (h) *kri-ñā-ti kri-ñ-anti* (*akrīñāt akrīñan*) *kri-ñī-te kri-ñ-ate* (*akrīñīta akrīñata*) ‘buy’: zero-grade root with suffix *-ñā-/ñī-/ñ-*.
- (i) *cor-ay-a-ti cor-ay-anti* ‘steal’, *kath-ay-a-ti kath-ay-anti* ‘tell relate’: suffix *-i-/e* (-*ay-* before vowels).

Similarly, there are several types of aorist stems, as in the following examples:

- (4) (a) *adā-t ad-us* (*dāld* ‘give’), *abhū-t ab-hūv-an* (*bhū* ‘be, become, come into being’): root aorist.
- (b) *apus-a-t apus-an* (*pus* ‘thrive’), *agam-a-t agam-an* (*gam* ‘go’): root followed by stem vowel *-a*.
- (c) *acūcur-a-t acūcur-an* (*cur* ‘steal’), *ajījan-a-t ajījan-an* ‘brought into being’ (*jan* ‘be born’): reduplicated aorist with stem vowel *-a*, the regular aorist corresponding to presents with *-i* of the type (3i) and causatives (*jan-i*: *jan-ay-a-ti* ‘brings into being’).
- (d) *anai-ş-īt anai-ş-us*, mid. *ane-ş-ṭa ane-ş-ata* (*nī* ‘lead’); *akār-ş-īt akār-ş-us* *akr-ta* (1st sg. *akr-ş-i*) *akr-ş-ata* (*kr*

‘do, make’), *abhait-s-īt abhait-s-us abhit-ta abhit-s-ata* (*bhid* ‘split’): *s-aorist*.

- (e) *anam-s-īt anam-siş-us* (*nam* ‘bow, bend’), *ayā-s-īt ayā-siş-us* (*yā* ‘go’): stem with *-siş-*, regular for bases in *-ā*.
- (f) *adhuk-şa-t adhuk-şa-n* (*duh* ‘milk’): stem in *-sa-*, regular for *aniṣ* verbs with final consonants that in combination with a following *-s-* give a cluster *-kṣ-*, as in *-dhukṣa-*; this verb originally had an *s-aorist* (3rd sg. mid. *adugdha*, 1st sg. mid. *adhukṣi*) which was the analogic source of this formation.

The general future stem is formed with a suffix *-sya-*, as in *dā-sya-ti* ‘will give’, *kar-iṣya-ti* ‘will do, make’. There is also a complex future, with an additional suffix *-tās-*, of the type:

- (5) 3rd sg. *kartā kartārau kartā* (act./mid.);  
2nd sg. *kartāsi kartāsthas kartāsthā* (act.), *kartāse kartāsāthe kartādvhe* (mid.);  
1st sg. *kartāsmi kartāsvas kartāsmas* (act.), *kartāhe kartāsve kartāsmahe* (mid.).

The source of this type is a periphrastic formation consisting of an agent noun in *-tr* and forms of the verb *as*, except for the third person forms. But this came to have the structure Pāṇini ascribes to it: a suffix *-tās-* is added.

In the language Pāṇini describes, the **aorist** (e.g., *avadhīt* ‘slew, has slain’) is used for a general past, including the day of reference; the **imperfect** (e.g., *ahan* ‘slew’) and **perfect** (e.g., *jaghāna* ‘slew’) are used for a past excluding the day of reference, with the perfect further distinguished by being used if the act in question was not witnessed by the speaker. These contrasts are also found in certain Vedic texts. There is a similar contrast between the future types *karisyāmi* ‘I shall do, make’ and *kartāsmi* ‘I shall do, make (at some time after today)’.

The **conditional** has an augmented stem with a suffix *-sya-* followed by secondary endings, of the type *adā-sya-* (3rd sg. *adāsyat* ‘would give, would have given’), *akar-iṣya-* (*akarisyat* ‘would do, would have done’). This is used in contrary-to-fact conditional sentences.

**Perfect stems** are generally characterized by reduplication, ablaut, and a particular set

of endings. For example, the perfect of *kṛ* ‘do, make’ is:

- (6) 3rd sg. *cakāra cakratus cakrus* (act.), *cakre cakrāte cakrire* (mid.);  
 2nd sg. *cakṛtha cakrathus cakra* (act.), *cakṛṣe cakrāthe cakṛdhve* (mid.);  
 1st sg. *cakāral/cakara cakṛva cakṛma* (act.), *cakre cakṛvahē cakṛmahe* (mid.).

Not all perfects have reduplicated stems. The most notable exception is the perfect of *vid* ‘know’: *veda vidatus vidus*. A periphrastic perfect of the type *gamayām cakāra* ‘caused to go’ is the norm for derived verbs such as causatives.

There are also **suppletive stems**; e.g., *ab-hū-t*, *avadh-īt* are the aorists corresponding to the presents *as-ti* ‘is’, *han-ti* ‘kills’.

**Imperative** forms have particular endings in second and third person forms. To indicatives with *-ti*, *-antil-ati*, *-e* (see (3)) correspond imperatives with *-u* instead of *-i* and *-ām* instead of *-e* in active and middle forms respectively. For example: *as-tu*, *s-antu*, *juho-tu*, *juhv-atu*; *sunu-tām*, *sunv-ātām*, *sunv-ātām*, *sunv-āthām*, *yaj-antām*. Second person singular forms have *-hi*, *-dhi*, *-o*, and the corresponding middle ending is *-sva*. For example: *i-hi* ‘go’, *juhu-dhi* ‘offer oblation’, *bhind-dhi* ‘split’, *paca* ‘cook’, *sunu* ‘press juice’, *kuru* ‘do, make’; *paca-sva*, *sunu-sva*, *kuru-sva*. The second plural middle has *-dhvam*; e.g., *sunu-dhvam*. Imperatives of the type *kṛ-ṇī-hi* ‘buy’ (see (3h)) are regular for vocalic bases; consonantal bases have corresponding imperative forms of the type *gr̥h-āṇa* (*gr̥hṇāti* ‘grasps’). First person imperative forms contain *-ā* followed by *-ni* (1st sg. act.), *-vahai*, *-mahai* (1st st. du., pl. mid.), with *-ai* instead of *-e*; similarly, the first singular middle has *-ai*; e.g., *bhav-āṇi* ‘I would be’, *sunav-ai*, *sunav-āvahai*, *sunav-āmahai*. Other imperative forms have secondary endings, as in *bhavatām*, (3rd du.), *bhavathām* (2nd du.), *bhavata* (2nd pl.), *bhavā* (1st du.), *bhavāma* (1st pl.).

**Optative** forms to stems in *-a* are characterized by *-e*, and optatives from other stems have active forms with *-yā-*, middle forms with *-ī(y)-*. Third plural forms contain endings *-us* (act.), *-ran* (mid.), and *-a* is the first singular middle ending; otherwise, secondary endings follow the stems. E.g., *pac-e-t pac-ey-us*, *pac-e-ta pac-e-ran pac-ey-a*, *sunu-yāt sunu-yus*, *sunv-ī-ta sunv-ī-ran sunv-īy-a*. **Precative** forms are radical and have endings like those of the optative, but the stem is characterized by *-s-* in the middle and active endings

## XVIII. Morphologischer Wandel II: Fallstudien

have *-s-* before nonfinal sounds; e.g., *sū-yā-t sū-yās-tām* *sū-yās-us*, *so-śīs-ṭa so-śīy-āstām* *so-śī-ran* (*su* ‘press juice’).

### 2.2. Derivational morphology

Early Indo-Aryan has a rich system of deriving bases from nominals and verbs.

#### 2.2.1. Nominal derivation

**Derived nominals** are denominative or deverbative. Nouns formed directly from verb roots include derivates signifying actions, agents, objects, instruments, and loci; e.g., *kṛ-ti-* ‘doing, deed’, *kar-tr-* ‘doer, agent’, *kar-man-* ‘action, object’, *kar-anā-* ‘doing, means, instrument’ (base *kṛ*), *-dhānt-* ‘receptacle’ (base *dhā-* ‘put’). Action nouns in *-tu* supply what are traditionally called infinitives. What is etymologically an accusative singular in *-tum* (e.g., *kar-tum*) is the norm in the language Pāṇini describes, but earlier Vedic also had other case forms of such derivates (dat. *-tave*, abl./gen. *-tos*). Moreover, forms in *-tum* alternate with datives of action nouns; e.g., *bhok-tum*, *bhojanāya* (dat. sg. of *bhoj-ana-*) ‘to eat’. There are also participles etymologically related to derivates with *-tu-*, of the type *kar-tavya-* ‘to be done, which can be done’, which alternate with derivates in *-anīya-* (e.g., *kar-anīya-*) and other suffixes. In addition, there are participles with tense values; e.g., *-ta-* (*kṛ-ta-* ‘done, made’, *ga-ta-* ‘gone’), present and future participles in *-at-l-ant-* (act.) and *-āna-*, *-māna-* (med./pass.), such as *kur-v-at-* (m. nom. sg. *kurvan*, instr. sg. *kurvatā*) ‘doing, making’, *kurvāṇa-* ‘id.’, *kariṣyat-* (*kariṣyan*, *kariṣyatā* ‘going to do’), and perfect participles in *-vas-l-us-* (act.), *-āna-* (mid.), such as *cakryas-* (*cakrvān* [nom. sg. m.], *cakruṣā* [instr. sg. m./n.]). There are, in addition, indeclinables with *-tvā* or *-ya* – the latter in nonnegative compounds – which are used with reference to an action that is performed prior to another; e.g., *kṛ-tvā* ‘after making, doing’, *ni-śad-ya* ‘after sitting’.

Several kinds of nominals are derived with secondary derivative affixes (called *taddhita*). A series of affixes occurs in derivates signifying the property of being what a given nominal base denotes; for example, *puruṣa-tva-*, *puruṣa-tā-* signify the property of being a man (*puruṣa-*), and *prath-imā-* designates the property of being broad (*prthu-*). There is a large group of derivates that correspond to phrases of the type *X-E Y*, with which they alternate, where the values of *X-E* are case

forms of nominals and *Y* stands for a nominal whose meaning is attributed to the derivational affix. For example, there are patronymics like *gārgī-* ‘son of Garga’, *aupagava-* ‘descendant of Upagu’: a case form of *gārgī-* or *aupagava-* corresponds to and alternates with a phrase containing a genitive of *garga-* or *upagu-* and a form of *putra-* ‘son’, *apatyā-* ‘offspring, descendant’, or a synonym of such a noun.

Some **taddhita derivates** are formed from a more restricted group of nominals. Thus, *tāvat-* (nom. sg. m. *tāvān*) ‘this much’, *yāvat-* ‘as much’, *kiyat-* ‘how much?’ are formed from a subset of pronouns. Some such derivates correspond to case forms. For example, *tatas* ‘from that, thence’, *tatra* ‘in, at that, there’ correspond to and alternate with ablative and locative forms of *tad-* ‘that’. Other adverbial terms derived from pronouns are *tathā* ‘thus’, *yathā* ‘as’, *katham* ‘how?’.

A particularly wide-spread taddhita affix is *ka*, which serves to form derivates with diminutive and other semantic shadings (e.g., *putra-ka-* ‘poor little child’, *ásva-ka-* ‘wretched horse’) and also occurs redundantly, as in *avi-ka*, synonymous with *avi-* ‘sheep’.

Sanskrit is like other Indo-European languages in that it forms what are traditionally called **comparatives** and **superlatives** of adjectives by means of suffixes. For example, *madhumat-tara-* ‘quite full of honey’, *priyatama-* ‘most dear’, *gar-īyas-* ‘weightier, more prolix (*guru-* ‘weighty, prolix’), *gar-iṣṭha-* ‘most weighty, prolix.’ As can be seen, derivates with *īyas*, *iṣṭha* are formed from roots, not to adjective stems, and in Vedic the type *yaj-iṣṭha-* ‘who best performs a rite’ is widespread. Moreover, while eliminating the use of derivates with these suffixes in agentive derivates formed from productive verb roots, Sanskrit developed the type *pacati-tarām* (= *pacati-tara-ām*) ‘cooks very well’, *pacati-tamām* ‘cooks extremely well’, with the suffixes *-tara*, *-tama* attached to finite verb forms.

**Compounds** are of four general kinds: *tatpuruṣa* (determinative), *dvandva* (copulative), *bahuṛihi* (exocentric), and a type that is usually invariant (*avyayībhāva*). The first member of a *tatpuruṣa* is regularly equivalent to a case form other than a nominative; e.g. *tatpuruṣas* (nom. sg.), *grāma-gatas* ‘gone to the village’ are equivalent to *tasya puruṣaḥ* ‘his (gen. sg. *tasya*) man, servant’ and *grāmar̥i gatas*. A subtype of *tatpuruṣa*, called *karmadhāraya*, has a first member coreferen-

tial with the second, which it modifies, as in *nīlotpalam* ‘blue (*nīla-*) lotus’, equivalent to *nīlam utpalam*. Like *tatpuruṣa-*, the compound *bahuṛihi-* is an instance of the class: *bahuṛihi* (nom. sg.) is equivalent to *bahuṛihi asya*, used of someone who has (*asya* ‘of this one’) much (*bahu-*) rice (*vrīhi-*). Dvandvas are equivalent to phrases with *ca* ‘and’; e.g., *mātāpitaraū* (nom./acc. du.) is the equivalent of *mātā ca pitā ca* ‘mother and father’. *avyayībhāva* compounds are generally though not always invariant; e.g., *upāgni* ‘near the fire’.

*upāgni-* is an obligatory compound in the sense that the constituents *upa* and *agnes*, are not used together in a syntagma that alternates with the compound. Similarly, there are *tatpuruṣa* compounds such as *kumbhakāra-* ‘pot maker’: the derivate *-kāra-* does not occur outside of a compound. Certain nominals also have variants that occur only in compounds. For example, *rājan-* is an *n*-stem, but there is an *a*-stem *-rāja-* found in compounds, as in *mahārāja-* ‘great king’.

Number words designating units also form compounds with terms for decades.

- (7) '11' *ekā-daśa* (*eka-* ‘one’)
- '12' *dvā-daśa* (*dvi-* ‘2’ [archaic nom./acc. du. *dvāl*])
- '13' *trayo-daśa* (< *trayas-daśa*) (*tri-* ‘3’ [nom. pl. m. *trayas*])
- '14' *catur-daśa*
- '15' *pañca-daśa*
- '16' *śo-daśa* (*śaṣ-* ‘6’)
- '17' *sapta-daśa*
- '18' *aṣṭā-daśa* (*aṣṭān* ‘8’ [archaic nom./acc. pl. *aṣṭāl*])
- '19' *nava-daśa* (also *ekona-viṁśatis*; *ūna-viṁśatis* [*‘20 less one’*])
- '20' *viṁśatis*
- '50' *pañcāśat*
- '51' *eka-pañcāśat*
- '52' *dvi-pañcāśat*
- '53' *tri-pañcāśat*
- '54' *catuh-pañcāśat*
- '55' *pañca-pañcāśat*
- '56' *śat-pañcāśat*
- '57' *sapta-pañcāśat*
- '58' *aṣṭa-pañcāśat*
- '59' *nava-pañcāśat* (*ekona-śaṣṭis*)

Sanskrit also has iterative sequences like *damē dame* ‘in each house, in house after house’. The second element does not have a high-pitched vowel. In *pada-pāṭhas* (analyzed versions) of Vedic texts, such sequences

are treated as compounds, but Pāṇini and other grammarians treat them as sequences that involve repetition of a word.

### 2.2.2. Verb derivation

Derived verbal bases are either deverbal or denominative. To the former group belong causatives, desideratives, and intensives. **Causatives** are formed with a suffix *-i-*, which generally conditions substitution by a vowel *ā ai au* in a preceding base. For example, the causatives of *yaj* ‘venerate, perform a rite’, *kṛ* ‘do, make’ are *yāj-i-* (3rd sg. pres. ind. *yāj-ay-a-ti*), *kār-i-* (*kār-ay-a-ti*). In addition, verbs in *-ā* and a small group of other verbs show a final *-p* preceding the causative suffix, as in *sthāp-i-* ‘set up, found’ (*sthā* ‘be in place’), *arp-i* ‘cause to reach’ (*r* ‘go to’). **Desideratives** have the suffix *-sa-*, usually with reduplication; e.g., *vi-vak-ṣa-* (*vivakṣati*) ‘wish to speak’. **Intensives** are generally formed to consonant-initial monosyllabic bases, with the suffix *-ya-* and reduplication; such bases are inflected medially; e.g., *yā-yaj-ya-* (*yāyajyate*) ‘repeatedly perform a rite’. There are also intensives of the type *roravīti* ‘roars’, which involve reduplication without a suffix.

**Denominatives** are regularly formed with the suffix *-ya-*, as in *putrī-ya-* (3rd sg. pres. indic. *putrīyati*) ‘wish for a son, treat as a son’, *vrsā-ya-* (*vrsāyate*) ‘act like a bull’, *apsarā-ya-* (*apsarāyate*) ‘act like an Apsaras’. In addition, verb endings could directly follow nominal bases, without a derivational suffix, a type found mainly in Vedic; e.g., *bhiṣaj-* ‘healer’, *bhiṣak-ti* ‘heals’.

### 2.3. Vedic features

Early Vedic had variants that were eliminated in dialects that make up later Sanskrit. For example, Vedic dialects have *a*-stem forms of the types *vīryā* ‘heroic power’ (instr. sg.), *ubhā* ‘both’ (nom./acc. du. m.), *devāsā* ‘gods’ (nom. pl.), *āyūdhā* ‘weapons’ (nom./acc. pl. n.), *devām* (gen. pl.). In early Vedic, a distinction is also made between derivative stems of the types *vrkti-* ‘female wolf’ and *devī-* ‘goddess’. The first type has *-s* in the nominative singular (*vrktis*) and inflects like a consonant stem (e.g., acc. sg. *vrkyām*); the second lacks *-s* in the nominative singular (*devī*) and has alternative stems of the types *devī-*, *devyā-*. Forms of the two types were later collapsed into a single type, illustrated by *nadī-* in Tab. 158.1.

Sanskrit has particles such as *ā*, which cooccur with particular case forms, as in *ā*

*pāṭaliputrāt* (abl. sg.) ‘up to Pāṭaliputra’. In Vedic, one also has *ā* redundantly postposed to a case form, as in *diva ā* ‘from heaven’ (abl. sg. *divas*), *ghra āñ* ‘in the cloud’ (loc. sg. *ghbre*).

Vedic shows traces of an aspectual contrast (perfective : imperfective), most clearly seen in negative imperatives of the types *mā vādhīs* ‘do not slay’ (perfective: 2nd sg. aor. *avadhīts*), meant to keep someone from initiating an act, versus *mā dīvyas* ‘stop gambling’ (imperfective: 2nd sg. impfv. *adīvyas*), meant to have someone cease what he or she is already doing. From earliest attested texts, however, the contrasts are primarily among temporal stems. Some perfect forms in early Vedic reflect the Indo-European use as stative (e.g., *bī-bhāy-ā* ‘is afraid’ [3rd sg. pf.]), but from quite early on the perfect too is incorporated into a tense system.

The subjunctive (e.g., *as-ā-t*, 3rd sg. subj. of *as* ‘be’) gradually goes out of use in Sanskrit, being supplanted by forms of the optative and present and future indicative. In Pāṇini’s description, subjunctive forms are marked as particular to Vedic usage. A remnant of this type persists in first person imperative forms of the type *karavāni* (1st sg.) ‘I ... do, make’ (e.g., *kim karavāni* ‘what shall I do, what may I do?’). Similarly, the earlier injunctive remains in the negative imperative types *mā vādhīs*, *mā dīvyas* (see above).

In some instances, there are different stems which are historically related. For example, in Vedic *kṛ* ‘make, do’ has a root aorist of the type *akār* (3rd sg. act. < \*ákart [1st sg. *akāram*]), *akrān* (3rd pl. < \*ákr-ant), in which the stem is simply the base (with possible augment), with either full grade (*kar*) or zero-grade (*kr*). There is also a type *akār-a-t* (3rd sg.), developed analogically from the athematic root aorist, in which the stem is invariant: *akar-a-*, with the stem vowel *-a-*. Both these stems are found in earliest Vedic texts. Later, however, the productive aorist is sigmatic: *akār-s-ūt*, with the stem suffix *-s-* and lengthened grade of the base (*kār-*). Forms of the earlier root aorist persist in the medio-passive; e.g., 3rd sg. *akr-ta* ‘did, made (for himself)’ forms part of a paradigm that includes 1st sg. *akr-s-i* and 3rd pl. *akr-s-ata*. In early Vedic also, middle forms like *stave* ‘is praised’ could function as passives and coexisted with marked passives of the type *stū-ya-te* ‘is praised’. Later, the second type prevailed as the norm for passives.

A particularly noteworthy contrast between early Vedic and the later language which Pāṇini describes concerns imperative and optative forms. The indicative (3rd sg.), imperative (2nd sg.) and optative (3rd sg.) forms in (8) represent the norm at Pāṇini's time:

- (8) (a) *sad* 'sit down': *s̄dati*, *s̄da*, *s̄det*  
      (b) *śru* 'hear, listen': *śr̄noti*, *śr̄nu*, *śr̄nuyāt*

Such forms occur in earlier Vedic, which, however, also has nonindicative forms like 2nd sg. imper. *sada*, *śr̄udhi*, from the aorist stems. Early Vedic had comparable modal forms also to perfect stems (e.g., *sasadyāt* [*sad* 'sit']).

This abundance is also to be found in other categories. Thus, there is a large number of accusative, dative, ablative, and genitive forms used as infinitives that Pāṇini explicitly recognizes as proper to Vedic usage only, and he also mentions Vedic absolutives in *-tvāya*, *-tvī*, *-tvīnam* in addition to those in *-tvā*.

Some formations that were eliminated in what came to be viewed as standard Sanskrit are reflected in Middle Indo-Aryan.

### 3. Middle Indo-Aryan

#### 3.1. Inflectional morphology

##### 3.1.1. General

Middle Indo-Aryan morphology differs from that of Old Indo-Aryan with respect to the number of contrasts observed. The dual is eliminated as a distinct category, and the use of ablaut variants is severely restricted both in the nominal and verbal systems. The number of nominal cases is diminished. In the verb system also the number of contrasts gradually lessens. The contrast between active and medio-passive endings is gradually eliminated, and the large number of stems within categories is reduced.

##### 3.1.2. Nominal morphology

The major differences between Old and Middle Indo-Aryan **nominal morphology** consists in the reduction of contrasts in the latter. The number of cases formally distinguished is reduced. In general, the dative is replaced by the genitive, except in expressions of purpose. The instrumental and ablative plural merge in the Pāli type *purisehi* 'men', which has the ending *-hi* found in other instrumentals (cf. Old Indo-Aryan *-bhīs*). In addition, the con-

trast between nominal and pronominal endings of the types *-āt*, *-e*, *-āyās*; *-smāt*, *-smin*, *-asyās* in Old Indo-Aryan (see 2.1.1) tends to be levelled, so that Pāli has nominal forms of the type *purisamhā*, *purisamhi* (*purisa-* 'man', cf. also Ásokan *vijitamhi* 'in the empire'), and pronominal *tāya*, comparable to *tamhā*, *tamhi*, and *kaññāya* (*kaññā-* 'girl'). Moreover, ablaut alternation of the type *agni-lagne-*, *vāyu-lvāyo-* is gradually eliminated.

The loss of final consonants, along with analogic remodelings, results in the replacement of consonant-stems by vowel-stems, with alternants found in early stages. For example, Pāli *gacchanto* 'going', *mahanto* 'great:NOM.SG.M', *manassa* 'mind:GEN.SG', are inflected like Skt. *devas*, *devasya* (see Art. 5: 4.2.2, (10)) as opposed to Skt. *mahān*, *manasas*. These developments continued in other dialects and later times. As a consequence, there are paradigms of the type *devo* (see Art. 5: 5.2, (38)). According to the descriptions of Prākṛit grammarians and literary sources, the following are among Prākṛit forms equivalent to the forms of Sanskrit *agni-* 'fire', *vāyu-* 'wind', *pitr-* 'father', *bhartr-* 'husband' (see Tab. 158.1; Pischel 1965: 266–76).

Analogical extensions have been carried out, so that stems like *piara-*, *bhattāra-* have been abstracted. The obliteration of formal contrasts continues to develop in later Middle Indo-Aryan, so that, for example, in Apabhrāmī nominative and accusative forms merged (e.g., *dahamuhu* 'ten.faced:NOM.SG.M', *caūmuhu* 'four.faced:ACC.SG.M'), as did the ablative and genitive (e.g., *mahu* 'of, from me'), and etymologically instrumental forms could function as locatives, as in *dāhiṇābhāēm* 'in the southern section', *ṇiyaniyathā-nehim* 'in their proper places'.

One additional point that is worth mentioning concerns the accumulation of affixes in some case forms. For example, *-himto*, *-suṁto* (see Tab. 158.2(b)) obviously consist of *-him*, *-su* and an appended element *-to*. In Old Indo-Aryan, *-tas* was indeed used in forms that alternated with ablatives; e.g., *grāmatas* = *grāmāt* 'from the village'. Moreover, the R̄gveda already shows *-tas* appended to an actual case form: *patsyatas* 'at the feet', with *-tas* following a locative plural. The extension of such a procedure has been carried further in Middle Indo-Aryan.

Already in Old Indo-Aryan, the affix *-ka* was used not only in derivates with particular semantic shadings such as diminutive (e.g., *putra-ka-* 'little child, poor child') but also

## (a) Singular

	<i>bhattāūnō</i>				

Tab. 158.2: Nominal system in Middle Indo-Aryan

with no difference from the base to which the suffix was added; e.g., *avi-*, *avi-ka-* ‘sheep’. This redundant affix and its variant *-aka-* became wide spread in Middle Indo-Aryan. For example, Aśokan *hakam* ‘I’ is equivalent to *aham*; as a result of phonological developments, in Apabhraṃśa, the form is *haiṁ*. Similarly, Apabhraṃśa nominative-accusative forms in *-ai* (m.) and *-aüṁ* (n.) are developed from such enlarged bases, and feminines in *-ī* developed from comparable enlarged stems (Old Indo-Aryan *-ikā*). These are the sources of New Indo-Aryan *-o*, *-ā*, *-u* *ṁ*, *-ī* in variable nouns and adjectives (see 4.1.1).

The Middle Indo-Aryan **pronominal system** is systematically like that of Old Indo-Aryan (see 2.1.1). The major differences between the two have to do with dialectal variations, phonological changes, and analogical developments. Interrogative and relative pronouns are characterized by *k-* and *j-*, the latter due to a phonological change of *y-* – still found in early Middle Indo-Aryan (Pāli *yo* (nom. sg. m.) etc.) – to *j-*. Personal pronoun forms like Pāli *amhehi* (instr./abl. pl.), *amhesu* (loc. pl.) ‘us’ (Pkt. *amhehiṁ*, *amhesu*) have *amhe-* as in the nom./acc. pl. *amhe*. Similarly, *tumhehi*, *tumhesu* ‘you’ (Pkt. *tumhehiṁ*, *tumhesu*) have *tumhe-*, as in the nom./acc. *tumhe*; and

forms with *yu-* have been eliminated in favor of forms with *tu-*. Apabhraṃśa again shows a considerable reduction in forms:

- (9) (a) Sg. 1. *haiṁ*, 2–3–7. *maiṁ*, 5–6. *mahu/majju*; pl. 1–2. *amhelamhaiṁ*, 3–7. *amhehim* 5–6. *amhaham*, 7. *amhāsu*;
- (b) Sg. 1. *tuhum*, 2–3–7. *taüṁlpaiṁ* 5–6. *taul/tujha/tudhra*; pl. 1–2. *tumhel* *tumhaṁ*, 3/7. *tumhehim*, 6. *tumhaham* 7. *tumhāsu*.

Middle Indo-Aryan also has demonstrative pronouns comparable to those of Old Indo-Aryan: *sa-/ta-* ‘that’ (e.g., Pāli *so* (nom. sg. m.), *sā* (f.), *tam* (acc. sg. m./f.), *te* (nom./acc. m.), *tā* (nom./acc. f.), and so on. Again various phonological and analogical changes account for differences between Old and Middle Indo-Aryan. For example, since final stops are lost, the Old Indo-Aryan contrast between the types Skt. *sarvam* ‘all’ and *anyat* ‘other’ is absent; thus Pāli *añña-* ‘other’ has an inflection like that of *sabba-* ‘all’. Pāli *imam* ‘this:ACC.SG.F’ as opposed to Skt. *imām* shows a regular shortening of *-ā* in final syllable, but forms like *iminā*, *imamhā*, *imassa*, *imamhi* (m./n. sg. 3, 5, 6, 7), *imehi*, *imesam*, *imesu* (m./n. pl. 3/5, 6, 7) and *imayā*, *imāya*, *imissā*, *imissam* (f. sg. 3, 5, 6, 7), *imāhi*, *imā-*

*sam*, *imāsu* (f. pl. 3/5, 6, 7) show a generalization of *ima*-*.* Similarly, Pāli forms like *amūhi*, *amūsam*, *amūsu*, used for all genders, show a generalization of *amū-* at the expense of *amī-*.

In late Middle Indo-Aryan, Apabhraṃśa has *tahāṁ*, *jahāṁ*, *kahāṁ*, *tahim*, *jahim*, *kahim* equivalent to Old Indo-Aryan ablative and locatives *tasmāt* ‘from that ...’, *yasmat* ‘from which ...’, *kasmāt* ‘from which ...?’, *tasmin*, *yasmin*, *kasmin*.

### 3.1.3. Verb morphology

In its course of development, Middle Indo-Aryan also eliminated many contrasts found in the Old Indo-Aryan verb system. One now has a system with present, future, and preterit stems. The perfect and the periphrastic future are done away with. In addition, forms with active endings gradually replace forms with middle endings, as in presents like Pāli *maññati* ‘thinks’, *vuccati* ‘is said’; contrast Skt. *man-ya-te*, *uc-ya-te*, with the middle ending *-te*.

Ablaut variations are gradually eliminated in favor of single stems; e.g. Pāli *e-ti* (3rd sg.) ‘go:3.SG (goes)’, *e-nti* ‘go:3.PL (go)’ as opposed to Skt. *e-ti*, *y-anti*. In addition, the present stem tends to function as the basis for deriving stems of other verb forms; e.g., Pāli *gacch-a-ti* ‘goes’, fut. *gacch-issa-ti*, aor. *agacch-i* (*agañch-i*), past participle *gacch-ita* as opposed to Skt. *gacch-a-ti*, *gam-isy-a-ti*, *agam-a-t*, *ga-ta-*, which also have counterparts in Middle Indo-Aryan. In later Middle Indo-Aryan, moreover, the present stems themselves are generally reduced to two prevalent types, in *-a-* and *-e-*; e.g., *kar-a-i* ‘does’, *kah-e-i* ‘says, tells’ (Pāli *katheti*, Skt. *kathayati*). Further, these two types could alternate, as in *sun-a-/su-e* (*sun-a-i*, *suṇe-i*) ‘hear, listen’.

In early Middle Indo-Aryan, the prevalent preterital forms were sigmatic (e.g. Pāli *agacch-is-arṇ* ‘I went’). However, in the course of history, Middle Indo-Aryan tended to eliminate verbally inflected preterital forms in favor of past participles of the type *gaya-*, *gaa-* ‘gone’, *kaya-*, *kaa-* ‘done, made’ (Skt. *ga-ta-*, *kṛ-ta-*). If such participles derive from transitive verbs, they agree in number and gender with nominals denoting objects, but derivates from intransitives agree with subjects. By the late Middle Indo-Aryan period, this was the norm.

Future stems of the Pāli type *karissati* ‘do:FUT:3.SG (will do)’ represent phonological outcomes of Old Indo-Aryan *-sya-* (Skt. *kari-*

*syati*). Due to a phonological change, moreover, later Prakrit has not only a future with *-ssa-* but also one with *-ha-*, as in *pucchihām* ‘I will ask’.

Suppletion of course occurs also in Middle Indo-Aryan. For example, the past participle corresponding to the Prakrit present *jā-* (3rd sg. *jā-i*) ‘go’ is *gaya-/gaa-*. Moreover, as a result of phonologic and analogic developments, there are other instances where suppletion can justifiably be invoked although etymologically a single root is involved. For example: *ne-i* ‘leads’ (phonologically <*naya-ti*>) : *nī-ya-* (<*nī-ta-*>), *suṇa-i* ‘hears, listens’ (generalized stem *suṇa-* <*śr-ṇv-a-* [cf. Skr. *śrṇvanti*]) : *su-ya-*. Etymologically, the present and participle forms contain the same base.

Middle Indo-Aryan maintains not only indicative but also imperative and optative forms, with varying developments at particular stages in different dialects. For example, Pāli *gaccha*, *gacchāhi* ‘go:IMP.2.SG’, *gacchatha* ‘go:IMP.2.PL’, *karotu* ‘go:IMP.3.SG (should go)’, *karontu* ‘go:IMP.3.PL’, *gaccheya* ‘go:OPT.3.SG’.

Middle Indo-Aryan also has passives, again with various dialect forms. Passives like Pāli *vuccati* represent developments of passives with the suffix *-ya-*. In addition, there are passives with a suffix *-iya-/īya-*, as in Pāli *har-iya-tilhar-īya-ti* ‘is taken away’, Pkt. *pucch-ijja-i* ‘is asked’ (*pucch-a-ti*, *pucch-a-i* ‘asks’). Moreover, new passive aorists based on present stems were developed, as in Pāli *chijjīnsu* ‘were cut down’ (pres. *chijjanti* ‘are cut down’).

## 3.2. Derivational morphology

### 3.2.1. Nominal derivation

Nominal forms derived from verbs are typologically like those of Old Indo-Aryan, with variation: **action nouns** such as Pāli/Pkt. *karaṇa-* ‘doing’; **agent nouns** such as Pkt. *kattār-* (nom. sg. *kattā*, acc. sg. *kattāram*, etc.; see Tab. 158.2); present and past participles (e.g., *gacchanta-*; cf. 3.1.1), *gacchita-*, *gaya-*, *gaa-*); gerundives (e.g., Pāli *kātabba-* ‘to be done’, *dassanīya-* ‘worthy of being seen’; Skt. *kartavya-*, *darśanīya-*); absolutives (e.g., Pāli *nikkham-itvā* ‘after leaving’); infinitives (e.g., Pāli *pappotum* ‘obtain’; Pkt. *soum* ‘hear, listen’). As can be seen, the rules of distribution differ from those of Old Indo-Aryan: *nikkhamitvā* has *-tvā* after a complex with a preverb and *pappo-tum* has *tum* added to the present stem, but Sanskrit has *niṣkramya*,

with *-ya*, and *prāptum*, in which the derivational suffix follows the verb root. In addition, Middle Indo-Aryan has some derivates not found in standard Sanskrit; for example, Prakrit absolutives with *-ānal-iṭṇa*, as in *dāṭṇa* ‘after giving’, *genh-iṭṇa* ‘after taking’. Apabhrāṁśa has a series of different gerundives, absolutives, and infinitives. Hemacandra (4.438–441; cf. Vaidya 1958) enumerates the following: gerundives in *-ievvaiūṁ* (e.g., *kariievvaiūṁ* = *kartvayam*), *-evvaiūṁ* (*sahевваиūṁ* = *sodhavyam* [*sah* ‘bear’]), *-evā* (*soevā* = *svapitavyam* [*svap* ‘sleep’]); absolutives in *-i* (*māri* = *mārayitvā* ‘after first killing’), *-iu* (*adohiu* ‘without plunging into’), *-ivi* (*cumbivi* = *cumbitvā* ‘kissing’), *-avi* (*vichodavi* ‘letting go of’), *-eppi* (*jeppi* = *jītvā* ‘conquering’), *-eppiṇu* (*deppiṇu* = *dattvā* ‘giving’), *-evi* (*levi* ‘taking’), *-eviṇu* (*jhādeviṇu* = *dhyātvā* ‘meditating on’); infinitives in *-evaṁ* (*devaṁ* = *dātum* ‘give’), *-anya* (*karana* = *kartum* ‘do’), *-anahāṁ*, *-anahim* (*bhuñjaṇahāṁ*, *bhuñjaṇahim* = *bhoktum* ‘enjoy’), *-eppi* (*jeppi*), *-eppiṇu* (*caeppiṇu* ‘abandon’), *-evi* (*pālevi* = *pālayitum* ‘maintain’), *-eviṇu* (*leviṇu*). As can be seen, some absolute and infinitive forms are identical. Moreover, the infinitives in question are etymologically absolutives in origin. For the use of absolutives as infinitives, compare also *pievae laggā* ‘they began to drink’, with the locative singular of a gerundive of *pi* ‘drink’ (Bhayani 1953, ed.: 70).

The formation of derivates signifying degrees of qualities by means of suffixes continues in Middle Indo-Aryan. For example: Pāli *piya-tara-* ‘dearer’, *sat-tama-* ‘best’, Pkt. *daḍha-yara-* ‘firmer’, *pia-ama-* ‘dearest’.

As in Old Indo-Aryan, so too in Middle Indo-Aryan there are derivates formed from pronouns. For example: Pāli *yāvat-* ‘as much’, *tāvat-* ‘that much’, *yathā* ‘as’, *tathā* ‘thus’, *kathā* ‘how?’ and their Prakrit equivalents *jāvaṭa-*, *tāvaṭa-*, *jahāljaḥ*, *tahāltaha*, *kahāmī*.

Middle Indo-Aryan also has compounds comparable to those of Old Indo-Aryan. E.g. *tatpuruṣa*: Pāli *aggi-sikhā-* ‘flame of fire’, *suvanṇa-kāra-* ‘goldsmith’, Pkt. *ahinda-* (*ahi* + *inda*) ‘king of snakes’, *kumbha-āra-* ‘pot maker’; *bahuvrīhi*: Pāli *rattakkha-* (*ratta* + *akkha*) ‘red-eyed’, Pkt. *candarīnsu-* (*candā* + *arīnsu*) ‘hot-ray, i.e. the sun’; *dvandva*: Pāli *ajelakā-* (*aja* + *elaka*) ‘goats and sheep’, Pkt. *ammā-piyara-* ‘parents’; *avyayībhāva*: Pāli *abhi-dosam* ‘at evening time’, Pkt. *upa-gaṇ-garī* ‘near the Gangā’.

One difference between Old and Middle Indo-Aryan compounds is due to phonologi-

cal behavior (see Davane 1956: 144–151). Such phonological differences are evident also in other instances. For example, the Apabhrāṁśa equivalents of Skt. *yādṛṣa-* ‘of what sort’, *tādṛṣa-* ‘of that sort’ (Pāli *yādisa-*, *tādisa-*, Pkt. *jārisa-*, *tārisa-*) are *jaṭsa-*, *taṭsa-*, and corresponding to the Old Indo-Aryan number words for ‘11’ to ‘19’ (see 2.2.1, (7)), Apabhrāṁśa has:

- (10) ‘11’ *eāraha*
- ‘12’ *bāraha*
- ‘13’ *teraha*
- ‘14’ *caīuddaha*
- ‘15’ *panṇaraha*
- ‘16’ *solaha*
- ‘17’ *dahasatta*
- ‘18’ *aṭṭhāraha*
- ‘19’ *eguṇavīnsā*

The first vowels of the taddhita derivates Pāli *nemittika-*, Pkt. *ṇemittia-* ‘one who knows the omens’, Pāli/Pkt. *komāra-* ‘juvenile’ are *e*, *o*, as opposed to *ai*, *au* of the corresponding Sanskrit derivates *naimittika-*, *kaumāra-*. This is due to the change of *ai au* to *e o*.

### 3.2.2. Verb derivation

Causatives generally contain *-e-* (< *-aya-*) as in Pāli *kār-e-ti*, Pkt. *kār-e-i* ‘has ... do’. As there are alternant noncausative present stems with *-al-e* (Pkt. *suna-i/sune-i* ‘hears, listens’), so are there causatives with *-a-* and *-e-*; e.g., *pāde-ilpāda-i* ‘causes to fall’. Further, due to sound changes, consonant alternation came to be linked with causative derivation, as in *toda-i* ‘breaks (trans.)’ versus *tutṭa-i* ‘breaks (intr.)’; contrast Skt. *trutyati* : *troṭayati*. A type with *-āp-ay-a-* was gaining in productivity from early Middle Indo-Aryan on. Thus, Aśoka uses *lekh-āpi-ta-* ‘caused to be inscribed’, and causatives with this extended affix are formed to present stems, as in Pkt. *pucch-āve-* ‘have ... ask’. In addition, there are alternative causatives in *-āve-l-āva-*, e.g., *kar-āve-l kar-āva-* ‘have ... do, make’. Apabhrāṁśa also has causatives such as *bham-ād-a-* ‘cause to turn’. Desideratives and intensives of the Pāli types *bubhukka-* (3rd sg. pres. *bubhukkhati*) ‘wish to eat’, Pkt. *susūssa-* (*susussaī*) ‘attend to, serve’ and Pāli *caṅkama-* (*caṅkamati*), Pkt. *cakkamma-* (*cakkammaī*) ‘stride’ reflect the Old Indo-Aryan types *bubhukṣa-* (*bubhukṣate*), *śuśrūṣa-* (*śuśrūṣate*), *caṅkramya-* (*caṅkramyate*).

Denominatives are formed, as in Old Indo-Aryan, with a suffix *-ya-*, e.g., Pāli *sukhāyati*, Pkt. *suhāadi* ‘is happy’. In addi-

tion, there are denominatives such that endings follow a nominal directly; e.g., *missaī* ‘mixes’.

#### 4. New Indo-Aryan

New Indo-Aryan grammatical systems represent results of developments whose beginnings appear in earlier stages, but the outcome makes this stage considerably different from Old Indo-Aryan.

##### 4.1. Nominal morphology

###### 4.1.1. Nominal system

The old system of inflection, whereby a single inflected form signalled both case and number, has been greatly reduced, with an increasing use of postpositions. In a large part of the Indo-Aryan area, there is an opposition between **direct** forms, used independently, and **oblique** forms. The latter occur with postpositions and connectives – postposed elements that function in the manner of genitive endings in the earlier stages – followed by postpositions. The following examples from Gujarati and Hindi will illustrate:

###### (11) Gujarati

- (a) *chokro* ‘boy:DIR.SG’  
*chokrī* ‘girl:DIR.SG’  
*chokrā(o)* ‘boy:DIR.PL’  
*chokrī(o)* ‘girl:DIR.PL’
- (b) *chokrā* ‘boy:OBL.SG’  
*chokrī* ‘girl:OBL.SG’  
*chokrā(o)* ‘boy:OBL.PL’  
*chokrī(o)* ‘girl:OBL.PL’
- (c) *chokrā-ne* (obj.) ‘the boy, to the boy’  
*chokrā-thī* ‘from, by the boy’  
*chokrā-ne-māṭe* ‘for the boy’  
*chokrā-nī-pāchal* ‘behind the boy’  
*chokrā-nī-sāthe* ‘with the boy’  
*chokrī-ne* ‘the girl, to the girl’  
*chokrī-thī* ‘from, by the girl’  
*chokrī-ne-māṭe* ‘for the girl’  
*chokrā-nī-pāchal* ‘behind the girl’  
*chokrī-nī-sāthe* ‘with the girl’
- (d) *chokrā(o)-ne*  
*chokrā(o)-thī*  
*chokrā(o)-ne-māṭe*  
*chokrā(o)-nī-pāchal*  
*chokrā(o)-nī-sāthe*  
*chokrī(o)-ne*  
*chokrī(o)-thī*  
*chokrī(o)-ne-māṭe*  
*chokrī(o)-nī-pāchal*  
*chokrī(o)-nī-sāthe*

###### (12) Hindi

- (a) *laḍkā* ‘boy:DIR.SG’  
*laḍkī* ‘girl:DIR.SG’  
*laḍke* ‘boy:DIR.PL’  
*laḍkiyāṁ* ‘girl:DIR.PL’
- (b) *laḍke* ‘boy:OBL.SG’  
*laḍkī* ‘girl:OBL.SG’  
*laḍkom* ‘boy:OBL.PL’  
*laḍkiyom* ‘girl:OBL.PL’
- (c) *laḍke-ko* (obj.) ‘the boy, to the boy’  
*laḍke-se* ‘from, by the boy’  
*laḍke-ke-liye* ‘for the boy’  
*laḍke-ke-pīche* ‘behind the boy’  
*laḍke-ke-sāth* ‘with the boy’  
*laḍkī-ko* ‘the girl, to the girl’  
*laḍkī-se* ‘from, by the girl’  
*laḍkī-ke-liye* ‘for the girl’  
*laḍkī-ke-pīche* ‘behind the girl’  
*laḍkī-ke-sāth* ‘with the girl’
- (d) *ladkom-ko*  
*ladkom-se*  
*ladkom-ke-liye*  
*ladkom-ke-pīche*  
*ladkom-ke-sāth*  
*ladkiyom-ko*  
*ladkiyom-se*  
*ladkiyom-ke-liye*  
*ladkiyom-ke-pīche*  
*ladkiyom-ke-sāth*

There are also nominals that do not have different direct and oblique forms throughout. For example, Hindi *ādmī* ‘man’ has an oblique plural *ādmiyom*, but *ādmī* occurs otherwise; a feminine noun such as *mez* ‘table’ has a direct plural *mezem* and an oblique plural *mezom*. Gujarati *koṭ* (m.) ‘coat’, *vāṭ* (f.) ‘matter, story’, *kām* (n.) ‘work’ show no variation between direct and oblique forms. The contrast between direct and oblique forms is not always observed elsewhere also. For example, eastern languages like Bangla lack the contrast in the singular. On the other hand, even in such instances, the contrast appears for certain forms. For example, Bangla *chele-ra* ‘boys’ (nom. pl.), *chele-d-er* ‘of the boys’, *chele-d-er-ke* ‘(to) the boys’ (colloquial *cheleder*).

As can be seen, New Indo-Aryan languages agree in the general opposition of direct versus oblique forms and the use of postpositions but differ with respect to the exact forms of the nominals and postpositions. Moreover even where postpositions are the norm, inflectional forms occur. For example, Hindi has a vocative plural of the type *laḍko* ‘boys’, *ladkiyo* ‘girls’, and Panjabi has abla-

tive singular (e.g., *khetom* ‘from the field’) and locative plural (e.g., *khetīn* ‘in the fields’) forms for subsets of nouns. In addition, Gujarati has a plural marker *-o-*, which can be omitted if plurality is otherwise shown (e.g., by use of a number word) in a context. Further, the connective *-nā-/ne-/nī* can be omitted in Gujarati in certain instances. Comparable differences are seen in other languages.

The status of postpositions is like that of the English genitive *s* in that they regularly follow phrases, as in Gujarati *pelā māṇas-na dīkrā-ne*, Hindi *us ādmī-ke bētē-ko* ‘that man’s son’, where the postpositions *-ne* and *-ko* follow phrases with oblique forms. In addition, more than one postposition can be attached to a nominal. For example, in Gujarati *ophis-e-thī* ‘from the office’, Hindi *ghar-mem-se* ‘from the house’, the postpositions *-thī*, *-se* follow complexes that include the locative postpositions *-e*, *-mem*. Such usage has parallels in earlier Indo-Aryan (see 3.1.2). Indeed, the use of postpositions goes back to earliest Indo-Aryan (see 2.3), and Rgvedic *samiddhasya ... purastāt* ‘... in front of the lighted (fire)’ (see Bloch 1965: 159) is equivalent to the Hindi type *āg-ke sāmne* ‘before the fire’, in which *sāmne* ‘before’ with the connective *-ke* follows *āg* ‘fire’. What sets the New Indo-Aryan system apart is that it involves direct forms, which occur independently, in opposition to oblique forms that occur with postpositions.

In the western area of Indo-Aryan, languages like Gujarati, Marathi, and Konkani have three formal genders; e.g., Gujarati *chokro* ‘child:DIR.SG.M (boy)’, *chokrī* ‘child:DIR.SG.F (girl)’, *chokrum* ‘child:DIR.SG.N’ (*chokrām* ‘child:DIR.PL.N’); adjectives *nāno*, *nānt*, *nānum* ‘small’. In other areas, two-genders contrast, as in Hindi *ladkā* versus *ladkī* ‘girl’, *chotā*, *chotī* ‘small’. In the east, on the other hand, languages like Bangla lack such formal gender distinctions.

#### 4.1.2. Pronominal system

The New Indo-Aryan pronominal system has reflexes of the earlier types: personal, demonstrative, interrogative, indefinite, relative. E.g., Hindi *maiṁ* ‘I’ (*mujhe* ‘me’, *mujh-se* ‘from me, by me’, etc.), *ham* ‘we’ (*hamer* ‘us’, *ham-se* etc.); *kaun* ‘who?’, *kyā* ‘what?’ (obl. sg. *kis-*, pl. *kin-*, pl. obj. *kinhem*), *koi* ‘some one’ (obl. *kisī-*), *jo* ‘who, which’ (obl. sg. *jis-*, pl. *jin-*, pl. obj. *jinhem*). In some areas, reflexive pronouns occur obligatorily in certain

syntactic configurations; e.g., Hindi *apnā* (obl. pl. *apne*), *apnī*.

In Indo-Aryan, as in many other areas of Indo-European, personal pronouns retain morphological complexities that are eliminated elsewhere. Thus, Hindi has *maiṁ*, also used in the agentive *maiṁ-ne*, opposed to *mujh-*, and the derivate equivalent to a noun with *-kā* is *merā* (f. *merī*): *merā bētā* ‘my son’, *merī bētī* ‘my daughter’, *mere liye* ‘for me’. Correspondingly, *tum* ‘you’ pairs with *tumhārā* (*tumhārī*) ‘your’. Gujarati *hum* ‘I’, *mē* (agentive), *māruṁ* and *tame* ‘you’ (also agentive), *tamāruṁ* has comparable variants. New Indo-Aryan languages also show the effects of regularization. For example, Old Gujarati had forms such as the accusative singulars *mujha* ‘me’, *tujha* ‘you’, which have been replaced by *mane*, *tane* in modern Gujarati.

New Indo-Aryan languages differ with respect to degrees of **deixis**; e.g., Hindi *yah* (obl. sg. *is-*, pl. *in-*) ‘this’, *vah* (obl. sg. *us-*, pl. *un-*) ‘that’; Bangla *e* ‘this one’ (obj. sg. *e-ke*, gen. sg. *e-r*), nom. pl. *e-rā*, obj./gen. pl. *e-der*), *se* [ʃe] ‘he, she it’ (obj. sg. *tā-ke*, gen. sg. *tār*, nom. pl. *tā-rā*, obj./gen. pl. *tā-der*), *o* ‘that one’ (*o-ke*, *o-r*, *o-rā*, obj./gen. pl. *o-der*); Gujarati *ā* ‘this’, *e* (agentive sg. *ene*, pl. *enē*), *te* (agentive sg. *tene*, pl. *tenē*), ‘that’, *pelum* (m. *pelo*, f. *pelā*, etc.) ‘yonder one’. Languages of the west also distinguish inclusive and exclusive first person plural pronouns, as in Gujarati *ame* ‘1.PE’ versus *āpne* ‘1.PI’ ‘we’; Marathi *āmhi*, *āpan*.

In general, modern Indo-Aryan observes a contrast of degrees of respect or distancing conveyed by the use of different second person pronouns: **honorific**, **ordinary**, **intimate**. Thus, Hindi *tum* is a non-distancing pronoun used towards close friends, one’s wife and such; *āp* is the more generally used, respectful pronoun; and *tū* is intimate. Similarly, Bangla has three degrees of formality represented in the use of *tui*, *tumi*, *āpni*, but these are singular pronouns with plural counterparts (*torā tomrā āpnāra*). In Gujarati, on the other hand, *tame* is the pronoun generally used, *tum* is used as the intimate pronoun, and *āp* is not generally used. If someone is addressed with this, it implies either extreme respect, even fawning, or that one is making fun of the person. The contrast between ordinary and honorific can be shown by formal contrasts for the third person also, as in Bangla: neutral *se* [ʃe] versus formal *tini* (pl. *tāra*, *tāmrā*). Even in those languages that do not have comparable formal distinctions among

third person pronouns, there are strategies to signal the difference: plural forms are used – including the neuter plural for respectful reference to a woman (as in Gujarati) – along with plural agreement in verb forms that take gender-number affixes, and an honorific second person pronoun can be used, as in Hindi (*āp*).

#### 4.2. Verb morphology

The sources of the verbal systems of New Indo-Aryan languages are of course found in late Middle Indo-Aryan (*Apabhraṃśa*) and early stages of New Indo-Aryan. By the late Middle Indo-Aryan period, as noted earlier (see 3.1.3), verbally inflected preterit forms had been eliminated in favor of nominal forms. Nevertheless, present indicative forms of the types *karaī* ‘does’, *kahei* ‘says’ continued in use, right down into the early New Indo-Aryan period, and such forms are still used in some languages as presents (e.g., see (18)). In the course of development, however, these too came not to be used as present indicative forms. For example, Gujarati and Hindi have the type *kar-ε*, *kar-e* ‘might do, may do’ (Old Gujarati, Old Hindi *kar-a-i*), but this does not function as a present indicative. In effect, the system represented in the greater part of New Indo-Aryan languages is based on a contrast between **imperfective** and **perfective**, along with temporal auxiliary forms. The following Gujarati examples will illustrate:

- (13) (a) *mohan śum̥ kar-ε*  
Mohan what do-3  
‘what might Mohan do?’
- (b) *mohan śum̥ kar-ε ch-ε*  
Mohan what do-3 AUX-3  
‘what is Mohan doing?/what does Mohan do?’
- (14) (a) *mohan śum̥ kar-t-o*  
Mohan what do-IPFV-M.SG  
*ha-t-o*  
AUX-IPFV-M.SG  
‘what was Mohan doing?’
- (b) *mohan-e śum̥ kar-y-uṁ*  
Mohan-AGT what do-PFV-N.SG  
‘what did Mohan do?’

The imperfective stem *kar-t-* is followed by a gender-number element, as is the temporal auxiliary stem *ha-t-*. The imperfective stem *kar-t-* appears also in negative sentences of the type:

- (15) *mohan kaśum̥ nathī kar-t-o*  
Mohan something NEG do-IPFV-M.SG  
‘Mohan is doing nothing at all’

but in positive sentences of the type (13 b), one has what I call the neutral form *kar-ε* with the temporal auxiliary form *ch-ε*. The ergative type (14 b) has the perfective stem *kar-y-* along with a gender-number element. The imperfective and perfective markers appear also in *jam-t-* and *kar-y-* of examples such as in (16).

- (16) (a) *jam-t-ī wakhat-e*  
eat-IPFV-F time-LOC  
‘at the time to eat, at dining time’
- (b) *kām kar-y-ā pachī*  
work do-PFV-OBL after  
‘after doing the work’

Other languages have comparable system, with variations. Thus, Hindi distinguishes a **continuous** from a **non-continuous**, as in (17).

- (17) (a) *mohan kyā kām kar-t-ā*  
Mohan what work do-IPFV-M.SG  
*h-ai*  
AUX-3.SG  
‘what work does Mohan do?’
- (b) *mohan kyā kar rah-ā*  
Mohan what do remain-PFV.M.SG  
*h-ai*  
AUX-3  
‘what is Mohan doing?’

Although modern Hindi has the type *kar-e*, it does not use this in conjunction with a temporal auxiliary to form present forms, as in Gujarati.

**Habitual** and **continutive** presents contrast elsewhere also, in different ways. For example, in Bangla personal endings follow the base or the affix *-ch-*:

- (18) (a) *tumi ki kar-o [koro]*  
you what do-2.NEUTRAL  
‘what do you do?’
- (b) *tumi ki kar-ch-o [korcho]*  
you what do-IPFV-2.NEUTRAL  
‘What are you doing?’

The ergative type (14 b) also shows variations in different languages with respect to **agreement** phenomena. For example, contrast the following examples from Gujarati (19) and Hindi (20):

- (19) *mē tamār-ī dīkr-ī-ne jo-o-ī*  
1.SG.AGT your-F child-F-OBJ see-PFV-F  
‘I saw your daughter’

- (20) *maiñ-ne āp-kī bet-ī-ko*  
 1.SG-AGT you-POSS.F child-F-OBJ  
*dekh-ā*  
 see-PFV.M.SG  
 'I saw your daughter'

In (19), the perfective *jo-ī* ( $\leftarrow$  *jo-y-ī*) is feminine, agreeing with *dikr-ī-ne*, but in (20) the verb agreement is suspended, since *bet-ī-ko* has the postposition *-ko* in the object phrase. The agreement appears in an example like (21), where the object phrase *kitāb* 'a book' does not have *-ko*.

- (21) *maiñ-ne kitāb padh-ī*  
 1.SG-AGT book read-F  
 'I read a book'

In languages of the east, on the other hand, perfective forms show person number agreement of non-ergative systems. The following illustrate the difference (Gujarati, Hindi, Bangla):

- (22) (a) *hum̩ gayol/gaī* 'I went'  
*ame gayāl/gaī* 'we went'  
*tame gayāl/gaī* 'you went'  
*e gayol/gaī* 'he/she went'  
*e gayāl/gaī* 'they went'  
 (b) *maiñ gayāl/gaī* 'I went'  
*ham gael/gaīñ āp gael/gaīñ* 'we went'  
*vah gayāl/gaī* 'he/she went'  
*ve gael/gaīñ* 'they went'  
 (c) *āmil/āmrā gelum (gelām)* 'I/we went'  
*tumil/tomrā gele* 'you went'  
*se [ʃe]/tarā gela [gelo]* 'he/she/they went'

The perfectives *gayo*, *gai*, *gaya*, *gaī*, and so on in (22 a-b) agree in gender and number with the subjects, but in (22 c) the verb forms differ according to person; similarly, Bangla *āmi karlum* [korlum] and so on from the base *kar* 'do, make'.

In addition, New Indo-Aryan languages have **future stems** with various formants. For example, Gujarati has a future with *-ś-* that shows person-number differences: *kar-iś* 'I shall do', *kar-ś-e* 'he/she/they will do', *kar-iś-ūñ* 'we will do', *kar-ś-o* 'you will do'. Bangla *kar-b-o* [korbo] (1st person) *kar-b-e* [korbe] (ordinary 2/3 person) 'will do' has person markers following the future suffix *-b-*. Hindi, on the other hand, has a future with *-g-* that shows not only person-number but also gender differences: sg. *kar-uñ-gā-ī* 'I shall do', *kar-e-gā-ī* 'he/she shall do', pl. *kar-eñ-gē-ī*.

Forms of the type Hindi *kar-e*, Gujarati *kar-e* have modal functions. They are used,

for example, in the protasis of a **conditional sentence** as well as in sentences like (23) from Hindi (23 a) and Gujarati (23 b).

- (23) (a) *maiñ kyā kar-uñ*  
 1.SG.AGT what do-1.SG  
 'what am I to do?'  
 (b) *hum̩ sūñ kar-uñ*  
 1.SG.AGT what do-1.SG  
 'what am I to do?'

There are also forms used in contrary-to-fact conditional sentences, as in the following examples from Gujarati (24 a) and Hindi (24 b):

- (24) (a) *mārī-pāse paisā ho-t to*  
 me-by money be-COND then  
*tamārī-sāthe jā-t*  
 you-with go-COND  
 (b) *agar mere-pās paise ho-t-e*  
 if by me money be-COND-M.PL  
*to āp-ke sāth jā-t-ā*  
 then you-OBL with go-COND-M.SG  
 'If I had money I would go with you.'

In Gujarati, forms of the type *hot*, *jāt* have *-t* following a verbal base; in Hindi, *-t-* is followed by a gender-number affix: m. sg. *hotā*, pl. *hote*. The forms in question, however, can be neutral with respect to time reference, as is the Sanskrit conditional of the type *abhavīyat*. Historically, the forms with *-t-* reflect the use of present participles in conditional sentences, a usage that goes back to late Middle Indo-Aryan.

In addition, New Indo-Aryan languages have formally distinct **imperatives**. For example, the imperatives of the bases *baith*, *bas* [bɔʃ/bɔ], *bes* [bes] 'sit' linked to the use of the pronouns Hindi *tū tum āp*, Bangla *tui tumi āpni*, Gujarati *tum̩ tame* are:

- (25) (a) Hindi: *baith*, *baith-o*, *baith-iyē*  
 (b) Bangla: *bas*, *bas-o*, *bas-ūñ*  
 (c) Gujarati: *bes*, *bes-o*

The first consists simply of the base; others have particular affixes, as shown. In addition, Hindi allows the use of imperatives in *-o* with the pronoun *āp*: *āp āo*. Various other forms function as imperatives, with semantic shadings. For example, Hindi has imperatives with *-iegā*, as in *ā-iegā*, which are used to attenuate the feeling of command, and Gujarati has forms with *-je*, *-jo* (the latter more deferential), as in *āv-je*, *āv-jo*; the last cited form is also the common expression for 'goodbye'.

In addition, there are third person imperative forms, e.g., Bangla *kar-uk*, Gujarati *kar-o* ‘... should do’. Moreover, some languages distinguish tenses for imperatives; thus, the Bangla forms in (25 b) are present imperatives, and the corresponding future imperatives are: *kar-is*, *kar-o*, *kar-ben*. The very polite imperative Gujarati type *kar-s-o-ji* ‘(you will) please do’ contains a formal future.

As in earlier stages, there is **suppletion** in New Indo-Aryan, and the situation is comparable to that of Middle Indo-Aryan (see 3.1.3). Thus, the Hindi preterit forms *thā the thī thīm* (m. sg., pl., f. sg., pl.) of the temporal auxiliary correspond to present forms with *h-*: *hūm* (1st sg.), *hai* (2nd sg. [t̪e], 3rd sg.), *ho* (2nd [tum]), *haiṁ* (2nd [āp], pl.); in Gujarati, the preterit forms corresponding to the present *ch-* (*hum̄ chum̄*, *tum̄ che*, *e che*, *amelāpne chie*, *tame cho*, *e che*) are *hato*, *hatā*, *hatī*, *hatum̄*. The following examples of infinitives and perfectives will serve further to illustrate:

- (26) (a) Hindi  
*de-nā : di-yā* ‘give’  
*jā-nā : ga-yā* ‘go’  
(b) Gujarati  
*āp-vum̄ : dī-dhum̄* ‘give’  
*ja-vum̄ : ga-yum̄* ‘go’

As expected, levelling has also taken place; for example, in standard Gujarati the perfective of *jo-vuṁ* ‘see, look’ is *jo-yuṁ*, though *diṭhum̄* occurs in dialects.

New Indo-Aryan languages have **passive** formations, but these occupy a special status, for two reasons. Passive sentences that correspond to actives usually involve obligatory omission of an agent expression. Passive sentences with agent expressions have particular semantics: that one is or is not capable of doing something, that one has done something accidentally, and are most commonly negative. Moreover, passive formations are not limited to transitive verbs. Passives are formed both with particular affixes and by periphrasis. For example, Gujarati has a passive suffix *-ā-*, as in *kar-ā* ‘be done’, *av-ā-* (passive to *āv-* ‘come’). In Hindi, on the other hand, a passive consists of a perfective form of the verb followed by a form of *jā* ‘go’, as in *kīyā jā-*, *calā jā-* (*cal-nā* ‘move’).

#### 4.3. Derivation

##### 4.3.1. Nominal derivation

New Indo-Aryan languages have a large variety of nominals derived from verbs, such as Hindi *lad-āt* ‘fighting’ (*lad-nā* ‘fight-INF’), *bah-āv* ‘flow’ (*bah-nā* ‘flow-INF’), *ruk-āvat*

‘obstruction’ (*rok-nā* ‘stop-INF’). Of particular interest are derivates that are generally classed as **infinitives** and **absolutives**. The examples from Hindi (27 a) and Gujarati (27 b) both of which mean ‘Allow him to go’, have the oblique forms *jāne*, *javā* in construction with an imperative of *de-* ‘give’.

- (27) (a) *us-ko jā-ne do*  
this-OBJ go-INF give:IMP  
‘allow him to go’  
(b) *ε-ne ja-vā dō*  
this-OBJ go-INF give:IMP  
‘allow him to go’

Action noun forms in *-nā*, *-vum̄* (e.g., *jā-nā*, *ja-vum̄*) serve as lexical entries for verbs in dictionaries of Hindi and Gujarati. Oblique forms of such derivates appear also with postpositions, as in Hindi *jāne-ke liye*, Gujarati *javā māte* ‘in order to go’. Hindi (28) and the equivalent Gujarati sentences (29) contain masculine *kar-nā*, feminine *padh-nī*, and neuter *kar-vum̄*, feminine *wāṁc-vī* in concord with the nouns *kām*, *kitāb* and *kām*, *copdī*.

- (28) (a) *mujhe kām kar-nā*  
to.me work do-ACNNR.M  
*pad-ā*  
fall-PFV.M.SG  
‘I had to work’  
(b) *āp-ko yah kitāb padh-nī*  
you-to this book read-ADJR-F  
*pad-eg-ī*  
fall-FUT-F  
‘you will have to read this book’  
(29) (a) *māre kām kar-vum̄*  
to.me work do-ACNNR.N  
*pad-y-um̄*  
fall-PFV-M.SG  
‘I had to work’  
(b) *tamāre ā copdī wāṁc-vī*  
you.to this book read-ACNNR.F  
*pad-ś-e*  
fall-FUT-F  
‘you will have to read this book’

In these examples, the verbal derivates function as adjectival modifiers, in the manner that gerundives function in earlier Indo-Aryan. Similarly, Gujarati *pī-vā-nuṁ pāṇī* ‘drinking water’ has an adjectival derivate *pīvānuṁ* (n. sg.) construed with *pāṇī* ‘water’. In Hindi, an oblique stem of the type *jā-ne* is followed by the suffix *vālā* to form agentive nouns such as *jānevālā* ‘one who is going, is about to go’, *rahnevālā* ‘one who dwells (in an area, resident of a place)’.

Another type of infinitive appears in *kar-ī śak* ‘be able to do’ of Gujarati:

- (30) *ā kām ām kar-ī śak-ā-y*  
 this work thus do-INF can-PASS-3  
 ‘this work can be done this way’

The equivalent modern Hindi infinitive has the simple base (*kar*): *kar sak-* ‘be able to do’.

A derivate in *-ī* occurs also as an absolute in Gujarati:

- (31) *kām kar-ī-ne gher jā-o*  
 work do-ABS-to home go-2  
 ‘do your work before you go home’

Other New Indo-Aryan languages have comparable constructions, with differences in how the absolutives are formed. For example, in Hindi, *kar* follows a verb base (e.g., *jā-kar*) other than *kar*; this takes *-ke* (*kar-ke*), which can be used with other verbs also.

**Attributive participles** corresponding to perfectives are formed in different manners. For example, Hindi has the construction type *padhīt hut kitab* ‘the book that has been read’, in which a perfective is followed by a form of the perfective of *ho-* (*huā, hue, huī, huīṁ*) agreeing in number and gender with the modified noun. In Gujarati, on the other hand, the equivalent construction has a suffix *-el-* after the perfective stem, as in *wāṁcelī cōpdī* ‘a book that has been read’, *pidhelo māṇas* ‘drunken man’. The formation with *-l-* occurs elsewhere and is doubtless also incorporated in verb forms of the type given in (22c).

Denominative formations involve affixation and composition. There is a large number of suffixes used in forming substantives and adjectives. Some examples from Hindi will suffice to illustrate: *lamb-āt* ‘length’ (*lambā* ‘long’); *bac-pan* ‘childhood’ (*baccā* ‘child’); *dukān-dār* ‘shopkeeper’ (*dukān* ‘shop’); *taiksi-vālā* ‘taxi driver’; *dhārmik* ‘religious’ (*dharma* ‘religion’). There are also prefixes, though less numerous. For example: Hindi *anu-kram* ‘sequence’; *gair-hāzir* ‘absent’ (*hāzir* ‘present’); *be-kār* ‘unemployed, useless’. Many such derivates involve elements and processes borrowed from Sanskrit and Perso-Arabic sources. Thus, *dharma* is a Sanskrit borrowing and *dhārmik* involves a Sanskrit vowel replacement along with the affix *-ik* (Skt. *-ika*).

As in earlier stages of Indo-Aryan, there are particular derivates from pronouns, illustrated here by the following examples

from Hindi (32a) and Gujarati (32b), with equivalent meanings:

(32) (a)	<i>aisā</i>	‘of this sort’
	<i>vaisā</i>	‘of that sort’
	<i>jaisā</i> (rel.)	‘of which sort’
	<i>kaisā</i>	‘of what sort?’
	<i>itnā</i>	‘this much’
	<i>utnā</i>	‘that much’
	(b) <i>āvūṁ</i>	‘of this sort’
	<i>evūṁ</i>	‘of that sort’
	<i>jevūṁ</i> (rel.)	‘of which sort’
	<i>kevūṁ</i>	‘of what sort?’
	<i>ātlūṁ</i>	‘this much’
	<i>eṭlūṁ</i>	‘that much’

There are also adverbial counterparts: Hindi *aise* ‘in this way’, *vaise* ‘in that way’, *kaise* ‘how?’, *yahāṁ* ‘here’, *vahāṁ* ‘there’, *jahāṁ* ‘where’, *kahāṁ* ‘where?’, *jab* ‘when’, *kab* ‘when?’. The equivalent Gujarati derivates are *ām*, *em*, *jem*, *kem*, *ahīṁ*, *tyāṁ*, *jyāṁ*, *kyāṁ*, *jyāre*, *kyāre*. Synchronously, these involve affixation, but historically a form like Hindi *jaisā* reflects an earlier compound, and Hindi *yahāṁ* and similar as well as Gujarati *em*, *jem* reflect earlier case forms (cf. 3.1.2).

**Compounds** such as Hindi, Gujarati *tār-ghar* ‘telegraph office’ and Hindi, Gujarati *mā-bāp* ‘parents’ conform to the tatpuruṣa and dvandva compound types. Compounds of the bahuvrīhi type are commonly Sanskrit (e.g., Hindi *pragati-śīl* ‘one with progressive character’). The productivity of composition and of different compound types varies across languages.

There are also compound-like sequences of closely connected units. Particularly noteworthy because it is not limited to Indo-Aryan is the “echo formation” of the type Hindi *pustak vustak*, Gujarati *cōpdī bōpdī*, Bangla *boi ̄toi* ‘book and such’: A nominal is repeated with a change of its first sound to form a sequence meaning ‘x and related matter’.

#### 4.3.2. Verb derivation

New Indo-Aryan languages also continue the use of morphologically derived **causatives**, reflecting both the earlier type Old Indo-Aryan *troṭayati*, Middle Indo-Aryan *todaī* ‘breaks’ and the more prevalent type with a morpheme that reflects the Middle Indo-Aryan generalization of *-āp-ay-* (Middle Indo-Aryan *-āp-e-, -āv-e-*). For example:

- (33) (a) *khul-* : *khol-* (Hindi)  
*khul-* : *khol-* (Gujarati)  
 ‘open (intr.)’ ‘open (trans.)’

<i>tūt-</i>	:	<i>tod-</i> (Hindi)
<i>tūt-</i>	:	<i>tod-</i> (Gurajati)
‘break’		‘break’
(b) <i>kar-</i>	:	<i>kar-ā-</i> (Hindi)
<i>kar-</i>	:	<i>kar-āv-</i> (Gurajati)
‘do, make’		‘have ... do, make’
<i>cal-</i>	:	<i>cal-ā-</i> (Hindi)
<i>cāl-</i>	:	<i>cal-āv-</i> (Gurajati)
‘move, go’		‘cause to move, to go’
<i>padh-</i>	:	<i>padh-ā-</i> (Hindi)
‘read, study’		‘teach’
<i>vāñc-</i>	:	<i>vañc-āv-</i> (Gurajati)
‘read’		‘have ... read’

A noteworthy characteristic of modern languages of India is the use of complexes usually referred to as compound verbs, involving particular verbs, which have been labelled **vector verbs**. The complex commonly involves particular semantic features. For example, Hindi *mār-* means ‘beat’ but *mār dāl-* means ‘kill’; cf. also: *bol-* ‘speak’ : *bol uth-* ‘blurt out’. There are also oppositions of the type *dēkh de-* ‘let someone have a look’ : *dēkh le-* ‘have a look’. In addition, aspectual features and restrictions concerning possible negation are linked to the use of compound verb complexes.

## 5. Transliteration and transcription

I generally follow the standard system of transliteration (see Art. 5), but where *ai*, *āi*, and so on are sequences of vowels – as in some Middle Indo-Aryan forms – I transliterate *ai* and so on. In addition, *ṁ* following a vowel indicates nasalization. For modern Indo-Aryan, I use a combination of transliteration and transcription. *ɖ* represents the flap commonly represented by *r*. Since vocalic [l] does not occur in Middle and New Indo-Aryan languages, *l* represents retroflex [l]. Although in some languages, such as Bangla, Gujarati, and Marathi, high vowels do not contrast by length, I still write long vowels in accordance with spelling conventions. If the script is ambiguous and an unambiguous representation is required, a transcription is given. For example, in Hindi the graphemes *ai au* represent [ɛ] [ɔ], so that a transliteration is used, but in Gujarati the same symbols (*e o*) are used to represent [e] [o] and [ɛ] [ɔ], so that I use IPA symbols for the lower vowels.

### 1. Introduction

The non-phonetic nature of the Chinese script places peculiar difficulties in the way of the historian of the language. The native tradition of rhyme dictionaries and rhyme tables, supplemented by comparison of modern dialects and other indirect evidence, makes it possible to reconstruct the phonological system of Late Middle Chinese (LMC), the *koine* of the Tang dynasty (A. D. 618–906), and Early Middle Chinese (EMC), the standard common to the educated classes of North and South during the period of division from the fall of Western Jin in A. D. 316 to the reunification by Sui in 589, with a fair degree of confidence. The first reconstruction of Early Middle Chinese on a modern scientific basis (under the name Ancient Chinese) was achieved by Bernhard Karlgren (1915–1926) and is still widely used. The newer reconstructions of Late and Early Middle Chinese cited in this article are those of Pulleyblank (1984; 1991a).

For Old Chinese, the language of the Chinese classics and other early texts, the evidence is much less satisfactory. The reconstruction (under the name Archaic Chinese) by Karlgren (1940; 1957) based on the rhyming categories of the earliest poetic anthology, the *Shijing* (*terminus ante quem* 600 B. C.) and the evidence of phonetic loans in the script, is commonly cited but has been much criticized (e.g. Li 1971; 1974–1975; Pulleyblank 1962; 1977–1978; 1991c). Tentative reconstructions cited here are preceded by an asterisk. References to Modern Chinese in this article are to the current standard called variously Mandarin, National Language (*Guoyu*) or Common Language (*Putonghua*) based on the vernacular of the capital, Beijing.

The traditional characterization of Chinese as monosyllabic is not far off the mark.

As one distinguished linguist put it, “The so-called ‘monosyllabic myth’ is in fact one of the truest myths in Chinese mythology” (Chao 1968: 139). Though much of the vocabulary of Modern Chinese consists of disyllabic or polysyllabic lexemes these are mostly compounds of monosyllables that have the status of morphemes. Exceptions are some foreign loanwords, words like *méigui* ‘rose’, and *chóuchú* ‘hesitate’ that are reduplicative in form though there are no simpler morphemes to which they can be referred, and a small residue of unanalyzable disyllabic or polysyllabic forms like *wúgong* ‘caterpillar’ and *hàshimǎ* ‘Chinese forest frog’ (cf. *hámá* ‘frog’). The traditional term “isolating” is also not inappropriate. Grammatical relationships are mostly conveyed by rules of word order and particles. In the modern language there are a few noun-forming suffixes, the plural or collective suffix *-men* for personal pronouns and animate nouns, and a handful of aspect suffixes for verbs, but even these affixes often do not have the obligatory character that such elements commonly have in inflected languages.

It was not always so. Isolated traces of ancient morphological processes survive to the present. Thus *cháng* ‘long’ and *zhǎng* ‘grow; elder; chief’ are written with the same graph and must be from the same root. *Zhāng* ‘stretch’, *zhàng* ‘swell’ and *zhàng* ‘curtain (i.e. something stretched)’, which are written with the graph for *cháng* ‘long’ with additional semantic determinatives, must also be related. In other cases obsolete variant readings of the same graph associated with differences in meaning are recorded in old dictionaries and commentaries, or sound similarities suggest etymological relationships between words even when there is no graphic connection.

Early attempts to analyze morphological processes in Old Chinese (Conrad 1896) could make little progress before phonological reconstruction had been put on a sound basis. Serious analysis of the morphology of grammatical particles also began with Karlgren (1920), who observed that the first person pronouns, *wú* and *wǒ*, had different distribution in texts of the classical period and suggested that *wú* had originally been used for the nominative and genitive and *wǒ* for the accusative. While the interpretation of the distinction as one of case on the Indo-Euro-

pean model is unsatisfactory (Kennedy 1956), the general conclusion that these and other pronouns and particles were subject to morphological alternations associated with changes in grammatical function is well established. Karlgren also assembled sets of words that appeared to be related in both sound and meaning which he called “word families” and pointed out a number of recurrent patterns (Karlgren 1933; 1949: 70–101; 1956). He concluded that Proto-Chinese must have had formal word classes and regular systems of inflection and word derivation but was unable to find clearcut associations between patterns of phonetic alternation in Old Chinese as he reconstructed it and specific semantic or grammatical functions and concluded that by the time of the earliest texts the derivational processes had been too much obscured by phonetic change to yield to analysis. The study of morphological processes can, however, suggest alternative solutions to problems of Old Chinese phonology. Comparisons with other Sino-Tibetan languages, especially Tibetan, which in its classical form preserves a rich (though imperfectly understood) system of affixation in verbal morphology as well as word formation, can also suggest hypotheses to explain patterns of alternation in Chinese. The proposals that are put forward below are based on a thoroughly revised reconstruction of Middle Chinese (Pulleyblank 1984; 1991a) and on new ideas about the reconstruction of Old Chinese that are still being tested and revised.

## 2. Affixation in Old Chinese

### 2.1. Departing Tone as derivational – the suffix \*-s

In Middle Chinese **syllables** were divided into four categories, labelled Level, Rising, Departing, and Entering, that correspond to the **tones** of modern spoken forms of Chinese. The Entering Tone in particular, which consisted of syllables ending in a stop consonant, was not “tonal” in a phonetic sense, and it is now thought that the Rising and Departing Tones had also developed between Old and Middle Chinese out of segmental features at the end of the syllable, a final glottal stop in the case of the Rising Tone and a suffix \*-s in the case of the Departing Tone (Haudricourt 1954 a; 1954 b; Pulleyblank 1962; 1973 b; 1978; Mei 1970). During the Late Middle Chinese period a further split occurred into

Upper and Lower registers conditioned by the devoicing of initial obstruents, giving a schematic system of eight tone classes which have been simplified or further elaborated in various ways in different dialects. The four tones of Modern Mandarin correspond roughly to the Middle Chinese categories as follows: (1) *mā* ‘mother’ Upper Level, (2) *má* ‘hemp’ Lower Level, (3) *mǎ* ‘horse’ Rising, (4) *mà* ‘curse’ Departing. Neutral tone on particles and the second morphemes of some compounds is unmarked.

Even in the modern language there are many examples of words originally in Level, Rising or Entering Tone with cognate forms in the Departing Tone. *Mó* ‘rub, grind’ and *mò* ‘mill’, written with the same character, show such an alternation between Level and Departing. Similar alternations between Rising and Departing and between Entering and Departing are *hǎo* ‘good’ and *hào* ‘love’, *è* ‘bad’ and *wù* ‘hate’. In the last example both words now have the Departing Tone but *è* ‘bad’, Cantonese *ɔ:k*, Sino-Japanese *aku*, ended in -k in Middle Chinese. Though the semantic relationships associated with this pattern are quite various, it seems clear that, in general, forms in Departing Tone must be derivatives of forms in the other categories. It has sometimes been thought that the conditioning factor was always a matter of tone (e.g. Wang 1958). In the case of the Entering Tone, however, this would imply that variation in pitch could lead to the loss of a final stop consonant, a kind of phonetic change for which it is difficult to find a parallel. Comparison with cognate Austroasiatic languages led to the discovery that the Vietnamese tone corresponding to the Middle Chinese Departing Tone originated in the loss of final \*-h, from an earlier \*-s, and to the suggestion that Chinese might have had a parallel history (Haudricourt 1954 a; 1954 b). A parallel was also drawn with the -s suffix that figures prominently in Tibetan verbal morphology (Forrest 1960) and there is much evidence that a final sibilant survived in certain classes of Departing Tone syllables throughout the Han period (206 B. C. – A. D. 220) and as late as ca. A. D. 500 in the southern form of Early Middle Chinese (Pulleyblank 1962; 1973 b; 1979). The semantic relationships corresponding to Departing Tone derivation are quite varied and difficult to classify (Downer 1959; compare also Chou 1962: 50–92). It is possible that more than one original suffix is involved. Apart from its

use as a marker of the **Perfect** in certain classes of verbs, the suffix *-s* in Tibetan appears in other forms where its meaning is hard to determine and it is nearly in complementary distribution with another suffix *-d*.

## 2.2. Voicing of initial obstruents – \**ã* as a prefix

There are many alternations involving a contrast in Early Middle Chinese between voiceless and voiced **initial obstruents** (Karlgren 1949: 90–92; Downer 1959: 263; Chou 1962: 50–92). Typical examples are *jiān* EMC *ken<sup>h</sup>* ‘see’, *xiān* EMC *yen<sup>h</sup>* ‘appear’, *zhū* EMC *teuawk* ‘attach’, *shū* EMC *dzuawk* ‘be attached, belong’. It has been proposed (Pulleyblank 1973 a: 114–116; 1989) that the voiced alternants in such pairs reflect a prefix *ã-*, a non-syllabic, pharyngeal glide that caused voicing, or in some dialects, voiced aspiration of a following obstruent, cognate to the Tibetan prefix, *ha-čhūn*, and to the prefix *?ã-* of Written Burmese. It typically had the effect of changing transitive verbs into intransitives or to adjectives describing a state. In Classical Tibetan the prefix *h-* is associated especially with the so-called “present” stem in verbs, which has an aspectual rather than temporal meaning. It expresses what is universally the case, is going on at the present time, or is treated as going on in a narrative referring to the past (Hahn 1974: 61). The *?ã-* of Burmese is used especially to derive nouns from verbs, e.g. *wak* ‘to halve’, *?awak* ‘half’. It seems to be the same morpheme *\*a*, with “introvert” meaning, that was involved in the *ə/a* ablaut (2.3) and it could, perhaps, also occur as a suffix (2.4).

## 2.3. Ablaut – *\*a* as an infix

As a corollary to the hypothesis that, like that of modern Mandarin (Hartman 1944; Hockett 1947; 1950; 1955: 88; Martin 1957; Chao 1968; Cheng 1973; Chen 1976; Pulleyblank 1981; 1984), the vowel system of Old Chinese was based on a two-way ‘vertical’ contrast in rhyme vowels, /ə/ and /a/, with features of frontness and roundedness encoded underlyingly as glides, /j/, /w/ and /ɥ/, it has been proposed that there was a morphological system of ablaut between the vowels /ə/ and /a/, associated with an extrovert/introvert contrast in meaning. This will account for alternations such as *tán* EMC *dəm* ‘talk about (trans.)’, *tān* EMC *dam* ‘talk (intrans.); conversation’; *sì* EMC *zi'*, < \*-ጀ? ‘resemble’, *xiàng* EMC *zian'*, < \*-ጀ? ‘imi-

tate, represent; image’; *qiū* EMC *kʰuw* < \*-xʷጀy ‘hill’, *qū* EMC *kʰiā* < \*-xʷጀy ‘large hill, mound, abandoned city’ (Pulleyblank 1963; 1965; 1973 a; 1989). In spite of the example of Mandarin, vertical vowel systems of this kind have been regarded as unnatural (Ting 1975: 32, citing Jakobson & Halle 1971) but the development of nonlinear phonology in the seventies has made such an analysis more acceptable (Anderson 1978). A further point that has become a commonplace of recent phonological theory is that shwa vowels are often best analyzed as epenthetic, inserted by rules of syllabification, rather than underlyingly present in the lexicon (cf. Anderson 1978; 1982). If Old Chinese is analyzed in this way, the *\*ə/a* ablaut can be interpreted as a process of affixation, i.e. as infixation of *\*a*, rather than alternation between two ends of a polar opposition and is easier to understand as a normal linguistic process.

Much work remains to be done on identifying and analyzing the role of the *\*ə/a* ablaut. It plays a role in function words as well as families of content words. For example, the prohibitory negative *wú* EMC *muā* ‘do not’ and *wú* EMC *muā* ‘not have, there is no ...’ were already homonyms by the fourth or third century B. C. but were originally written with different graphs, implying that the former had the vowel *\*ə* and the latter had the vowel *\*a*. The particles *zhū* EMC *teiā* < \**tāy* ‘the collectivity of, those of a certain class’, and *zhē* EMC *teia'*, < \**tāy?* (?), pronoun substitute for the head of a noun phrase, must be related by way of the *\*ə/a* ablaut to *zhī* EMC *tei* < \**tə(y)*, the particle that functions both as the mark of subordination before the head of a noun phrase and as a general third person object pronoun.

## 2.4. Rising Tone – *\*a* as suffix?

Oppositions within word families between the Middle Chinese Level and Rising Tones are less frequent than those involving the Departing Tone but are by no means rare. *Zhǎng* EMC *trian'* ‘grow; elder’, contrasting with *zhāng* EMC *triaŋ* ‘stretch’ is one such case. As noted above, there is good evidence that the Rising Tone reflects an earlier final glottal stop. Though glottal stop *?-* was also an initial consonant in Middle Chinese, there is reason to think that it was not a lexically distinctive phoneme in Old Chinese but rather an automatic accompaniment of vowel onset (Pulleyblank 1991c). In this case, the source of final glottalization also becomes

problematical. Parallelism suggests that it may have been an automatic feature after an open vowel, e.g. *\*-aŋ* (> Level Tone) vs. *\*-aya?* > *\*-aŋ?* (> Rising Tone). In this case the affix that changed ‘stretch’ into ‘grow’ would be a suffix *\*-a*, presumably the same morpheme that, as a prefix, was responsible for voicing the initial in *cháng* EMC *driŋ* ‘long’. In both cases the derived form had a less active, more introvert, meaning, though in the case of the prefix the result was an adjective, while in the case of the suffix the result was an intransitive verb. Another example of Rising Tone corresponding to a clearly defined difference in meaning is *zhéng* EMC *tɕiaŋj* ‘in good order; put in order; whole’, which is related both graphically and phonetically to *zhéng* EMC *tɕiaŋj* ‘to set right, regulate’, now found only in the sense of *zhéng yuè* ‘regulating moon, the month that starts the year’ and, with an additional semantic indicator in the graph, in *zhéng* ‘mount a (punitive) expedition against, attack; tax’, as well as in the more common derivatives in Departing Tone, *zhèng* EMC *tɕiaŋj<sup>h</sup>* ‘correct, right’, and *zhèng* EMC *tɕiaŋj<sup>h</sup>* ‘government’.

## 2.5. Prefix *\*s*

In Tibetan *s-* clearly has a **causative** function and this is also found in other Tibeto-Burman languages, for example, Burmese, where *\*s-* has given rise to aspiration of the following consonant (Benedict 1972: 105 ff.). Traces of the same prefix can, perhaps, be seen in Old Chinese in a case such as *sì* EMC *z<sup>i</sup>ŋ<sup>h</sup>* < *\*sləks* ‘feed; food, fodder’, from *shí* EMC *zik* < *\*lək* ‘eat’ (Pulleyblank 1973 a:117), but parallel examples are few and the phonology of Old Chinese *\*s-* clusters is still quite uncertain.

## 2.6. Initial aspiration

Though Middle Chinese had a three-way manner contrast for obstruents, the voiced stops were of secondary origin, partly derived from the effect of the prefix *\*ü-* and partly from the ‘hardening’ of voiced continuants in Type A syllables (*\*l-* > *d-*, *\*w-* > *yw-*), leaving only a two-way contrast between plain voiceless and voiceless aspirates in Old Chinese. Classical Tibetan also has a three-way contrast in obstruents between plain voiceless, voiceless aspirates and voiced, but the two voiceless series are in complementary distribution after prefixes and only the aspirates occur freely without a prefix as syllable onsets. Plain voiceless stops in this position are

mostly confined to special categories of words, including reduplicative forms, foreign loanwords and, in some cases, doublets of forms with prefixes such as *kog-pa* ~ *skog-pa* ‘shell, rind, bark’ or *pags-pa* ~ *lpags* (in compounds) ‘skin, hide’ (Li 1933; Benedict 1972: 20). Benedict concluded that only the distinction of voice was pertinent and aspiration of the voiceless initials was allophonic in Tibeto-Burman but the comparative evidence will equally well support the hypothesis that the original contrast was between plain voiceless and voiceless aspirates and that voicing of the non-aspirates in Classical Tibetan was secondary. In that case, alternations that we find in Tibetan verbal morphology between voiced stops in Present and Future and the corresponding plain voiceless or voiceless aspirate in Perfect and Imperative, as in *hgebs-pa*, *bkab*, *dgab*, *khob* ‘cover’ imply that an original plain voiceless stop became aspirated as a result of some morphological process. The source of this aspiration cannot be the prefix *s-*, which survives in Tibetan, but there could have been another prefix, such as *s*, *x*, or *h*, that did not survive in Classical Tibetan (Shafer 1950: 721 f.). An alternative suggestion, also by Shafer, is that aspiration could have resulted from the coming together of two identical plain unaspirated stops: *p-p-* > *p<sup>h</sup>-*, *k-k-* > *k<sup>h</sup>-*, etc., a process that is alleged to occur in the morphophonemics of Tsangla, that is, from a kind of initial reduplication. In Chinese aspiration also plays a role in word families. In a few cases, such as *pàn* EMC *p<sup>h</sup>an<sup>h</sup>* ‘divide’ vs. *bàn* EMC *pan<sup>h</sup>* ‘half’ or *kuò* EMC *k<sup>h</sup>wak* ‘expand, stretch’, vs. *guǎng* EMC *kwaŋ* ‘wide’ (the variation in final consonants is also to be noted) it appears to be associated with causative formations and, in the absence of clear evidence as to the phonology of the prefix *\*s* in Chinese, one might conjecture that this was the source of aspiration. In other cases the semantic relationship between the unaspirated and the aspirated form is much less clear, as in *qī* EMC *k<sup>h</sup>iā* ‘one-footed’, cf. *jī* EMC *kiā* ‘odd number’, *qǐ* EMC *giā* ‘strange’; *cǐ* EMC *ts<sup>h</sup>iā* ‘this’, cf. *zī* EMC *tsi* ‘this’; *chē* EMC *te<sup>h</sup>ia* ‘carriage’, also *jū* EMC *kiā* ‘carriage’ (variant pronunciations of the same character). Comparison with Tibetan suggests that aspiration probably arose independently of prefixed *\*s-* in Chinese also.

## 2.7. Prefix (or infix?) *\*r*

The Tibetan prefix *r-* with parallels in Kachin, Bodo-Garo and Mikir (Benedict 1972: 109 f.) may have an Old Chinese paral-

lel in cases like *zhì* EMC *tri<sup>h</sup>* ‘cause to arrive, bring’, derived from *zhì* EMC *tsei<sup>h</sup>* ‘arrive at, reach’, and *chù* EMC *tr<sup>h</sup>wit* ‘expel’, derived from *chū* EMC *te<sup>h</sup>wit* ‘go out’ (Pulleyblank 1973 a:118). Though the Middle Chinese form might seem to imply a \*Cr- cluster, in which the derivation would have to be interpreted as infixation, a prefixed \*r- could have given the same result.

#### 2.8. Presyllables \*kə-, \*tə-, \*pə-, \*mə-

Assuming that Tibetan orthography was based on the conventions of the Indian alphabet on which it was modelled, the Tibetan prefixes *g*, *d*, *b*, *m*, which are written on the line before the root initial rather than on top of it, were probably originally followed by a shwa vowel and formed **enclitic presyllables**. Isolated parallels to this are found in modern Chinese dialects, e.g. colloquial Pekingese *gēbei* or *gēbo* ‘arm’, which must be related to Classical *bì* EMC *pjiā<sup>h</sup>* ‘arm’ (Yang 1977–1978: 292–294). Another trace of this may be the so-called “softened” initials in North-western Min dialects. Thus, Kienyang sometimes has zero or *v*- instead of *p*-, corresponding to Middle Chinese *p*- and *b*-, *l*- corresponding to Middle Chinese *t*-, *d*-, *ts*-, *dz*-, and zero or *h*- corresponding to Middle Chinese *k*- and *g*- (or *y*-). The common Min word for ‘cockroach’ has a presyllable in Fuzhou *ka<sup>6</sup> sak<sup>8</sup>*, Amoy *ka<sup>1</sup> tsua<sup>7</sup>*, but a “softened” initial in Kienyang *hue<sup>8</sup>*, Chungan *huai<sup>8</sup>*, suggesting that in at least some cases the “softening” of the initials may have resulted from weakening in intervocalic position, with subsequent loss of the presyllable (Norman 1986: 383 f.). A similar “softening” of initial obstruents in Vietnamese corresponds to presyllables in other Mon-Khmer languages, e.g. *gà* ‘chicken’ Ruc *rəka*; *vái* ‘cotton’ Ruc *kupal* (Haudricourt 1965; Thompson 1976: 1131–1133) and such “softened” initials also occur in early Vietnamese loans from Chinese (Pulleyblank 1981: 279). In particular, Vietnamese has *vai* ‘shoulder’ corresponding to Chinese *bì* EMC *pjiā<sup>h</sup>*, colloquial *gēbo*, *gēbei* ‘arm’. In a number of cases the Min softened stops correspond to voiced stops in Yao loanwords which, in turn, correspond to prenasalized stops in Miao, which has led to the suggestion that prenasalization was also the general source of the phenomenon in Chinese (Norman 1986: 381–383). Prenasalization in Miao-Yao could, however, simply be the effect of a preceding unaccented shwa vowel derived from a lost presyllable. The *ha-čhün*

prefix in Tibetan, written in Tibetan script as a presyllable, had the effect of prenasalizing obstruents in that language.

#### 2.9. Dental suffixes \*-n, \*-t, \*-l

Besides \*-s, Tibeto-Burman had the dental suffixes \*-n and \*-t whose precise functions are difficult to analyze (Benedict 1972: 98–103). There is also internal Chinese evidence for \*-n and \*-t as suffixes. In a number of sets of particles in the preclassical and early classical language \*-n seems to be associated with **durative** or **continuative** aspect, while \*-t is associated with **punctual** or **perfective** aspect (Graham 1983) and derivatives in \*-n or \*-t can be recognized among ordinary content words as well (Pulleyblank 1991b: 29–33). It seems likely that \*-l could also function as a suffix in word formation.

#### 2.10. Miscellaneous affixation

A **distributive** suffix \*-k appears in a number of pronominal forms: *huò* EMC *ywək* < \*wók ‘(there is) some one, something’ from *yǒu* EMC *wu'* < \*wó? ‘have; there is/are’; *mò* EMC *mak* < \*mák ‘(there is) no one, nothing’ from *wú* EMC *muă* < \*máy ‘not have, there is/are not’; *shú* EMC *dzuwk* ‘which’ from *shuí* EMC *dzwi* ‘who’; *gè* EMC *kak* ‘each’, cf. *jǐ* EMC *kiǎ* < \*kày? ‘all’, *jiē* EMC *kəj* ‘all’, *jǐ* EMC *kuă* ‘both’, etc. These particles are placed between the subject and the verb, or in front of the verb without an expressed subject, and have the effect of selecting among possible subjects: ‘some of X’, ‘none of X’, ‘which of X?’, ‘each of X’. The same suffix can be recognized in the early classical demonstrative pronoun *shí* EMC *dzik* < \*-ək ‘this’, with a dialectal variant showing palatalization of the final consonant *shí* EMC *zit* (for *dzit*), which is related to the common demonstrative *shi* EMC *dziă* ‘this’ and has the function of recapitulating a preceding subject and giving it contrastive emphasis (Pulleyblank 1960).

A type of alternation of which there are several examples is between Old Chinese \*-ŋ and either the corresponding voiced continuants \*-ɣ or zero: *děng* EMC *təŋ?* < \*təŋ? ‘step, degree’, also read EMC *təj?* < \*təɣ?, *wáng* EMC *muaj* < \*máy ‘there is no; disappear, die; lose’, *wú* EMC *muă* < \*má(y) ‘there is no’; *wǎng* EMC *wuaj?* < \*wáŋ? ‘go’, *yú* EMC *wuă* < \*wá(y) ‘go to; to’; *fāng* EMC *puaj* < \*páŋ ‘just now’, *fǔ* EMC *puă?* < pà(y)? ‘begin, for the first time’ (Pulleyblank 1962: 232 f.).

### 3. Prosodic alternation – Type A and B syllables

A phonological alternation that was probably not the result of affixation is the contrast between what have been called Type A and Type B syllables. In Karlgren's reconstructions this phonological contrast is represented by the absence (Type A) or presence (Type B) of a medial *yod*, *-j-*. Though the contrast between syllable types that it marks is real and important, the interpretation in terms of a medial segmental element is a basic error in his system (Pulleyblank 1984; 1992 a). In EMC Type A syllables had a mid or low nuclear vowel, while Type B syllables had a high vowel, *i*, *i*, or *u*, either as the sole element in the nucleus or as the first mora of a diphthong, *ia*, *ia*, or *ua*. Since one can in general derive corresponding A and B pairs from every Old Chinese rhyme category, it seems likely that the Middle Chinese contrast reflects an earlier **prosodic contrast** in Old Chinese which put prominence either on the second mora of the syllable (Type A) or the first (Type B). There is a parallel in Sizang (Siyin) Chin, a Tibeto-Burman language of Burma, which distinguishes within sequences ending in -VV, -VC, and -VVC between a syllabic peaking that falls upon either the first or the second mora, e.g.: *pai* 'to lose' vs. *pai* 'to go'; *bel* 'to take shelter under' vs. *bel* '(superlative particle)'; *tam* 'jungle' vs. *tam* 'to number, many' (Stern 1963; Pulleyblank 1992 b). The process of diphthongization affecting Type B syllables that gave rise to the Early Middle Chinese contrast seems to have occurred around the beginning of the present era and there is comparative evidence that it spread as an areal feature to Vietnamese and other languages that were within the Chinese sphere of influence at that time (Pulleyblank 1992 b). Type A and B syllables are marked by an acute or a grave accent respectively in Old Chinese reconstructions, e.g. \*-án > EMC -an (Type A), \*-àn > EMC -ian or -ian, depending on the initial (Type B).

There are alternations between the two syllable types both in grammatical particles: *ān* EMC ?an < \*?án 'where? how?' (Type A), *yān* EMC ?ian < \*?án 'where? how?' (Type B) (with no apparent difference in meaning); *nuò* EMC nak < \*nák 'agree, say yes', *ruò* EMC niak < \*nák 'thus; conform to, accord with' – and content words: *biān* EMC pen < \*pján and EMC pjian < \*pján 'plait; compile'. Compare also *māo* EMC maiw <

\*mráw 'cat', also read EMC miaw < \*mràw with corresponding forms in some modern dialects, e.g. Changsha miau, as well as *mau*. There is a more marked semantic difference between Type A and Type B in *nāi* EMC nɔj' < \*nóy? 'then, thereupon' and *ér* EMC ni < \*nóy 'then, and'. The stronger form, *nāi*, is a connective between independent clauses or sentences and can also serve to emphasize a following noun predication, while *ér* is a colourless connective between serial verbs.

### 4. Syllabic prefixes and suffixes in Old Chinese

Besides processes that changed the forms of monosyllables, there are certain constructions in the preclassical language that have been described as 'prefixation' that involve syllables represented by separate graphs. *Yōu*, which ordinarily means 'have; there is ...' sometimes appears in front of nouns, especially proper names, where it seems to be part of the noun phrase though what, if anything, it adds to the meaning is not clear (Wang 1958: 219 f.). There are also certain prefixed syllables that mark distinctions of aspect in a following verb (Chou 1962: 248 ff.; Graham 1983: 56; Pulleyblank 1986: 3). They may be compared to the aspect suffixes of Mandarin (see below). A formative element that was used in Classical Chinese and is also found in the modern language is -rán '-like, -ly', a derivative in -n of *rú* 'is like', used as a suffix forming adverbs of manner, e.g. *huírán* 'kindly' from *huí* 'to favour; kindness'. Unlike purely colloquial suffixes, it retains its full tone in the modern language, a mark of its literary origin.

### 5. Reduplication

A process that was already present in the ancient language and has continued to be active until the present is complete or partial **reduplication** (cf. Art. 57). Examples of reduplication used in onomatopoeia, expressive adjectives and adverbs, and names of plants and small animals are *guān'guān*, 'cry of a bird', *xiāoyá* 'free and unfettered, carefree', *zhīzhū* 'spider'. Of more interest from the point of view of word formation are expressions such as: *xūyú* EMC suā juā 'a moment', from *xū* EMC suā 'wait', and *cōngróng* EMC tsʰuawŋ 'juawŋ (note the aspiration) 'at leisure, unhurriedly', from the root found in *zòng* EMC

*tsuawŋ<sup>h</sup>* ‘release; loose’ and *cóng* EMC *dzuawŋ* ‘follow’; *pífú* EMC *bəbək* < \**bábək* ‘crawl’. In a few cases the analysis of such disyllabic forms as reduplicative breaks down, e.g. *húdié* EMC *yɔ dep* ‘butterfly’ (Kennedy 1955), but the second syllable does occur separately and is probably cognate to Tibetan *leb* in *phye-ma-leb* ‘butterfly’ (where *phye-ma* means ‘flour’ and refers to the flour-like scales on a butterfly’s wing), and written Burmese *lip-pra* ‘butterfly’.

Certain productive categories of full reduplication that are normal in the modern language – familiar terms of address like *gēge* ‘elder brother’, distributives like *rénrén* ‘person:RDP (everybody)’, *tiāntian* ‘every day’, and repetition of a verb to express tentative aspect as in *kānkān* ‘have a look’ – are not found in the classical language.

## 6. Compounding

Compounding, by which word sequences arising out of regular syntactic processes of the language are lexicalized with special meanings (Lyons 1977: 535), which is so prominent in modern Chinese, was already in progress in the classical language. There are many disyllabic expressions whose meaning cannot be inferred transparently from that of the separate elements, e.g.: *báixìng* ‘common people’ (literally: ‘hundred surnames’), *guárén* ‘I (term of self-reference for the ruler of a state)’ (literally: ‘solitary man’), *jūnzǐ* ‘gentleman’ (literally: ‘son of a lord’), *shùjí* ‘almost, nearly, it is to be hoped that’ (literally: ‘many-few’). Unfortunately there is no way to tell whether there were any phonological correlates. In modern Mandarin the second member of a compound is frequently toneless, which binds the two syllables together into a single tone-bearing unit. Since there is no clue to it in the writing system, it is difficult to know when this appeared historically. It is not found in more conservative dialects such as Cantonese.

## 7. New flectional suffixes

### 7.1. The plural suffix *-men*

In modern spoken Chinese *-men* is used to mark the **plural** of personal pronouns: *wǒmen* ‘we’, *zánmen* ‘we (inclusive)’, *nǐmen* ‘you’, *tāmen* ‘they’ (only when referring to persons, otherwise simply *tā*). In this sense it clearly fits the definition of an inflectional suffix. Its use with nouns is not strictly comparable. It

has been called a mark of the **indefinite plural** (Kupfer 1980: 56), but according to another interpretation, it forms **collective nouns** (cf. Art. 101), which would make it a derivational suffix (Chao 1968: 244 f.). With nouns it cannot be used when a definite number is specified: *liángge qiángdao* ‘two bandits’, not \**liǎngge qiángdaomen*, while with pronouns it can, though it is also possible to omit it: *wǒmen liǎngge* or *wǒ liǎngge*, *wǒ liǎ*, ‘we two’. The etymology of *-men* is obscure. In the literary language certain words like *chái*, *shǔ*, *cáo*, *děng*, *bèi* meaning ‘class, category, group’ or the like are used from time to time with both nouns and pronouns to indicate a collectivity but there is nothing approaching a regular grammatical process of plural marking. The suffix *-men*, written in a variety of ways that seem to indicate that it was an innovation in the vernacular without a recognized antecedent, begins to appear in colloquial texts from about the tenth and eleventh centuries (Lü 1955; Wang 1958: 272 f.). From an early period it appears to have had the allomorphs *-me* and *-m*, still found in present-day usage. Out of the latter have developed polite forms of the second and third person pronouns used without reference to number, *nǐn* < *nǐm* and *tān* < *tām*, by the regular shift of syllable final *-m* to *-n* that occurred around the end of the fifteenth century (Lü 1955: 213). In epistolary style, though not in speech, one can even create new plural forms, *nǐnmen* and *tānmen* (Chao 1968: 244 f., 640 f.).

### 7.2. The verbal suffixes *-le*, *-zhe*, *-guo*

The **perfective** suffix *-le* and its homonym, the sentence final particle *le*, are derived from *liǎo* ‘end, finish’, which is still current as a monosyllabic verb in certain expressions and is also found in such combinations as *liǎojíé* ‘finish, settle’, *liǎojú* ‘end, solution, settlement’, *zhōngliǎo* ‘end (of a period)’, etc. The full form *liǎo* is also found as what Chao calls a ‘phase complement’ to other verbs, that is, a complement that expresses the phase of an action of the preceding verb, rather than some result in the action or goal like an ordinary resultative complement (Chao 1968: 449). This may have been the earliest development in its progress towards **grammaticalization**. Its use as a perfective suffix seems to have become established in the vernacular by the tenth and eleventh centuries, by which time it had also come into use as a sentence final particle, taking over the functions of the classical final particle *yǐ* (Wang 1958: 304–307, 447 f.). Unfortunately

textual evidence does not enable us to trace the steps by which the full form *liǎo* became reduced phonetically to *le* in the suffix and sentence final particle. The suffix *-zhe* for **progressive** aspect is similarly related both graphically and etymologically to *zháo* EMC *driak* ‘come in contact with, touch’, which also occurs both in the form *zháole*, with the perfective suffix *-le*, as an ordinary resultative complement ‘hit the mark, touched the essential point’, and, with optional neutral tone, as a phase complement, translated by Chao as ‘touched, got at, successful after an attempt’ (Chao 1968: 447). As an aspect suffix it immediately follows the verb and cannot be separated from it by an object (Chao 1968: 248–250). The suffix *zhe* was a little later in appearing than *le* but there is evidence for it already in the eleventh century (Wang 1958: 309–311). The verb *guò* ‘pass’ can also be used, with optional neutral tone, as a complement, in which case it can be followed by the perfective suffix *-le*, as in *chīguòlē fàn* ‘have had one’s meal’, but it can also be used as a suffix in the neutral tone to mean ‘completed action at an indefinite time in the past’, as in *méi chīguó yáng* ‘has never been abroad’ (Chao 1968: 252f.). This usage can also be found by the eleventh century (Wang 1958: 312). Two compound suffixes, *-qilai*, from *qilai* ‘rise, get up’, and *-xiaqu*, from *xiàqu* ‘go down, descend’, which one scholar would prefer to relegate to the domain of word formation or syntax (Kupfer 1980: 57), are used as suffixes for **inchoative** and **successive** aspect respectively (Chao 1968: 251f.).

## 8. New derivational affixes

### 8.1. Noun prefixes

*A-*, as in *āgē* ‘elder brother’, is found widely in modern Chinese dialects (though not in Peking Mandarin) as a prefix with proper names and words of relationship, conveying a feeling of endearment or familiarity. Though it is not found in texts of the classical period, it occurs quite early in postclassical times (Wang 1958: 222) and is probably an inheritance outside the literary tradition from Sino-Tibetan. Benedict (1972) argued that, as a prefix of familiarity in Tibeto-Burman, *ʔa-* was a variant of the *ha-čhun* prefix of Tibetan that has been discussed in 2.2 and this seems very likely. The difference would be that, in the one case, \**a-* acquired a glottal stop onset and remained a distinct syllable, while in the other, it was a non-syllabic prefix, that in

Chinese voiced a following obstruent initial and then disappeared but in Tibetan was still pronounced as an onglide at the time when the script was invented and afterwards realized as prenasalization (Pulleyblank 1986). Although it does not appear as a separate syllable in the classical language, the prefix of familiarity has left its trace in the Middle Chinese voiced initial of standard Chinese *fù* “father” EMC *bua’* < \**pà?*. The unprefixed form with voiceless initial is *fǔ* EMC *pua’* < \**pà?*, written with the same character, which was used as an honorific form of address outside the family context in Old Chinese (Benedict 1972: 121ff.; Pulleyblank 2000).

In the present standard language the function of *a-* as a prefix of familiarity has been taken over by *lǎo* ‘old’, which is found in this usage as early as the Tang period (7th to 9th centuries), e.g. *lǎo xiōng* ‘elder brother’ in a collection of conversations by a Chan master or *lǎo Yuán* ‘old Yuan’ in a poem addressed by Bai Juyi to his friend Yuan Zhen. The prefix *lǎo* has become attached to some names of animals with no implication of age, e.g. *lǎoshǔ* ‘rat’, *lǎohǔ* or *lǎohu* ‘tiger’. This usage, too, begins from Tang times (Wang 1958: 223–225).

### 8.2. Noun-forming suffixes, *-zi*, *-(ə)r*, *-tou*, *-zhē*, *-de*

*Zi* ‘child’ already occurs in some combinations in Classical Chinese that superficially appear to anticipate its later use as a noun-forming suffix but they can all be derived from semantic extensions that are also found for the independent morpheme. Compare the modern compound *shízi* ‘cobblestone’ made up of *shí* ‘stone’ plus the same morpheme *zǐ* in the sense of ‘small, hard object’. It is a reasonable conjecture that its use as a suffix at first had a **diminutive** force but by the sixth century, when we first have clearly documented examples, it had become fully established in its modern usage, with no discernible diminutive force. We find such examples as *núzǐ* ‘slave’, *rızǐ* ‘day’, *gézǐ* ‘clam’ and examples multiply in the following centuries (Wang 1958: 226f.). In modern usage *-zi* as a suffix is distinguished from *zǐ* as the second member of a compound by its neutral tone but it is not known when this distinction appeared diachronically. In the modern language the suffix *-zi* is no longer productive and nouns which require it have become fully lexicalized.

The similar use of *ér* ‘child’ as a noun suffix is later in appearing. By the eleventh cen-

tury, however, there are unambiguous examples in which *ér* is attached to nouns referring to inanimate objects, apparently with a diminutive sense. Unlike *zǐ*, which lost any diminutive force that it may have once had at an early date, *ér* has retained this connotation, combined with an implication of endearment or familiarity (Wang 1958: 227–229; Chao 1968: 230). It is still a productive suffix in the modern language. Except for some speakers of Manchu background who still pronounce it as a separate, toneless syllable *-er* (Chao 1968: 140), the phonological reduction has gone farther for this suffix than for other flexional and derivational suffixes of modern Mandarin, so that it has become simply the consonant *-r* which is attached to the preceding syllable with various morphophonemic changes. Etymologically, suffixal *-r* also has two other sources in Mandarin, a reduced form of *rì* ‘day’ in *jīnr* ‘today’, *zuó* ‘yesterday’, etc., and a reduced form of *lì* ‘inside’ in the place words *zhèr* ‘there’, *nàr* ‘there’ and *nār* ‘where’ (Chao 1968: 229).

A noun-forming suffix of less frequent occurrence, for which there are examples from the fifth century onwards, is *-tou*, derived from *tóu* ‘head’, as in *shítou* ‘stone’, *gǔtou* ‘bone’ (Wang 1958: 230 f.). The suffix *-ba*, apparently derived from the verb *bā* ‘cling’, is found in a few nouns such as *wéiba* ‘tail’, *níba* ‘mud, clay’ (Chao 1968: 244).

The classical particle *zhě* which functions as a pronominal substitute for the head of a noun phrase has been borrowed into the modern spoken language as suffix for **agent nouns**, as in (*xīnwén*) *jízhě* ‘(newspaper) reporter’, *láodòngzhě* ‘worker’. It shows its literary origin, however, in that it retains its tone and cannot be combined with purely non-literary verbs, such as *chī* ‘eat’ or *páo* ‘run’. The true modern equivalent of *zhě* is *de*, which, like *zhě* in the classical language, is not only a suffix for agent nouns, as in *zhǎngsháorde* ‘chef’, but, more generally, a **nominalizer** of a noun-modifier phrase with the head omitted or without a specified head, e.g. *Tā shi cóng Zhōngguó lái de* ‘He is one who comes from China’ instead of *Tā shi cóng Zhōngguó lái de rén* ‘He is a man who comes from China’. In the modern language the particle of **subordination** in *de rén* is homonymous with the nominalizing particle *de* that is used when *réni* is omitted. As a particle of subordination *de* is a variant of the classical particle *zhī* that has developed separately in the colloquial language. Nominalizing *de* can similarly be regarded as the colloquial

development of *zhě*. For the original morphological connection between *zhī* and *zhě* see 2.3.

### 8.3. Other derivational suffixes

*Shi*, a reduced form of the **copula** *shì* ‘is’, is a suffix in a number of particles: *yaòshí* ‘if’, *ruòshí* ‘if’, *dōushí* ‘all, in all cases’, *kěshí* ‘but’, etc. (Chao 1968: 722 f.). Chao notes that in the case of *ruòshí* the two components can still be separated in *ruòbushi* ‘if (is) not’, showing that the meaning of the suffix as a copula is not completely attenuated.

**Prepositions**, or “coverbs”, in Chinese are a special class of transitive verbs that form phrases that modify a main verb rather than standing on their own. They normally do not take aspect particles since they take their aspect from the main verb. In some cases, however, we do find them with the aspect suffixes *-zhe* or *-le* with no apparent change in meaning or with some specialized meaning that cannot be directly related to the usual force of the particle. Thus, *wèi* ‘for; because of; for the sake of’ also has the forms *wèizhe* and *wèile*. Authorities differ as to the precise shades of meaning that these forms convey.

## 160. From Classical Arabic to the modern Arabic vernaculars

1. History of the Arabic language
2. Morphology of the verb
3. Morphology of the noun
4. Demonstratives and interrogatives
5. Pidginization and creolization in Arabic
6. References

### 1. History of the Arabic language

For the purposes of this article the term “Classical Arabic” will refer to the type of

Arabic that was used in the Arabian peninsula during the pre-Islamic period in poetry and the *Qur’ān* and that was to remain the standard language throughout the entire Arabo-Islamic history. Its modern form is usually called “Modern Standard Arabic”; this variety is distinguished from Classical Arabic mainly by its lexicon and phraseology, as well as minor syntactic adaptations. According to most Western Arabists, in the pre-Islamic

period Classical Arabic was an intertribal and supratribal language, based on the dialects of the Bedouin in the central and eastern parts of the peninsula (cf. Rabin 1951). In this view, the “poetico-Qur’ānic **koine**”, as it is sometimes called (cf. Zwettler 1978: 97–188), was never used in everyday communication. The vernacular of the Arab tribes is assumed to have differed from the Classical type of Arabic in lexicon and phonology, but chiefly in the absence of declensional and modal markers (*i'rāb*). The proponents of this view point to the evidence found in the inscriptions of early forms of Arabic, such as Lihyanite (cf. Müller 1982; Robin 1992). According to Corriente (1976) the *i'rāb*-less dialects were mainly found in the periphery of the peninsula, namely in those areas where contact with other languages took place.

The Arabs themselves view the history of their language in a different way. According to them, there was only one Arabic language in the pre-Islamic period, the *Arabiyya*. It is true that the Arab grammarians mention a considerable amount of differences between tribal dialects (*lughāt*), but these concern almost without exception lexical and phonetic features. In this account, the Arabic language was “corrupted” by the contact with the inhabitants of the conquered territories after the conquests. This resulted in a drive for the preservation of the language by the grammarians, thanks to whom the Classical language remained the standard language for cultural, political, and above all, religious purposes. The Arabs emphasize the vulgarity and decadence of the language of the sedentary population as against the purity of the language of the Bedouin. Some Western Arabists have followed this view of the development of the language (cf. Nöldeke 1904; Blau 1977), and it has been re-interpreted in terms of the **acquisition process** of the language, which may be compared with processes of pidginization and creolization (cf. Versteegh 1984; 1997: 102–112; but see Holes 1995: 19–24).

In this article, the type of Arabic that became the colloquial language after the period of the conquests will be called “New Arabic” or “Arabic dialects”. In the contemporary Arab world this colloquial language is usually called the “common, vulgar language” (*āmmiyya*) as against the “correct, Classical language” (*fushā*). Both varieties serve as the extremes in a continuum of speech variation, which was described as one of the classic cases of **diglossia** by Charles Ferguson

(1959a). Even according to those Arabists who maintain that some of the features of New Arabic were already present in the posited pre-Islamic colloquial language, the bulk of the linguistic changes were introduced during the period of the conquests. Explanations for the development of the colloquial language are complicated by the occurrence in the dialects of common differences that set them apart from the Classical language, as well as differences among them. The common features of New Arabic are explained either by a theory of **monogenetic origin** (cf. Ferguson 1959b), or by a **general drift**, which is compared to similar trends in other Semitic languages, such as Neo-Aramaic and Amharic. Others draw the attention to subsequent processes of **convergence**, which led to greater similarity between the dialects (cf. Cohen 1970; Diem 1978). The differences between the various dialect areas are sometimes explained by **substratal influence** (cf. Diem 1979; Versteegh 1997: 104–107).

In some instances, the dialects exhibit analogous processes of change with varying lexical realization, such as the development of an analytical possessive construction and a system of aspectual markers in the verb: each dialect has its own characteristic genitive exponent and aspectual particles. In view of this, the most reasonable account for the emergence of the dialects seems to be an explanation in terms of a polygenetic origin. Accordingly, the similarity of the development they went through must be the result of the similarity in acquisition process of the language by the inhabitants of the conquered territories. This may explain some of the common features. Other features, especially in the lexicon, may have spread by subsequent convergence.

An important common factor in the development of New Arabic is the influence of the Classical language, which was pervasive in all Arabophone areas, except in the so-called **language islands** (Malta, Cyprus, Anatolia, Uzbekistan, Afghanistan). The development in the latter dialects is characterized by the fact that from a certain point in time onwards they no longer underwent the influence of the Classical standard, so that elements of the original structure could be maintained. Changes in the structure of the dialects of the language islands did occur under the influence of the **adstratal languages** (e.g., Italian in the case of Maltese, Uzbek in the case of Uzbekistan Arabic, Turkish and Kurdish in the case of Anatolian Arabic).

Within the Arabic dialects the dialects of the Bedouin occupy a special position (cf. Rosenhouse 1984). The Arab grammarians asserted that only the Bedouin spoke a pure Arabic, with all the inflectional features preserved. According to them, the Bedouin only gradually succumbed to the corruption of sedentary speech. This constitutes an important argument for the thesis according to which the *Arabiyya* was, indeed, of the Classical type, with only minor regional differences. The main criteria that distinguish Bedouin from sedentary dialects are: the realization of Classical /q/ (Bedouin voiced [g], [g<sup>y</sup>] etc.; sedentary voiceless [q], [χ] etc.); the realization of the Classical interdentals (Bedouin [t], [d], [d̪]; sedentary [t̪], [d̪], [d̪̫]); the realization of some morphological features in Bedouin dialects (e.g., the ending *-in*, *-an* as a marker of **indefiniteness**; gender distinctions in the plural of the verb and the pronoun; internal **passive**; **causative**). The characterization of a dialect as Bedouin or sedentary is a linguistic one, since there have been many secondary processes of bedouinization and sedentarization, for instance in the dialects of Baghdad, where the Muslim dialect was bedouinized, whereas the Christians and the Jews continued to speak their sedentary dialects (cf. Blanc 1964).

Geographically, the contemporary dialects are divided into the Western and the Eastern dialects. The main isogloss between these two areas is that of the 1st person singular and plural of the imperfect verb (cf. 2.1). The Western dialects include the dialects of North Africa: the Ḥassāniyya dialect of Mauretania, Moroccan (for the dialect of Rabat, cf. Harréll 1962; Caubet 1993), Algerian, Tunisian, and Libyan. The Eastern dialects are usually divided into four major groups: Egyptian Arabic (cf. Behnstedt & Woidich 1982–1999; Woidich 1990), including Sudanese and Chad Arabic, with outliers stretching into Nigeria (cf. Owens 1993); Syro-Lebanese dialects (for the dialect of Damascus, cf. Grotzfeld 1965); Mesopotamian dialects (cf. Jastrow 1978; for the dialect of Baghdad, cf. Erwin 1963), including the dialects of language islands in Anatolia and Uzbekistan; and the dialects of the Arabian peninsula: Yemeni (cf. Behnstedt 1985/1992; Watson 1993), dialects of Saudi-Arabia (cf. Prochazka 1988; Ingham 1982; 1994), and Eastern Arabic Gulf dialects (cf. Holes 1990). Within each area, there is a division into Bedouin and sedentary dialects.

The description of the Arabic dialects is complicated by the diglotic situation. On the one hand, the existing continuum between dialect and standard and the constant interference between the extremes make it very difficult to elicit ‘pure’ dialect forms. Especially in the presence of a researcher speakers tend to use the prestigious variants more often than they normally do. As a result, the description of dialects often reflects Classical structures, and researchers usually interpret New Arabic structures in terms of Classical Arabic. On the other hand, speakers actually use the prestigious variants much more frequently nowadays because of increased education and exposure to the language of the media. A case in point is the analytical possessive construction, which for most speakers competes with the Classical construction even in informal speech. In this connection, the dialects of the language islands may serve as a point of reference: to some degree, they have escaped the influence of the Classical language and are, therefore closer to the original dialect structure.

In general, scholars maintain that the development of the Arabic dialects (apart from those in the language islands and from the attested cases of pidginization/creolization in the Arab world, cf. 5) is not very spectacular compared to the development in, for instance, the Neo-Aramaic dialects (cf. Diem 1978). To some extent, this is correct because of the influence of the Classical language, but on the whole, such a view tends to obscure the most salient traits of New Arabic, especially in the field of syntax.

Most scholars would agree that the development of the dialects is characterized by a process of **reduction** and a tendency towards greater **analyticity** vis-à-vis the Classical language. Partly because of changes in stress and accent (cf. Janssens 1972) New Arabic has lost the final short vowels, some of which served as the core of the inflectional endings. This has led some scholars to assume that the disappearance of the inflectional system may be explained phonologically. On the whole, however, this is not acceptable (cf. Diem 1991) since the inflectional system has broken down in its entirety, and the changes involved are clearly structural ones.

## 2. Morphology of the verb

Classical Arabic has a verbal system with distinctions for number (singular, dual, plural), gender (masculine, feminine in the 2nd and

3rd person), person (1st, 2nd, 3rd). Most verbs consist of three radicals that are usually indicated by the three consonants *f*-*l*. Traditionally, a perfect (*fa'ala*) and an imperfect (*yaf'alilu*) verb are distinguished, along with an imperative (*if'al*). Morphologically the perfect, which denotes past actions with a punctual, perfective or stative aspect, is marked by suffixes, and the imperfect, which denotes actions with a durative or habitual aspect, is marked by prefixes and suffixes. The imperfect verb has a three-way distinction between indicative, subjunctive (mainly after conjunctions) and apocopate or jussive (mainly for adhortative and prohibitive functions), which are marked by a change in endings, e.g. *yaf'al-u* (indicative), *yaf'al-a* (subjunctive), *yaf'al* (jussive).

### 2.1. The sound verb

The paradigm for **sound verbs** (i.e., those not containing *w* or *y* as one of their radicals) is as follows (cf. Tab. 160.1).

In all or most dialects the following developments have taken place, usually as a result of reduction or analogous change:

- the category of the **dual** has disappeared without leaving any traces;
- in most sedentary dialects the **gender** distinction has disappeared in the 2nd and 3rd person plural, in Western dialects even in the singular;
- the **modal** distinctions in the imperfect verb have disappeared through the loss of the short vowel endings and the ending *-na*;
- in most dialects the personal endings *-tu/-ta* have merged in *-t*; for the feminine ending of the 2nd person singular a new

ending *-tī* (> *-ti*) has emerged; in the Western dialects *-ta/-ti* have merged in *-tī* (> *-ti*), whereas the 1st person has become *-t*;

- the personal prefixes in the imperfect verb have the vowel *-i-* instead of Classical *-a-* in almost all dialects; this phenomenon (called *taltala*) was already known in some of the pre-Islamic dialects (cf. Rabin 1951: 61);
- the imperfect verb has developed a system of **aspectual markers** (cf. 2.4);
- some dialects have achieved greater regularity for the perfect plural endings *-tum/-ū*, e.g., in some Egyptian dialects *katabtum*, *katabum*; other dialects have *-tul-u*; Western dialects have *-tum/-tīw*;
- all Western dialects are characterized by a 1st person singular prefix of the imperfect verb *ni-*, plural *ni-..-u*; the existence of a mixed paradigm in the Egyptian delta (*aktib/niktibu*) shows that the earlier explanation of this development as a contraction from *'ana 'aktubu* 'I write' > *naktub* is probably wrong (cf. Behnstedt 1978: 69);
- in Classical Arabic verbal bases of the form *fa'ala* alternate with verbal bases of the pattern *fa'ila* (for non-permanent states, e.g., *gadiba* 'to be angry') and *fa'ula* (for permanent states, e.g., *hasuna* 'to be good'); in the dialects only two bases have been preserved without semantic distinction, namely *fa'al* and *fi'il*; in Moroccan and Algerian Arabic there is only one base, *f'āl*;
- in Classical Arabic the perfect bases correlate with imperfect patterns: *fa'ala* verbs have imperfect *yaf'lu* or *yaf'ilu* (in

'to write'		singular	dual	plural

<i>šaribalyašrabu</i>	<i>šriblyišrab</i>	<i>širablyišrab</i>

Tab. 160.2: Perfect/imperfect patterns in Classical Arabic and two dialects

some phonological contexts *yaf'alu*); *fa'ila* verbs regularly have *yaf'alu*; and *fa'ula* verbs regularly have *yaf'ulu*; in the dialects reflexes of these three patterns occur, but often with a different distribution (cf. Tab. 160.2).

As an example of one of the most conservative dialects, in which only the modal endings have disappeared, we quote here the verbal paradigm of a Saudi-Arabian Bedouin dialect, Gāmid (cf. Prochazka 1988:27) (cf. Tab. 160.3):

'to write'		singular	plural
perfect	1st	<i>katabt</i>	<i>katabna</i>
	2nd masc.	<i>katabt</i>	<i>katabtum</i>
	2nd fem.	<i>katabti</i>	<i>katabtunnah</i>
	3rd masc.	<i>katab</i>	<i>katabaw</i>
	3rd fem.	<i>katabat</i>	<i>katabnah</i>
imperfect	1st	<i>aktub</i>	<i>niktub</i>
	2nd masc.	<i>tiktub</i>	<i>tiktubūn</i>
	2nd fem.	<i>tiktubīn</i>	<i>tiktubnah</i>
	3rd masc.	<i>yiktub</i>	<i>yiktubūn</i>
	3rd fem.	<i>tiktub</i>	<i>yiktubnah</i>

Tab. 160.3: Verbal paradigm of Gāmid (Saudi-Arabia)

As an example of an innovative dialect with complete disappearance of gender distinction, except in the 3rd person singular we quote the verbal paradigm of sedentary Moroccan (Rabat) (cf. Tab. 160.4):

## 2.2. The weak verb

In Classical Arabic the conjugation of the **weak verbs** (i.e., those containing a *w* or *y* as one of their radicals) differs from that of the sound verbs as the result of various morpho-phonological rules. The following types may be distinguished (I, II, III indicating the three radicals of the verbal stem) (cf. Tab. 160.5):

		singular	plural
perfect	1st	<i>ktəbt</i>	<i>ktəbna</i>
	2nd masc.	<i>ktəbti</i>	<i>ktktəbtiw</i>
	2nd fem.	<i>ktəb</i>	
	3rd masc.	<i>ktəb</i>	<i>kətbu</i>
	3rd fem.	<i>kətbət</i>	
imperfect	1st	<i>nəktəb</i>	<i>nkətbu</i>
	2nd masc.	<i>təktəb</i>	<i>tkətbu</i>
	2nd fem.	<i>tkətbī</i>	
	3rd masc.	<i>yəktəb</i>	<i>ykətbu</i>
	3rd fem.	<i>təktəb</i>	

Tab. 160.4: Verbal paradigm of sedentary Moroccan (Rabat)

In New Arabic the following developments in the conjugation of the weak verbs may be noted; they all tend towards greater regularity:

- in most dialects the type Iw has become sound, e.g., in Egyptian the verbs *wazan/iywzin* 'to weigh', *wa'adlyiw'id* 'to promise', *wi'i/yiw'a'* 'to fall down';
- the two types IIIw and IIIy have merged in all dialects, e.g., in Egyptian *mišil/mišeṭ/yimši* 'to walk' (IIIy, ē < ay) and *da'ala/ēṭ/yid'i* 'to invite' (IIIw); the same development took place in the perfect of the *laqiya* group, e.g., Egyptian *la'allā/ēṭ/yil'a* 'to meet';
- the type II = III has merged with the II measure of the IIIy verbs, e.g., in Egyptian *raddal/raddēt* 'to return' like the II measure of *maša*: *mašša/maššet*.

A tendency may be noted in the dialects towards greater similarity between the endings of the weak and those of the sound verbs, especially in the case of the type IIIy. In many cases this similarity was achieved by

	underlying	3rd person perfect	3rd person imperfect	1st person imperfect
Iw	wa`adal	<i>wa`ada</i>	<i>ya`idu</i>	<i>wa`adtu</i>
IIw	qawama	<i>qāma</i>	<i>yaqūmu</i>	<i>qumtu</i>
IIy	sayara	<i>sāra</i>	<i>yasīru</i>	<i>sirtu</i>
	hawifa	<i>hāfa</i>	<i>yahāfu</i>	<i>hiftu</i>
IIIw	da`awal	<i>da`ā</i>	<i>yad`ū</i>	<i>da`awtu</i>
IIIy	mašaya	<i>mašā</i>	<i>yamšī</i>	<i>mašaytu</i>
	laqiyā	<i>laqiyā</i>	<i>yalqā</i>	<i>laqītu</i>
II = III	radada	<i>radda</i>	<i>yaruddu</i>	<i>radadtu</i>

Tab. 160.5: Types of weak verbs in Classical Arabic

assigning the sound endings to the weak verb, but alternatively, there are dialects in which the weak endings are transferred to the sound verb, either in the perfect (e.g., Muslim dialect of Baghdad) or in the imperfect (e.g., Jewish dialect of Baghdad), as shown in Tab. 160.6 (where  $\bar{e} < ay$ ,  $\bar{o} < aw$ ).

Classical	Egyptian (Cairo)	Muslim Baghdad	Jewish Baghdad

Tab. 160.6: Weak and sound endings in Arabic dialects

The development of the weak endings was important in another respect as well. In Maltese Arabic the pattern of the weak verbs has proliferated to such an extent that foreign loans, especially from Italian, which often ended in a vowel, could be integrated easily (cf. Mifsud 1995), e.g., *iddependaljidddependi* ‘to depend’ (< Italian *dipendere*), *importaljimporta* ‘to matter’ (< Italian *importare*).

Similar developments have taken place in French loans in Moroccan Arabic (cf. Heath 1989: 108–112).

### 2.3. The verbal measures

In Classical Arabic the verb system may be enlarged to form semanto-syntactic categories, the so-called **verbal measures**. Usually the following measures are recognized as productive stem formations (the main function indicated as far as possible, although in many cases the meaning is fixed lexically):

II	<i>kattaba</i>	intensive, causative, denominative
III	<i>kātaba</i>	transitive to direct object
IV	<i>'aktaba</i>	causative
V	<i>takattaba</i>	reflexive-intransitive to II
VI	<i>takātaba</i>	reciprocal to III
VII	<i>inkataba</i>	reflexive-passive
VIII	<i>iktataba</i>	reflexive-intransitive to I
IX	<i>(il)marra</i>	colours, bodily defects
X	<i>istaktaba</i>	request, opinion of I

Tab. 160.7: The verbal measures in Classical Arabic

In most dialects the II and III measures have been preserved, although only the II measure is productive (as intensive, denominative or causative); the III measure is lexically fixed and functions just as an alternative vowel pattern, e.g., Moroccan *qatəl* ‘to kill’/*qatəl* ‘to fight’. The IV measure has disappeared from almost all dialects and is replaced by the II measure, e.g., Moroccan *ktəb* ‘to write’/*kattəb* ‘to make so. write’ (Classical Arabic *'aktaba*), or by a periphrastic expression. Only in some Bedouin dialects in the East a IV measure is still productive, e.g., Dēr iz-Zōr (Syria) *haḍar/yihḍur* ‘to be present’, *ihḍar/yihḍir* ‘to

produce' (Fischer & Jastrow 1980, eds.: 46; cf. Ingham 1994: 77 for Nağdī Arabic). In Classical Arabic, the IX measure was strictly limited to verbs denoting colours and bodily defects; in the dialects this form has often been replaced by the II measure, e.g., in the Gulf dialects *bayyad* 'to make white' or 'to be white' (Fischer & Jastrow 1980, eds.: 71); other dialects have preserved a restricted IX measure, e.g., Egyptian *iħmarra* 'to be red'. In Maghrebine dialects a new form has developed, e.g., Moroccan *ħmar* 'to be red'. The X measure exists only in isolated lexical items, often loans from Classical Arabic, e.g., Moroccan *stħsen* 'to approve', *stəd'a* 'to summon'.

Each verbal measure has a passive in Classical Arabic, marked by a characteristic **vowel pattern** (so-called 'internal passive'), e.g., I measure *katabalyaktubu*, passive *kutibalyuktabu*; VIII measure *iktatabalyaktatibu*, passive *uktutibalyuktatabu*. In most dialects the **internal passive** has disappeared (Retsö 1983), but some Bedouin dialects have preserved a passive formation, e.g., in Saudi-Arabia (Ristāq) from *gatal* 'to kill' *gtill/yugtal* (Fischer & Jastrow 1980, eds.: 117, 262; cf. Ingham 1994: 26–28). In the Hassāniyya dialect of Mauretania a new internal passive has developed for derived stems, e.g., from *sahħah* (II) 'to correct' *uṣahħah/yusahħah* (Zavadovskij 1981: 35 f.).

In the other dialects some of the verbal measures have become specialized for the passive (cf. Retsö 1983). In some dialects the VII measure is used for this purpose, e.g., in Hassāniyya from *šrab* 'to drink' *nšrab* 'to be drunk' (Zavadovskij 1981: 34). In other dialects the Classical V and VI measures with their intransitive meaning are used for the passive, building on the Classical pattern of verbs like *gayyara* II 'to change st.', *tagayyara* V 'to be changed, to change [intrans.]'. In these dialects the marker *ta-* has become a passive marker which may even be used with the base stem (measure I). Examples are Moroccan *ktab* (I) 'to write'/*ttaktab* (tI, with secondary initial gemination) 'to be written'; *səmma* (II) 'to call'/*tsəmma* (tII) 'to be called'; Egyptian *misik* 'to catch'/*itmasak* 'to be caught'. In the tIII stems the Classical reciprocal meaning has usually been preserved, e.g., Moroccan *tqatel* 'to fight each other'.

The vowel patterns of the derived measures show a tendency towards a uniform vocalization. In Egyptian, for instance, the per-

fect and the imperfect of the II measure have acquired identical vowels: Classical Arabic *kallamalyukallimu* 'to talk', Egyptian *kalliml yikallim*. In the tII and tIII measures the vocalization is identical: Classical Arabic *ta'allaħħalayataħħamu* 'to learn', *taqāħbalalayataqāħbalu* 'to be met, to meet each other', Egyptian *it'ħallim/yit'ħallim*; *it'ħabbilyit'ħabil* (Jastrow 1982: 136).

#### 2.4. The aspectual markers

The most radical departure from the structure of Classical Arabic is the marking of verbal **aspect**. The main function of the two verbal forms, perfect and imperfect, in Classical Arabic seems to have been aspectual (Denz 1982: 71 f.; but cf. Eisele 1999). They may be combined with the auxiliary verb *kāna* to indicate past **perfectivity** and past **durativity** or **habituality**, respectively, e.g., *kāna qad kataba* 'he had written', *kāna yaktubu* 'he was writing, he used to write'. There are two particles that are connected with aspect/tense: *qad* indicates perfectivity and *sawfa* (*sa-*) indicates **future tense**. Neither particle has any reflex in New Arabic. In the dialects a new form of aspectual marking is used. The old **imperfect**, stripped of its modal endings, has become a modal form itself, e.g., Egyptian *tiħrab* 'ahwa 'would you like to have coffee?'. Durative and future/volitional aspect are indicated by clitic particles, whose etymology is not always clear, but seems to be connected with the notion of 'being at, sitting' for the durative and 'going' or 'desiring' for the future. The particles are highly characteristic for each dialect (Czapkiewicz 1975) (cf. Tab. 160.8).

	durative	future
Egyptian Arabic	<i>bi-</i>	<i>ha-</i>
Moroccan Arabic	<i>ka-</i>	<i>ġa-</i>
Syrian Arabic	<i>'am-</i>	<i>bi-</i>
Baghdad (Muslim)	<i>da-</i>	<i>rah-</i>

Tab. 160.8: Aspectual markers in Arabic dialects

Apart from the geographical variation the markers vary with regard to their semantic domain: the Syrian marker *bi-*, for instance, is used for a **volitional** aspect (probably <*yibgi* 'to desire'), whereas certain future actions are indicated in this dialect with a marker *rah-* (<*rāyih* 'going'). Another example is the indication of habitual or general statements. In some dialects, for instance

Egyptian and Moroccan, the durative marker is used for habitual actions, whereas in Syrian the *bi-* marker is used for that purpose. In 'Iraqi Arabic (cf. Erwin 1963: 335–344) the durative particle is restricted to a certain period of time, whereas the modal imperfect is used for general and habitual statements. The dialects also differ with regard to the combinability of the aspectual markers. In most dialects the durative marker may be combined with the past marker *kān* to indicate past durativity, e.g., Egyptian *kān b-yiktib* 'he was writing'; the combination *kān* + future marker to indicate **irreality** is not available in all dialects: in Egyptian *kān hā-yiktib* means 'he was going to write (but he didn't)', but in Moroccan the combination *kān ga-* is impossible.

In Classical Arabic the active **participle** *fā ilun* may be used to indicate durativity: *huwa kātibun* 'he is writing, he is going to write' (Denz 1982: 72 f.). In many dialects the participle is used to indicate a **resultative** or **perfective** aspect, e.g., Egyptian *ana nāsi* 'I have forgotten', *ana wākil* 'I have eaten'. In Uzbekistan Arabic the participle has become an integral part of the verbal system: it is used instead of the perfect for punctual actions in the past, and it takes both subject and object suffixes, e.g., *zōrib* 'he hit', *zorbinī* 'I hit', *zorbinik* 'I hit you' (Fischer 1961: 255).

## 2.5. The verbal complex

In Classical Arabic **pronominal suffixes** referring to the object may be added to the verb, e.g., *katabtu-hu* 'I wrote it'. There are no restrictions with regard to the person; although fairly unusual, combinations of suffixes may occur with ditransitive verbs, e.g., '*a'lamtukahu*' 'I let you know it' (the preferred form is with the particle *iyyā*: '*a'lamtukahu iyyā*'). The **indirect pronominal object** is indicated with the preposition *li-*, e.g., *katabtu-hu la-hā* 'I wrote it to her'. The indirect object is not incorporated in the verbal form, and it can be separated from it, e.g., *qultu dālikā la-ka* 'I told you that'.

In general, the modern dialects have preserved the form of the pronominal suffixes. Noteworthy is the disappearance of the *-h* of the 3rd person masc. sing. in virtually all dialects, e.g., Egyptian *katabt-o* 'I wrote it'. In some dialects this leads to a secondary stress contrast with suffixless forms, e.g., Syrian *kátabu* 'they wrote' vs. *katabú* 'they wrote it'. The normal morphophonemic rules lead to epenthesis and vocalic switch, e.g., Syrian

*yaktubu-hu* > *yiktbo* > *yəkətbo*, or Egyptian (with stressed epenthetic vowel) *yiktibō*.

An innovation is the development of the indirect object as a clitic to the verbal form, e.g., Egyptian *katab-līna* 'he wrote to us'. In most dialects a direct pronominal object of the 3rd person may be combined with an indirect object suffix, usually without constraints as to the person of the indirect object, e.g., Egyptian *iddet-hā-lo* 'I gave her to him', *bi-ywarri-ho-lhom* 'he shows him to them'. In Anatolian Arabic (Daragözü) the indirect object precedes the direct object, which may only be 3rd person, e.g., *wəddī-lī-a* 'bring her to me!', *wəddī-lā-an* 'bring them to her!' (Jastrow 1973: 68). For the development of subject suffixes with the participle in Uzbekistan Arabic see 2.4.

As we have seen in 2.4 the aspectual markers are added clitically as prefixes to the verbal form. The negative **circumfix** *mā ... š* may be added to the verbal form as well, so that morphologically rather complex forms may result. As an example we may quote Moroccan *ma-ğā-nəktəb-o-lək-š* 'NEG-FUT-I.write-it-to.you-NEG (I won't write it to you)' or Egyptian *ma-bi-tgib-hā-lhom-š* 'NEG-DUR-you.bring-her-to.them-NEG (you are not bringing her to him)'.

## 3. Morphology of the noun

In Classical Arabic substantives and adjectives are inflected for **case** (nominative, genitive, accusative), **number** (singular, dual, plural) and **(in)definiteness**. There is a two-way distinction between masculine and feminine nouns, the feminine nouns being characterized by the ending *-at* (pausal form *-ah*), and for some categories of nouns, by *-ā*, *-ā'*. Indefiniteness is marked by the ending *-n* (the so-called **nunation**), definiteness by the definite article *al-* and the absence of nunation.

### 3.1. Case

The singular declension is as follows (cf. Tab. 160.9):

	masculine 'man'	feminine 'city'
nominative	<i>rağul-u-n</i>	<i>madīn-at-u-n</i>
genitive	<i>rağul-i-n</i>	<i>madīn-at-i-n</i>
accusative	<i>rağul-a-n</i>	<i>madīn-at-an</i>

Tab. 160.9: Singular declension of the noun in Classical Arabic

In New Arabic the **feminine** ending has become *-a* in sedentary dialects; the form with *-at* (> *-it*) appears before pronominal suffixes and in possessive constructions (Egyptian *‘ōda* ‘room’, *‘ōdtak* ‘your room’, *‘ōdit il-bēt* ‘the room of the house’). Bedouin dialects retain the pausal form *-ah*, *-ih*. In some dialects a redistribution of the feminine ending has taken place, depending on the preceding consonant, e.g., Syrian *mnīha* ‘good:F’ vs. *kbīra* ‘big:F’. The alternative endings *-ā*, *-ā'* have disappeared, e.g., Egyptian *hamra* ‘red:F’ vs. Classical *hamrā’u*.

Since the short vowel endings of Classical Arabic have all disappeared in New Arabic, there is no inflection for case in the singular. The fact that in the sound plural, too, only one case ending has been preserved (cf. 3.2) and the fact that the nunciation as marker of indefiniteness has disappeared completely (apart from a few traces in Bedouin dialects), clearly show that the development is a morphological one (cf. Diem 1991). The syntactic function of the cases has been transferred to syntactic devices: the word order in the dialects has become more or less fixed to SVO; the adverbial and adnominal functions of the accusative have been transferred to other constructions, and the possessive function of the genitive has been taken over by the genitive exponent.

The emergence of the **genitive** exponent constitutes one of the most obvious changes in the structure of the language towards greater analyticity, e.g., Egyptian *il-bēt bitā’* ‘*il-wizīr* ‘the house of the minister’ instead of Classical Arabic *bayt-u l-wazīr-i*. The etymological origin of the genitive exponent is usually a noun meaning ‘possession’, ‘belonging to’, ‘thing’. Just as with the aspectual markers of the verb (cf. 2.4) the choice of the exponent is highly characteristic for each dialect area (cf. Harning 1980) (cf. Tab. 160.10):

Syrian Arabic	<i>taba’</i>
Egyptian Arabic	<i>bitā’</i>
Moroccan Arabic	<i>d-</i> , <i>dyl</i>
Baghdad Arabic (Muslims)	<i>māl</i>
Sudanese Arabic	<i>haqq</i>
Cypriot Arabic	<i>šāyt</i>
Sa‘īdī Egyptian	<i>šugl</i>
Chad Arabic	<i>hana</i>
Anatolian Arabic (Daragözü)	<i>līl</i>
Maltese	<i>ta</i>

Tab. 160.10: Genitive exponents in the Arabic dialects

Although not strictly relevant for the morphological development, two remarks should be added here. In most dialects, the analytical possessive construction coexists with the Classical construction. The choice for the latter is in some cases obligatory, due to semantic constraints. In Moroccan Arabic, for instance, the analytical construction is not used with terms of kinship, e.g., *mnī-i* ‘my mother’ (not *\*l-umm dyl-i*). In most dialects there is a distinction between **alienable** and **inalienable** possession (cf. Art. 103), e.g., Egyptian *il-lahm ibtā’i* ‘my piece of meat’ vs. *lahm-i* ‘my flesh’. Apart from these semantic distinctions there is a high degree of sociolinguistic variation in the use of the possessive construction. The current diglossia has (re-)introduced the Classical construction as an alternative in the dialect speech community. Not surprisingly, the language islands do not exhibit such variation. In Maltese Arabic, for instance, the analytic construction with the genitive exponent *ta* is obligatory, except for a few isolated expressions and terms of kinship. Conversely, in some of the more conservative Bedouin dialects the analytic genitive is hardly ever used.

In some dialects the disappearance of the formal marker for indefiniteness has led to the development of an **indefinite article**. Examples are ‘Iraqi *fat* (< Classical Arabic *fard* ‘individual’), also in Uzbekistan Arabic (which has lost the definite article), Moroccan Arabic *wahd* (< Classical Arabic *wāhid* ‘one’), Cypriot Arabic *ehen/lehte* (< Classical Arabic *’ahad* ‘one’; cf. Borg 1985: 145).

In a few Bedouin dialects the nunciation has not disappeared completely since there is a generalized nunate ending, acting as a connector between noun and attribute and indicating indefiniteness without marking the syntactic function, e.g., in Nağdī Arabic (Saudi-Arabia) the indefinite marker *-in* (cf. Ingham 1982: 53–56), *kalmit-in gālo-hā-li* ‘a word which they said to me’, *giz-in min-h* ‘a part of it’; in Uzbekistan Arabic the same marker *-in* is used, e.g., *fat haġart-in kabīra* ‘a big stone’ (cf. Fischer 1961: 244, who derives this marker from Classical Arabic *’ayna* ‘where?’). Andalusian Arabic seems to have known the ending *-an* as a connective element (cf. Corriente 1977: 121). In Yemeni Arabic a contrast exists between *bayt-u* ‘a house’ and *al-bayt* ‘the house’ (cf. Fischer & Jastrow 1980, eds.: 120).

### 3.2. Number

Classical Arabic has three numbers, **singular**, **dual**, and **plural**. The dual is marked by the endings *-āni* (nom.)/-*ayni* (gen./acc.) for masculine, and *-atānīl*-*atayni* for feminine nouns. One of the characteristics of the modern dialects is that they have lost the dual in the verb and the pronoun. In most dialects the formation of dual nouns is not productive either, except for a limited category of nouns. In Egyptian and Syrian, for instance, the dual is current with terms of kinship, e.g., *bintēn* ‘two daughters’, but it may be used occasionally with other nouns as well. In Moroccan the dual is only used with expressions indicating a period of time, e.g., *yumayn* ‘two days’, *sa'tayn* ‘two hours’. In some dialects the ending *-ayn* is also used for paired body parts, the so-called **pseudo-dual** (cf. Blanc 1970), e.g. Syrian *'enēn* ‘eyes’, *idēn* ‘hands’. The difference between this pseudo-dual and the original dual is obvious in the contrast between *'enēn*, which functions as a plural, and *'entēn* ‘two eyes’, which functions semantically as a dual. In combination with pronominal suffixes the pseudo-dual loses the ending *-n*, as in Classical Arabic – compare *īdēk* ‘your hands’ with *bintēnak* ‘your two daughters’.

In Classical Arabic there are two kinds of plural. The so-called **sound plural** is formed with the help of suffixes: *-ūna* (nom.)/-*īna* (gen./acc.) for masculine, and *-ātunl*-*ātin* for feminine nouns. The sound plural is used almost exclusively with some adjectives and all active participles, e.g., *gāmīlūnā/gāmīlātūn* ‘beautiful’; *muslīmūnā/muslīmātūn* ‘Muslims [act. part. IV measure]’. The second type of plural (the so-called **broken plural**) consists in a rearrangement of the vowel pattern of the singular. More than thirty different patterns are used, some of them connected with specific singular patterns, but by no means exclusively. A few examples: *rağulun/riğālun* ‘man’; *kitābun/kutubun* ‘book’; *wazīrun/wu-zarā'u* ‘minister’; *ṣadīqun/'aṣdiqā'u* ‘friend’; *ṭalibun/tullābun* ‘student’. The broken plurals are declined as singular nouns, except for the ones ending in *-u* (diptotic plurals) which have their gen./acc. in *-a* when they are indefinite.

As we have seen in 3.1, New Arabic has lost its declensional system: the sound plural is marked by the oblique ending *-īn* for masculine and *-āt* for feminine nouns. In the iso-

lated dialects there is a tendency to generalize these endings. In Uzbekistan Arabic (Fischer 1961: 243), for instance, the ending *-īn* is reserved for male persons, e.g., *uhwīn* ‘brothers’ (Classical Arabic *ihwatun*), *zuḡīn* ‘husbands’ (Classical Arabic *'azwāġun*), whereas the ending *-āt* is used for female persons and all other plurals, e.g., *rāsāt* ‘heads’ (Classical Arabic *ru'ūsun*), *uhāt* ‘sisters’ (Classical Arabic *'ahawāt*). In Cypriot Arabic (cf. Borg 1985: 180) *-āt* is the general plural ending for a large number of inanimate nouns, even for those which etymologically are broken plurals, e.g., *humāt* ‘kinds of meat’ (Classical Arabic *lahm*, plural *luhūm*).

The usual plural ending for adjectives in the dialects is *-īnl*-*āt*. For adjectives of the type *fa'īl*, e.g., *kabīr* ‘big’, all dialects have developed a new form, *fi'īl*; the plural for this type has become *fu'āl* (Classical Arabic *fi'āl*), e.g., Egyptian *kubār*, whereas substantives with the same plural ending in Classical Arabic retain *fi'āl*, e.g., *gamall/gimāl* ‘camel’.

Most dialects have retained a number of broken plural types, although with less variation than in Classical Arabic. In some cases the dialects have expanded the domain of certain types of plurals. The two patterns *fa'ālīl* and *fa'ālīl* for quadrilateral nouns have merged in most dialects into *fa'ālīl*, e.g., Egyptian *šābabīk* (Classical Arabic *šābabīku*) from *šubbāk* ‘window’. In Western dialects the resulting pattern is *f'ālīl*, e.g., Moroccan *šabbak/šbabak*. The plural pattern *'af'āl* has become identical in many dialects with the pattern *fi'āl*, due to the disappearance of the pretonic vowel, e.g., Moroccan *qləm/qlam* ‘pen’ (Classical Arabic *qalamun/qaqlamun*). The plural pattern *fa'ālt* > *fa'āli*, which in Classical Arabic was reserved for the singular types *fa'lā*, *fa'lā'u*, has become much more general, e.g., Egyptian *hāral/hawāri* ‘alley’ (Classical Arabic *hāra/hārāt*). In one category of nouns, expressing professional activities, the ending *-āt* has been replaced with the feminine singular (and **collective**) ending *-a*, e.g., Syrian *laḥḥām/laḥḥāme*. Weak nouns of this type have the ending *-iyya*, e.g., Egyptian *ḥarāmil/ḥarāmiyya* ‘thief’. The latter ending became generalized in foreign loans, e.g., Syrian *sōfēr/sōfērīye* ‘driver’.

In most dialects new patterns for the plural have developed. In Yemeni Arabic, for instance, the plural *af'ūl* is found, e.g. *'amm/ā'mūm* ‘uncle’ (cf. Fischer & Jastrow 1980, eds.: 91). Another new plural pattern in Ye-

meni Arabic is *fi'wal*, *fu'wal* for singulars of the type *fa'il*, e.g., *tariq/turwaq* 'street'. This pattern has sometimes been associated with the plural *qetwōl*, *qetyōl* in Modern South Arabian, but according to others, it is a case of common Semitic stock rather than direct substratal influence (cf. Diem 1979: 64–75).

### 3.3. Nominal patterns

As we have seen in the case of the broken plurals in the modern dialects, New Arabic has preserved the triradical system of Classical Arabic. Alongside the inflectional patterns Classical Arabic used a large number of derivational patterns, which were partly productive, partly fixed. In the case of singular nouns, some types appear to constitute semantically constrained categories, e.g., the type *fa'il*, which is prevalent in adjectives. Clear examples of derivational patterns are the following: *'af'alu* (colours), *fa-'āl* (occupations), *mif'āl* (instruments), *maf'ala*, *maf'ala* (places of action). In New Arabic most of these patterns have been preserved, and in some cases they have regained productivity through the efforts of the Arab Academies to create a pure Arabic lexicon with the help of derivational patterns (cf. Ali 1987). This development stimulated the creation of new word patterns in the dialects, or the expansion of old patterns. A case in point is the pattern *fu'āl*, which has become the normal pattern for illnesses, e.g., *sufār* 'jaundice' (from *asfar* 'yellow').

In a few cases the interference from other languages led to the formation of completely new patterns; an example is the pattern *tafsa-'ālat* indicating professions in Moroccan Arabic, which was borrowed from Berber, e.g., *tanəżżarət* 'carpentry'.

The most serious threat to the triradical structure of Arabic was the enormous influx of **foreign loans**. In Classical and Modern Standard Arabic most loans were integrated more or less fully into the system, e.g., *faylasūf/falāsifa* 'philosopher' (< Greek *philó-sophos*); *film/filmāṣlām*. In the modern dialects of North Africa the borrowing of French loans as a rule did not cause any major deviation from the triradical structure since most of these could be integrated. As examples we may quote from Algerian Arabic (cf. Hadj-Sadok 1955) *foršēṭal/frāṣāṭ* (< French *fourchette*), *bordill/bṛāḍel* (< French *bordel*). In cases where an internal plural is impossible

most loans receive the plural ending *-āt* or *-iyye*. The existence of a large number of quadrilateral consonants in Classical Arabic facilitated this incorporation of foreign loans.

In Moroccan Arabic a similar situation obtains. A detailed analysis (Heath 1989) has shown the amount of segmental conversion and adaptation that was needed in order to incorporate the nouns borrowed from French into the Arabic system. Noteworthy is the re-analysis of final vowels as the feminine ending *-a*: *anṭirna* (< French *l'internat*) is feminine in Moroccan Arabic, but *duš* (< French *douche*) is masculine. The former example also shows the re-analysis of the French article as part of the noun; other examples of this are *liba* (< French *les bas*), plural *libāt*, and *luṭuṣṭup* (< French *l'autostop*).

In Maltese, the incorporation of Italian loans has led to a completely new system of nominal patterns and to a proliferation of patterns based on Arabic weak stems (cf. Mifsud 1995). Due to the structure of Italian words, the morphology of the nominal patterns had to be restructured, and in many words the pattern has come to control only part of the word, e.g., *umbrella/umbrelel* (< Italian *umbrella*), *gverra/gverer* 'war' (< Italian *guerra*).

The reduction in variation also applies to the patterns of the verbal nouns. In Classical Arabic the **verbal noun** (the so-called **masdar**) of the base stem occurs in a large variety of forms, e.g., *darb* 'hitting', *hurūg* 'going out', *dahāb* 'going away'; some verbs may have more than one masdar. In the derived measures, the verbal nouns have a fixed form. In the dialects there is a general tendency to reduce the number of masdar types (Jastrow 1982: 139) and some of the more isolated dialects have preserved only one type. In Uzbekistan Arabic all verbal nouns end in *-ān*, e.g., *gatalān* 'killing' (Classical Arabic *qatl*), *dahālān* 'entering' (Classical Arabic *duhūl*). The verbal nouns of the derived measures in this dialect use the same ending attached to the participle, e.g., *inkasar* (VII), verbal noun *minkisriyān* (Fischer 1961: 257). Likewise, in Daragözü Arabic *f'il* is the pattern for all verbal nouns, e.g., *fith* 'opening', even in the derived measures, e.g., *tammam* (II), verbal noun *təmmim* 'completing' (Jastrow 1973: 53). In the Maghrebine dialects, which have preserved a much larger number of patterns for the verbal noun, the pattern *f'il* < *fa'il* is also much more frequent than in Classical Arabic.

#### 4. Demonstratives and interrogatives

##### 4.1. Demonstratives

A good example of the enormous variation between the Arabic dialects, within an identical frame of development, is provided by the deictic system. Classical Arabic has two series of demonstrative pronouns, one for near, and one for far deixis. The canonical forms for **near deixis** are *hādā*, fem. *hādihi*, pl. *hā'ulā'i*; for **far deixis** the forms are *dāl-ika*, *tilka*, *ūlā'ika*. These forms are indeclinable, except for the dual, which has two cases (masc. nom. *hādāni*; gen./acc. *hādayni*; fem. *hātānil/hātayni*). The deictic element *-t-* in the feminine *tilka* is also found in an alternative form of the demonstrative pronoun for the near deixis, *tā*, *tī*, which is, however, seldom used.

All modern dialects have at least two series of demonstrative pronouns (cf. Fischer 1959). The near demonstrative pronouns either continue the Classical form or they lose the element *hā-*. The forms for the far deixis are all new developments and the Classical forms are not found in any dialect. The demonstratives for the near deixis are sometimes found in two forms, a short one for attributive use, and a long one for substantivized use, e.g., Algerian Arabic (Djidjelli) *had* vs. *hada*, *hadi*, *hadu*. With regard to the form of the near deixis demonstratives the dialects may be divided into three groups: those which use only forms without *hā-* (e.g., Egyptian, Eastern Sudanese); those which use only forms with *hā-* (e.g., Tunisian, Palestinian, Lebanese); and those which use both (e.g., Moroccan, Algerian, Saudi-Arabian, Andalusian Arabic). In the third group the forms with *hā-* are usually less emphatic than the ones without.

In general the number of different forms in the dialects is staggering. As an example we quote here the demonstrative series from a number of dialects that may be regarded as typical. They all exhibit in varying combinations the deictic elements *-h-*, *-d-*, *-k-*, *-l-* (cf. Tab. 160.11).

The pronouns for the far deixis in Egyptian Arabic are fairly uncommon and used almost exclusively in situations of contrasting deixis. In Cairene there is an alternative set of forms for the near deixis consisting of a combination of demonstrative and personal pronoun (*dawwat*, *diyyat*, *dōlat*); these forms have become slightly stigmatized. In some dialects there is a third series for **middle deixis**, consisting of a combination between the de-

	near deixis	far deixis

	<i>adi</i>	<i>adik</i>
	<i>alli</i>	<i>allik</i>

Tab. 160.11: Demonstratives in the Arabic dialects

monstratives of the near and the far deixis, for instance in the dialect of Ġiblah (Yemen) *hādkāh*, *hādkih*, *hādkūh*; in the dialect of Bəh-zānī (Iraq) *hākā*, *haykā*, *hawkā* (cf. Fischer & Jastrow 1980, eds.: 116, 151); and in the dialect of Daragözü *ukkan*, *ukkanī*, *ukkanō* (cf. Jastrow 1973: 41).

##### 4.2. Interrogatives

The interrogatives of Classical Arabic *man* ‘who?’ and *mā* ‘what?’ have not been preserved in the majority of Arabic dialects. For ‘who?’ many dialects have a form that goes back to a non-attested form *mīn* (except for Moroccan which has *škun*, probably going back to a combination *'ayyu šay'in yakūn* ‘what thing is it?’); for ‘what?’ almost all dialects have opted for a reflex of *'ayyu šay'in (huwa)* ‘which thing?’, e.g., Moroccan *aš*, *šnu*, Egyptian *ē*, Chad Arabic *šinu*, Syrian *šū*, *ēš*.

The development of a new interrogative ‘what?’ illustrates a process of periphrasis that is particularly obvious in the interrogative adverbs. For ‘how much?’, for instance, many dialects have a form that goes back to a substantive meaning ‘form’ or ‘measure’, e.g., Syrian *addēš* (< \**qadr* *'ayyi šay'in* ‘which measure?’), Cypriot Arabic *áška* (< \**'ayyu šay'in qadr*). Likewise, in the interrogative adverb ‘how?’ we find Syrian *šlōn* (< \**'ayyu šay'in lawn* ‘which colour?’), Egyptian

*izzayy* (< \*'ayyu šay'in zayy 'which appearance?') and Cypriot Arabic *áššik* (< \*'ayyu šay'in šakl 'which form?').

These different realizations of the interrogative adverbs seem to point at a polygenetic origin in different contact situations. They all represent the product of an attempt at communication in which salient and semantically transparent forms are preferred over opaque ones such as Classical *kam* 'how much?' and *kayfa* 'how?'.

### 5. Pidginization and creolization in Arabic

There is one documented case of **pidginization** and subsequent **creolization** in Arabic (cf. also Art. 153). The structure of this dialect, (Ki-)Nubi, is an interesting example of a non-Indo-European based creole. Moreover, this dialect plays an important role in the discussions about the developmental processes in the central Arabic dialects (cf. Heine 1982; Versteegh 1984: 113–128; Prokosch 1986; Owens 1990). The origin of Nubi lies in the 19th century when a pidginized variety arose in the Anglo-Egyptian army camps in Upper Egypt as the principal means of communication between the Arabic-speaking subalterns and the multilingual recruits from the Southern Sudan, most of whom were speakers of Nubian. It is possible that in the formation of this pidgin elements from an earlier Arabic trade language in the region were used. Some of the soldiers followed the English army to Uganda and Kenya, where they settled and married indigenous women. The children who were born in these mixed marriages creolized the pidginized variety. Nowadays there are ±80,000 speakers of Nubi, all of them living in Uganda and Kenya. In the Southern Sudan the pidginized variety has remained in use as a **lingua franca** under the name of 'Juba Arabic'. In the cities it tends to become creolized by children from bilingual marriages (cf. Versteegh 1993).

Nubi exhibits the classic features of other creole languages (Wellens 2003):

- as in all creole languages there is a complete breakdown of the inflectional system of the original language; in the pidginized variety nouns had only one form for singular and plural, in Nubi there seems to be a new plural marker -á, which is, however, frequently omitted (cf. Heine

### XVIII. Morphologischer Wandel II: Fallstudien

- 1982: 29); there are a few fossilized broken plurals, e.g., *kááfír/kufará* 'infidel';
- adjectives have no inflection for gender or number, e.g., *mářia úe-dé kebír* 'this woman is big'; there seems to be a plural marker -ín, but this marker, too, is often omitted (Heine 1982: 33);
  - there is an analytical **collective** form, e.g., *nas-yalá* '(group of) children' (< *nás* 'people');
  - there are many compound nouns, e.g., *rásu-lakáta* 'tree-top' (lit. 'head + tree');
  - there is no reflex of the Arabic **article**, but the deictic form *dé* (< Egyptian *da*) has taken over some of the functions of the article, e.g., *lakáta dé kebír* 'the [above mentioned] tree is big'; a new series of demonstratives has developed: *úe-dé*, plural *dól-dé* for the near deixis; *náa-dé* for the far deixis;
  - the verb has only one form, diachronically connected with the 3rd plural of the perfect or with the imperative, e.g., *áalim* 'to teach' (< imperative *'allim?*), *ásurubu* 'to drink' (< imperative *iśrab?*); the ending -*u* seems to function as a **transitivity marker**, possibly derived from the 3rd person singular object suffix -*hu* (cf. Versteegh 1984: 124);
  - from verbs a verbal noun is derived by a change in stress (or possibly tone) pattern, e.g., *kárabú* 'to spoil', verbal noun *karáb*; this is probably an innovation that arose at the creolization stage;
  - there is a system of aspectual markers that is remarkably similar to that of other creole languages; at the same time it is not completely different from the system in central Arabic dialects (cf. Tab. 160.12).

---

#### 'to come'

---

<i>rúa</i>	neutral form
<i>bi rúa</i>	future
<i>kalà(s) rúa</i>	perfective
<i>káán rúa</i>	pluperfect

<i>bi gí rúa</i>	future durative
<i>káán gí rúa</i>	past durative
<i>káán bi rúa</i>	hypothetical, unrealis

---

Tab. 160.12: Aspectual markers in Nubi (Heine 1982: 38)

In Juba Arabic exposure to the prestige variety of Khartoum Arabic has led to a change

in the verbal system. The personal prefixes of the imperfect verb in Khartoum Arabic are first re-interpreted as alternative aspectual markers; with continued contact they are assigned the function of indicating person (cf. Mahmud 1979). In this way, the dichotomy perfect/imperfect of the central Arabic dialects is re-instated in Juba Arabic.

## 161. Tok Pisin

1. Pidgins and development
2. Historical background
3. History of research
4. Documentation
5. Internal history of Tok Pisin word formation
6. Theoretical consequences
7. References

### 1. Pidgins and development

Pidgin languages, because of their relatively short history and rapid development, are ideal test cases for general linguistics. Tok Pisin (from English *talk pidgin* also referred to as Neo-Melanesian or New Guinea Pidgin) is a particularly important example because

- (a) it is one of the very few languages whose entire linguistic development can be documented in some detail;
- (b) it illustrates two types of developments: that from simple jargon to complex creole and that of a conservative rural language to an anglicised urban one;
- (c) it illustrates both the spontaneous development of new morphology and the influence of deliberate acts of standardisation and planning.

While the development of inflectional morphology in Tok Pisin has been widely used (Sankoff 1977; 1980) in the debate about substratum influence and universals of linguistic development as well as the testing of other theoretical proposals, data from Tok Pisin derivational morphology have rarely been employed.

### 2. Historical background

Like the other two big Melanesian pidgins, Solomon Islands Pijin and Vanuatu Bislama, the history of Tok Pisin began outside its present area of currency. Between 1879 and 1914, thousands of New Guineans were recruited to work on the plantations of Samoa, as well as a much smaller number for a much shorter time (1880–1885) on the Queensland sugar plantations. In Samoa, Papua New Guineans picked up the plantation jargon that had developed among the multilingual workforce from Kiribati, Vanuatu and elsewhere and, from about 1890 onward, they also influenced this plantation language lexi-

cally and grammatically. Whilst it was a reasonably stable pidgin, Samoan Plantation Pidgin English remained a rather rudimentary language with no inflectional morphology, circumlocution and borrowing being the main sources of lexical expansion. As the Melanesian workers returned from Samoa to New Guinea and as a local plantation economy developed, the number of Tok Pisin speakers in former German New Guinea (which comprised of Northeastern New Guinea and the Bismarck Archipelago but not Papua) rapidly increased. From a few hundred in 1880, the numbers had grown to about 15,000 in 1914. Today there are about 2 million speakers of Tok Pisin, i. e. more than 50 percent of the population of independent Papua New Guinea. With the increase in speakers, Tok Pisin became more useful and was employed in a growing number of new situational contexts. It also began to acquire first language speakers. The main new contexts were (a) the gold industry from 1930 onwards, (b) Christianisation and missionisation, also from about 1930 onwards, (c) extension of Australian administrative control from 1920 onwards and, most important of all, (d) increasing use of Tok Pisin as the language of inter-tribal communication, replacing previously established local pidgins, bilingualism or silent barter.

During the Second World War Tok Pisin was used extensively in the information campaigns of the allied forces and the Japanese. After 1945 a Tok Pisin-medium press was set up and it also became a medium of education (until its condemnation by the United Nations in 1953). In spite of negative official policies Tok Pisin developed into the *de facto* language of village councils, new political parties in pre-independence days and the language of political self determination after independence. In the first seventy years of its existence intertribal marriages were rare, but, after 1945, new non-traditional settlements developed (mission stations, inter-tribal cargo cult centres, boarding schools and towns), significantly increasing the number of intertribal marriages. **Creolisation** of Tok Pisin began around 1950 and this process has accelerated greatly since. In most large urban areas, children have grown up with Tok Pisin as their first language.

### 3. History of research

The study of the morphology of Tok Pisin is a very recent phenomenon, mainly because until very recently there was little morphology to study. Early missionary grammars (surveyed by Mühlhäusler 1985 a) contain occasional references to apparent patterns of morphology, and in Hall (1943) a more detailed statement of zero derivation is given. The absence of productive reduplication is noted, an observation that was confirmed subsequently in Laycock (1970) and Wurm (1971), both of whom identified some other productive word formation devices. It was only when investigators turned to data from speakers who had acquired Tok Pisin after the Second World War that larger areas of morphological regularities became evident. Thus, the beginnings of verbal inflections are noted in Sankoff (1977), and in Mühlhäusler (1979) a dramatic increase in derivational productivity in the early 1970s is documented. Coinciding with political independence, there was a rash of activity in the area of lexical planning (surveyed by Wurm et al. 1977) and some detailed studies of recent developments in Tok Pisin morphology have been prepared by Romaine (1990). Smith (2002) contains valuable information on recent trends in creolised Tok Pisin and the continuing uncertainty about its social position and grammatical standards.

### 4. Documentation

The emergence of inflectional categories is relatively easy to document because of their high token frequency. There are, however, some problems for those who rely on the written text, including:

- (a) the failure of recorders to pick up phonologically reduced forms;
- (b) the lack of clear indications of what is an affix and what is an independent form (e.g. should *wanfela botol* be analyzed as 'one fellow bottle' or not);
- (c) the emergence of norms for writing, (e.g. *mipela* 'we') can conceal new developments, such as the morphologically reduced *mitla*.

The development of derivational morphology is much more difficult to document, as many lexical items are of a very low token frequency. However, research on Tok Pisin is in the fortunate position of being able to draw

on extensive lexicographical work by German missionaries. In my own studies I have used these to compile a very large corpus, supplemented by observational data and questionnaires.

An important consideration in all this is the locus of lexical regularities, as with a rapidly developing language such as Tok Pisin one cannot assume that a complex morphological form is the result of the application of any rule at all. For instance, for some speakers the compound adjective *bolhet* 'bald' forms part of the pattern:

- (1) *bikhet* 'conceited'  
*guthet* 'intelligent'

i.e. a pattern *someone i gat* adjective noun > adjective noun. For others, it is interpreted as *het i olsem bol* 'the head is like a ball', just like adjectives of the type *sakman* 'the man is like a shark (sharp customer)'. For yet others *bolhet* may simply be an unanalysed simple lexical entry.

It has been found that speakers who learnt Tok Pisin before World War II do not have the same number of productive patterns as younger speakers. It has also been observed that they will produce fewer morphologically complex forms and, in some instances, Melanesian-type forms produced by older speakers are being replaced by more English derived ones among younger speakers, as in *kot ren* 'rain coat' being replaced by *renkot*. To what extent such clear differences in grammar affect the communication is not understood. However, one suspects that the postulation of a common code is not a satisfactory model for a dynamic system such as Tok Pisin.

### 5. Internal history of Tok Pisin word formation

The internal history of Tok Pisin is most conveniently portrayed by referring to a number of idealised stages. It should be kept in mind that the processes are at least partly continuous and that at most times speakers of different developmental stages can interact. The stages are:

	first found
(a) Jargon	1870
(b) Stabilisation	1890
(c) Expansion	1925
(d) Creolisation	1950
(e) Post pidgin/post creole	1960

### 5.1. The Jargon stage

**Jargons** are distinguished from proper **pidgin** languages by their excessive instability, extremely impoverished expressive power and high context dependence. As they are individual rather than social solutions to the problem of crosslinguistic communication, it would seem to make little sense to postulate ideal speaker/hearers. Rather, one is to assume that interaction is characterised by different communication strategies and resulting misunderstandings and failures to communicate. At this stage, speakers of the **lexifier language** English (i. e. the language which provided most of the lexical roots) continue to use their own inflectional morphology, though they also make unsystematic simplifications characteristic of foreigner talk. Local speakers tend not to have any productive inflectional patterns, though fossilised inflections are in evidence, such as English plural -s in:

- (2) *masis* ‘match’  
*anis* ‘ant’

or the genitive affix -s in

- (3) *boskru* ‘boat’s crew’

the German plural -en in

- (4) *binen* ‘bee’

and the German infinitive -en in

- (5) *beten* ‘pray’  
*singen* ‘sing’

Some of these endings have since found their way into the grammar of Tok Pisin.

The derivational morphology of English is similarly eroded in the jargon stage, and morphologically complex forms typically end up with simple roots, as in the case of

- (6) *bilinat* ‘betelnut’  
*trausel* ‘tortoise shell’  
*katuana* ‘guard of honour’

Differences between indigenes’ and expatriates’ perceptions of morphological relatedness of words persist for long periods of time. As late as 1970 one could note differences such as:

expatriate	indigenous	gloss
<i>go – go ap</i>	<i>go – kwap</i>	‘go-climb’
<i>daun-daun</i>	<i>daun-tambilō</i>	‘down-hold’
<i>bilo</i>	–	‘of a ship’

Tab. 161.1: Expatriates’ and indigenes’ words

The jargon phase is characterised both by a very reduced and mostly nominal lexicon, and considerable pressure on speakers to say more than the language can express adequately.

In fully developed languages there tends to be constructional **iconicity** (cf. Art. 30) of the type:

- (a) all central concepts to be expressed by lexical stems;
- (b) all complex concepts to be expressed by complex or derived forms;
- (c) all percepts and other singularities to be expressed by phrases, sentences or other syntactic means.

In early **jargon** texts, one encounters many examples of speakers/hearers resorting to either non-verbal means of expression (e. g. by pointing to the chest to indicate ‘chest’, an item for which there is no word, but one that was used frequently as chest infections were common in the plantation context), or else, the formation of *ad hoc* circumlocutions, though this device was limited by the absence of syntactic regularities and lexical items useful in defining other items. Some early examples include:

- (7) *kas bilong pulimap wara*  
‘cask for filling with water (barrel)’  
*bokis bilong man i dai*  
‘box of person who died (coffin)’  
*wara bilong maus*  
‘water of mouth (saliva)’  
*lata bilong haus*  
‘ladder of house (stairs)’

Pointing and circumlocution were individual *ad hoc* solutions and most of these were probably unrecorded.

### 5.2. The stabilisation stage

**Stabilisation** of a **pidgin** language refers to its becoming a linguistic system separate from its lexifier languages, and the first language of its users. Stabilisation in the lexical component is manifested (a) in the development of socially sanctioned conventions about lexical information, (b) the reappearance of lexical structure, and (c) the use of stable syntax as a means of deriving new lexical items. Although additions to the lexical inventory do occur, they filter slowly into the language without causing severe structural disruption or major changes in lexical organisation. The main function of lexical additions is to con-

solidate the pidgin as a means of communication in a relatively narrow field of interlingual contacts.

The stabilisation of Tok Pisin was not a sudden event but a continuing process, starting with the stabilisation of Samoan Plantation Pidgin on the Samoan plantations and culminating in the crystallisation of a flexible and stable **lingua franca** spoken throughout German New Guinea. The lexicon which developed during this period derived its separate identity from the impact of Tolai and German and, to a lesser degree, Malay and Samoan, which replaced English as Tok Pisin's principal **lexifier languages** between 1880 and 1920.

The effect of stabilisation on inflectional morphology was relatively small. It manifested itself mainly in word class marking and number marking in pronouns.

The form *-pela* which occurred in a number of jargons variably as a kind of adjective marker or noun classifier became a marker of attributive, but not predicative monosyllabic adjectives in stable Tok Pisin as in:

- (8) *gutpela man* 'a good fellow, a good man'  
*smolpela pik* 'a small pig'  
*bikpela tais* 'a big swamp'

Similarly, *-im* (from English *him*) became a marker of transitive verbs as in:

- (9) *lukim* 'to see'  
*tanim* 'to turn'  
*ritim* 'to read'

An incipient marking of intransitives by means of **reduplication** as in Tolai, the language spoken around Rabaul, the former capital, remained unsuccessful and is now found only in a handful of items including:

- (10) *waswas* 'bathe'  
*wasim* 'wash someone'  
*singsing* 'dance'  
*singim* 'sing a song'  
*lukluk* 'watch'  
*hukim* 'see someone'

Pronominal number marking in Tok Pisin is the result of an encounter of two solutions, the Samoan Plantation Pidgin one using *ol* after pronouns as in:

- (11) *me ol* 'we (excl. & incl.)'  
*you ol* 'you (pl.)'  
*(em)ol* 'they'

and a different tradition employing *-pela* for this purpose.

Most present-day variants of Tok Pisin employ

- (12) *mi pela* 'we (excl.)'  
*you pela* 'you'  
*(em)ol* 'they'

*Ol* rather than *-pela* was subsequently adopted as a nominal plural marker (see Mühlhäusler 1981).

Tense, aspect and modality in stable Tok Pisin continued to be marked by fully stressed adverbials and auxiliaries. Developments of word formation devices were more spectacular, suggesting that the expansion of the lexicon was more important than stylistic flexibility or syntactic refinements.

By the time German control came to an end in 1919, the lexical inventory of Tok Pisin comprised perhaps 750–1,000 items, most of them lexical bases. Throughout the stabilisation stage, borrowing from outside sources remained the most important means of increasing Tok Pisin's referential adequacy. However, in contrast with the lexicon of Jargon English, that of stabilised Samoan Plantation Pidgin and Tok Pisin was no longer an unstructured list. Instead, one can observe the development of lexical structures manifested in (a) the emergence of tightly structured semantic fields; (b) the use of stable syntax in circumlocutions; and (c) the development of a small number of regularities of lexical derivation.

With regard to the last category, most complex forms were still phrase level items as:

(a) names for different kinds of people:

- (13) *man bilong pekato* 'a sinner'  
*man bilong kamda* 'a carpenter'  
*man bilong stia* 'a helmsman'  
*man bilong limlimbur* 'an idler'

(b) names for certain kinds of buildings:

- (14) *haus kuk* 'kitchen'  
*haus boi* 'hut for labourers'  
*haus kot* 'court house'  
*haus pekpek* 'toilet'  
*haus marit* 'married quarters'

(c) distinction of sex in humans and animals:

- (15) *hos man* 'stallion'  
*hos meri* 'mare'  
*pikinini man* 'young boy'  
*pikinini meri* 'young girl'  
*dok man* 'male dog'

<i>dok meri</i>	'bitch'
<i>pik man</i>	'boar'
<i>pik meri</i>	'sow'
<i>kakaruk man</i>	'cock'
<i>karakaruk meri</i>	'hen'

(d) antonyms of adjectives and intransitive verbs:

(16) <i>gut</i>	'good'
<i>nogut</i>	'bad'
<i>strong</i>	'strong'
<i>nostrong</i>	'feeble'
<i>stret</i>	'correct'
<i>nostret</i>	'incorrect, unacceptable'
<i>nap</i>	'sufficient'
<i>nonap</i>	'insufficient'

Another important innovation at this stage are conventions for changing the subcategorial status of words. Thus nouns referring to trees can also refer to the fruit from these trees, thus *bata* 'avocado tree' can also mean 'avocado pear', *saksak* 'sago palm' and 'sago', or *muli* 'orange tree' and 'orange'.

The name of a sound is derived from the name of the instrument with which it is produced. Examples are *tandok* 'horn trumpet' and 'signal for beginning or ending work'; *kundu* 'drum' and 'sound of a drum'; *visil*, *kaviv* 'flute' and 'sound of a flute', and so forth.

Next we can observe a third convention, which was less generally maintained than the first two: a noun referring to a material can at the same time refer to something typically made out of this material, e. g. *purpur* 'flower, purpur bush' and 'grass skirt', *ain* 'metal' and 'flat-iron, anvil', *kapa* 'shiny metal' and 'washing copper', *let* 'leather' and 'belt'.

Finally a very small number of causative verbs were formed by adding the transitivity marker *im* to intransitive verbs. As late as 1940 observers remark on the absence of word formation in Tok Pisin. There are certainly few signs of the sometimes allegedly vigorous role of reduplication in early pidgin development.

### 5.3. The expansion stage

The realisation that pidgins can be classified not only in terms of their social functions, but also in terms of their structural complexity, is a relatively recent one, stemming from the work of Samarin (1971), Mühlhäusler (1974), and Todd (1974). It was found that, as pidgins are used in new functions, their linguistic complexity also increases. Tok

Pisin's structural expansion appears to have taken place at a time when the number of first language speakers was diminutive. Whilst these few first language speakers may have contributed to its structural development, it appears that the bulk of innovations originated among second language speakers. Thus, the view that significant structural expansion of a pidgin only occurs with its creolisation is not borne out.

Tok Pisin's structural expansion after 1920 is defined by two main developments, namely the emergence of sentence embedding and discourse structure and the development of a derivational lexicon. Developments in the area of inflectional morphology remained modest, as phonological reduction and consequent clitisation, or affixation, is not favoured by second language speakers of Tok Pisin. As the age at which Tok Pisin was learnt decreased progressively from 1920 onwards, some of the processes usually associated with creolisation are found among fluent younger speakers of Tok Pisin, particularly those that have grown up in the towns. Derivational morphology on the other hand experienced a dramatic expansion during this phase. This asymmetry of development in the inflectional and derivational areas is an index of the relative unimportance of stylistic flexibility and importance of referential adequacy in a pidgin language.

The following general tendencies in the growth of the derivational lexicon have been observed:

- (a) a continued increase in the number of productive lexical regularities;
- (b) an increase in the distance between lexical structures and syntactic structures, in particular a tendency for lexical items to shift down from higher to lower lexical size levels;
- (c) an increase in the numbers of lexical items accounted for by individual lexical regularities, i. e. increase in productivity.

Thus, instead of the handful of word formation patterns found in 1920, 57 such patterns were identified by Mühlhäusler (1979), involving **conversion**, **compounding** and **reduplication**, enabling speakers to create hundreds of new morphologically complex words. This increase in productivity of the lexicon appears to have been governed by a number of principles, particularly those of gradual downshifting and an increase in derivational complexity.

Downshifting, i. e. the shift from phrase to word level lexical items can be illustrated with examples such as:

1945	present day Tok Pisin
<i>lam wokabaut</i> 'hurricane lantern'	<i>wokabautlam</i>
<i>manki bilong masta</i> 'servant (male)'	<i>mankimasta</i>
<i>mekim hariap</i> 'to speed up someone'	<i>hariapim</i>
<i>hatpela wara</i> 'soup, hot water'	<i>hatwara</i>
<i>mani pepa</i> 'paper money'	<i>pepamani</i>
<i>wara bilong skin</i> 'sweat'	<i>skinwara</i>
<i>man bilong stil</i> 'thief'	<i>stilman</i>
<i>man save</i> 'knowledgeable person expert'	<i>saveman</i>

Tab. 161.2: Downshifting

This trend is continuing today. One consequence is the decreasing reliance of speakers on circumlocutions.

An interesting though insufficiently understood phenomenon is the creation of morphologically complex nonce words (cf. Downing 1977), e.g. *hetman* 'a ghost that was a head only' in a ghost story, rather than the lexicalised item *hetman* 'village chief'.

Increasing derivational complexity is illustrated by a loss of morphological transparency. For example, one can contrast the early emergence of cumulative compounds of the type:

- (17) *papamama* 'parents'  
*manmeri* 'people'

with the late appearance of:

- (18) *wantok* 'someone who speaks the same language'  
*wankaikai* 'mess mate'  
*wansmok* 'someone who shares a smoke'  
*wanmak* 'someone of the same size'  
*wanlain* 'someone working in the same labour line'

In addition, many derivational regularities have become considerably more productive over the years. Thus, no compounds ending

### XVIII. Morphologischer Wandel II: Fallstudien

in the agent suffix *-man* 'person, doer' are found before 1920 though lexical phrases of the form [man bilong Vint] expressing 'someone who usually does what is referred to by the verb' are documented in fair numbers for the mid 1920s, including:

- (19) *man bilong singaut* 'noisy person, beggar'  
*man bilong slip* 'sleepy, lazy person'  
*man bilong stil* 'thief'

The only word-level items at this point are *sutman* 'policeman', and *fulman* 'jester'. Most commonly nouns with an agentive meaning are fully lexicalised. Typical examples from an unpublished 1924 vocabulary by Leo Brenninkmeyer are *kuskus* 'clerk, writer', *ridima* 'redeemer', *kamda* 'carpenter' and *kundar* 'acolyte'.

For the mid-1930s the authors of a dictionary (*Wörterbuch* n. d.: 53) remark that "-man as the suffix of verbs forms agent nouns" (author's translation). However, only a few word-level items are listed:

- (20) *wasman* 'watchman'  
*sikman* 'patient'  
*daiman* 'dead, dying man'  
*stilman* 'thief'

Phrase-level items listed in the *Wörterbuch* (n. d.) include:

- (21) *man bilong toktok* 'talkative person'  
*man bilong save* 'wise, knowledgeable person'  
*man bilong pait* 'warrior, fighter'  
*man bilong pret* 'fearful person'

The only additional items culled from Kutscher (1940) are:

- (22) *rabisman* 'destitute person'  
*lesman* 'loafer'

It is interesting to note that Kutscher does not list 'thief' as *stilman*, as had been done in the *Wörterbuch* (1935) but as *man bilong stil*.

The three trends identified in the derivational morphology of expanded Tok Pisin continue to dominate the development of the next stage, creolisation.

#### 5.4. The creolisation stage

**Creolisation** (i. e. the language becoming adopted as a first language) in Tok Pisin began in the early 1950s but has only become a large scale phenomenon since urbanisation, from the 1970s onward. Today an estimated 50,000 children speak Tok Pisin as their first or main language, mainly in towns such as

Port Moresby, Lae or Madang. The main changes once Tok Pisin becomes a first language appear to lie in the area of inflectional morphology. Many of these changes are the result of the growing tempo at which Tok Pisin is now spoken and the consequent phonological reductions. As yet the underlying morphological structure of complex forms does not appear to have been affected, though quite significant deeper restructuring may occur within a few generations.

Generally speaking one can observe two trends:

- (a) that from lesser to greater morphological synthesis;
- (b) that from lesser to greater fusion.

These combined trends make for a dramatic increase in morphological complexity and result in communication problems between speakers of creolised and non-creolised varieties as well as problems with the existing spelling system.

Typical examples of such problems include possessive pronouns, indirect object pronouns and future/irrealis modality in verbs (cf. Romaine & Wright 1982; Mühlhäusler 1983; 1985 b).

In traditional second language varieties of Tok Pisin the pattern for expressing the possessive pronoun is:

- (23) *bilong mi* ‘my’  
*bilong yu* ‘your’  
*bilong em* ‘his/her’

and so on. In progressive creolised varieties these forms are reduced to *blomi*, *bloyu*, *blem*, and *blusat* (from *bilong husat*) ‘whose’.

Most speakers would produce such eroded forms as well as intermediate forms such as *belomi* and so on.

As regards the dative case of pronouns, in traditional varieties one finds:

- (24) *long mi* ‘to me’  
*long yu* ‘to you’  
*long em* ‘to him/her’

In creolised varieties these appear as *leme*, *leyu* and *lem* respectively. Note that in at least two examples there is a loss in regularity (instead of *bilong* as the possessive marker, we now have *blo* or *blu*, depending on what noun or pronoun follows) as well as a loss of transparency: *lem* is not as transparent and easy to recognise as *long em*.

A final example of the loss of morphological transparency is that of future/irrealis mo-

dality in verbs. Labov’s (1985) demonstration that **pidgins** and **creoles** develop verbal affixes out of free-standing adverbials or auxiliaries is borne out by evidence from Tok Pisin. Most commentators, e.g. Sankoff (1980), have postulated a developmental hierarchy such as:

- (a) *baimbai mi kam* ‘I shall come’, with a fully stressed sentence initial adverbial;
- (b) *bambai mi kam*, exhibiting phonological reduction;
- (c) *bai mi kam*, with a fully stressed monosyllabic adverbial;
- (d) *mi bai kam*, with a shift of the adverbial to a position in front of the main verb;
- (e) *mi bai kam*, with further phonological reduction and finally:
- (f) *mi bakam*, with cliticisation of the future marker.

Whilst examples of all of the above constructions can still be found, most speakers use these forms variably, but not necessarily in an implicity ordered manner. Further research is needed to determine what the role of creolisation is in the development of inflectional morphology.

The effects of **creolisation** on derivational morphology as characterised by Mühlhäusler (1979) are:

- (a) an increase in the productivity of existing patterns of word formation;
- (b) a greater relaxation of earlier restrictions on word formation rules, i.e. a move from context-sensitive to context-free;
- (c) a relaxation of the constraint on the recursive application of word formation rules.

These three combined trends make for a much more powerful derivational lexicon. Note that all of the above trends have already begun with fluent second language speakers of expanded pidgin. We are thus dealing with a quantitative rather than a qualitative difference.

I shall now turn to more specific examples which demonstrate these trends. Increased productivity of derivational morphology in Malabang creolised Tok Pisin can be illustrated with the occurrence of new abstract nominals derived from verb or adjective bases. For example:

- (25) *no ken gat sot bilong wara*  
‘there won’t be a shortage of water’  
*I gat planti harim bilong Tok Pisin*  
‘there are many dialects of Tok Pisin’

- maski mi gat sting nogut*  
 ‘although I have a bad infection’  
*i gat planti kain kolim bilongen*  
 ‘there are many different names for it’  
*rait bilong mi i no klia tumas*  
 ‘my writing is not very clear’  
*karim bilong dispela meri i hat tru*  
 ‘the act of childbirth is very painful for  
 this woman’  
*dilim bilong yu i no strett*  
 ‘your way of dealing (cards) is not cor-  
 rect’  
*em i lukim ron bilong olgeta pis*  
 ‘he looked at the movement of the fish’

A second instance of functional change is the direct derivation of **causative** verbals from verb or adjective bases by means of the affix *-im*, which in Malabang Tok Pisin appears to apply to all adjective or intransitive verb bases and to be fully recognised as a stylistic variant of the periphrastic construction [mekim N i Adj/V]:

- (26) *wara i stingim ol plang*  
 ‘the water makes the planks rot’  
*dispela kaikai i switim maus bilong mi*  
 ‘this food gives my mouth a pleasant  
 taste’  
*meri i bonim pikinini*  
 ‘the woman gave birth to a child’  
*em i wok long raunim diwai*  
 ‘he is busy making a piece of wood  
 round’  
*meri i smatim em yet*  
 ‘the girl dolled herself up’

A further example are verbs derived from nouns referring to instruments. In second language Tok Pisin these can be formed as long as they are not used as instruments for cutting, a contextual constraint that may have been introduced from Tolai. Whilst forms such as *akisim* ‘to cut with an axe’ and *naipim* ‘to cut with a knife, to stick a knife into’ are not documented for non-creole varieties, they occur freely in the Malabang creole of Manus Island.

Next, one finds the relaxation of derivational constraints on the formation of new word-level items. The disappearance of the constraint specifying that words should not consist of more than two morphemes can be seen in the following examples observed in spontaneous conversations:

- (27) *nek-tai-im*  
 ‘tie a necktie around someone’  
*han-kap-im*  
 ‘put handcuffs on’  
*kol-sisel-im*  
 ‘cut with a cold chisel’  
*pinis-taim-man*  
 ‘returned labourer’  
*bik-het-pasin*  
 ‘stubbornness’

More important, and hardly ever observed in non-creolised varieties of Tok Pisin, is the high incidence of **multiple derivation**, i. e. the operation of derivational processes on derived lexical items, as in:

- |                 |                 |                |
|-----------------|-----------------|----------------|
| (28) <i>huk</i> | > <i>huk</i>    | > <i>huk</i>   |
| ‘hook’          | ‘to go fishing’ | ‘fishing’      |
| <i>kuk</i>      | > <i>kukim</i>  | > <i>kukim</i> |
| ‘boil, cook’    | ‘cook           | ‘cooking       |
|                 | something’      | method’        |

### 5.5. The post-pidgin and post-creole stages

Post-pidgin and post-creole development, i. e. the language coming under heavy influence from English, can be dealt with together, since in the towns where these developments are encountered, the difference between first and second language varieties of Tok Pisin is not great, particularly among young speakers. Generally speaking, what one expects to find at this stage are the beginnings of a post-creole continuum. However, in the case of Tok Pisin, one cannot easily identify the operation of certain, generally accepted principles such as “new forms are adopted before new meanings”. Since there is a growing number of speakers who are bilingual in English and Tok Pisin and as access to the acrolect continues to increase with the introduction of new media such as T.V. and video, in at least some cases, contact with the acrolect has led not to a gradual approximation, but to new morphology distinct from that of the systems in contact.

As English is not a highly inflected language, the number of inflectional morphemes taken on by speakers of urban Tok Pisin remains limited. Most notable is the very considerable increase in the use of plural *-s*, replacing or supplementing the conservative *ol* + noun construction. My own data (Mühlhäusler 1981) suggest that the adaptation of the *-s* does not follow any known developmental path, such as the **animacy hierarchy**. However, other researchers have found evidence of such patterns emerging in the speech

of young urban speakers. Possessive *-s* and verbal agreement *-s* are absent in Tok Pisin as is the past tense *-ed*. A number of examples of *-ing* were found, particularly in written texts. They appear to be the result of a reinterpretation of the transitive/causative suffix *-im*, rather than a straight borrowing of the English continuous marker *-ing*: Consider the following examples from private letters:

- (29) *mi no man bilong spiking English*  
       'I do not speak English'  
       *ol meri i ken draiving kar*  
       'the women can drive a car'  
       *dispela toktok i helibing yu*  
       'this talk supports you'  
       *mi laik askim yu long wanpela samtim*  
       'I want to ask you for something'

Most writers would prefer *spikim*, *draivim*, *helipim*, and *samtng* instead of the highlighted forms. The effects of renewed massive contact with its original lexifier language has brought about some important changes in the derivational morphology of Tok Pisin. Generally speaking, the current preferred strategy of many urban speakers is to borrow a word from English rather than make use of existing derivational regularities. In some cases, existing complex items are being replaced by borrowed ones, with the resulting decline in the productivity of derivational morphology and an increase in suppletion.

The following table illustrates how borrowing has replaced previously existing regularities with suppletion as effect:

rural Tok Pisin	urban Tok Pisin	meaning
<i>bekim</i>	<i>bekim</i>	'answer'
<i>bekim</i>	<i>ansa</i>	'the answer'
<i>bungim</i>	<i>kolektim</i>	'gather'
<i>bung</i>	<i>bung</i>	'gathering place'
<i>hariap</i>	<i>hariap</i>	'hurry up'
<i>hariap</i>	<i>spit</i>	'speed'
<i>subim</i>	<i>subim</i>	'shove'
<i>subim</i>	<i>pos</i>	'force'
<i>tingtink</i>	<i>tingting</i>	'think'
<i>tingting</i>	<i>aidia</i>	'idea'
<i>hevi</i>	<i>hevi</i>	'heavy'
<i>hevi</i>	<i>wait</i>	'weight'
<i>peim</i>	<i>peim</i>	'pay'
<i>pe</i>	<i>wes</i>	'pay, wages'

Tab. 161.3: Suppletion as effect of borrowing

A second trend is the reordering of the elements of nominal compounds to make them conform more closely to the English model:

rural Tok Pisin	urban Tok Pisin	meaning
<i>tok ples</i>	<i>plestok</i>	'local language'
<i>sit bet</i>	<i>betsit</i>	'bed sheet'
<i>masta rot</i>	<i>rotmasta</i>	'road constructor'
<i>haus</i>	<i>morata-</i>	'house constructed of
<i>morata</i>	<i>haus</i>	'bush materials'
<i>gris pik</i>	<i>pikgris</i>	'pig grease, lard'

Tab. 161.4: Reordering in nominal compounds

As yet, no productive pattern directly resulting from English has been observed. However, if other creoles are anything to go by, then these will appear in Tok Pisin before too long.

The ultimate fate of Tok Pisin would not seem to be a linguistic matter. It will depend on the degree to which Tok Pisin is needed by its speakers. With the reemergence of regional *lingue franche* in the provinces and English in the towns, the role of Tok Pisin remains unclear.

## 6. Theoretical consequences

The evidence presented here raises a number of questions including:

- (a) the question of substratum influence;
- (b) the question of linguistic universals;
- (c) the question of structure and function.

These questions can only be addressed if proper attention is paid to the temporal dimension. Large scale changes in morphological power and productivity can be observed over a very brief period of time. Comparing arbitrarily selected points of this developmental continuum with the grammar of a particular substratum or superstratum language could be quite misleading because of the numerous changes the language has undergone. There is also the analytical problem of how one can identify morphological material across two or more languages.

As regards inflectional morphology, the sole successful example of **substratum influence** are a few (subsequently lexicalized) examples of nominal plurals being indicated by means of **reduplication**, as in Tolai:

- (30) *sipsip*      'sheep'  
       *meme*      'goat'

The bulk of the innovations in this area are the result of internal developments such as increasing tempo, reassignment of stress, re-interpretation of word boundaries and similar well known phenomena. These developments parallel those found in other creoles such as those discussed by Labov (1985). For derivational morphology, Mosel (1980) has prepared a painstaking comparison between the fifty-seven word formation patterns of Tok Pisin, identified by Mühlhäusler (1979), and those of Tolai. Mosel's findings include:

- (a) in the vast majority of cases (40 out of 57 patterns) there are no close parallels between Tok Pisin and its alleged substratum languages;
- (b) in many cases where there are parallels, other forces such as universals or reanalysis seem to have been at work simultaneously.

Not mentioned by Mosel but highly significant, is that many of the similarities between Tok Pisin and Tolai developed at a time when Tolai's importance as a lexifier language of Tok Pisin had already declined. In the foundation years of Tok Pisin (1880–1910) virtually no word formation was in evidence. There is another temporal or developmental factor that weakens substratum arguments, i.e. the observable fact that the productivity of derivational regularities is very low until well into the expansion phase of the language. This would seem to indicate that substratum languages contribute a few bases for analogical extension rather than productive lexical rules. There are numerous other ways in which derivational morphology can arise. These are discussed by Mühlhäusler (1979: 257–273). Among these, grammatical reanalysis is a particularly important process.

The question of **universals** arises mainly in connection with the sequence in which morphological regularities are added to the grammar of a language such as Tok Pisin. The presence of **substratum** or **superstratum** sources in itself is neither a necessary nor a sufficient condition for the development of new morphology. Rather, it appears that its growth is governed by language independent principles (such as causatives will be derived first from static verbs and all verbs before adjectives or nominals or the emergence of plural affixation will proceed along the accessibility and animacy hierarchies). Insufficient developmental data for other pidgins and

other types of second language acquisition are available to warrant firmer conclusions.

The presence of universal trends in the development of pidgin morphology needs to be regarded as independent of the question of the ontological status and sources of such universals (cf. Art. 118, 153). It certainly does not follow that the postulated hierarchies of morphological development are **biopgrammatic** (Bickerton 1981). Functional explanations for the development of pidgin morphology remain underexplored, though it is widely acknowledged that the structural expansion of these languages is a response to increased functional requirements.

The often heated debate about "**substratum** or **universals**" has failed to ask to what end such processes need to operate. As has been pointed out above, **pidgins**, like other languages, serve to express a number of concepts and generalities as well as percepts or singularities. The latter are expressed by syntactic means, for instance: *dispela naispela meri i sindaun long ret pela sia* 'this nice girl who is sitting in the red chair'.

For concepts, however, one needs lexical items such as:

- (31) *meri* 'woman, girl'

Typically, basic concepts are expressed by word bases. Complex concepts are expressed by morphologically complex lexical units such as in:

- (32) *singelmeri* 'single girl'  
*develmeri* 'spirit woman'  
*pamukmeri* 'prostitute'

It is the growing need for more complex concepts that has brought into being greater lexical power.

At the same time, because **pidgins** are second languages they need to remain learnable, and enriching the lexicon by borrowing more and more lexical bases from **substratum** or **superstratum** languages is therefore costly in terms of learnability. The emergence of lexical regularities of the type described in this article is an answer to this problem. This view is in harmony with the observation that pidgins begin not as simple languages, but as highly complex, heavily lexical and impoverished ones, and that simplicity in the sense of regularity or grammaticality emerges only in the process of their becoming referentially and expressively more adequate.

Many morphological questions still remain unanswered. A corpus of linguistic and func-

tional data at present being compiled in connection with the international project on “Languages of Intercultural Communication in the Pacific” (see Mühlhäusler 1986) is likely to make available information which can illuminate further the issues raised here.

#### 162. Mentale Repräsentation morphologischer Strukturen

1. Mentale Repräsentationen
2. Das mentale Lexikon und das Lexikon der Grammatik
3. Beobachtungsbereiche und Forschungsmethoden
4. Einige Grundprobleme der Forschung
5. Zitierte Literatur

##### 1. Mentale Repräsentationen

Der Ausdruck "mentale Repräsentationen" bezeichnet ein Kernkonzept für die Frage nach der Struktur, dem Format und der Funktionsweise kognitiver Prozesse. In den **Kognitionswissenschaften** hat der Begriff unterschiedliche Ausformungen erhalten, die schon früh in der Geistesgeschichte nachweisbar sind (Scheerer 1992). Die beiden Grundpositionen des symbolverarbeitenden Ansatzes und des **Konnektionismus** sind dabei beide durch ihren Bezug auf Computerorganisation und Programmiersprachen gekennzeichnet. Im symbolverarbeitenden Ansatz wird die Manipulation von Symbolen als zentrale Aufgabe kognitiver Prozesse angesehen; mentale Repräsentationen sind durch Regelanwendung zustande gekommene syntaktisch wohlartikulierte und semantisch interpretierbare Verkettungen von Symbolen (vgl. u. a. Pylyshyn 1984). Die Grundeinheiten in den konnektionistischen Ansätzen sind dagegen subsymbolischer Natur: Es gibt nur Knoten (*nodes*) und ihre mannigfachen Verknüpfungen (*connections*); mentale Repräsentationen können sich nur als emergente Eigenschaften von Netzwerken insgesamt ergeben, und zwar als multivariate Aktivierungsmuster. Die Diskussion zwischen den beiden Grundpositionen ist derzeit nicht entschieden, vgl. die Reaktionen auf den expositorischen Artikel "On the proper treatment of connectionism" in der Zeitschrift *Behavioural and Brain Sciences* (Smolensky 1988). Dabei spielt sich die Debatte neuerdings vornehmlich auf dem Gebiet der Modellierung sprachverarbeitender

Prozesse ab: Der symbolverarbeitende Ansatz findet ja eine vorbildliche Ausformung in den Regeln und Repräsentationsebenen generativer Grammatiken.

Morphologie ist erst relativ spät Gegenstand psycholinguistischer Analysen geworden. Zunächst modellierte man auf der Basis linguistischer Beschreibungen (Halle 1973) den Worterkennungsvorgang als einen Zerlegungsprozeß, in dem zuerst die Bausteine des Wortes bestimmt werden, weil nur so auf das mentale Lexikon zugegriffen werden kann (s. 2); z. B. engl. *re-tell* besteht aus dem Präfix *re-* und dem Stamm *tell*, beides lexikalische Einträge, die durch eine Regel "Verb → Präfix plus Stamm" zu der komplexen Einheit *retell* führen (Taft & Forster 1975). Die Diskussion dieses in der Folgezeit vielfach modifizierten Ansatzes wird mit wenigen Ausnahmen auf der Grundlage der symbolverarbeitenden Position geführt (vgl. zusammenfassend Taft 1988 und Art. 163).

Erst in den letzten Jahren werden konnektionistische Modelle mit linguistischen Erklärungsansätzen für spezielle Erscheinungen wie **Kasussynkretismus** in Zusammenhang gebracht (Carstairs & Stemberger 1988) oder die Ähnlichkeit des alten Terminus **Analogie** (z. B. Paul<sup>5</sup> 1920; Art. 148) mit dem konnektionistischen Grundschema hervorgehoben (Derwing & Skousen 1989). Neuerdings ist der Erwerb der Flexionsmorphologie zu einem zentralen Gegenstand in der Konnektionismusdiskussion geworden. In Rumelhart & McClelland (1986) war gezeigt worden, daß **Übergeneralisierungen** vom Typ engl. *goed* (statt des suppletiven *went*), die seit langem (z. B. Berko 1958) als prototypische Evidenz für regelbasiertes Verhalten galten, auch in einem konnektionistischen Netzwerk ohne Regeln durch *back propagation* erzeugt werden können. Die Debatte darüber ist nicht abgeschlossen, u. a. weil nicht klar ist, in welcher Weise konnektionistische Systeme den un-

markierten Fall erkennen und als solchen lernen (vgl. u. a. Clahsen & Rothweiler 1992; Hare et al. 1995).

## 2. Das mentale Lexikon und das Lexikon der Grammatik

### 2.1. Das Lexikon in modernen Grammatiktheorien

In der Auffassung der neueren Grammatiktheorien erzeugt die Syntax reguläre abstrakte Strukturen, die durch die Einsetzung lexikalischer Elemente individuiert werden. Es ist das Geschäft der lexikalischen Komponente einer Grammatik, lexikalische Repräsentationen zu erzeugen; diese (und nicht die lexikalischen Minimaleinheiten) sind es, die in syntaktische Strukturen eingesetzt werden. Für diesen Zweck spezifiziert die morphologische Theorie den Begriff "mögliche Wortform" einer Sprache.

Dementsprechend wird von den meisten Linguisten angenommen, daß zumindest reguläre Flexionsformen wie etwa im Paradigma der schwachen Verben des Deutschen nicht jede einzeln im Lexikon der Grammatik aufzuführen sind, sondern durch eine Regel "Verbform = Verbstamm plus Endung" generiert werden. Lexikalische Einheiten sind also nur der Stamm, z. B. *sag-*, sowie die einzelnen Endungen, so daß bei der lexikalischen Einsetzung die grammatische Form "Verb + 2. Person Singular Präteritum Indikativ Aktiv" identifiziert werden kann mit, z. B., *sag- + -test*.

In neueren Wortstrukturtheorien wird ferner angenommen, daß auch die Wortbildung weitgehend analog zur Syntax organisiert ist (vgl. unter vielen anderen Olsen 1986). Deutsche Adjektivableitungen mit dem Suffix *-bar* oder dreiwertige deutsche Verben mit dem Präfix *be-* lassen sich informal so beschreiben:

Sei X ein deutsches transitives Verb. Dann ist X-*bar* ein Adjektiv mit der Bedeutung "kann (ge)-x-t werden", z. B. *hörbar*, *bewohnbar*, *ableitbar*, etc.

Sei X ein deutsches transitives dreiwertiges Verb mit Subjekt, direktem Objekt und direktonaler Präpositionalphrase. Dann ist *be-X-en* ein transitives dreiwertiges Verb gleicher Bedeutung mit Subjekt, Objekt und einer Präpositionalphrase mit der Präposition *mit*, wobei Objekt und Präpositionalphrase bei Basis

und Ableitung vertauscht sind, vgl. *belegen*, *bemalen*, *bepflanzen* etc.

Diese Strukturbeschreibungen treffen sowohl auf eine Anzahl existierender deutscher Wörter zu als auch auf Wörter, die wir gegenwärtig kaum in einem auch umfangreichen Lexikon finden wie z. B. *drückbar*, *zerrbar*, *ionisierbar* oder *bekugeln*, *betüpfeln*, *besprøyen*, wobei die Regeln auch kombiniert werden können wie in *betüpfelbar* oder (mit weiteren Regeln) *Unbetüpfelbarkeitssymptomatik*. Solche **lexikalischen Regeln** für die Generierung von Ableitungen und Zusammensetzungen spezifizieren lexikalische Repräsentationen, d. h. das, was beim Vorgang der lexikalischen Einsetzung in die durch die Syntax generierten Strukturen eingesetzt wird. Unabhängig vom konkreten Format, in dem derlei Regeln zu formulieren sind, erlaubt diese Konzeption die Aufrechterhaltung der klassischen Lexikonkonzeption, wonach konkrete Lexikoneinträge nur das enthalten, was nicht durch Regeln abgeleitet werden kann.

Dazu gehören aufgrund des **Arbitraritätsprinzips** zunächst einmal alle Morpheme einer Sprache. Daneben muß es freilich aufgrund des Phänomens der Lexikalisierung auch komplexe Lexikoneinträge geben. Dazu gehören z. B. Wörter, die bestimmte Affixe aufweisen, aber dennoch offenbar nicht unter die einschlägigen Regeln fallen, im Beispielbereich etwa Wörter mit unikalen Morphemen wie *begehren*, *urbar* sowie lexikalisierte Bildungen wie *befolgen*, *kostbar* etc. Ein besonders instruktives Beispiel ist das Wort *befehlen*. Obgleich es weder wortsyntaktisch noch semantisch irgendwie zu der o. a. Regel paßt, muß es als präfigiertes starkes Verb gekennzeichnet werden, denn das Partizip heißt nicht \**gebefehlt* oder \**gebefohlen*, sondern *befohlen*, eine für Präfixverben typische Bildungsweise (ohne das Partizipialaffix *ge-*). Die lexikalische Repräsentation von *befehlen* muß also einerseits die Struktur "be-fehl-en" spezifizieren, andererseits klar machen, daß *fehl-* hier nicht der gleiche Stamm wie z. B. in *Fehl-er* ist. Es gibt also im Lexikon der Grammatik Einträge für *befehl-*, *befolg-*, *begehr-* etc., da diese Wörter zwar als präfigiert anzusehen sind, aber nicht der o. a. *be-*-Regel folgen. Dagegen gibt es keinen Lexikoneintrag für z. B. *bepflanz-*; für dieses gibt es aber eine lexikalische Repräsentation, da die o. a. Regel auf *pflanz-* anwendbar ist, was in *bepflanzen* resultiert.

## 2.2. Das mentale Lexikon

Die Tatsache, daß die Wortform *sagtest* im Deutschen analysiert werden kann als bestehend aus dem Stamm *sag* und dem Affix *-test*, wobei letzteres die 2. Person Singular des Präteritums bezeichnet, und daß alle regulären deutschen Verben diese Form so bilden, besagt zunächst einmal nichts darüber, ob jemand, der diese Form in einem Satz äußern möchte, in seinem Gedächtnis erst den Stamm *sag* sucht, dann das Suffix für "2. Person Singular des Präteritums regulärer Verben" rauskramt, beide zusammenleimt und schließlich diese Gebilde produziert, oder ob ein Leser sie beim Lesen in ihre Teile zerlegen muß, bevor er sie verstehen kann (vgl. Günther 1988 b), denn "the existence of a logical system in the language does not necessarily imply that the mental structures that develop for dealing with this system will reflect this logic" (Sandra 1994: 245).

Ein zentrales Merkmal linguistischer Theoriebildung ist es ja, daß von der realen Sprachtätigkeit systematisch abgesehen wird, u. a. von Bedingungen der Produktion und Perzeption von Äußerungen sowie von ihrer Modalität. Diese aber spielen eine zentrale Rolle bei psycholinguistischen Fragestellungen. Das Konzept des mentalen Lexikons bezeichnet den bei der menschlichen Sprachverarbeitung beim Sprechen und Hören, Lesen und Schreiben benutzten Speicher an sprachlichen Elementen. Der Ausdruck ist eine Metapher, wonach der Speicher sprachlicher Elemente im Gedächtnis nach Art eines Lexikons organisiert ist; eine gute Zusammenfassung des Forschungsstandes findet sich in Aitchison (1994). Lexikalischer Zugriff (*lexical access*) besteht in der Identifikation eines Reizes mit einer gespeicherten lexikalischen Einheit und ist definiert als derjenige Moment, in dem z. B. beim Lesen die auf dem Papier stehenden Buchstabenfolge *WORT* als das Wort *Wort* im Gedächtnis identifiziert wird. Nach den meisten Konzeptionen stehen in just diesem Moment schlagartig sämtliche Informationen zu dieser Lexikoneinheit zur Verfügung, also seine Bedeutung(en), verwandte Wörter, seine Aussprache, seine grammatischen Eigenschaften (Geschlecht, Flexion, Valenz), etc.

Wie sind morphologisch komplexe Wörter im mentalen Lexikon gespeichert, und wie erfolgt lexikalischer Zugriff: auf morphologisch komplexe Wörter direkt, oder muß das Wort zuerst morphologisch zerlegt werden? Die Konsequenz aus beiden Ansätzen ist deutlich:

Nach der oben schon erwähnten sog. **Dekompositionshypothese** enthält das Lexikon nur Stämme, Affixe und Wortbildungsregeln, und es muß immer erst zerlegt werden (Taft & Forster 1975); nach der Theorie vollständiger Einträge (sog. *full listing hypothesis*, Butterworth 1983) kann direkt auf die vollständig gespeicherten komplexen Wörter zugegriffen werden. Beide Ansätze sind dem symbolverarbeitenden Ansatz verpflichtet. Alternative Vorstellungen, die seit dem Beginn der 80er Jahre im konnektionistischen Umfeld publiziert worden sind, gehen dagegen von einem allgemeinen Erregungsgeschehen aus, in dem der magische Moment des lexikalischen Zugriffs als solcher entfällt; vielmehr ergibt er sich in einem ständig sich wandelnden Aktivationsgeschehen.

## 3. Beobachtungsbereiche und Forschungsmethoden

Der Frage nach der mentalen Repräsentation und kognitiven Verarbeitung morphologisch komplexer sprachlicher Einheiten wird auf verschiedene Weise nachgegangen. Zusammenhängende Theorien lassen sich nur durch die Integration einer Vielzahl von Befunden aus verschiedenen Beobachtungsbereichen formulieren; dies sind u. a. linguistische morphologische Theorien, die Beobachtung und Analyse von Sprechfehlern und Sprachstörungen (Aphasien), die Beobachtung und Analyse des Spracherwerbs und seiner Störungen sowie die experimentelle Untersuchung der Produktion und Perzeption von Wörtern. Eine Darstellung von Theorien und Befunden in den genannten psycholinguistischen Bereichen geben die fünf folgenden Artikel (Art. 163–167). Es soll deshalb hier nur die jeweilige Forschungslogik gekennzeichnet und dazu eine Beschreibung der wichtigsten experimentellen Methoden gegeben werden.

### 3.1. Beobachtungsbereiche

Die Analyse von **Sprechfehlern** gehört seit dem Ende des 19. Jahrhunderts zu den wichtigsten Quellen psycholinguistischer Theoriebildung aufgrund der schon in einer klassischen Studie vorgetragenen Erkenntnis, "daß man sich nicht regellos verspricht ... (die Sprechfehler) müssen durch konstante psychische Kräfte bedingt sein" (Meringer & Mayer 1895: 9). Weil Sprechfehler strukturiert sind und klassifiziert werden können, lassen sie Rückschlüsse auf den normalen

Sprachproduktionsprozeß zu. Sprechfehler, in denen morphologische Elemente falsch angeordnet sind, vgl. *wenn ein begründeter Bedacht versteht, im Wolken nordig oder er hat mich zum Skileiden eingelaufen* (Beispiele aus Levelt 1989 und Leuninger 1993) werden als Beleg dafür angesehen, daß bei der Sprachproduktion komplexe Wörter aus den Morphemen zusammengesetzt werden. Für eine systematische Aufarbeitung der Sprechfehlerliteratur vgl. Levelt (1989); eine sehr knappe Zusammenfassung theoretischer Grundüberlegungen findet sich in Leuninger (1993) (s. auch Art. 164).

Auch die Analyse von **Sprachstörungen** folgt der Logik, durch die Erklärung der Störungsursache den nicht direkt beobachtbaren Sprachmechanismus zu modellieren (s. Art. 167). Dabei werden spezifische sprachliche Ausfälle zum Beleg bestimmter theoretischer Konzepte der psycholinguistischen Morphologieforschung herangezogen. Das Phänomen des **Agrammatismus** hat besondere Aufmerksamkeit gefunden, weil ein Aspekt der Symptomatik, das Weglassen von Flexionsaffixen, diese aphasischen Störung *prima facie* als eine flexionsmorphologische Störung zu kennzeichnen scheint (Goodglass & Berko 1960). Einer sehr vielbeachteten Theorie zufolge handelt es sich aber um eine phonologisch bedingte Störung (Kean 1979). Neuere Arbeiten sehen eher eine syntaktische Störung, d. h. die morphologischen Ausfälle sind Folge und nicht Ursache des Agrammatismus (z. B. Grodzinsky 1990; Art. 167). Ein anderes Syndrom ist die sog. phonologische **Dyslexie** (die Patienten können u. a. Wörter lesen, aber keine Pseudowörter). Caramazza et al. (1988) interpretieren die Ergebnisse einer Untersuchung solcher Patienten als Beleg für ihren Ansatz eines Vollformenlexikons, in dem Wörter morphologisch zerlegt sind (s. 4.1).

In der **Spracherwerbsforschung** gehört die Entwicklung der Morphologie zu den zentralen Themen. In allen Sprachen der Welt beginnen Kinder mit sog. Einwortsätzen zu sprechen, d. h. unflektierten Einzelwörtern. Flexionsformen werden in einer gewissen Reihenfolge erworben, wobei die Komplexität der signalisierten Bedeutung und die des sprachspezifischen Formensystems, die Eindeutigkeit der Laut-Bedeutungs-Zuordnung und andere Faktoren eine Rolle spielen (Slobin 1985, Hrsg.; Art. 165). Die Fähigkeit von Kindern, erworbene Flexionsregularitäten zu (über)generalisieren und auch auf unpas-

sende Stämme sowie auf Nonsensewörter anzuwenden (z. B. *singte, bringte, beste* statt *sang, brachte, fegte* – Berko 1958, ein Klassiker der psycholinguistischen Morphologieliteratur) wird in der Regel als Beleg für eine morphologische Dekomposition im o. g. Sinne interpretiert. Die Fähigkeit zur Wortbildung durch Derivation bildet sich später heraus; auch hier kommt es zu Übergeneralisierungen in Fällen, in denen in der Erwachsenensprache ein bestimmter anderer Ausdruck konventionalisiert ist (wie das o. g. *er beste* statt *fegte*). Unklar ist, welche Relevanz Erwerbsdaten für die Modellierung mentaler Repräsentationen und den Zugriff auf morphologisch komplexe Wörter beim Erwachsenen haben (vgl. Sandra 1994: 260–264).

Die experimentelle Untersuchung der Produktion und Perzeption morphologisch komplexer Wörter hat seit der initialen Studie vor 20 Jahren (Taft & Forster 1975) einen stürmischen Aufschwung genommen. Denn eine psychologische oder psycholinguistische Theorie kann nur in dem Maße als validiert angesehen werden, als sie empirisch – und das heißt experimentell – bestätigt ist; vgl. zu den methodischen Grundlagen Günther (1989). Eine Zusammenfassung der Befunde und Argumentationen in der älteren experimentellen Morphologieforschung bietet Henderson (1985); eine problemorientierte neuere Darstellung findet sich bei Sandra (1994) (s. auch Art. 163). Im folgenden sollen die wichtigsten Untersuchungsmethoden aufgezählt werden.

### 3.2. Methoden

In der psycholinguistischen Morphologieforschung stehen bislang Experimente zur visuellen Worterkennung im Vordergrund. In solchen Experimenten wird der Versuchsperson ein einzelnes Wort visuell dargeboten. Bei den in der älteren Literatur beschriebenen Experimenten bedient man sich eines Tachistoskops. Mithilfe dieses Geräts ist es möglich, visuelle Reize beliebig kurz darzubieten. Die Aufgabe der Versuchsperson besteht darin, den nur als kurzen Lichtblitz gezeigten Reiz (schriftlich oder mündlich) zu benennen. Ausgewertet wird meist entweder die Fehlerzahl oder die Anzahl wiederholter Darbietungen, die nötig ist, um den Reiz korrekt zu identifizieren. Diese Methode wurde z. B. bei der Untersuchung der Verarbeitung englischer flektierter Wortformen angewandt (Gibson & Guinet 1971). Eine andere Aufgabenstellung besteht darin, gleichzeitig zwei

Reize darzubieten und danach zu fragen, ob diese gleich oder verschieden sind. Sie fand z. B. bei der Untersuchung starker und schwächer Verbflection Verwendung (Jarvella & Snodgrass 1974). Ebenfalls häufig ist die Messung der Zeit, die eine Versuchsperson braucht, um ein unter verschiedenen Bedingungen gezeigtes Wort auszusprechen (z. B. Schreuder et al. 1989).

Die überwiegende Mehrzahl der in der neueren wissenschaftlichen Literatur publizierten Experimente zur Verarbeitung morphologisch komplexer Wörter aber bedient sich der Technik der **lexikalischen Entscheidung**. Hier bekommt die Versuchsperson auf einem Bildschirm eine Buchstabenfolge dargeboten und hat die Aufgabe, so schnell wie möglich zu entscheiden, ob diese Folge ein Wort ist oder nicht; gemessen wird die Reaktionszeit. Die Popularität dieser Aufgabenstellung in den letzten 20 Jahren hat mit dem Konstrukt des lexikalischen Zugriffs zu tun. Zur Untersuchung der Vorgänge beim lexikalischen Zugriff können im Grunde nur solche Aufgaben herangezogen werden, bei denen man sicher sein kann, daß auch tatsächlich lexikalischer Zugriff erfolgt (Coltheart 1978). Diese Sicherheit gibt es z. B. nicht, wenn die Versuchsperson die Aufgabe hat, von einem Paar von Wörtern zu sagen, ob diese gleich oder verschieden sind: Das kann sie tun, ohne ihr mentales Lexikon zu konsultieren, indem sie einfach Buchstaben vergleicht. Anders bei der lexikalischen Entscheidung, jedenfalls beim Einhalten bestimmter Randbedingungen: Daß die Buchstabenfolge *FEST* ein deutsches Wort ist, *DEST* dagegen nicht, kann man nur entscheiden, wenn man *FEST* im mentalen Lexikon gefunden hat, da die Buchstabenfolge *DEST* durchaus ein deutsches Wort sein könnte. Es ist typisch für die lexikalische Entscheidungsaufgabe, daß die Reaktionszeiten auf Wörter kürzer sind als die auf sog. Pseudowörter wie *DEST*, die orthographisch und phonologisch möglich, aber in der Sprache nicht realisiert sind.

Die Logik solcher Experimente besteht darin, die Reaktionszeit auf zwei verschiedene Typen von Wörtern miteinander zu vergleichen, von denen die Verarbeitung des einen Typs durch einen morphologischen Zerlegungsprozeß nach der Theorie behindert /gefördert würde, die des anderen aber nicht. Ein Beispiel bieten sog. pseudopräfigierte Wörter: Das bekannteste englische Beispiel ist *sublime*, ein deutsches Beispiel wäre *gering*. Wenn man annimmt, daß automatisch

zerlegt wird, so erhält man mit *sub-lime* (bzw. *ge-ring*) neben dem **Pseudopräfix** einen Bestandteil, der zwar im mentalen Lexikon aufzufinden ist (*lime*, *ring*), aber nicht Stamm des gezeigten Wortes ist; es muß reanalyisiert werden, wodurch es zu Reaktionszeit-Verlangsamungen im Vergleich zu "echt" präfigierten Wörtern kommt (Taft 1981). Eine quasi umgekehrte Logik findet sich in Experimenten, die sich zusätzlich der sog. **Priming-Technik** bedienen. Werden einzelne Reize während des Experiments zweimal gezeigt, so zeigt ein Wort bei der Wiederholung eine signifikant kürzere Reaktionszeit verglichen mit der ersten Darbietung (Scarborough et al. 1977). Zwischen der ersten Darbietung (*prime*) und der zweiten (*target*) können unterschiedlich viele andere Kontrollreize eingefügt werden. Häufig werden die Reize auch ohne Pause hintereinander dargeboten, wobei nur auf den zweiten Reiz reagiert wird. Dieser Ansatz des Bahnens durch Wiederholung (*repetition priming*) hat in der Morphologieforschung der letzten Jahre eine besondere Rolle gespielt. Es konnte nämlich gezeigt werden, daß ein Bahnungseffekt auch dann auftritt, wenn nicht die gleiche Wortform als Bahnungsreiz dargeboten wird, sondern eine morphologisch verwandte Form, z. B. *walked* vor *walk*; dies wurde als Beleg dafür angesehen, daß in der Tat der Stamm wiederholt verarbeitet wird und nicht zwei einzelne Formen (Stanners et al. 1979). Neuerdings spielt auch die Modalität eine Rolle; so wird die Reaktionszeit auf einen visuellen Reiz gemessen, dem ein auditives Prime vorausging (*cross modal priming*, vgl. z. B. Marslen-Wilson et al. 1994; für eine Diskussion der wichtigsten früheren Ergebnisse vgl. Monsell 1985, für neuere Daten Sandra 1994 und Art. 163).

Eine andere Untersuchungstechnik ist die Beobachtung der Augenbewegungen beim Lesen (Inhoff & Rayner 1996). Durch verschiedene Meßmethoden läßt sich zeigen, ob morphologische Eigenschaften der gelesenen Wörter das Augenbewegungsmuster tangieren, z. B. ob bei pseudopräfigierten Wörtern abweichende Bewegungsmuster zu beobachten sind (Lima 1987). Ein Vorteil dieser Methodik besteht darin, daß Sätze oder auch Texte gelesen werden können, nicht nur einzelne Wörter (s. 4.3). – Da die meisten psycholinguistischen Experimente zur Verarbeitung morphologisch komplexer Wörter nach wie vor im Bereich der visuellen Worterkenn-

nung angesiedelt sind, kann für weitere Methoden einschließlich kritischer Diskussion auf Smith (1996) verwiesen werden.

#### 4. Einige Grundprobleme der Forschung

Die psycholinguistische Morphologieforschung ist am Beginn des 21. Jahrhunderts nur 30 Jahre alt. Anders als in anderen Bereichen, in denen während der 80er Jahre ein systematisches Abschütteln der Dominanz linguistischer Theorien zugunsten einer Synthese psychologischer und linguistischer Theoriebildung notiert werden konnte (Tannenhaus 1988), ist in der Morphologieforschung deren Verhältnis nach wie vor unklar (Henderson 1988). Dies hat eine besonders ausgeprägte Divergenz der Ansätze zur Folge. Im folgenden sollen die wichtigsten Fragestellungen und Hauptprobleme der gegenwärtigen Diskussion knapp kritisch gekennzeichnet werden.

**4.1. Dekomposition vs. Vollformenlexikon**  
 Dies ist die klassische Fragestellung: Werden morphologisch komplexe Wörter bei der Sprachwahrnehmung erst zerlegt, bei der Produktion erst zusammengesetzt, ehe sie verstanden/produziert werden können, oder sind sie als "Ganze" für die Wahrnehmung und Produktion verfügbar; enthält das mentale Lexikon ganze Wörter, deren morphologische Struktur die Verarbeitung nicht beeinflusst (Butterworth 1983), oder nur Stämme und Affixe, deren struktureller Zusammenhang durch Dekompositionsregeln bestimmt ist (Taft & Forster 1975)? Praktisch alles, was zwischen 1975 und 1985 in der psycholinguistischen Literatur zu morphologischen Aspekten der Sprachverarbeitung publiziert wurde, ist dieser Frage gewidmet (vgl. Henderson 1985).

Die aus der linguistischen Diskussion (Halle 1973) in die Psychologie importierte Dichotomie von **Dekomposition** vs. **Vollformenlexikon** war ursprünglich durch Ökonomieerwägungen motiviert. Es schien unrealistisch, daß alle Formen im menschlichen Gedächtnis aufgelistet sein sollten; die linguistisch basierten Regeln boten eine Möglichkeit, den Speicherbedarf zu reduzieren. Betrachtet man die Metaphorik wissenschaftlichen Sprachgebrauchs, so zeigt sich eine enge Bindung an den jeweils erreichten Stand der Technik. Das Streben nach Speicherplatzmi-

nimierung der frühen Dekompositionsmodelle entsprach den Kleincomputern der ersten Generation: So verblüffend (damals) ihre Geschwindigkeit schien, so klein war der Speicher – es stand für maximal 6000 Wörter Speicherplatz zur Verfügung, und nur etwa das Fünffache ließ sich auf Diskette speichern. Trotzdem gab es Disketten mit Lexika von knapp 200000 Wörtern, die geschickt organisiert waren und nur durch spezielle Software mit "Auspakeregeln" lesbar waren.

Demgegenüber ist großer Speicher in Form von Festplatten oder CD-ROM heute überhaupt kein Problem mehr. Statt der Reduzierung von Speicherplatz ist heute Geschwindigkeit des Zugriffs auf große Datens Mengen gefragt. In weniger als 300 Millisekunden ruft der durchschnittliche Erwachsene praktisch fehlerfrei aus einem Wortschatz von 50000 bis 400000 Wörtern das richtige Wort ab (Überblick zu solchen Zahlen bei Aitchison 1994: 5–8) und fügt es in syntaktische und semantische Strukturen ein. Auch bislang für unvorstellbar gehaltene Datenmengen scheint das menschliche Gedächtnis aufnehmen zu können, wenn sie strukturiert abgelegt werden (s. 4.2). Sofern also Prozeduren wie die morphologische Zerlegung allein durch Ökonomieüberlegungen motiviert sind, sind sie abzulehnen, da sie Zeit kosten. Befürworter morphologischer Dekomposition müssen deshalb zeigen, daß ihr Modell schnellere Verarbeitung ermöglicht als ein Vollformenlexikon.

Es ist instruktiv, diese Entweder-Oder Diskussion in Parallelle mit der Frage des phonologischen Rekodierens beim Lesen zu stellen: Involviert der Lesevorgang notwendig eine Phase des phonologischen Rekodierens, oder liest zumindest der erfahrene Leser "direkt", d.h. ohne die Notwendigkeit phonologischer "Übersetzung"? Weil es empirische Argumente für beide Auffassungen gab, entwickelte sich die Idee des Pferderennenmodells (*horse race model*), womit eine über 10 Jahre dauernde Diskussion (nicht unbedingt voll befriedigend) abgeschlossen wurde: Danach wird immer beides versucht, nämlich phonologisches Rekodieren und direkter Zugriff; was perzipiert wird, ist (primär) von der Geschwindigkeit der Routen abhängig (Humphreys & Evett 1985; die Schwächen einer solchen Konzeption werden in Henderson (1982) ausführlich diskutiert).

Dem entspricht das Ergebnis der Diskussion über *Decomposition* vs. *Full Listing*: Extremen Vertretern der einen Richtung (Taft &

Forster 1975) und der anderen (Butterworth 1983) entgegnen etwa Laudanna & Burani (1985) oder Frauenfelder & Schreuder (1992), daß auch hier ein Wettbewerb stattfinde: Danach sind im Lexikon sowohl Stämme und Affixe als auch volle Wörter enthalten; zwei parallele Prozesse suchen entweder nach dem einen oder dem anderen, und der schnellere obsiegt.

#### 4.2. Lexikalischer Zugriff und mentale Repräsentation

Betrachtet man die Literatur, so ist bemerkenswert, daß die Frage nach der Rolle morphologischer Strukturen fast ausschließlich als Problem des lexikalischen Zugriffs diskutiert worden ist (Sandra 1994). Dabei wurden paradoxerweise entgegengesetzte Positionen für den gleichen Sachverhalt bemüht. Das Modell von Forster (1976) sieht einen Hauptspeicher aller Wörter vor; nur für den lexikalischen Zugriff muß zerlegt werden. In der Tat ist bei der Weiterentwicklung zum sog. BOSS-Modell (vgl. Taft 1991) nicht mehr die rein morphologische Zerlegung wichtig, sondern nurmehr eine linguistisch völlig unmotivierte Zwitterstruktur aus anlautender Silbe und Morphem. Caramazza et al. (1988) dagegen sehen alle Wörter in der Zugriffsdatei; der Hauptspeicher bietet die Wörter in zerlegter Form. Frauenfelder & Schreuder (1992) schließlich nehmen eben zur Erklärung der Geschwindigkeit doppelte Repräsentation (und doppelten Zugriff) an.

Vom linguistischen Standpunkt aus betrachtet ist diese Vorstellung besonders problematisch: Sie verlegt systematisches morphologisches Wissen in unklare psychologische Prozesse. Eine alternative Konzeption könnte so aussehen, daß zwar das Lexikon volle Einträge enthält, diese aber morphologisch zerlegt und angeordnet sind (Caramazza et al. 1988); gemäß den Anordnungsprinzipien des Lexikons sind damit implizit auch die Morpheme gelistet. Bei der Verarbeitung liegt dann weder prä- noch postlexikalische Dekomposition vor: Es ist Bestandteil des sprachlichen Wissens, daß *Haus-tür*, *freund-lich*, *sag-t* etc. Einheiten sind, die aus zwei Teilen bestehen. Die zerlegte Struktur der Lexikoneinträge impliziert dabei nicht, daß morphologische Strukturen immer in die Syntax "mitgenommen" werden (z. B. bei Argumentvererbung, s. Art. 83), schließt das aber auch nicht aus (vgl. zu dieser Frage Anderson 1992 und die Rezension durch Cardstairs 1993).

Es ist offensichtlich, daß konnektionistische Modelle eine solche Konzeption systematisch inhärieren; aber auch symbolverarbeitende Ansätze könnten sie aufnehmen. In der psychologischen Diskussion war die Möglichkeit der internen Strukturiertheit von vollständig gespeicherten Wörtern lange Zeit nicht gesehen worden. Alle Befunde, die einen Einfluß morphologischer Struktur auf die Verarbeitung belegen (z. B. der Pseudopräfixeffekt, s. 3.2), lassen sich in einem *Full Listing*-Modell mit interner morphologischer Strukturierung gut erklären: Der Verarbeitungsvorteil entsteht hier dadurch, daß die morphologische Information bei der Verarbeitung genutzt wird; dieser automatische Vorgang führt bei pseudopräfigierten Wörtern (*gering*) zu Verlangsamungen.

Dies ist weniger trivial als es zunächst scheint. Beispielsweise ist faktisch unbegrenzter Speicher wenig nützlich, wenn die gespeicherten Daten nicht auch schnell abrufbar sind. Wenn das Suchsystem, wie bei einer Tonkassette, nur linear abfragen kann, weil die Daten eindimensional linear und nicht weiter strukturiert angeordnet sind, ist kaum zu verstehen, wie solche Geschwindigkeiten erreicht werden sollen. Abgesehen von konnektionistischen Modellen sind im Allgemeinen lineare Abfragemechanismen vorgesehen worden (prototypisch: Forster 1976; vgl. kritisch Sandra 1994). Neuerdings ist die Forschung zum mentalen Lexikon stärker mit der Ermittlung seiner Organisationsprinzipien befaßt (Aitchison 1994). Offenbar spielt sowohl die links/rechts Orientierung als auch die von rechts nach links (Reimfähigkeit) eine Rolle. Primärassoziationen, Clusterbildung, semantisches Priming etc. zeigen, daß auch die semantischen Beziehungen zwischen den Wörtern Anordnungsprinzipien bilden – und es gibt noch viele andere (vgl. Aitchison 1994). Auf die alte Metapher des mentalen Lexikons als Bibliothek angewendet bedeutet das, daß z. B. alle Einheiten, die mit *pe* anfangen, in einem Regal stehen; die mit *pel* stehen links von denen mit, z. B., *pet*. Die reimenden Einheiten stehen vor bzw. hintereinander (*Sprung*, *Leitung*, *jung* vor *Geiz*, *Reiz*, *Schweiz*, aber hinter *prima*, *firma*, *Rheuma*) und die semantische Dimension ist in der Vertikalen ausgedrückt: Die Pflanzenwörter (z. B. *Pelargonie*, *Petunie*) stehen unter den Tieren (*Pelikan*, *Perlhuhn*), etc.

Es ist offensichtlich, daß die Metapher zusammenbricht, sobald mehr als drei Dimensionen auftreten; dies aber ist der Fall: mor-

phologische, syntaktische, konnotative Merkmale gehören ebenfalls zur Systematik des mentalen Lexikons. Im Sinne herkömmlicher Datenbanksysteme läßt sich diese vieldimensionale Anordnung der Einheiten als Indizierung begreifen: Jede Einheit ist u. a. sowohl bezüglich ihrer linksläufigen als auch ihrer rechtsläufigen Organisation, ihrer semantischen Kategorie, ihrer syntaktischen Klasse und ihrer alphabetischen Position indiziert. Alle Einheiten könnten intern strukturiert sein. Eine solche Zerlegtheit läßt die Indizierung der einzelnen Lexikoneinheiten nach Morphemen zu. Im konnektionistischen Ansatz würde man davon reden, daß ein Eintrag mit allen gleich beginnenden, allen reimenden, allen semantisch ähnlichen Einträgen etc. Verknüpfungen aufweist, und zwar unterschiedlich starke nach Maßgabe der Ähnlichkeit. Es ist ungeklärt, inwieweit dies lediglich Notationsvarianten ein und derselben Struktur sind oder aber inhaltlich verschiedene Lösungen.

#### 4.3. Flexion vs. Wortbildung, Produktivität, Lexikalisierung

Die Unterscheidung zwischen Flexion und Wortbildung ist in den frühen psycholinguistischen Arbeiten praktisch nicht berücksichtigt worden (Henderson 1985). Obgleich die exakte Grenzziehung im Einzelfall problematisch ist, so daß bisweilen von einem Kontinuum statt einer Dichotomie gesprochen wird (Bybee 1985), ist in der Mehrzahl der Fälle die linguistische Zuordnung problemlos: Flexion ist automatisch, verändert Wortart und lexikalische Bedeutung nicht, Wortbildung dagegen ist idiosynkratisch und verändert häufig Wortart und Bedeutung.

In Analogie zur segmentalen Ebene visueller Wortsprachkennung, für die eine Ebene abstrakter Buchstabenrepräsentationen angenommen wird (Coltheart 1981), wird von vielen Forschern im Falle der Flexion eine abstrakte Repräsentation angenommen (z. B. Marslen-Wilson et al. 1994), aus der dann bei der Äußerung die konkrete Form gebildet wird – eine Form des Paradigmas steht im Lexikon, die anderen werden daraus für die konkrete Verwendung „abgeleitet“. Experimentelle Daten legen nahe, als solche Basisform die lexikalische Zitierform anzusehen (Günther 1988a). Dabei ist nicht Speicherplatzökonomie der Grund für eine solche Annahme (s. 4.1). Es ist vielmehr der Umstand, daß auch Wörter, die der Sprecher nicht kennt oder selbst erfindet, sofort flektiert

werden können (Mugdan 1977), also bereits bevor sie Teil des mentalen Lexikons sind. Teilweise wird auch davon ausgegangen, daß häufige Formen als Ganze gespeichert und abgerufen, seltene jedoch abgeleitet werden (z. B. Frauenfelder & Schreuder 1992). Für die Unterscheidung von Flexion und Derivation spricht der Umstand, daß Bahnungseffekte zwischen Wortformen desselben Lexems immer wieder gefunden wurden (also z. B. zwischen engl. *walking* und *walked*, zuerst von Stanners et al. 1979); solche Effekte gibt es nicht zwischen derivierten Bildungen (wie *friendly* und *friendship*, Marslen-Wilson et al. 1994).

Es ist bekanntlich möglich, aus den vorhandenen Morphemen gänzlich neue Kombinationen zu bilden, die jedoch von den Hörern sofort verstanden werden wie das *betüpfelbar* (s. 2.1), das man sofort zu *unbetüpfelbar* oder gar *Unbetüpfelbarkeitssymptomatik* erweitern kann, die ebenfalls direkt verstehbar sind. Man spricht davon, daß die Affixe wie *be-*, *-bar*, *-keit*, *un-* oder die nominale Komposition im Deutschen produktiv sind. Dieser alte Begriff linguistischer Wortbildungsforschung ist erst in jüngster Zeit Gegenstand psycholinguistischer Studien geworden (Baayen 1992; Frauenfelder & Schreuder 1992). Dabei ist es bemerkenswert, daß sich in der Linguistik Stimmen mehrten, dieses Konzept als grundsätzlich außerhalb des Bereichs linguistischer Morphologieforschung, als reine Angelegenheit der Sprachverwendung anzusehen (Motsch 1988).

Zwar ist das Vorkommen gänzlich „neuer“ Bildungen, d. h. solcher, die man nie gehört oder gesehen hat, erheblich seltener als die Literatur suggeriert, doch scheinen Hörer und vor allem Leser solche Wörter, wenn sie ordnungsgemäß gebildet sind, ohne Probleme zu verstehen. Die Produktivität von Wortbildungsmustern stellt ein zentrales Problem für Listenmodelle dar, die die Prozeßkomponente auf den reinen Zugriff beschränken wollen. Typisch dafür ist der Ansatz von Aitchison (1994), Neubildungen durch einen völlig unzureichend spezifizierten *lexical tool kit* zu erfassen, einer Art Zusatzeinrichtung, die keinen Bezug auf die im Lexikon enthaltene Morphologie nimmt (vgl. kritisch Berg 1989).

Der Ansatz von Baayen (1992) zur Berücksichtigung von Produktivität in einem psycholinguistischen Modell besteht darin, Häufigkeiten von Token in Relation zur Zahl der

vorkommenden Typs zu stellen; die so ermittelten Werte determinieren in seinem Zwei-Wege-Modell, ob ein Wort dekomponiert wird oder lexikalischer Zugriff auf das ganze Wort erfolgt (d. h. also eine Zwei-Wege-Theorie der morphologischen Dekomposition); eine besondere Rolle spielen dabei ad-hoc-Bildungen, die definitionsgemäß nicht in einer Liste aufgeführt sein können. Auch in der kritischen Weiterentwicklung des Modells durch Frauenfelder & Schreuder (1992) spielt Vorkommenshäufigkeit eine zentrale Rolle; allerdings berücksichtigen sie auch die **Durchsichtigkeit** von Wortbildungen. Hinzugefügt muß allerdings werden, daß bisher experimentelle oder andere empirische Daten fehlen, die belegen, daß eine Neubildung wie *betupfelbar* tatsächlich auf die gleiche Weise erkannt bzw. produziert wird wie etwa *bemalbar*, d. h. daß bei der Produktion oder Erkennung von Neubildungen derselbe Mechanismus aktiv wird wie bei "alten" Bildungen (vgl. auch Sandra 1994).

Auch die Lexikalisierung von Wörtern, quasi die umgekehrte Dimension, hat in der psycholinguistischen Morphologieforschung bislang kaum Beachtung gefunden. So werden etwa in Taft (1981) als präfigierte Stimuli ausschließlich englische Wörter herangezogen, die als völlig lexikalisiert gelten müssen (z. B. *approach*, *reproach*). Es scheint jedoch aus linguistischer Sicht äußerst unwahrscheinlich, daß, wie auch immer sie im mentalen Lexikon repräsentiert sein und daraus abgerufen werden mögen, lexikalisierte Bildungen wie *Zeitung*, *Handschuh* oder *anfangen* auf die gleiche Weise verarbeitet werden wie durchsichtige Wörter wie *Bergung*, *Hauschuh* oder *abfangen*. In der Tat weisen Ergebnisse von Marslen-Wilson et al. (1994) in diese Richtung: Zwischen lexikalierten Bildungen und dem Stamm treten keine Bahnungseffekte auf, wohl aber bei durchsichtigen Bildungen: Engl. *government* bahnt *govern*, aber *department* hat keine bahnende Auswirkung auf *depart*.

#### 4.4. Untersuchungstechniken und Modalitäten

Die Mehrzahl der psycholinguistischen Untersuchungen zur Rolle der Morphologie in der Sprachverarbeitung bedient sich der visuellen lexikalischen Entscheidungsaufgabe. Diese Methode ist, wie verschiedene Befunde der letzten 10 Jahre nahelegen, in besonderer

Weise strategieabhängig: Die Versuchsperson versucht, aus den gebotenen Reizen bestimmte Prinzipien für ihre Antwortstrategie abzuleiten. So läßt sich der Pseudopräfixeffekt zum Verschwinden bringen, wenn alle Wörter des Experiments präfigiert sind (Rubin et al. 1979; Günther 1987); Bahnungseffekte werden um so stärker, je mehr "gute" Primes im Material auftauchen, etc. Es ist deshalb denkbar, daß eine Versuchsperson beim lexikalischen Entscheidungsexperiment Dinge tut, die sie bei der "normalen" Produktion und Perzeption von Sprache gerade vermeidet. Dafür spricht u. a. die Reaktionszeit: Geht man davon aus, daß die durchschnittliche Zugriffszeit zu einem Wort 220 msec beträgt (vgl. Aitchison 1994: 8), so klafft zwischen diesem Wert und den ca. 500 msec lexikalischer Entscheidungsaufgaben eine Lücke, die nicht primär der Auslösung und Exekution der motorischen Reaktion zugeschrieben werden kann. Es liegt nahe, an teilautomatisierte metasprachliche Determinanten der Reaktionszeiten zu denken.

Dies wird verstärkt durch die Tatsache, daß es sich hier (wie in vielen anderen Aufgaben) um die Erkennung einzelner Wörter handelt. Dieser Umstand mag Strategien und Verhaltensweisen fördern, die in der "normalen" Sprachproduktion und -perzeption fehlen. In der Tat ist die Erkennung isolierter Wörter eine Aufgabe, die selbst in auditiven Experimenten Schriftlichkeit involviert oder zumindest voraussetzt; es ist eine in genuiner Mündlichkeit nicht vorkommende Tätigkeit, mit einzelnen Wörtern zu hantieren. Es mag also der Fall sein, daß ein Großteil der experimentellen Befunde zur Morphologie eine Ebene schriftbezogener Metasprachlichkeit betreffen, die in der "normalen" Sprachproduktion und -rezeption eine untergeordnete Rolle spielt. Das dürfte insbesondere für Befunde gelten, in denen lexikalierte Bildungen dennoch morphologische Effekte zeigen (z. B. Taft 1981). Sandra (1994: 264 f.) zitiert Überlegungen, wonach morphologische Effekte simple Konsequenzen orthographischer Redundanz sind.

Wichtiger scheint die Beobachtung, daß entwickelte Alphabetschriften grundsätzlich zur Morphologisierung tendieren. Ein wesentliches Ergebnis der neueren Orthographieforschung ist die Beobachtung des Prinzips der Morphemkonstanz in der geschriebe-

nen Sprache, die es im Gesprochenen so nicht gibt (s. Art. 175). In der Tat ist es ja ein wesentliches Geschäft von Phonologie und Morphophonemik, verschiedene Lautformen auf eine und dieselbe lexikalische Einheit zurückzuführen. Im Geschriebenen (Deutsch oder Englisch) ist dagegen eine solche Verschiedenheit die (eigens zu erklärende) Ausnahme. Das Morphemkonstanzprinzip ist im Englischen, der (bislang) hauptsächlich untersuchten Sprache in der psycholinguistischen Morphologieforschung, besonders ausgeprägt; es gibt gute Gründe anzunehmen, daß der Zusammenhang von *sign* und *signal*, von *concern* (Verb) und *concern* (Sustantiv) etc. dem Kind erst nach Erwerb der geschriebenen Sprache zur Verfügung steht. Unter diesen Umständen ist es bemerkenswert, daß morphologische Fragestellungen in erster Linie in schriftlichen Aufgabenstellungen untersucht worden sind. Bis ca. 1985 war die psycholinguistische Morphologieforschung vollständig auf die visuelle Domäne beschränkt; auch der jüngste Überblicksartikel beschränkt sich ausdrücklich auf diesen Bereich (Sandra 1994); Untersuchungen gesprochener Sprache wie Tyler et al. (1988) bleiben die Ausnahme.

#### 4.5. Die Rolle der Diachronie

Die Frage nach der mentalen Repräsentation morphologisch komplexer sprachlicher Einheiten ist im derzeitigen Stadium kaum auch nur ansatzweise zu beantworten. Dies liegt in einer besonderen Diskrepanz der verschiedenen Forschungsansätze. Im Gegensatz etwa zur Erforschung der Satzverarbeitung ist das Verhältnis zwischen linguistischen und psychologischen Ansätzen nach wie vor ungeklärt (Henderson 1988). Auf der einen Seite sind vor allem die frühen Modelle stark von linguistischen Überlegungen zur Struktur des Lexikons der Grammatik beeinflußt, deren Zielsetzung die systematische Ausblendung von Aspekten der Sprachtätigkeit bedingte, dem wesentlichen Forschungsgegenstand psychologischer Forschung. Paradoxe Weise hat die Konzentration (um nicht zu sagen Reduktion) auf das (psychologische) Problem des lexikalischen Zugriffs Modelle hervorgebracht, die (zumindest für dieses Problem) sprachliche Strukturen als möglicherweise irrelevant erscheinen lassen (Sandra 1994). Auf der anderen Seite sind bis in jüngste Zeit klassische Fragestellungen sprachwissen-

schaftlicher Forschung (Produktivität, Lexikalisierung) dort praktisch nicht zur Kenntnis genommen worden. Dabei könnte gerade dieser Bereich zum Modellfall für das sinnvolle Miteinander linguistischer und psychologischer Forschung werden. Das folgende Zitat kennzeichnet den Sachverhalt, wenn Henderson (1982: 65) zu bedenken gibt, "how much clarifications of a psychological problem can be achieved before we have done a single experiment. Indeed, it seems to me folly to take up a psychological position before examining in some detail what the language allows and encourages. The linguistic evidence does not provide the psychological answers, but it goes a long way toward clarifying the questions". Die ältere linguistische Literatur zu Flexion und Wortbildung und ihren historischen Veränderungen wimmelt geradezu von psychologisierenden Erklärungen. Insofern scheint die systematische Auswertung diachroner Morphologie- und Wortbildungsforschung auch und gerade für die psycholinguistische Modellierung der mentalen Repräsentation morphologisch komplexer Wörter von Interesse: Welche Typen von Veränderungen gibt es, und wie lassen sich diese auf Aspekte rezenter Modelle abbilden?

### 1. Introduction

Controversy surrounds the role of morphology in speech perception and production. The crucial issue is the following: do morphemes affect speech processing? That is, are words such as *girls*, *boys*, *girlish*, *boyish*, treated as if they were simple sequences of sound, or does their internal make-up affect the way in which they are produced or perceived?

A common assumption is that items which are derived by a regular rule are (dis)assembled in the course of speech, in line with Chomsky and Halle's claim (1968: 12) that "regular variations are not matters for the lexicon which should contain only idiosyncratic items". The dissimilarity between regular and irregular forms has been confirmed by neural imaging (Jaeger et al. 1996; Marslen-Wilson & Tyler 1998). But a straightforward division between the two types is problematical, for two reasons.

First, it is unclear which forms should be regarded as 'regular' and which 'irregular'. There seems to be a cline, with regular items at one end, and irregular at the other. In the middle, a plethora of semi-regular forms are found (Bybee & Slobin 1982; Bybee & Moder 1983; Bybee 1995 a; Pinker 1999). They are governed by rules, but rules with a number of conditions attached. For example, English has a productive suffix *-ness* which forms abstract nouns from adjectives e.g. *happiness*, *slowness*. Yet if the adjective ends in [l], the preferred ending is *-ity*, not *-ness* e.g. *mobility*, *futility*. Such examples do not easily fit into either the category of 'regular' or 'irregular' behaviour.

Second, common sense cannot decide the issue: there is a trading relationship between processing and storage which has to be discovered. Words ready-assembled in the mental lexicon would presumably allow faster processing, but would take up considerable

memory capacity. (Dis-)assembling words would slow down processing, but require less memory. Our current knowledge of the mind is insufficient to allow a priori judgments.

### 2. Processing models

Three main processing models have been discussed intensively over the last quarter century – though this oversimplifies the numerous proposals found:

- (a) Whole-word look-up, often known as the **full-listing hypothesis** (e.g. Butterworth 1983). According to this model, speakers/hearers look up whole words, which they routinely treat as indivisible sequences. Morphological affixes are firmly attached to their stems in the mental lexicon: *girls*, *girlish*, *boys*, *boyish* are four different lexical entries. Morphological divisions are potentially detectable by speakers/hearers, but this analytic ability is not brought into use during normal speech processing.
- (b) On-the-spot (dis)-assemblage, sometimes referred to as the **decompositional hypothesis** (e.g. Taft et al. 1986). According to this model, speakers/hearers routinely (dis)-assemble complex words. Morphological affixes are detached from their stems, and morphological (de)composition is part of the normal processing procedure. The stems *girl* and *boy* constitute the main lexical entries, and morphological affixes are listed as sub-entries or additional notes.
- (c) **Mixed processing** (e.g. Laudanna & Burani 1985; Burani & Caramazza 1987). According to this model, processing can be carried out either via the full form, or via the component morphemes. Lexical entries have a double format, in which each word occurs both as a whole and in morphemes. A variant of this, which overlaps with (a), is whole-word look-up with automatic 'word-parsing': morphological affixes are attached to their stems, but morphological make-up is automatically accessed whenever the word is considered, as if, metaphorically, the lexical entry was stored in hyphenated form: *girl-s*, *boy-s*, *girl-ish*, *boy-ish*.

These viewpoints all assume that morphological make-up is potentially available during processing. The critical question is the extent to which (de)composition is bound to occur. Schreuder & Baayen (1995) summarise similarities and differences between these and other newer variants, such as AAM (Augmented Addressed Morphology) model (Burani & Laudanna 1992), MRM (Morphological Race Model) (Baayen et al. 1997).

### 3. History of the question

The role of morphology in speech processing has been discussed primarily by psychologists, since theoretical linguists have traditionally been more interested in a speaker's 'competence' (internal system, or 'representation') than in 'performance' (how that system is used, or 'access') (Sandra 1994).

The morphology question surfaced in psychology in the 1970s, largely as a result of a **prefix-stripping** claim made by Taft & Forster (1975). They discovered that readers rejected non-words such as *\*juvenile* relatively slowly. This slowness, they suggested, might be because *-juvenile* is listed as an entry in the mental lexicon, though with an additional note specifying the obligatory attachment of *re-*. *\*Juvenile* was therefore initially assumed by readers to be a word, and was eventually rejected only after the extra notes had been checked. Words, the researchers concluded, are normally stored as stems, with prefixes which have to be stripped off in comprehension. This claim was backed up with further experiments: 'pseudo-prefixes' words – words which look as if they have a prefix, but in fact do not, such as *precipice* – take extra processing time because readers mistakenly strip off the prefix, and look for a non-existent *\*cipice* (Taft 1981). Later, the notion of stripping was extended to include suffixes also. The assumption that the mental lexicon contains primarily stems which can be accessed only after affixes have been stripped off was strongly maintained by some (e.g. Taft et al. 1986) – though Taft has now modified his views (Taft 1994).

**Affix-stripping** claims were however disputed by others even from the start. According to its detractors, the experimental task may have induced special strategies, word-stress was ignored, and affix-stripping effects, if they exist, may involve at most only written words. (Useful summaries of the early years

of this dispute can be found in Butterworth 1983; Cutler 1983; Henderson 1985.) Early work tended to conflate evidence from different processes, different stages of processing, different media, different languages, different types of morphology, and different degrees of productivity.

Later work on the topic showed increasing sophistication, as researchers refined their methodological tools, and showed that it may be unrealistic to rely on one global model for morphological processing.

### 4. Important variables

Over the years, psycholinguists have become increasingly aware of the large number of variables which need to be considered. The following dozen are perhaps the most basic. They can be divided broadly into linguistic factors and processing factors:

---

#### Linguistic factors

---

- (a) inflection vs. derivation vs. compounding
  - (b) prefixes vs. suffixes vs. infixes vs. circumfixes
  - (c) morphemes vs. syllables
  - (d) isolation vs. polysynthesis (morphemes per word)
  - (e) agglutination vs. fusion (segmentability)
  - (f) bound vs. free forms
- 

#### Processing factors

---

- (g) perception vs. production
  - (h) speech vs. reading/writing
  - (i) representation vs. process
  - (j) access vs. selection
  - (k) productive vs. unproductive processes
  - (l) frequent vs. infrequent words
- 

Tab. 163.1: Important variables

#### 4.1. Linguistic factors

- (a) Inflection vs. derivation vs. compounding. In the literature, the main distinction discussed is that between inflection (e.g. *drive-s*) and derivation (e.g. *driv-er*) (cf. Art. 38). Compounding has received less attention. In general, inflectional morphemes provide extra information about existing words (e.g. *The drivers loaded the vans with bananas*) while derivational

- morphemes form new words from existing ones (e.g. *The driver unloaded the perishable goods*). This distinction is not necessarily always clearcut (e.g. English *-ly* as in *quickly* is a well-known borderline case), and in some languages the boundary is more blurred than others. But in languages such as English, differences of treatment are mostly clear: derivational morphemes precede inflectional ones, as in *driv-er-s*, not *\*drive-s-er*; *nois-i-est*, not *\*nois-est-y* (Aronoff 1976; Spencer 1991). In consequence, inflection and derivation must be analysed separately wherever possible.
- (b) Prefixes vs. suffixes vs. infixes vs. circumfixes (cf. Art. 54–55). Affixes are traditionally divided into prefixes, suffixes, infixes, and (sometimes) circumfixes. In practice, almost all psycholinguistic work has related to prefixes (e.g. *un-*, *dis-* as in *uncover*, *discover*) and suffixes (e.g. *-ful*, *-ous*, as in *harmful*, *perilous*). Suffixes are considerably more common than prefixes in the languages of the world (Cutler et al. 1985; Hawkins & Cutler 1988), and beginnings of words are treated differently from endings (e.g. Marslen-Wilson 1989; Segui & Zubizaretta 1985).
  - (c) Morphemes vs. syllables. The syntactic unit ‘morpheme’ interacts with the phonological unit ‘syllable’. It sometimes coincides (e.g. *care-less*) and sometimes clashes (e.g. *lead-er* vs. *lea-der*). A further possibility is that morphemes may not have any status as ‘morphemes’, but may simply represent familiar phonic or orthographic chunks (Seidenberg & McClelland 1989).
  - (d) Isolation vs. polysynthesis. The number of morphemes per word varies from one (isolation, e.g. *sing*, *seven*) to several (polysynthesis, e.g. *polyunsaturated*: *poly-un-satur-ate-d*). This variation occurs partially within a single language, but more importantly, across languages, where languages vary from low to high on an index of synthesis (Comrie 1989).
  - (e) Agglutination vs. fusion. The segmentability of morphemes varies from straightforward divisibility (agglutination, e.g. *unwanted*: *un-want-ed*) to complete interweaving (fusion, e.g. *bit* ‘bite.PAST’). This variation occurs both within and across languages, where languages score differently on an index of fusion (Comrie 1989).
  - (f) Bound vs. free forms. Morphemes may be free (able to occur on their own as words, e.g. *sing*) or bound (obligatorily attached to another, e.g. *-ed* in *wanted*). This leads to degrees of affixation, e.g. *good#ness* has a suffix less tightly attached than *erot+ic*, since *good* is a word but *\*erot* is not. Further complications are noted in Giegerich (1999), Plag (2003).
- #### 4.2. Processing factors
- (g) Perception vs. production. Speech recognition, both auditory and visual, is known to be partly a matter of informed guesswork: hearers/readers reach conclusions based on outline clues. Some morphological information may therefore be redundant, and less carefully attended to. But production requires attention to the full form. It is therefore unreasonable to extrapolate from one process to the other.
  - (h) Speech vs. reading/writing. In speech, stress pattern and syllable structure are available to guide processing, whereas orthographic forms involve purely visual shapes. For example, the orthographic forms *decide*, *decapitate*, *decontaminate*, *decorate* all have a visual similarity for the first three letters, yet the spoken forms provide different, and possibly stronger, clues to their morphological make-up. The reverse happens with some inflections: for example, phonologically conditioned allomorphs of the English plural morpheme are spelled with an *s*, but pronounced either [s] (*cats*), [z] (*dogs*) or [iz] (*horses*). Discussions of morphology therefore need to be modality-specific (Chialant & Caramazza 1995).
  - (i) Mental representation vs. process. Considerable discussion as to the general architecture of the ‘mental lexicon’ has taken place. Some researchers assume the existence of a single ‘master-file’ with word representations based on some abstract form sometimes referred to as a *lemma*, which must be altered in some way when used in speech (Marslen-Wilson 1989; Bock & Levelt 1994; Marslen-Wilson 1993; Marslen-Wilson & Zhou 1999). This *lemma* level (if it exists) is intermediate between lexical-semantic representations and modality-specific lexical representations. The morphemic representations within this hypothesized master-file must be distinguished from the ac-

- tual forms used in speech processing. Others have argued that it is unnecessary to postulate a modality-neutral lemma-level of representation (Caramazza 1997).
- (j) Access vs. selection. Recent discussions mostly assume that perception and production are two-stage processes. Lexical access involves multiple activation of lexical possibilities, followed by a narrowing down and final selection (e.g. Marslen-Wilson 1989; Aitchison 2003). Treatment of morphology may therefore alter, depending on the stage in progress.
  - (k) Productive vs. unproductive processes. Productive processes which currently can be used to form new words (e.g. *non-* as in *non-modular*, *non-slip*) need to be distinguished from historical unproductive ones (e.g. *in-* as in *impermeable*, *indecent*). Productive morphemes are more easily attached/detached, and productivity also (usually) implies transparency and regularity (Bauer 2001).
  - (l) Frequent vs. infrequent words. Morphemes within frequently used words may become welded together (e.g. *would*, *should* where the final *-d* was in origin a past tense marker). This may mean that similarly structured words are not necessarily processed in the same way. Bybee (1985; 1995 a; 1995 b) pointed out that words of high frequency are more likely to be stored whole, while regular words of lower frequency are more likely to be formed by combination. The issue of frequent vs. infrequent words also overlaps with that of familiar vs. unfamiliar words (Chialant & Caramazza 1995).

The above variables indicate that morphological processing is a complex issue: numerous interacting factors cause complications even within a single language, and there is potentially considerable variation across languages.

## 5. Sources of evidence

Broadly, evidence which might decide the issues can be divided into two types: experimental (preferred by psychologists) and naturalistic (favoured by linguists). Ideally, the results of the two types would coincide.

### 5.1. Experimental evidence

The majority of experiments have probed speech perception, with either auditory or (more usually) visual stimuli. Experiments

have typically involved the measurement of response times ('response latencies'), on the assumption that if a morphologically complex word (e.g. *bluish*) takes longer to recognize than a simple word (e.g. *yellow*), then the complex word has probably involved some type of decomposition.

A **lexical decision task** is a widely-used technique ("Tell me as quickly as possible if this is a word or not"). The subject responds either verbally, or by pressing a button. This task can arguably be made subtler by the use of **priming** (prior presentation of another word). In its simplest form, the prime-word is the same as the 'target' (word on which the decision is being made). Such **repetition priming** speeds up response to the target, suggesting that previous access to a word in the mental lexicon facilitates its later retrieval. Any strong facilitatory effect is usually regarded as evidence that the prime-word and target are closely connected, and may even share a lexical entry. It is therefore one proposed way of checking closeness between morphologically related pairs (e.g. *creep* and *crept*, *deduce* and *induce*). A common technique is to compare the time taken to recognize a repeated word (e.g. *keep* and *keep*) with that taken to recognize a word with an extra affix (e.g. *keep* and *kept*).

**Cross-modal priming** is a further (controversial) refinement. It involves presenting the prime-word in a different modality from the target (e.g. an auditorily presented word followed by a visually presented one), on the (controversial) assumption that different modalities obligatorily involve accessing a neutral-between-modalities version of the word in the mental lexicon (Marslen-Wilson 1989). **Masked priming** is another variant, in which the prime-word is preceded by hash marks (#) equal to the number of letters in it, which supposedly makes memorization of the prime-word less likely (Forster & Davis 1984).

But various doubts have been raised about priming, since facilitatory effects may simply be due to one-off strategies devised for the experimental task: priming is unable to distinguish between online access and post-access procedures, and similar or related words can in some cases have inhibitory effects, rather than facilitatory ones (Monsell 1985). Furthermore, it is often impossible to tell whether a delay in recognition is due to independent representation (e.g. *keep* and *kept* might have separate lexical entries) or de-

composition (*kept* might need to be decomposed).

**Gating** is a further variant of a basic lexical decision task. This involves chopping off the word at successive points, until a 'recognition point' is reached. Its value in morphological processing is that it taps online procedures, and can (supposedly) reveal which parts of the word are essential for identification.

Overall, therefore, psycholinguistic experimentation has increased in sophistication over the years, though it is still something of a blunt instrument in that the results can often be interpreted in a variety of ways.

### 5.2. Naturalistic evidence

These data involve deviations or variations mostly in production, which fall into a variety of categories.

(a) **Slips of the tongue.** These are involuntary deviations from a speaker's intended utterance. They are rule-governed, in that such errors show recurring patterns. Morphologically, their value rests on the assumption that morphological errors might represent assemblage which occurs in the course of speech production. e.g. *concision* for 'precision' might be taken as evidence that *con-* was mistakenly added to *-cision* instead of *pre-* – though care needs to be taken to eliminate alternative explanations (e.g. *concision* might be a blend of *conciseness* and *precision*, or might be a late example of the archaic word *concision*).

A further problem is that it is not always possible to distinguish normal production routines from 'back-up' procedures, which come into play when the normal mechanisms break down. An error such as *deduceful* for 'deductive' could suggest that it is normal to assemble a derivative of *deduce* when required, or it might indicate that the speaker could not think of the 'standard' word, and so performed an emergency word-formation operation.

(b) The errors of **aphasics**. These are mistakes made by patients suffering from serious speech disorders. They are often similar in nature to ordinary 'slips of the tongue', though tend to be more numerous and more bizarre. The link between aphasics and normal speakers was pointed out by Freud (1953: 13): "The paraphasia in aphasic patients does not dif-

fer from the incorrect use and the distortion of words which the healthy person can observe in himself in states of fatigue and divided attention". Researchers hope to find patients with selective impairments, with some types of morphological affixes omitted, but others retained. However, care must be taken to consider alternative explanations, especially as people with damaged brains may adopt unpredictable compensatory strategies.

(c) Normal speech variation. Individuals are sometimes inconsistent in their treatment of inflection of the same lexical items. This is partly due to sociolinguistic factors, such as a shift from casual to formal styles, and partly uncertainty as to how to inflect particular words, as when *obscurer* interchanges with *more obscure* and *more obscurer*. Such inconsistency may reflect assemblage procedures.

In conclusion, evidence on morphological processing is rarely clearcut, whether it is experimental or naturalistic. The data can often be interpreted in more than one way. It is therefore necessary to look for convergence: areas in which different types of evidence apparently collude to provide a plausible account. These two sources can sometimes be supplemented by the observations of theoretical linguists. However, care must be taken when using the latter, as the aim of many theoretical linguists is to describe phenomena in a maximally economical way: this may not be the way the mind works.

## 6. Results of empirical studies

The majority of work on morphological processing has been carried out on English, so English will feature prominently in the account below, even though conclusions drawn from English cannot automatically be carried over to other languages.

### 6.1. Inflectional morphology

English inflectional morphology is relatively straightforward, in that a fairly small number of inflectional suffixes are found, which are all easily detachable.

Various clues suggest that these inflections are added on in the course of speech production:

(a) Slips of the tongue involving phrasal verbs (verbs composed of a base form

- and a separable particle). Examples such as *point outed*, *wash upped* instead of *pointed out*, *washed up* suggest that the basic lexical item is *point out*, *wash up*, and that the ending has been added on in the wrong place (Aitchison 1987; <sup>3</sup>2003).
- (b) Correct morphophonological form on slips of the tongue such as: *Take the freezes out of the steaker* (*steaks out of the freezer*). Here the plural morpheme which was originally intended for *steaks* has been adapted to its new stem *freeze*.
  - (c) Ability of normal speakers to immediately use any new lexical item with appropriate inflections, e.g. *they blanded out* from the recently popularized verb *bland out* ‘to become conformist’.
  - (d) Ability of fluent aphasics to inflect nonsense words appropriately, e.g. *She wikses a zen from me, with a pair of loyses or whatchemecalllem* (Butterworth & Howard 1987).
  - (e) Frequent failure of agrammatic aphasics to inflect words, except in the case of words which are more usually found in their inflected form (e.g. *eyes*).
  - (f) Inconsistent inflection of phrasal nouns such as *mother-in-law*, as in *mother-in-laws* (more usually *mothers-in-law*) suggests a lexical item *mother-in-law*, with inflection added on in the course of speech.
  - (g) Sociolinguistic variation between inflected and uninflected forms e.g. *we see*, *we sees*.

Overall, the evidence suggests that regular inflections are added as utterances are produced, though words which are more usually found in their inflected form may be fully listed with the inflection already added. A similar conclusion was reached by Chialant & Caramazza (1995). This is in line with arguments by Cutler et al. (1985) that the greater the syntactic role played by the suffix, the more likely it is that stem and affix will be separately processed.

Relatively little information is available about the comprehension of spoken inflected forms, though decomposition is supported by an aphasic patient who was found to have a selective deficit for inflectional morphology (Tyler & Cobb 1987).

Most of the information about written language relates to comprehension, where the evidence is consistent with decomposition. An early study showed that when subjects

were briefly shown a visual representation of inflected forms, they tended to perceive them as two units (Gibson & Guinet 1971). Priming studies have shown that prior exposure to a regularly inflected form of a word (*sings*) speeds up recognition time of the base *sing* as much as prior presentation of the word itself, though this is not true of irregular inflections (*sang*) (Stanners et al. 1979). This suggests that the subject is indeed accessing the same word, and ignoring the suffix. However, questions have been raised about whether these effects are genuine morphemic ones, rather than a by-product of visual or semantic similarity. Some studies have therefore tried to tease out the effects of formal similarity (e.g. *ribbon – rib*), semantic similarity (e.g. *pain – ache*), and morphemic relatedness (e.g. *sings – sing*, *sang – sing*) (Henderson et al. 1984; Napps & Fowler 1987; Napps 1989). The results suggest that “Priming among morphemic relatives cannot be explained as the combined effects of semantic and formal priming ... morphemic priming is a separate dimension along which two words can be related” (Napps 1989: 736).

Taken as a whole, evidence for (de)composition is fairly strong in the case of English inflectional suffixes, and further evidence is summarized in Cutler (1983). However, these English results are not necessarily generalizable to inflection in other languages – though Dutch and German appear to behave similarly (Jarvella & Meijers 1983). But in fusional languages, such as Serbo-Croat, inflectional forms appear to be fully listed: one inflected form seems to be at the centre of a constellation of related forms. A basic entry, the ‘nucleus’ has a cluster of ‘satellites’ around it (Lukatela et al. 1980; Lukatela et al. 1987; Feldman & Fowler 1987). This suggests that the English results may not be specific to inflectional morphology, but to the transparency and segmentability of inflectional morphemes in English, in particular to the fact that they are added to existing free forms.

Inflectional prefixes (sometimes regarded as part of a circumfix) exist in Dutch and German, and the evidence here is for (de)-composition (Jarvella & Meijers 1983). The prefix *ge-*, for example, is transparent and easily detachable.

## 6.2. Derivational morphology: prefixes

Evidence for prefix-stripping in English derivational morphology is slim and unreliable. One early study of production found a

number of apparently switched prefixes (e.g. *advice* for *device*) suggesting that prefixes are added on in the course of speech (Fay 1977). However, this study did not look at prefix maintenance, nor did it control for stress, or tease out the different types of prefixes. Another study which analysed speech errors involving words containing common initial sequences (e.g. *con-*, *de-*, *in-*, *dis-*) found that initial sequences were mostly maintained, and that almost half of the examples of apparent prefix switching were possibly blends e.g. *displayed* for *delayed* in: *The trains were disrupted and displayed* (Aitchison 1983–1984). A small residue was more plausibly interpreted as unstressed syllables which were ‘faint’ in memory, rather than detached prefixes (e.g. *deferred* for *referred*). In short, for all examples of prefix change “it is possible to suggest alternative, and arguably more plausible explanations than one which involves the notion of a mental lexicon with detached prefixes” (Aitchison 1983–1984:70).

However, this study did not cover productive prefixes before word boundaries (e.g. *un-* as in *unhappy*) – though the rarity of reported errors such as \**dishappy*, \**untasteful* perhaps indicates that prefixes are firmly attached to words, even when they are combined with free lexemes, since the productive possibilities are wide-ranging. Attested examples of wrongly attached negatives such as: *I disregard this as precise* (*I regard this as imprecise*) do not result in non-words, so cannot be taken as firm evidence for on-the-spot attachment. In short, there is no evidence of prefix attachment for existing words – but plenty of evidence that it is possible to coin new words with the use of productive prefixes (e.g. recently coined *unbundle* ‘to sell subsidiary companies’).

In spoken speech perception, Taft et al. (1986) claim to have found evidence of prefix stripping in a task which asked subjects to make lexical decisions in the case of various types of auditorily presented non-words: \**dejoyce* (real prefix, real stem) vs. \**tejoyce* (non-prefix, real stem) vs. \**dejouse* (real prefix, non-stem) vs. \**tejouse* (non-prefix, non-stem). They found that response latencies were slow in the case of real prefixes, and interpreted this as evidence that the prefix had been stripped, and the stem examined. Responses were slowest of all if the non-word contained a real prefix and a real stem, suggesting that the stem had been found in the mental lexicon, before realization dawned

that the prefix-stem combination was non-existent. But this ingenious task indicates only that speakers try to make sense of a word in any way they can before discarding it: it possibly probes strategies for coping with oddities, rather than normal processing.

A gating procedure (chopping off the word at various points until a ‘recognition point’ is reached) was used by Tyler et al. (1988) in a lexical decision task. They concluded that the presence of a prefix, whether stressed or unstressed, did not slow down processing: there was no evidence that lexical access was delayed until the stem could be identified, noting that words are simply recognized too early for the system to be waiting that long.

The general conclusion therefore is that prefix (de)composition occurs in speech production and recognition primarily as a back-up strategy, when the ‘normal’ processes have failed.

Extensive literature exists on the topic of visual recognition of prefixes, spawned by the original Taft & Forster (1975) prefix-stripping paper. As already noted, this has been heavily criticized by various researchers (e.g. Henderson et al. 1984). In general, Taft & Forster’s claim that certain pseudo-prefixes (e.g. *pre-* from *precipice*) are stripped off is thought by many to be a task-induced strategy, or a post-access phenomenon. At the most, prefix stripping is a preliminary attempt to divide a visual word into chunks, rather than a standard decoding procedure.

Relatively little information exists on the written production of prefixed words, though one puzzling study reported that a dysgraphic patient made more errors in writing non-affixed words than in productively-affixed ones (Badecker et al. 1990).

Overall, prefix stripping in English appears to be unlikely, though may be used as an occasional reading strategy. Of course, English does not necessarily behave in the same way as other languages. Reports of reading experiments suggest that Italian, like English, has its prefixes attached, but that Dutch derivational prefixes may be detachable (Jarvella & Meijers 1983; Jarvella et al. 1987).

### 6.3. Derivational morphology: suffixes

The unpredictability of English suffixes indicates that the majority are likely to be on fully listed words. Even productive and supposedly regular suffixes may show a high degree of unpredictability, as Henderson (1985)

points out: he draws attention to agentive *-er*, and notes irregularities even in a small and circumscribed area such as manufacturers/vendors (Henderson 1985: 39):

(1)	<i>bake</i> (V)	<i>baker</i>	<i>bakery</i>
	<i>butcher</i> (V)	<i>butcher</i>	( <i>butchery</i> ?)
	<i>fruit</i> (N)	<i>fruiterer</i>	?
	<i>hat</i> (N)	<i>hatter</i>	?
	<i>boot</i> (N)	?	?

In addition, there are various ‘baseless derivatives’. For example, *confabulation* is apparently ‘baseless’, in that there is no stem *confablate* or *-fication*. Such examples count against the proposal that composition is a normal procedure.

In speech production, slips of the tongue show relatively few ‘pure’ suffix errors. In one study, overall maintenance of the suffix was 81 Percent in a set of malapropisms (similar sound errors) which contained one of six common suffixes as target, error or both (e.g. *cyclonic* for ‘syphonic’, *actual* for ‘active’) (Aitchison 1987). Where suffix errors occurred, the malapropism usually involved other alterations as well (e.g. *malicious* for ‘malignant’, *relative* for ‘relevant’). The few examples of ‘pure’ suffix change could better be explained by procedures such as blending (e.g. *audial* for ‘auditory’, probably from ‘audio-visual’ or ‘auditory + visual’, *contential* for ‘contentious’, when the subject reported hovering between *contentious* and *controversial*) (vgl. Art. 91). An alternative explanation for some errors is a back-up procedure when the target is not wholly available: this is also a proposed explanation for a number of suffix errors such as *orangine* for ‘orangier’ made by a French aphasic (Pillon et al. 1991). According to the authors, the patient could only partially retrieve the desired phonological form, and produced errors which sometimes looked like derivational suffix errors, but were in fact provisional attempts to fill in the gaps in his partially retrieved form.

Experimental evidence is somewhat inconclusive (Cutler 1983), though tends to support the suggestion that initial access does not necessarily involve decomposition: it takes no longer to recognize a complex word such as *dusty* than a monomorphemic one such as *fancy* (Manelis & Tharp 1977). But when subjects were presented with two words, of which one was suffixed and the other not (e.g. *printer*, *slander*), the task took longer than when the words both had suffixes, or both lacked them. This possibly indi-

cates that suffix-stripping is an optional strategy which can be utilized if necessary. A variety of studies have shown close relationships between the base word and derived forms, such as *select* and *selection*, *destroy* and *destruction*, (e.g. Stanners et al. 1979), but none have produced definitive evidence for (de)-composition at an early stage. An authoritative survey (Henderson 1989) comments on priming studies that “findings suggest that priming by morphological relatives occurs at a stage beyond that of the word detectors” (Henderson 1989: 377).

In all, evidence suggests that initial access involves whole-word look-up, but that word-formation and word-parsing routines are available if required.

But full listing of words with derivational suffixes is not generalizable to all languages. In Turkish and other languages with a massive amount of productive agglutination, there must at least be some online parsing, though it may be misleading to refer to this as ‘suffix-stripping’ (Hankamer 1989).

## 7. Conclusion

Three models were outlined at the beginning of this article:

- (a) whole-word look-up: the full-listing hypothesis;
- (b) on-the-spot (dis)assemblage: the decompositional hypothesis;
- (c) mixed processing.

Empirical and experimental studies suggest that English inflectional suffixes are (de)composed in the course of speech, but that established complex words have their prefixes and suffixes firmly attached, though word parsing is an available back-up option which enables new words to be formed. The mixed processing model possibly represents a mixture of stages: whole-word look-up (initial access) may precede and overlap parsing and word formation. These findings are specific to English, and are not necessarily generalizable to other languages.

However, two points at least need stressing about these conclusions.

First, when morphological processing was first discussed, studies of the mental lexicon were in their infancy. Since then, it has become clear that the mind is capable of massive parallel processing (see summary in Aitchison <sup>3</sup>2003). It may be that considerably

more covert parsing activity is going on in parallel than we realise (cf. Bergman et al. 1988).

Second, there is clearly an interrelationship between transparency and segmentability of morphemes, and productivity. It may be more revealing to look at the interaction between these than to look at a straightforward split between inflection and derivation (Hay 2002). Also an aphasic patient showed an inability to handle morphologically complex words involving suffixes that were phonologically and semantically transparent, whether inflected or derivational (Tyler et al. 1990).

As researchers continue to work on an increasingly wide range of languages, and use increasingly sophisticated research tools, there is hope that many of the outstanding puzzles will soon be solved.

### 1. Introduction

A basic assumption of all linguistic **speech errors** research is that an analysis of these data can reveal something about both the **mental representation** of language knowledge – the grammar – and the ways in which we access

this grammar in speech production and comprehension (cf. Bierwisch 1982; Cutler 1988; Fromkin 1971; 1973, ed.; 1980, ed.; 1988; Garrett 1988; Stemberger 1982). Speech errors have been defined as involuntary deviations from intended utterances, as exemplified in the following (T = target; E = error):

- (1) (a) Feature  
T: *Cedars of Lebanon*  
E: *Cedars of Lemadon*
- (b) Segment  
T: *speech production*  
E: *preach seduction*

- (c) Word  
T: *tend to turn out*  
E: *turn to tend out*
- (d) Stem  
T: *The cost of flying*  
E: *The fly of costing* (stem)
- (e) Inflectional suffix morpheme  
T: *all the phones rang*  
E: *all the phone rangs*
- (f) Derivational prefix  
T: *imprecise*  
E: *disprecise*
- (g) Syntactic constituents  
T: *my sister went to the Grand Canyon*  
E: *the Grand Canyon went to my sister*

More recently, the deviant language errors produced by post-brain damaged aphasic patients have also been used as additional evidence for grammatical and production models (cf. Buckingham 1980; Dressler & Stark 1988, eds.).

There are two major kinds of **errors**. The first category involves linguistic units, e.g. disordering, deletion, or addition of intended features, segments, morphemes, words, syntactic phrases, which show what units must be represented or derived in the grammar, as illustrated in examples (1 a–g) above.

There are also errors which involve grammatical rules, for example, the application of a rule which should not apply as in (2):

- (2) T: *I know where they are*  
E: *I know where they're*  
(wrong contraction)

or failure to apply a rule which should be applied as in (3):

- (3) T: *But when will you leave?*  
E: *But when you will leave?*  
(Failure to invert subject and auxiliary)

or a possible wrong application of a derivational or inflectional morphological rule resulting in non-occurring lexical items as in (4):

- (4) (a) T: *he's a New Yorker*  
E: *he's a New Yorkan*  
(b) T: *he swam in the pool*  
E: *he swimmed in the pool*

Speech errors suggest that rules which have been posited as part of the grammar (i.e. as part of linguistic competence (Chomsky

1965)) may also be applied in linguistic performance. As will be discussed further below, some rules seem to be applied in order to prevent a proliferation of errors, referred to as accommodation (Fromkin 1971; Garrett 1980 b) illustrated in (5).

- (5) T: *cow tracks (/s/ plural)*  
E: *track cows (/z/ plural)*

(Note that /kaws/ is phonologically well-formed as shown by the word *mouse* /maws/ but if the intended /s/ was not “changed” to /z/ the result would have been morphologically ill-formed).

The majority of the examples are taken from the English UCLA corpus, but such errors occur in all languages obeying the same constraints.

## 2. Speech errors and linguistic theory

The attempt to understand (and explain) the kinds of normal and **aphasic speech** errors that occur would not be possible without general linguistic concepts. All theories of grammar (however they may differ in detail, concepts or goals) posit a number of basic components: phonology, morphology, the lexicon, syntax, and semantics. Questions of interest concern the autonomy of these components, the ways in which they interact, their units and forms of their representation, and the rules or principles which constrain the wellformedness of structures. It is interesting that spontaneously produced speech errors reveal deviations in the units and rules of all these components, occurring at different stages of the production of an utterance (which parallel but may not be identical to the stages in a derivation of a sentence).

Speech error data have proved insightful regarding various linguistic hypotheses concerning all aspects of the grammar; morphology – the structure of words and the organization of the lexicon is no exception.

Morphology occupied a major role in pre-generative linguistics (cf. e.g. Bloomfield 1933; 1939; Marchand 1969; Nida 1949). In the earliest versions of generative grammar (Chomsky 1957), however, the grammar contained no morphological component and no lexicon, and all word-formation, including inflectional and derivational morphology and compounding, resulted from syntactic transformations. With the publication of *Aspects of the Theory of Syntax* (Chomsky 1965) a

lexicon was included as a separate component of the grammar but word formation (compounding and affixation) was still considered a syntactic process. With the extension of Chomsky's (1970) lexicalist hypothesis by Jackendoff (1972), Halle's (1973) seminal *Prolegomena to a Theory of Word Formation*, and Aronoff's (1976) detailed model of word formation, morphology became an important area of study and theoretical development within the generative framework (Mohanan 1986; Kiparsky 1982; Siegel 1979; Pesetsky 1985; Anderson 1982; 1988).

Psycholinguistic models have also been concerned with the processing and accessing of lexical information which in many cases require assumptions on morphological representation and rules. Some of the attempts to address these issues have included analyses of speech errors; what follows is a discussion of some of these studies.

### 3. The structure of the lexicon

Traditionally, morphology concerned the structure of words and the rules of word formation. The nature of the lexicon itself was not part of morphology but rather the concern of lexicographers. With the inclusion of a lexicon as a component of the grammar, it was no longer possible to discuss morphological processes separate from the structure of the lexicon and the nature of lexical representation. Thus for example, one now needs to know whether lexical morphemes and/or words as well as derivational and inflectional morphemes are included in the lexicon, or in separate lexicons, whether complex words are derived by rule or listed in lexical paradigms, and how one should represent morphologically complex lexical entries. Analyses of speech errors have been used to address such questions.

#### 3.1. Sub-lexicons

Most psycholinguistic models of the lexicon partition entries into sub-components or **modules** (cf. Allport & Funnell 1981; Forster 1976; Fromkin 1985; Morton 1969). Thus, each lexical entry will have its phonological, orthographic, syntactic, and semantic representations in separate but intermeshed sub-lexicons. These particular sub-components have not been discussed in theories of morphology, although their inclusion does not seem to present any problems for any of the

current theories. Word substitution errors and blends provide some evidence for such partitioning, particularly for processing models. Although an isomorphism between a grammatical model and a psycholinguistic model is an open question, when such a parallel can be maintained the elegant solution is to do so.

Examples (6 a) through (6 c) illustrate that in **word substitution** errors, the substituting words often fall into the same semantic class as the substituted words in that they share semantic features (including the polar feature values of antonyms). This may be due to their having semantic 'addresses' close to each other in the semantic sub-lexicon, or due to their being activated because of their shared features.

- (6) (a) T: *don't burn your fingers*  
E: *don't burn your toes*
- (b) T: *my boss's wife*  
E: *my boss's husband*
- (c) T: *a horse of another color*  
E: *a horse of another race*

Examples (7 a–b) show that substituted words may instead be phonologically similar to the substituting words, again suggesting either listings according to phonology in a phonological sub-lexicon or activation of words with shared phonology.

- (7) (a) T: *white Anglo-Saxon protestant*  
E: *white Anglo-Saxon prostitute*
- (b) T: *Universal City*  
E: *University City*

It is interesting that word substitution errors made by aphasics and acquired dyslexics also show the same kind of semantic and/or phonological similarity (Fromkin 1987).

The possible causal effect of phonological similarity is discussed by Butterworth (1981) in an analysis of **word blends**. 51 of 65 blends that he analyzed involved pairs of presumed words which are phonologically similar in shared phonemes, syllable structure, initial segment, or stress pattern as in the following:

- (8) (a) *trying/striving* > *strying*
- (b) *draft/breeze* > *dreeze*
- (c) *terrible/horrible* > *herrible*
- (d) *grizzly/ghastly* > *grastly*
- (e) *slick/slippery* > *slickery*

Fay & Cutler (1977) in their study of **mala-propisms** – word substitution errors in which the substituted word is phonologically but

not semantically similar to the intended word – conclude that:

“(a) There is a single dictionary used for production and comprehension. (b) In this dictionary, words are arranged by phonemic structure, in a left-to-right manner, and based on a distinctive feature system. (c) The major partitioning of the dictionary, however, seems to be by number of syllables, with stress pattern as a second categorization within syllable categories. (d) Words may also be arranged by syntactic category.” (Fay & Cutler 1977: 515f.)

Hurford (1981), after analyzing the same set of malapropisms, concluded instead that:

“a. Malapropisms tend significantly to resemble their targets at both extremities of the lexical item ... b. Items listed in the mental lexicon are whole words, with suffixes already attached to stems.” (Hurford 1981: 423)

Hurford argues for this position on the basis of the similarity between target and error to the right of the first wrong segment which he concludes “is due ... almost entirely to a coincidence of such derivational suffixes” (Hurford 1981: 420).

There is, however, other evidence to suggest that in addition to whole words being listed in the lexicon (Halle 1973; Aronoff 1976), stems and/or morphemes must also be listed together with productive rules of word formation which may be incorrectly applied as illustrated by examples (4a) and (4b) above and the derivational errors shown in (9a–b) and inflectional errors in (9c–d). If the lexicon contained only actual words there would be no way to account for the possible but non-occurring words which are produced in speech errors.

- (9) (a) T: *we often go to the movies*  
E: *we oftently go to the movies*
- (b) T: *motivate*  
E: *motify*
- (c) T: *I already took a bath*  
E: *I already tooken a bath*
- (d) T: *I meant to say*  
E: *I meaned to say*

As Fay & Cutler (1977) and Hurford (1981) point out, there is strong evidence that words are listed in the lexicon according to various phonological criteria. This however does not contradict the need for also including a semantic sub-lexicon in which words are listed by semantic classes and/or features. There is also evidence for an orthographic sub-lexicon which is beyond the scope of this article.

### 3.2. Two lexicons

While the arguments for sub-lexicons revolve solely on processing considerations, there have been proposals for the bifurcation of words and/or morphemes into two separate lexicons based on grammatical and theoretical concerns (Stockwell et al. 1972). Golston (1991) presents evidence from speech errors in support of his claim that the grammar includes two lexicons, one consisting of content words and derivational affixes, and the second (which he calls a phrasicon) consisting of function words and inflectional affixes. In his model which he posits as being both a model of the grammar and a speech production processing model, he suggests that different kinds of speech errors occur at specific stages in production and further that other kinds of errors cannot occur. His model is similar to but not identical with Garrett’s (1980a; 1980b) model which also makes claims on the basis of the kinds of errors which occur at different stages or levels.

There is indeed much evidence that the linguistic processing mechanisms differentiate between affixes and lexical content words and/or stems. Berg (1987) summarizes the distinction (cf. also Fromkin 1973, ed.; Garrett 1975; MacKay 1979; Nooteboom 1969):

“Stems and affixes do not interact in tongue slips ... Prefixes and suffixes do not communicate with each other ... Inflectional and derivational suffixes, in turn, stay within their respective subcategorizations ... Lexical morpheme errors respect word class membership to a lesser extent than do independent word errors.” (Berg 1987: 13f.)

Golston points out that errors which consist solely of inappropriately selected function words can be accounted for by a two lexicon model in which the selection of such words occurs after the selection of content words as in the following errors from the UCLA corpus (Fromkin 1988):

- (10) (a) T: *John's going, isn't he?*  
E: *John's going, isn't it?*
- (b) T: *That's what we're going to be doing today.*  
E: *That's what we're going to be do today.*
- (c) T: *I wouldn't be surprised, would you?*
- (d) E: *I wouldn't be surprised, do you?*
- (e) E: *when everyone had left*  
T: *when everyone was left*

### 3.2.1. Word and stem errors

Garrett (1980 b) points out that affixes and lexical stems exhibit different patterns in speech errors further supporting the notion of separate lexicons for each and specific stages at which errors involving each occur. Word stems ('open class' lexical content morphemes) participate in exchanges (spoonerisms or reversals) often leaving their inflectional morphemes behind (referred to as stranding) as shown in the following:

- (11) (a) T: *the cost of the purchase*  
E: *the purchase of the cost*
- (b) T: *your keys are in my purse*  
E: *my keys are in your purse*
- (c) T: *does Jack smoke?*  
E: *does smoke Jack?*
- (d) T: *sweeping streets*  
E: *streeting sweeps*
- (e) T: *wine racks*  
E: *rine (Rhine?) wacks*

(Note that word exchanges do not always respect syntactic categories)

If pronouns are included in the first lexicon (that containing lexical formatives, and derivational morphemes, but not grammatical words or inflectional morphemes) it is not surprising to find that pronouns are involved in exchanges such as in (11 b) above.

### 3.2.2. Derivational exchanges

There are also errors involving exchanges of derivational affixes:

- (12) (a) T: *thinking and cognition*  
E: *thintktion and cogniting*
- (b) T: *colder and windy*  
E: *coldy and winder*
- (c) T: *bloody students*  
E: *bloodent studies (/studiz/)*

There are however no attested errors involving the exchange of inflectional affixes (when they function as bound morphemes, not as phonological units such as syllables). That is, errors such as (13) do not seem to occur:

- (13) T: *the girls are playing*  
E: \**the girling are plays*

### 3.2.3. Stranding errors

Errors such as (12 b) and (12 c) above are called stranding errors in that inflectional affixes are left behind or 'stranded' when the lexical stems exchange. Other examples are given in (14 a) to (14 c).

- (14) (a) T: *rules of word-formation*  
E: *words of rule formation*
- (b) T: *my check cashed*  
E: *my cash checked*
- (c) T: *a sweeter flute*  
E: *a fluter sweet*

Derivational morphemes rarely are stranded but such stranding errors do also occur as shown in (15).

- (15) T: *return your call*  
E: *recall your turn*

Garrett's model accounts for such stranding errors by suggesting that lexical stems are selected and inserted into syntactic planning structures or frames which contain these syntactic elements.

### 3.2.4. Shifts

The shift or movement of affixes from the intended place in the utterance with attachment to another word is also observed, as in the following:

- (16) (a) T: *print outs*  
E: *prints out*
- (b) T: *Larry Hyman's paper*  
E: *Larry's Hyman paper*
- (c) T: *when someone comes up to me*  
E: *when someones come up to me*

Again it should be noted that while derivational affixes seldom shift, grammatical words and minor grammatical categories (e.g. adverbs, intensifiers, determiners), like inflectional morphemes often do:

- (17) (a) T: *I can hear her*  
E: *I can her hear*
- (b) T: *he's been around a long time*  
E: *he's been a long around time*
- (c) T: *Why do we have to?*  
E: *Why do have we to?*
- (d) T: *I really hate to correct exams*
- (e) E: *I hate to really correct exams*

## 4. Rules and accommodations

It has often been pointed out that children's errors during the acquisition stage – *mouses* for *mice* or *bringed* for *brought* for example – reveal more about their grammar construction and the rules they are forming than do their well formed utterances (cf. Art. 165). This is also true of adult speech as shown by the errors they produce, as in (18 a–e):

- (18) (a) T: *the last I knew about it*  
E: *the last I knowned about it*
- (b) T: *he had to have it*  
E: *he haved to have it*
- (c) T: *I meant to say*  
E: *I meanded to say*
- (d) T: *Rosa always dated shrinks*  
E: *Rose always date shrank*
- (e) T: *they'd be breastfed*  
E: *they'd be breastfeeded*

Such possible forms (non-existent in the normal lexicon) suggest that a speaker may utilize regular inflectional rules applying them incorrectly at times to exceptional forms (although it is still possible that there may also be, in the normal situation, the selection of the correctly specified inflected form).

Such rules also surface in the process known as **accommodation** described and illustrated in (5) above and in the following:

- (19) (a) T: *I don't know that I'd know one if I heard it*  
E: *I don't know that I'd hear one if I knew it*
- (b) T: *an eating marathon*  
E: *a meating arathon*
- (c) T: *the museum that we saw*  
E: *the museum that saw us – we saw*
- (d) T: *I thought I was finishing your beer*  
E: *I thought you were finishing my beer*

In the Swedish example (20) the plural suffix *-ar* is changed to *-er* to accommodate to the morpholexical rules of the language.

- (20) Swedish (Linell 1982)  
T: *två dagar i rad*  
E: *två rader i dag*

## 5. Conclusion

The discussion above aimed at showing how questions concerned with the nature and structure of the lexicon and morphological representation and rules have been investigated through an analysis of spontaneously produced errors of speech. While many questions remain to be answered and some only through normal linguistic analysis, performance data such as speech errors can contribute to our understanding of some of the issues. Just from those examined here we can draw some tentative conclusions.

- (a) The lexicon appears to be subdivided into sub-lexicons, each containing a different set of representations. Thus a lexical entry like "coat" might be represented as in Tab. 164.1:

Sub-Lexicon	Representation
phonological	/kot/
orthographic	coat/COAT
syntactic	[ <sub>N</sub> coat] + sub-categorization, etc.
semantic	'coat'

Tab. 164.1: Sub-lexicons

- (b) In the phonological sub-lexicon, words and/or morphemes appear to be listed according to initial phonemes, number of syllables, and stress patterns.
- (c) Lexical and grammatical morphemes, and derivational and inflectional affixes function differentially and at different stages in production. This argues for, at the very least, distinct specifications and possibly two separate lexicons which are accessed at different stages in production.
- (d) Both derivational and inflectional word formation rules exist which when misapplied result in possible but non-occurring lexical items. Speech error data cannot determine whether in addition to the application of such rules, derived and inflected words also occur in the one or two lexicons and their sub-components, although it appears that they do.

Further cross-linguistic analyses of speech errors should make further contributions to questions concerning the nature and access of the lexicon and morphological representations and rules.

## 165. First language acquisition

1. Acquiring morphology
2. Inflection
3. Derivation
4. Summary
5. References

### 1. Acquiring morphology

Morphology has been studied for several different reasons by researchers interested in first language acquisition. First, the acquisition of inflections has been used to assess children's stage of language development. It is well established that, across languages, children at first make no productive use of closed class items like clitic pronouns, particles, and adpositions or of inflections marking grammatical categories such as tense, aspect, case, number, or gender. They then begin to add inflections and other grammatical markers, and their words become more complex (measured in morphemes), so that their utterances are longer. Computing the average length of children's utterances in morphemes yields a measure of early grammatical development that is more sensitive than length-in-words (e.g., Brown 1973; Dromi & Berman 1982).

Morphological development has also provided an important domain for testing hypotheses about how children learn. For example, do they learn inflections by rote, one word at a time, or do they abstract over words to come up with generalisations in the form of schemas or rules to apply to unfamiliar instances? If children can add past tense inflections to unfamiliar verbs, they must be relying on some more general principle than

rote learning. This finding is even more robust if children can be shown to inflect non-sense words, items that are non-existent in the established lexicon of their language. Such generalisations can be expressed as rules or schemas; they emerge early in the process of acquisition and show up in both spontaneous over-regularisations and elicited productions (e.g., Berko 1958; Bybee & Slobin 1982).

The acquisition of morphology also offers a testing ground for crosslinguistic comparisons where some of the contributions of typology can be assessed. Do children learn morphological rules or schemas in the same way, with the same ease, in synthetic, agglutinating, and isolating languages? What aspects of typology make for error-free versus error-full paths during acquisition? And what effect does typology have on the acquisition of specific grammatical systems such as tense-aspect or passivisation on the verb, or accusative versus ergative case-marking on the noun? (See, e.g., Berman 1990; Pye 1990; Slobin 1985, ed.; 1992, ed.; 1997, ed.)

Finally, the internal structure of words can be connected to conceptual and semantic development on the one hand, and to vocabulary acquisition on the other. When do children begin to analyse words into component parts? When do they start to make active use of derivational morphology in coining words? Are children sensitive to the productivity of the options available when they construct new words? These are just a few of the questions researchers have explored for derivational morphology and word formation more generally.

When children begin to talk, they typically produce one word at a time. These single words may consist of bare stems only, as in English, where the stem is normally a word too; or they may be “frozen” inflected forms. For example, a child may always produce a particular noun with the same case ending on it. Or they may always produce a verb in one particular form with tense, person, number, and gender marking (e.g., Berman & Armon-Lotem 1996). These initially invariant forms of words and their subsequent treatment by children discovering the relations of stems to inflectional affixes show which elements children focus on in the speech they hear. They consistently attend to stressed syllables and final syllables, for example, and tend to produce those first. Only later do they add other elements to their early words. It takes time for children to identify words or stems and their modulations – the different additions licensed by each word or word-type in a paradigm (Anderson 1985 a; 1985 b). Identification and analysis represent the first step (Peters & Menn 1993; Veneziano & Sinclair 2000). Only once that has been taken can children be credited with knowledge about the forms and meanings of inflectional paradigms or derivational patterns. And only then is it possible for researchers to generalise about children’s acquisition of such inflectional systems as case, number, gender, or tense.

A major source of information about children’s morphological development consists of the **errors** they make en route to the adult system (see also Art. 164). The errors may be errors of omission, where children fail to add the expected inflectional or derivational morpheme to a word-stem. These errors offer indirect information about what children at each stage find difficult and therefore omit from their utterances. Other errors are errors of commission. These provide a more direct source of evidence about how children are organising their morphological paradigms. When children regularise specific word-forms, they reveal both how they have analysed and how they have organised the relevant inflections or options for word formation so far.

In what follows, we look first at some of the findings for inflectional morphology (cf. 2) and then at derivational morphology (cf. 3) in acquisition.

## 2. Inflection

Children begin to add their **first inflections** and to use them in contrasting contexts sometime between 1;6 (one year, six months) and 2;0 (two years). By 2;6 to 3;0, they usually control some case endings, number marking on nouns and verbs, some person marking on verbs as well as some marking of aspect and tense, as well as gender and classifier systems in languages that mark nouns (and their associated modifiers) for these categories (see Art. 97–98). Just which inflections children have acquired by age three varies to a large extent with the typology of the language and with the complexity of the paradigms to be learnt. Cognitive complexity is one major pace-setter in acquisition (children must have established a conceptual category before they look for a means for talking about it), but formal complexity also plays an important role in determining when children master the forms available (Slobin 1973). If a language marks three genders as well as number and case on nouns, with different patterns of case endings for each gender and number, the inflectional system will take longer to learn than a language that marks neither gender nor case. Inflections that combine several elements of meaning (e.g., the Hebrew suffix *-ot* for plural number and feminine gender together) are acquired later than those that bear a clear one-to-one correspondence to a specific grammatical category (e.g., the Hebrew suffix *-a* for feminine gender in the default instance of singular number).

Our discussion focusses on questions of complexity in the acquisition of inflections (2.1), rote learning versus rule application (2.2), agreement marking (2.3), and the linear ordering of morphemes (2.4).

### 2.1. Added complexity

When children begin to add inflections, they modulate the meanings of the bases or stems the inflections are added to. These modulations mark additions to the basic or core lexical meanings of the pertinent terms. In general, “complexity in thought is reflected in complexity of expression” (Clark & Clark 1977: 523; Greenberg 1966). Each inflectional modulation adds **complexity**, whether in the forms of noun affixes to mark number and case, say, or in the forms of verb affixes to mark aspect, tense, person, and number (Bybee 1985). The added morphemes *will* and *-ed* explicitly mark added complexity of meaning

in the contrasts between *sleep* and *will sleep*, or *jump* and *jumped*, just as the plural morpheme *-s* marks the added complexity of ‘more than one’ over ‘one’ in *cats* versus *cat* or the ordinal *-th* marks ordinal rank versus cardinality in *seventh* versus *seven*. But added complexity of meaning is not always visible morphologically, so the various possibilities are: full form/meaning transparency where a given modulation is marked by a single additional morpheme (e.g., the English plural *-s* on nouns or the regular past tense on verbs); added complexity of meaning with no obvious morphological addition (e.g., the English plural noun *sheep* or the past tense form *cut*); or more than one modulation of meaning packed into a single morpheme (e.g., the Hebrew feminine plural on nouns, or Italian first person imperfect past on verbs). The general prediction for acquisition, then, is that the more transparent the modulation, the earlier it should be acquired by children.

Relative semantic complexity appears to account quite closely for order of acquisition in those domains where it is possible to make the relevant comparisons. It accounts for the order in which children acquire verb inflections in English (Brown 1973; see also Berman 1985 and Levy 1983 on Hebrew). But it is difficult to apply such a measure since few inflectional domains have been carefully analysed with respect to meaning, and even fewer have been compared across languages. Complexity of meaning is not the only kind of complexity children encounter during the acquisition of inflections. They must also master complexities of form – the number and kinds of changes required to mark a particular meaning in a language.

Complexity of form can be analysed from different points of view. One depends on which categories are morphologically marked in a language – case, gender, tense, number, aspect, negation, and so on (Anderson 1985a). A second factor that may increase formal complexity is the way the available structures map the relevant meanings – the number of different elements (compare the noun case systems of Hungarian and German, say); the number of case forms that carry more than one meaning within the singular or plural paradigm; or the morphophonemic rules and the extent to which the constituent morphemes in a word form remain readily analysable in the surface of each word. In Finnish, for instance, morpheme boundaries within words are often obscured,

whereas in English they often remain visible. A third factor is the consistency of the form-to-meaning mapping across semantic domains (Slobin 1985, ed.; 1992, ed.; 1997, ed.). Languages may differ greatly in these respects so that parts of the inflectional morphology within a language may be hard for children to acquire (e.g., noun plurals in Arabic, locative marking in Serbo-Croatian) while other inflectional paradigms may be much easier (e.g., plurals in English, locative marking in Hungarian) (Mikes 1967; Omar 1973; Pléh 1998; Slobin 1973). Complexity of meaning and of form must be taken into account when children are acquiring morphology.

## 2.2. Rote or rule?

Do children learn inflections for each word one by one? Or do they make generalisations based on some number of examples that they then apply to unfamiliar forms? That is, do they learn the form each member of every paradigm can have, and add each one to the paradigm as it is acquired? Such a task would demand **rote-learning** on a massive scale for a language like Turkish, for example, where the possible forms for a stem may be counted in the thousands. The alternative to such rote learning – where children could only learn the specific forms they happened to be exposed to – is that they analyse some sets of forms and extract from them systematic **schemas** that they can apply to any candidate stem to construct the desired form.

One of the first studies to tackle this question was carried out by Berko (1958). She presented five- and seven-year-old children with nonsense words used in specific syntactic contexts, followed by an elicitation frame, e.g., “This man likes to biff every day. Yesterday, he \_\_”, or “This is a wug. Now there are two of them. There are two \_\_”, accompanied by line drawings of the scenes or objects supposedly denoted by the nonsense words. Children were asked in this way to supply several inflections including the plural and possessive on nouns, and *-ing* and *-ed* on verbs. The results showed that children could supply appropriate inflections for ‘nouns’ and ‘verbs’ they had never heard before. They could not, therefore, be relying on any rote learning of the forms for such words. Rather, they must have been using some type of rule or schema to supply the requisite ending to express a specific meaning (Bybee & Slobin 1982). This finding is also consistent

with children's spontaneous errors, where production of such regularised forms as English *runned* (for *ran*) or *foots* (for *feet*) also give strong evidence for rule application and against simple rote learning.

At the same time, children are also influenced by the familiarity of the words they are asked to inflect in elicitation tasks. They more readily add inflections to familiar than to unfamiliar words. In Berkó's study, for instance, children succeeded in adding the appropriate allomorph of the plural /-iz/ to the noun *glass*, for *glasses*, but failed to do so with nonsense words ending in sibilants. In addition, children do better in elicitation tasks with nonsense words, when the situation itself calls for an inflected form (because it is pragmatically appropriate) than when the setting appears more test-like. So a child may fail to supply a plural inflection when asked about *wugs* ("Now there are two. There are two \_\_") but succeed when asked which pictures should be put away next ("Which pictures go next?"). Pragmatically appropriate tasks tend to offer a fuller picture of children's abilities than test settings can (Hecht 1983; see also Menn & Bernstein Ratner 2000).

As children learn the regular and irregular patterns of inflection in their language, they are tacitly building paradigms – sets of modulations that apply to particular classes of nouns or verbs. When they begin to identify such patterns, they must keep track of which affix-type goes on which stem-type. For example, in the Romance languages, children must classify verbs by conjugation in order to know which inflections apply. One might imagine that the most frequently heard forms would offer the first model for children, so if certain irregular verbs were the most frequent ones they heard, children should begin by generalising irregular forms. However, children attend not only to token frequencies but also to type frequencies, and their earliest generalisations appear to be based on the most frequent types (Guillaume 1927). In Romance, children consistently begin by choosing the first conjugation as their model when they add inflections to a verb, and so make errors of over-regularisation on verbs from other conjugations, as well on irregular verbs (Clark 1985). And in Semitic, children have to attend to the consonantal structure of the root in order to know which allomorph of an inflection to choose (e.g., Berman 1985).

Children must also store in memory what they hear from other speakers. This enables them to recognise words and phrases when they hear them on subsequent occasions and from different speakers. As a result, they store many conventional forms for comprehension that they themselves may not yet produce. The fact that they have some stored representation of such forms means that these are available when, for instance, children are asked questions about irregular verb forms. In fact, children aged three and older are willing to make judgements about who might say a particular form, adult or child, when presented with *brought* versus *bringed*. They could have both forms stored since they hear language spoken by their peers (users of *bringed*) as well as by adults (*brought*). But they also hear conventional *brought* more often and from many more speakers. Child judgements about which form is "okay" at a certain point begin to favour adult over child usage (Kuczaj 1978; Platt & MacWhinney 1983). A major issue here, as in other areas of language learning, is how children come to give up their own over-regularisations in favour of the conventional irregular forms (Bowerman 1988; Clark 1993; Clark & Chouinard 2000).

Frequency of exposure is one factor here. Since children hear conventional forms more frequently than any non-conventional ones, from the largest number of speakers, those should be the forms that they judge as more adult-like and that they themselves will eventually favour in production over earlier erroneous forms. Indeed, as children get older, it has been argued, their regularisation errors may largely reflect problems they are having in retrieving the appropriate (conventional) form from memory: A child who produces *buyed* in lieu of *bought* has failed to retrieve *bought* and so constructs a past tense form using the regular morpheme *-ed* (see Marcus et al. 1992). Speakers could store irregular forms in memory – these must be learnt by rote – but construct all regular forms when they are needed on the basis of an abstract rule or schema that captures the generalisation, (for English, here) that the past tense is marked by the addition of the morpheme *-ed*. However, other processing considerations have led researchers to argue for storage of some (not necessarily all) regular forms as well as irregular ones in addition to being able to construct regular forms by rule, rather than proposing two quite distinct

types of processing with separate domains (cf. Frauenfelder & Schreuder 1991; Maratsos 2000).

### 2.3. Agreement

One major function of inflectional morphology is to mark **agreement** in a language, to indicate which elements (or groups of elements) belong together and which play a specific grammatical role. For example, gender marking on nouns, articles, and adjectives can indicate which of these elements belong together within an utterance. Case marking on nouns typically distinguishes the grammatical functions of noun phrases as subject, direct object, or indirect (dative) object of the verb. And number agreement on nouns and verbs, along with person agreement, can also indicate which noun phrase is the subject. Languages differ considerably in the extent to which they rely on inflections for these purposes, and hence in the patterns of agreement they exhibit. Acquisition of the ways inflections function syntactically in marking **grammatical concord** has been rather less studied than the acquisition of isolated forms. Available data suggest that children begin working on these systems (e.g., article-noun agreement in French or German, subject-verb and noun-adjective agreement in Hebrew) before age two though children may make many errors both of omission and commission on the way to adult mastery.

In case-marked languages, children's earliest words are case-marked, but they do not vary in form from one context to the next. In other words, the case inflection is treated initially as if it were part of the word. Very soon, however, children begin to contrast two (or more) case-markings, and to use them consistently. In Russian for example, children begin to use accusative marking on nouns following transitive verbs before age two (Gvozdev 1961). Nominative and accusative marking are usually the first two cases to be distinguished (MacWhinney 1978; Smoczynska 1985). Early case marking often interacts with word order, another device for marking grammatical relations in addition to pragmatic discourse structure. But although it is possible that children might rely on word order to mark grammatical relations prior to acquisition of case-marking, the data so far suggest that case marking emerges at least as early as consistent word order (Slobin & Bever 1982).

Case on its own, though, does not provide evidence for agreement. What is needed is subject-case combined with an appropriate form of the verb, agreeing in person and number. This form of agreement, like others, begins to appear between age two and three (e.g., Clahsen 1986; Meisel 1986; Tracy 1984; Vihman 1999, ed.). In Hebrew, for example, children make a number of errors in noun-adjective agreement in the first few months after age two, and often produce masculine singular adjectives with feminine singular nouns. These agreement errors then decrease in number and have typically vanished by age three. What appears critical in the mastery of agreement here is children's prior acquisition of plural inflections for nouns. Once those are in place, Hebrew-speaking children can use the same plural ending on noun and adjective to mark agreement, e.g., *ha-xaruz-im ha-gadol-im nofl-im* 'the-bead-PL the-big-PL fall-PL (the big beads are falling)' with a masculine plural head noun, or *ha-kubiy-ot ha-gadol-ot nofl-ot* 'the-cube-PL the-big-PL fall-PL (the big cubes are falling)', with a feminine plural head noun. That is, children rely on the phonological similarity of the inflections across word classes in marking agreement (Berman 1985; Levy 1983).

Children learning other languages also seem to rely on phonological cues to gender and number marking where possible. In Bantu languages like Sesotho, children must learn that every noun belongs in one of 14 classes, each marked by a prefix. Class prefixes (some of them identical in form to the noun prefixes) must also be added to verbs for both subject and object agreement, to adjectives, and to demonstrative, personal, possessive, and relative pronouns. Noun class markers emerge rather slowly from age two on, with both omissions and some over-use of class 9/10 prefixes (probably because many nouns used at this age come from this class). Adjectives and demonstrative, possessive, and personal pronouns are in use by age two, but often appear with the wrong class marker. By age three, though, children mark agreement with considerable consistency and accuracy. They are aided in this, it has been suggested, by the phonological similarity of class markers to the markers for each noun class (Demuth 1988).

In Romance languages like French, children again make some errors in article-noun agreement once they begin to produce articles, but by age three such errors no longer

occur. It takes French-speaking children slightly longer to master agreement for gender on adjectives and on pronouns. But by about age six, they are consistent in making articles and nouns agree, regardless of the natural gender of the referents. They appear to rely primarily on phonological correlations of word form (in the noun) and article in gender agreement (Clark 1985; Karmiloff-Smith 1979). Reliance on phonological rather than semantic cues also seems to be the norm for Slavic (Gvozdev 1961; Smoczynska 1985) and for German (Mills 1985).

Use of inflections to mark agreement emerges as soon as children begin to produce the pertinent morphology and the relevant syntactic combinations (i.e., subject-verb, article-noun, noun-adjective, etc.). This suggests that they have already represented those parts of the system in memory, and have done so on the basis of the language spoken to them in the community. It also suggests that children do not first use word order, for example, to mark grammatical relations and then switch to inflections. Rather, they will use the agreement patterns conventional in the language they hear, from the start. They may mark them imperfectly, but as they produce more of the relevant inflections, these appear to emerge without significant error. In fact, reliance on case versus word order as clues to grammatical relations varies with the typology of the target language (see Bates et al. 1984; Slobin 1985, ed.; 1992, ed.; 1997, ed.; Slobin & Bever 1982).

#### 2.4. Linear ordering of morphemes

Children appear to make no errors in the **ordering** of bound morphemes within words. When they add inflections to a base or stem, they do so in the right order. At first they add only single inflections, so the only error possible would be to add suffixal inflections as prefixes or prefixal ones as suffixes. But children apparently never make this type of error. Suffixes are added to the end, prefixes to the beginning, in the appropriate order.

The only morpheme order error attested for English occurs in a setting that adult speakers tend to avoid: the formation of the comparative of adverbial forms like *prickly* or *dirtily*. Instead of the adult solution of using *more*, as in *more prickly*, young English-speaking children sometimes try out forms like *prickerly* where they add the comparative degree marker before the adverbial *-ly*, and thus appear to order an inflection be-

fore a derivational morpheme. (However, there is some dispute about whether degree *-er* is an inflection at all.)

Many languages license strings of inflectional morphemes, on the end or the beginning of the stem form. Here children have many more opportunities for errors in order. Yet again, studies of agglutinating and polysynthetic languages such as Turkish, Mohawk, K'iche Maya, Greenlandic Eskimo, and Walpiri report no instances of order errors (cf. Aksu-Koç & Slobin 1985, ed.; Miethun 1988; Slobin 1985, ed.; 1992, ed.; 1997, ed.). This striking absence of error within words is consistent with the operating principle: "Keep the order of morphemes within a word constant across the various environments in which that word can occur" (Slobin 1985: 1231). Children's adherence to morpheme order within words contrasts to some extent with the freedom they use in ordering their words. Use of word order to mark grammatical relations, for example, emerges only slowly. Initially, one- and even two-year-olds typically use word order as a pragmatic device to mark information as given versus new, and only later learn that word order may, in some languages, mark such relations as 'subject-of' (e.g., Bates 1976). Although children rarely make errors in their ordering of constituents after age three to four, they may still make word-order errors within constituents, as when they combine a quantifier like English *some* with a demonstrative and a noun (e.g., *these beads*) to produce *\*these some beads* instead of *some of these beads*.

Children acquire languages of quite different morphological types in similar fashion. In English, they learn a relatively lean system of inflections combined with considerable irregularity in the established vocabulary, but in Turkish they master a rich bound morphology that is highly regular in form and transparent in meaning. And in Hebrew, they learn a synthetic system with rich inflectional marking plus an elaborate system of agreement. In all three languages, children's acquisition of inflections plays a central part in early grammatical development and simple clause structure. What they must add subsequently is mastery of subregularities or minor lexical schemas that are limited to specific sets of items, conjugations, or declensions, as well as lexical exceptions – the unpredictable, idiosyncratic irregularities of the lexicon.

### 3. Derivation

The acquisition of **derivational morphology** has, by comparison, been relatively neglected even though it is relevant both to grammatical form and to lexical structure. Nonetheless, there are extensive corpora of novel word formations available for English, French, German, Hebrew, Hungarian, and Polish (Clark 1993). Innovative words that rely on derivational morphemes are an important source of evidence that children have carried out some morphological analysis and are not simply using ready-made forms from the conventional lexicon. The data available consist of spontaneous innovations in the lexicon, elicited innovations, and elicited glosses of the possible meanings of novel words. Several domains have been studied in detail for the association of a derived morpheme with a specific meaning, e.g., agent and instrument nouns, compound nouns and other nominals, and denominal verbs.

#### 3.1. Conventionality

A major task in language acquisition is to master the conventional lexicon. But children often wish to talk about things for which they have not yet acquired the conventional terms. When this occurs, they may coin a word on the spot to serve their purpose (cf. Art. 80). The conventional lexicon plays a critical role in this because it displays the range of possible word-structures that children can make use of in building word forms to carry new meanings.

Children fill the gaps in their lexicon as needed. For adults, such gaps may be momentary (when speakers fail to retrieve a word on the tip of the tongue and so fill in with a coinage instead) or permanent (when speakers come across a true gap in the lexicon where there is no conventional word for the pertinent meaning). The same distinction exists for children, but their still-limited knowledge of the lexicon may lead them to coin many words where conventional terms already exist. These coinages are effectively ones that, for adult speakers, would be pre-empted by the conventional terms.

**Conventional terms** take priority over **innovative** ones. Speakers expect that if there is a conventional term for the expression of a particular meaning, it must be used for that meaning. If it is not, then the person talking must have some other meaning in mind. As a result, innovative words cannot simply be

produced in place of conventional ones. To be used at all, they must contrast with them in meaning (Clark 1990; 1993; Clark & Clark 1979).

For children, there are many more gaps to fill because their conventional vocabulary is still so small. The result is a large number of illegitimate **coinages** – innovations that are pre-empted (or blocked) by the existence of conventional words with just those meanings – as well as many legitimate ones. Both types of innovation allow us to look in some detail at what children at different stages know about word formation in their first language.

#### 3.2. Structural options for word formation

What do children know, at each stage, about possible form-meaning combinations in their language? **Word formation** is a critical domain for answering this question. The major options available in a language typically include derivation (with or without affixes) and compounding (Anderson 1985 b). When children innovate, they show us what they know about the forms of possible words in the language. This holds true both at the phonotactic level (where children never attempt to impose impossible consonant clusters or syllable structures) and at the level of morpheme combination. That is, children take account of typological features of their first language from a very early point in acquisition, and are sensitive to the kinds of word formation options favoured in the language they are acquiring.

English-speaking children, for example, rely heavily on **zero-derivation** for forming new verbs from as young as age two (e.g., *[to] scale* for ‘weigh’, *[to] oar* for ‘row’; cf. Clark 1982), but Hebrew-speaking children do not. Children acquiring Germanic languages rely extensively on **compounding** to form new nouns (e.g., English *car-smoke* ‘exhaust’, *cup-egg* ‘boiled egg’), again from age two on, but children acquiring Romance languages do not. **Derivational affixes** (e.g., *caker* ‘someone who makes cakes’, *sweeper* ‘broom’; Clark 1993) tend to emerge slightly later, so in languages that favour derivation over compounding, children may not produce many coinages until age three or later. In general, children acquire suffixes before prefixes (Kuczaj 1979), for both inflection and derivation. Other options such as blending or clipping emerge later still, and are usually favoured more by adults than children (Ravid 1990; 1995). Compounding combined

with derivation emerges later than compounding alone. Just as with inflections, children begin with the stem and then add the modulation of meaning, whether through affixation, compounding, or some other means.

Children's earliest choices of word-forms for new meanings appear to be governed by two main factors in addition to typology: (a) the **simplicity** of the form used, with a premium on the fewest changes possible in the base form, and (b) the **transparency** of the meaning expressed, in relation to the meaning of the base. The youngest children favour coinages with zero-derivation (as in the English innovative verbs *[to] sand* 'grind into small pieces' or *[to] rug* 'vacuum a rug', both from two-year-olds) or simple noun + noun compounding as in *plate-egg* 'fried egg' or *baby-towel* 'face-cloth' (also from two-year-olds). The compounds are also transparent to the degree that the head noun denotes the kind of category being talked about (here an egg and a towel). As children analyse the meanings of affixes, their coinages become increasingly transparent: they add the appropriate affix to a base, and use English *-er*, for example, to mark the agent or actor (as in *rainer* '(imaginary) person who makes rain go away' or *crayoner* 'someone who makes pictures with crayons') (Clark & Hecht 1982; Clark & Berman 1984).

In short, children's lexical innovations show that they know a lot about the regularities of word formation in their language, even though they may not yet know the conventional terms for the referents they talk about.

### 3.3. Productivity

Once children have acquired several options related in meaning for forming new words, they have to choose which to use on particular occasions. Their choices appear to be guided by which option is the most **productive** for adult speakers in the same community (cf. Art. 33). Children rely more frequently on the device adults favour than on other options also available in the language. For example, in English, four- and five-year-olds favour agentive *-er* over *-ist* and *-ian*, and, in Hebrew, children favour suffixal *-an* to mark agents over the other options available (Clark & Berman 1984; Clark & Cohen 1984).

Previous research also shows that when adult preferences for one option over others change, children's choices of forms follow the

adults'. Children must therefore be tracking the frequencies of different form types in the input they hear. Shifts in what is productive for adult speakers are paralleled by shifts in children's preferences in the forms chosen for lexical innovations (Chmura-Klekotowa 1970).

Productivity in word formation presents a rather different face to productivity in inflection. In word-formation, some slots in a paradigm may be taken by existing words with the appropriate meanings, so use of the otherwise regular form is pre-empted by the existence of another form with the pertinent meaning. The degree of regularity overall is therefore somewhat lower than in inflectional paradigms. At the same time, the forms of innovative lexical items, coined to contrast with existing form-meaning combinations, offer strong evidence for the relative productivity of specific affixes or compounding patterns. In word formation, then, new formations, whether nonce uses or words that eventually enter the conventional lexicon, provide critical evidence for productivity (Berman 1987; 2000).

### 3.4. Order in word formation

When children coin words, they often make errors, but they rarely, if ever, make mistakes in how they order the morphemes within a new word. That is, derivational morphemes are consistently added to the base or stem before children add any inflections. And where they need to add more than one derivational or inflectional affix to a single stem, these too are placed in the correct order, as in *sweeper-s* (verb + *er* + *s*) for the machines used to sweep streets. This attention to morpheme-order within the word is all the more striking in the face of order errors elsewhere.

Children do make frequent order errors in compounds in some languages. These errors appear to be largely predictable on typological grounds and occur where there is a mismatch of head-modifier ordering in different constructions. For example, in English, the head of the verb phrase is the phrase-initial verb (e.g., *throw* in *throw the ball*). But in compound nouns, the head is in final position (e.g., *climber* in *cliff-climber*). Where the compound contains a verb stem (*climb*), children go through a stage of mis-ordering the modifier and head to produce compounds like a *climb-cliff* or a *climber-cliff* for 'someone who climbs cliffs'. But in languages with the same head-modifier order across con-

structions, children never make such errors (Clark 1993; Clark & Berman 1987).

Children are consistent in adhering to the ordering of morphemes within words. They begin with the base or stem form, add the relevant derivational affixes, and then add any inflections needed. Within words, children rarely if ever make errors in the linear ordering of affixal morphemes.

#### 4. Summary

After initial acquisition of single words, children aged two to three gain command of the syntax of simple clauses. They typically master case-marking with prepositions first, and then inflectional marking of agreement for number, gender, and person. They begin to add the modulations of case, tense, and other inflections before their second birthday, but make systematic errors along the way. Derived forms may also begin to appear between age two and three as children turn to coinage to fill gaps in their vocabulary. But the extent of such early reliance on derivation is limited. This is particularly clear in a language like Hebrew, where nearly all the word-formation processes require use of affixal morphology (Berman 2000). In languages like English, where zero derivation (without affixes) is also an option for word formation, children take advantage of it as young as age two to coin verbs from nouns. They may also begin to use derivational affixes that do not demand any change in the shape of the word stem (e.g., English *-er* in agent nouns like *jumper*) soon afterwards. However, derivational affixes appear to enter in large numbers only after age three. In both inflection and derivation, children regularise. They treat irregular forms as if they were regular, adopting those paradigms with the largest number of members (types) as their templates. The learning of lexical exceptions, whether inflectional or derivational, occurs only after mastery of regular forms.

The next year, from age three to four, is critical in word formation. It is then that children analyse the internal structure of words and become capable of coining new words with derivational affixes. They do this with a range of form-types consistent with the options in the target language (Clark 1993). Indeed, the ease with which children master morphological structure depends heavily on the typology of the language, for example

whether it is synthetic, polysynthetic, isolating, or agglutinating. It also depends to a large extent on the nature of the meaning-to-form mappings for inflectional and derivational paradigms. Finally, some lexical options in word formation are more productive than others, and the more productive they are, the earlier they tend to be acquired. In English and German, for instance, compounding appears much earlier than in Hebrew or French. Other options may be acquired late because they are formally very complex, as is the case for vowel-laxing and stress-shifts with derivation in the Latinate vocabulary of English, or for passive forms and certain derived nominals in Hebrew. Finally, some word-formation types may be used only in formal or written registers, and there, the patterns of usage account for late acquisitions in word-formation (see Jisa et al. 2002).

### 1. Morpheme-acquisition order

The first developmental studies in second-language (L2) acquisition dealt with the acquisition of a given set of morphemes in L2 English. In particular, it was studied in which order these morphemes were acquired. The reason for carrying out these studies was a discussion on the nature of L2 acquisition in the mid-seventies. The central issue of this discussion was the role of the mother tongue (L1). Dulay & Burt (1974; 1975) argued that L2 acquisition, like L1 acquisition, was essentially a process of “creative construction”. Given their assumption that L2 learners relying on their L1 could only do so if they were applying old habits, they compared L1 and L2 acquisition in order to demonstrate that L1 was not a relevant factor.

In order to test their claim on the irrelevance of L1, Dulay & Burt (1974; 1975) compared morpheme acquisition order in the L2 English of children with differing language backgrounds. It was found that the order of acquisition was independent of the L1. Therefore, since old habits did not play a role in L2 acquisition, it was concluded that L2 acquisition, just like L1 acquisition, was a process of creative construction. A similar conclusion was reached by Bailey et al. (1974) leading to what Krashen (1977) called the ‘Natural Order’ for L2 English represented in Fig. 166.1.

The studies by Dulay & Burt and Krashen were the first of many similar studies on the acquisition of morphemes in L2 English by native speakers of differing L1s (e.g. Larsen-Freeman 1975 and Andersen 1978). In addition, processes of morpheme acquisition in an L2 were compared with morpheme acquisition in other acquisitional and developmental contexts. For example, L2 acquisition was compared with processes of pidginization and creolization as well as diachronic change in language. The results of all the morpheme studies point to a common or nat-

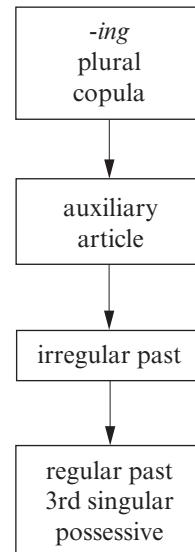

Fig. 166.1: Krashen’s (1977) ‘Natural Order’ for L2 English

ural order of acquisition which is seen as evidence for L2 learning as a process of creative construction. Most of these studies, however, have not paid a great deal of attention to what mental mechanisms could explain the particular orders found.

### 2. Inherent inflectional morphology

As proposed in Booij (1994), two types of inflection should be distinguished, **inherent** and **contextual inflection**. Inherent inflectional morphology as opposed to contextual inflectional morphology serves to express a particular semantic content. Examples of inherent inflection are tense or aspect with verbs and number with nouns.

#### 2.1. Past tense

The acquisition of past tense morphology in English has become an area of heated debate between adherents of connectionist and symbolic models of language acquisition. The question is whether or not there is an essential difference between regular and irregular forms with respect to acquisition, storage, and production. Within a **symbolic framework**, linguistic knowledge of the regularly formed past tense form in English is ade-

quately represented by a morphological rule, whereas irregular forms are stored as associative knowledge (Pinker & Prince 1988). Within the **connectionist view**, on the other hand, there is no principled difference in linguistic status between regular and irregular forms. All types of past morphology are based on associative relations (Rumelhart & McClelland 1986). Notions such as rules and **overgeneralizations** are only to be seen as epiphenomena (Bates et al. 1983).

L2 acquisition of regular and irregular verbs was studied by Lalleman et al. (1997). They wanted to find out whether or not it is possible for advanced learners of L2 Dutch to implicitly acquire the same kind of unconscious linguistic knowledge as L1 speakers. Based on the idea that production by rule is not affected by **frequency** of occurrence, whereas **lexical retrieval** is, they hypothesized that production time for irregular verbs is faster with familiar forms than with unfamiliar forms.

In order to investigate this hypothesis they carried out a production time experiment for past tense formation. The results from this experiment were similar to those from the experiments on L1 English. First, differences in production time were found between regular and irregular past tense forms. Furthermore, high-frequency irregular past tense forms were produced faster than their low-frequency counterparts, while with regular verbs there is no effect of past tense frequency on the production time, neither for L1 nor for L2 speakers. Obviously, native speakers were faster than L2 learners and differences in production time between regular and irregular forms were larger with L2 learners.

Lalleman et al. (1997) also compared production time of prototypical and atypical regular verbs. Prototypical regular verbs are those with a short vowel (except *i*, *e*) plus a geminate consonant in the infinitive form. They are prototypically regular because, as far as their morphology is concerned, there are no irregular counterparts. Examples are Dutch *knallen* 'to bang', *bukken* 'to stoop', *klappen* 'to clap' (an exception is *vallen* 'to fall'). Prototypical regular verbs are produced more quickly and with fewer errors than other regular verbs. Comparing the percentages of irregularization errors in 11 prototypical regular verbs such as *knallen* 'to bang', *bukken* 'to stoop', *klappen* 'to clap', and in 11 atypical regular verbs such as

*kleven* 'to stick' and *huilen* 'to cry', they found that L2 learners irregularize past tense forms in prototypical regular verbs less often (0,3 percent) than in atypical regular verbs (12,0 percent). In this respect L2 learners behave differently from native speakers. This L2 learner behaviour is probably due to the way in which morphological rule formation takes place. Rule formation in morphology depends on type frequency, i.e. the frequency with which different lexical items share the same morphological properties. Since there are classes of high-frequency irregular verbs which share morphological properties with regular verbs, L2 learners are likely to infer that these verbs are to be related on the basis of a particular morphological rule. As long as learners do not know that this apparent regularity is just an epiphenomenon of the lexical properties of an arbitrary list of verbs, L2 learners may treat regular verbs with similar morphology the same way.

## 2.2. Aspect

In child language acquisition, studies by Bronckart & Sinclair (1973), Antinucci & Miller (1976), and Bloom et al. (1980) started a debate on whether past morphology is initially used for coding past tense or perfective aspect. In L1 acquisition this issue has been addressed in connection with what is called the Defective Tense Hypothesis (Weist 1986). In studies on second language acquisition the same question of 'aspect before tense' or 'tense before aspect' became relevant with respect to the development of interlanguage morphology.

With respect to the acquisition of L2 Spanish by native speakers of English, Andersen (1991) found a developmental sequence for encoding tense and aspect with past morphology. Given a semantic classification of verbs into the four verb categories 'states', 'activities', 'telic events', and 'punctual events', Andersen discovered that L2 learners approach the L2 system by linking aspectual marking and lexical meaning: "[t]he Spanish Preterit and Imperfect are initially interpreted as [redundant] markers of inherent aspect" (Andersen 1991: 319). This results in a developmental process in which the Imperfect is first used for states (*tenía* 'had') and then also for activities (*jugaba* 'played'), whereas the Preterit is first used for punctual events (*se partió* 'broke in two') and later for telic events (*enseñó* 'taught x to y') as well (see Fig. 166.2).

imperfect →			← preterit
states	activities	telic events	punctual events
<i>tenía</i> ‘had’	<i>jugaba</i> ‘played’	<i>enseñó</i> ‘taught x to y’	<i>se partió</i> ‘broke in two’

Fig. 166.2: Aspectual/lexical meaning in L2 Spanish (Andersen 1991: 314)

states	activities	telic events	punctual events
<i>tenía</i> ‘had’	<i>jugaba</i> ‘played’	<i>enseñó</i> ‘taught x to y’	<i>se partió</i> ‘broke in two’
<i>tuvo</i> ‘had’	<i>jugó</i> ‘played’	<i>enseñaba</i> ‘taught x to y’	<i>se partía</i> ‘broke in two’

Fig. 166.3: Grammatical aspect in Spanish (Andersen 1991: 314)

Subsequently, learners gradually also acquire the use of the Imperfect with telic and punctual events and the use of the Preterit with activities and states (see Fig. 166.3). This means that in the end they will have acquired the variable use of past tense morphology as a device for marking grammatical aspect according to the perspective the speaker may take with respect to the temporal course of the situation.

Giacalone Ramat (1995) observed a systematic opposition between simple present and past participle morphology in the initial stages of L2 Italian of native speakers of Chinese, Eritrean, Iranian, English, German, and French. An example from Giacalone Ramat (1995) is given in (1).

- (1) *Poi aperta la bottiglia... poi*  
 then open:PAST.PART the bottle then  
*bevi vino.*  
 drink:3.SG wine  
 ‘After he opened the bottle, he drinks wine.’

Giacalone Ramat argued that this opposition has to be interpreted in terms of aspect: the simple present form or the infinitive encodes imperfective aspect, whereas the bare past participle indicates perfect aspect.

Another observation by Giacalone Ramat indicates that L2 learners of Italian initially encode the aspectual opposition imperfective aspect vs. perfect aspect lexically. This explains why in many cases punctual and telic verbs are marked with a past participle form (such as *arrivato* ‘arrived’, *lasciato* ‘left’, *trovato* ‘found’), whereas durative and stative

verbs (such as *stare* ‘stay’) receive imperfect marking. An example is given in (2).

- (2) *Pensi così + + quanto*  
 think:1.SG so if  
*trovato molto bene + stare*  
 find:PAST.PART very well stay:INF  
*qui + va bene.*  
 here go:3.SG well  
 ‘I think so: If I feel O.K. in Italy, I’ll stay here.’

With respect to the acquisition of L2 German, Dutch, and English, it has been noted that, independently of the L1, tense is acquired before aspect. This results from research by Dietrich et al. (1995) on L2 German, by Housen (1993) on L2 Dutch and by Vogel (1987) on L2 English. These authors draw the conclusion that their L2 learners first distinguish between past and non-past. Andersen (1991), however, concludes from a number of studies on the acquisition of L2 English, that here past inflection is first used only with punctual verbs (*left*), then also with telic verbs (*taught*), subsequently for activities too (*ran*), and finally also with verbs referring to states (*had*).

### 2.3. Plural

For L2 learners, plural marking in German is difficult to acquire due to the fact that the German plural system consists of nine plural markers. Studies dealing with L2 learners' plural marking in German are Köpcke (1987) and Wegener (1994; 1995). In Köpcke (1987), plural marking on pseudowords is experimentally investigated in 40 adult native

speakers. The data are compared with L2 learners' data from 80 English speaking American students of German who were studied by Phillips & Bouma (1980). Wegener collected data from two groups of children between 7 and 9 years of age: 4 Turkish children participating in bilingual classes and 4 *Aussiedler* children (3 Polish and 1 Russian) going to transition or regular classes. Both studies focused on processes of rule formation and thus on processes underlying overgeneralization.

First, Wegener found that regularizations are formed with *-Ø*, *-e*, *-(e)n*, *-s*, and "practically never with *-er* and the Umlaut" (Wegener 1994: 277). Furthermore, "the *-(e)n* plural is the most frequently overgeneralized plural" (Wegener 1994: 279). With respect to the order in which these overgeneralizations were acquired, it was found that first *-(e)*, then *-(e)n*, and finally *-s* was learnt.

Köpcke's analysis of the L2 learners' pseudoword production leads to similar findings. The plural morphemes most frequently used were *-(e)n* and *-e*. In one-syllable words with no particular morphological properties, *-(e)n* and *-e* are used most frequently with no obvious gender bias.

To explain the fact that *-en* and *-e* are overgeneralized, Wegener assumes that in dealing with the input data learners may choose between two strategies: a holistic-formulaic or a cognitive-analytic strategy (cf. Art. 163). If learners first acquire plural forms as unstructured wholes and analyze them later, the holistic-formulaic strategy is applied. If they are geared towards the identification of plural markers and rules for plural formation, learners apply a cognitive-analytical strategy. In her data Wegener has found evidence that rule formation is aided by high type frequency. High type frequency means that many different nouns have the same plural marker. High type frequency furthers rule formation because the more heterogeneous the nouns with a particular plural marker, the more productive or applicable this plural marker is. The fact that it is first the plural *-e* that is regularized most frequently is explained by its higher token frequency in the basic lexicon. Later in the acquisition process it is substituted by *-(e)n*, which has the highest type frequency. Furthermore, whereas in the target grammar, use of a particular plural marker depends on markedness and gender of the noun, in the L2 learners' grammar it correlates with word endings: nouns ending

with *-e* have plural *-n* (as in *Jungen* 'boys'), nouns ending with a consonant have plural *-e* (as in *Türe* 'doors', *Elefante* 'elephants'), and nouns with pseudosuffix *-el* have *-Ø* or *-n* (as in *Kugel* or *Kugeln* 'bullets').

### 3. Contextual inflection

Inherent inflectional morphology serves to express a particular semantic content independently of its syntactic context. Contextual inflectional morphology, however, depends on particular properties of syntactic context cf. Booij (1994). In the following sections, two examples of the L2 acquisition of **contextual inflection** will be discussed: the acquisition of finiteness in L2 German and L2 Dutch and adjectival morphology in L2 Dutch.

#### 3.1. Finiteness

In L2 German and Dutch the acquisition of finiteness constitutes an important target. Verb inflection in German and Dutch is context-dependent in the sense that morphology is determined by the person and number of the subject. It is obvious, however, as illustrated in (3), (4), and (5), that use of inflectional morphology also correlates with positional properties.

- (3) (a) *Karl gibt Hans ein Buch.*  
*Karel geeft Hans een boek.*  
 Charles give:3.SG John a book  
 'Charles gives John a book.'
- (b) *Gibt Karl Hans ein Buch?*  
*Geeft Karel Hans een boek?*  
 give:3.SG Charles John a book  
 'Does Charles give John a book?'
- (4) *Ich sehe, daß Karl Hans ein Buch gibt.*  
*Ik zie dat Karel Hans een boek geeft.*  
 I see:1.SG that Charles John a book give:3.SG  
 'I see that Charles gives John a book.'
- (5) *Karl möchte Hans ein Buch geben.*  
*Karel wil Hans een boek geven.*  
 Charles want:3.SG John a book give:INF  
 'Charles wants to give John a book.'

Verb forms showing agreement (i.e. finite) morphology, occur in second (3 a) or first po-

sition (3 b) in main clauses, whereas in subordinate clauses they occur in sentence-final position (4). Verb forms with no inflectional morphology always appear in sentence final position (5).

In the initial stages of the acquisition of L2 German by L1 Italian speakers, learners apparently assume that verbs should occur in first or second position. This is what they know from their L1. Then, (as evidenced by Klein & Carroll 1992: 157 ff.) at some point they learn that lexical verbs can occur both in non-final and final position, without noticing that these positional options correlate with finite vs. non-finite morphology. What they do seem to acquire, however, is that this distributional difference correlates with the absence or presence of an auxiliary. Illustrations of this particular stage of acquisition are utterances from Gina, which were collected within the framework of the European Science Foundation project as reported in Klein & Carroll (1992).

- (6) *gucken in eine bäckerei*  
look:INF in a bakery  
'to look into a bakery'
- (7) *und dann habe eine brot*  
and then have:1.SG a bread  
*gebringen*  
bring:PAST.PART  
'and then I have brought a loaf of bread'

As Gina is able to learn the positional properties of lexical verbs independently of the relevant functional property of finiteness, it is not at all obvious how she will eventually be able to do so. What seems to be crucial to the acquisition of finiteness by learners such as Gina, is the acquisition of particle verbs with a separable particle. An example is *zurückkommen* (come back) in *er kommt morgen zurück* 'he come:3.SG tomorrow back (he comes back tomorrow)'. The acquisition of separable particle verbs focusses learners on the variability of the position and the form of the lexical verb with respect to the particle. See e.g. the position of *kommt* and *gekommen* in (8).

- (8) *kommt zurück vs. ist zurückgekommen*

The acquisition of finiteness in L2 Dutch by L1 speakers of Turkish differs from the acquisition of L2 German by Romance speakers. While the particular properties of the target languages are the same, the developmental processes differ.

It is typical of Turkish learners of Dutch (see Coenen & Klein 1992; Jordens 1988) that in the initial stages they use most of the lexical verbs with non-finite morphology in final position, as in (9). Only a small group of verbs occurs with finite morphology in initial, i.e. first, second or third position, as in (10). The examples in (9) and (10) are taken from Mahmut.

- (9) *En dan die politie gezien.*  
and then that police seen:PAST.PART  
'And then he saw the police.'
- (10) *Ja, dan politie komt naast.*  
yes then police come:3.SG next  
'Yes, then the police comes next.'

Ergün is a good example of a Turkish learner who has reached a more advanced developmental stage. When he begins to use infinitives in final position with modal verbs as in (11) and past participles in final position with or without auxiliaries as in (12), he also uses non-finite verbs in non-final position most of the time as in (13).

- (11) *Hij zegt, "ik wil niet gaan buiten".*  
he say:3.SG I want:1.SG not go:INF outside  
'He says, 'I do not want to go outside'.'
- (12) *Ja dan is terug naar achter politie/politie gaan.*  
yes then be:3.SG back to after police/police go:PAST.PART  
'Yes, then he went after the police again.'
- (13) *Hij gaan werk of zo.*  
he go:PAST.PART work or so  
'He goes to work probably.'

This opposition between (11) and (12), on the one hand, and (13), on the other, indicates that in final position lexical verbs are used to describe the 'non here-and-now', whereas in non-final position lexical verbs are used to refer to the immediate 'here-and-now' situation.

At the point at which Turkish learners discover that for a description of here-and-now situations the lexical verb must be placed in non-final position, they will notice that the target model does not have *-en* morphology. This means that now, faced with positive evidence, they are able to learn the target-like, correct forms.

### 3.2. Adjectival morphology

Adjectival morphology in languages such as French, Dutch, and German depends on relations of **agreement**. In French, for example, depending on grammatical gender and number of the noun, adjectives vary with respect to their morphological endings: *la grande hotel* ‘the big hotel’, *le grand café* ‘the big café’, *les grandes hotels* ‘the big hotels’. In Dutch, adjectival morphology also depends on whether the determiner is definite or indefinite: *het dikke boek* ‘the thick book’, *een dik boek* ‘a thick book’. Furthermore, in German adjectives vary according to grammatical case as well. For example, in the case of a singular noun with masculine gender, adjectives have different morphology according to whether the noun is nominative or accusative: *der dicke Baum* (nominative) ‘the big tree’, *den dicken Baum* (accusative) ‘the big tree’.

An interesting case for the L2 acquisition of adjectival morphology is Dutch. Here, the target system is relatively simple. Only with nouns that have neuter gender (evident from the use of the article *het*) can adjectives have or not have *e*-morphology depending on whether the noun is definite, as in *het dikke boek* ‘the thick book’, or indefinite, as in *een dik boek* ‘a thick book’. Masculine/feminine nouns (with the article *de*), on the other hand, always have *e*-morphology regardless of whether they are definite, as in *de dikke boom* ‘the big tree’, or indefinite, as in *een dikke boom* ‘a big tree’.

With regard to language use there are two ways in which this type of knowledge may be represented. One possibility, as illustrated in (14), is that the rules of adjectival morphology are stored as a property of the noun.

- (14)  $N_{de}$  with definite article: adj. *-e*  
with indefinite article: adj. *-e*
- $N_{het}$  with definite article: adj. *-e*  
with indefinite article: adj. *-Ø*

Another possibility is that the use of *-e* or *-Ø* is stored not as a property of the noun but as a property of the determiner *de* or *het*, such that *de* can be substituted by the options given in (15 a) and *het* by those in (15 b):

- (15) (a) *de de* [ADJ]*e een* [ADJ]*e*  
(b) *het het* [ADJ]*e een* [ADJ]

If the use of adjectival morphology is based on a knowledge system as represented in (15), language learners can be expected to produce

errors such as: \**de (grote) bos*, \**een grote bos*, \**het (dikke) boom*, \**een dik boom*. However, one would not expect to find errors such as \**del\*het dik boom* or \**del\*het groot bos*. Analysis of a set of production errors (Jordens 1992) leads to the conclusion that this is indeed the case. L2 learners of Dutch make many errors as in (16). Here, the errors are due to incorrect gender.

- (16) *Gelukkig mijn vader woont in een rustig wijk.* (correct: *rustige*)  
‘Fortunately, my father lives in a quiet neighbourhood.’
- Hij is een betrouwbare mens.* (correct: *betrouwbaar*)  
‘He is a reliable person.’

Errors based on the use of an indefinite adjectival form in a definite context (\**del\*het dik boom*, \**del\*het groot bos*) do not occur. Moreover, there is evidence that learners using *e*-morphology with the adjective in an indefinite noun phrase use *de* as the definite article, while learners using *Ø*-morphology with the adjective use *het*. Hence, relations of adjectival agreement are learnt as syntactic patterns which constitute the morphological properties of either *de-* or *het*-nouns.

### 4. Case marking

Structural case is usually seen as an example of contextual inflectional morphology, because it is the verb that determines both the number and the kind of case positions that are required. German, however, also allows a choice between dative and accusative morphology, i.e. between *ihm* and *ihn* in sentences as in (17).

- (17) *Der Hund beißt ihm/ihn in das Bein.*  
the dog bite:3.SG 3.SG.M.DAT/ACC in the leg  
‘The dog bites him in the leg.’

Using experimental and corpus data, Zubin (1975; 1977; 1979) has argued that the use of dative vs. accusative morphology is determined by what he calls ‘degree of contribution’. The notion ‘degree of contribution’ is defined by Zubin as “the degree to which a participant is ‘agent-like’ in an event” (Zubin 1975: 174f.).

With respect to subject selection in particular, Ertel (1974; 1977) has shown in several experiments that it is the egocentric bias

which is the determining variable. This means that “symptoms of relative closeness between the subject element and the speaker’s ego” (Ertel 1977: 147) decide which participant is chosen as the subject of the sentence.

In order to explain the use of **case morphology** in the L2 German of Dutch learners, I assumed that here too principles of ego-nearness and degree of contribution played a role (Jordens 1986; 1992). Use of these principles by L2 learners of German explains why in (18) the indirect object is incorrectly marked with nominative case, and why in (19) the grammatical subject is incorrectly marked with accusative case.

- (18) \**Er wurde von uns geholfen.*

he was by us help:PAST.PART  
(correct: *Ihm*)  
‘We helped him.’

- (19) \**Den Sieg ist mir*

the victory:ACC is me  
*entgangen.*  
escape:PAST.PART  
(correct: *Der Sieg*)  
‘Victory deluded me.’

Second, according to the principles underlying subject selection, sentences with a rhematic subject are processed as if they are subjectless. Hence, it can be understood why it is that with this type of subject L2 learners of German typically use incorrect accusative case. An example is given in (20).

- (20) \**es wurde einen*

there become:PAST.3.SG INDEF:ACC.SG.M  
*Fall erwähnt*  
case mentioned  
(correct: *ein Fall*)  
‘a case was mentioned’

Third, object topicalization is a way of expressing ego-nearness of the object. Hence, Dutch learners of German often incorrectly use nominative morphology here. An example is given in (21).

- (21) \**Jeder Republikaner betrachtete*

every Republican consider:PAST.3.SG  
*er als seinen persönlichen Feind.*  
he as his personal enemy  
(correct: *Jeden Republikaner*)  
‘He considered every Republican a personal enemy.’

## 5. Derivation

In French there are two morphological devices to derive nouns from verbs. From transitive verb stems, nouns can be formed with

the affix *-age*. An example is *raffiner* ‘to refine’ – *raffinage*. From intransitive verb stems, nouns can be formed with the affix *-ment*. An example is *embarquer* ‘to embark’ – *embarquement*. In an experiment on the role of error correction, Carroll et al. (1992) investigated whether native speakers of English are able to learn to use these noun formation rules productively in L2 French. Knowledge of noun formation in French was tested by having subjects give the corresponding noun to a given verb, as in the following test items: *Dans cette usine, on RAFFINE le sucre* ‘In this factory, they refine sugar’. *Donc, c'est une usine de ...* ‘So, it's a refinery’. *Le champagne doit PÉTILLER* ‘Champagne should bubble’ ... *est bon signe* ‘This bubbling is a good sign’. “When the subjects in the experimental group made an error, they were given the correct response” (Carroll et al. 1992: 180). The aim was to find out if this procedure would enable adult learners to construct morphological generalizations. However, the results of the experiment were negative. Carroll et al. had to conclude that their experimental subjects were not able to induce “the subcategorization properties of the suffixes *-age* and *-ment*” (Carroll et al. 1992: 186).

Whereas in this particular experiment Carroll et al. (1992) found no evidence that L2 learners of French learn the use of *-age* and *-ment*, there is evidence showing that in other circumstances L2 learners do learn to use L2 derivational properties. This evidence comes from research on the use of compensatory strategies. Poulsis (1995: 147), for example, noted that Dutch learners of English who did not know the lexical verb *to iron* produced the verb *ironize* instead, thus showing that they learnt to use the suffix *-ize* productively as a device to derive verbs from adjectives and nouns, as in *normalize*, *foreignize*, *synchronize*, *womanize*.

It is a matter of investigation why it is that with respect to *-age* and *-ment* L2 learners were not able to discover the underlying generalization, whereas in the case of the suffix *-ize* they were. It seems reasonable to hypothesize that transfer plays a role here. While the difference between *-age* and *-ment* is a property of French which does not exist in English, there is a Dutch equivalent to the English suffix *-ize*. Therefore, as soon as Dutch learners of English discover that the L1 derivational morpheme *-iseren* can have the same function as *-ize* in English (as, for example,

in *normaliseren/normalize, verbaliseren/verbalize*), it may be used as productively as the L1 equivalent.

## 6. Compounding

In compounding, typological properties with respect to head-modifier relations become manifest (see Art. 165). In Dutch, for example, compounds have modifier-head structure. However, in comparing compounds such as *afdelingshoofd* ‘department-head’ with their [noun phrase + prepositional phrase] equivalent *hoofd van de afdeling* ‘head of the department’, it is obvious that, with regard to the structure of complex noun phrases, input data for L2 learners must be confusingly ambiguous: the same meaning can be expressed either by a modifier-head or a head-modifier structure. Interestingly, the same holds for nominal possessive constructions. A nominal possessive with a preposed genitive as in *mijn vaders broer* ‘my father’s brother’ can also be expressed as a [noun phrase + prepositional phrase] construction such as *de broer van mijn vader* ‘the brother of my father’.

Particularly interesting with respect to the acquisition of compounding is a comparison of the acquisition of L2 Dutch by native speakers of Turkish and Moroccan. This is because typologically Turkish is structured in terms of modifier-head relations, whereas Moroccan has underlying head-modifier structure. Since both Turkish and Moroccan learners of Dutch encounter structures which are typologically similar to the way in which the head-modifier relations of their L1 are instantiated, there is reason for each of these learner groups to assume that Dutch is structured like their native language. Evidence from these learners’ data on the acquisition of **compounds** and nominal possessives shows that this is precisely what is found (Broeder 1991: 171 f.). As illustrated by the examples (22) and (23), Turkish informants prefer to use compounds or complex noun phrases with head-modifier structure, while the Moroccan subjects choose the [noun phrase + prepositional phrase] equivalent with modifier-head structure.

- (22) L1 Turkish:  
*sigaretten-winkel*  
 cigarette-shop  
 ‘cigarette shop’

L1 Moroccan:  
*winkel van sigaret*  
 shop of cigarette  
 ‘cigarette shop’

- (23) L1 Turkish  
*vader zus*  
 father sister  
 ‘father’s sister (aunt)’  
 L1 Moroccan:  
*die dochter van ander vrouw*  
 the daughter of other woman  
 ‘the daughter of the other women’

An interesting example discussed recently by Clahsen (1991) is the acquisition of compounding in L2 German. In German, there is a relation between plural formation and compounding: plurals with -Ø (*Lehrer* ‘teachers’), -e (*Schweine* ‘pigs’), -e and Umlaut (*Mäuse* ‘mice’), -er (*Kinder* ‘children’), -er and Umlaut (*Kräuter* ‘herbs’), and -(e)n (*Schrauben* ‘screws’) are accessible to compounding, while plurals with the inflectional -s marker (*Autos* ‘cars’), are not. Examples are: *Lehrermangel* ‘teacher shortage’, *Schweinefleisch* ‘pork’, *Mäusemännchen* ‘little mouseman’, *Kindergarten* ‘kindergarten’, *Kräuterkuchen* ‘spicecake’, *Schraubenzieher* ‘screwdriver’, *Autfriedhof* ‘car cemetery’.

Clahsen observed that native speakers of Spanish, Portuguese, and Italian initially used -e, -er, and -en as plural markers for compounding in L2 German (24 a). Furthermore, in some cases -en was left out in the early stages (24 b), while -s was never used (24 c).

- (24) (a) *schweinefleisch* ‘pork’  
*kindergarten* ‘kindergarten’  
*schraubenzieher* ‘screwdriver’  
 (b) \**krankkasse* (correct: *Krankenkasse*)  
 ‘health insurance’  
 \**tapetenfabrik* (correct: *Tapetenfabrik*)  
 ‘wallpaper factory’  
 (c) *kontonummer* ‘bank account number’

Clahsen assumes innate level ordering to explain why the -s plural – which he regards as the default plural form – does not occur in L2 German compounding and why, at an intermediate stage of the acquisition of German at which -en is seen as the regular plural ending, -en does not occur in compounds either.

Lardiere (1995) investigated the acquisition of compounding in the L2 English of native speakers of Spanish and Chinese. Sub-

jects were asked to produce novel compounds in response to questions such as: "What could you call a person who cleans shoes/protects children/wears pants, etc.". The aim of the experiment was to see whether subjects would produce plurals inside deverbal (synthetic) compounds. In the test questions, subjects were confronted with three types of plurals: regular plurals (*babies, cats*), irregular plurals (*children, mice*), and pluralia tantum (*pants, people*). Most of the 15 Spanish subjects used both regular and irregular plurals inside these compounds, there were only 2 subjects who correctly produced irregular plurals in compounds while omitting regular -s plurals. The Chinese speakers, on the other hand, while tending to omit the regular plural -s in compounds, also often used singular forms for irregular plurals and even for pluralia tantum. From this Lardiere concludes that "there is no evidence of the engaging of a universal constraint prohibiting regular plurals in compounds" (Lardiere 1995: 42). Furthermore she notes that given the fact that Spanish has plural objects in compounds, as in *un lavaplatos* 'dishwasher' and *un abrelatas* 'can-opener', whereas Chinese has no plural inflection at all, "the subjects' L1 clearly seems to be having some kind of influence on their responses" (Lardiere 1995: 42).

One may wonder how it is possible that Clahsen and Lardiere come to such contradictory conclusions. In order to understand why this is the case, one has to acknowledge that English and German are linguistically different as far as compounding is concerned.

First, in English, the -s plural is the default while in German, contrary to Clahsen's beliefs, it is not. As has been pointed out by Wegener (1994: 270), the -s plural in German has marked status, whereas due to high type frequency -e and -en are the default plural markers. Second, in German the -s occurring in compounds such as *Arbeitsamt* 'employment service' and *Brechungsindex* 'refractive index' is a linking morpheme and not a plural marker. Third, contrary to English, German never has the plural -s in compounds, whether in deverbal, as in *Autoverkauf* 'car sale' or in root compounds (see German *Trambahn* 'tramway' vs. English *weapon(s)* analysis).

As far as second language acquisition is concerned, in L2 English learners are confronted with the regular plural -s in root

compounds. Generalization from plurals in root compounding explains why L2 learners may incorrectly use -s in deverbal compounds as well.

In L2 German, the plural -s is marked. Given the status of the plural -s in German, the differences between Spanish and Italian learners of German can be explained (see Clahsen 1991: 59). Due to their L1 only Spanish and Portuguese learners use -s initially incorrectly as in \*grupps 'groups' (correct: *Gruppen*), \*saches 'things' (correct: *Sachen*). However, as soon as they are confronted with more and richer input, these s-plurals die out quickly and are never used in compounds. Clahsen (1991: 62) also observed that at a certain point in L2 development the -n is sometimes left out in compounds like \*krankkasse 'health insurance', \*tapetefabrik 'wallpaper factory'. Taking into account that Clahsen only found the examples given, these errors seem to be generalization errors in compounding due to the productive use of the singular form, and the plural -e and -en morphology. Overgeneralization of -e in compounds may be due to the high type frequency of -e plurals in isolation compared to their occurrence in compounds as well as, in the case of native speakers of Italian, to L1 influence.

## 167. Sprachstörungen

1. Einleitung
2. Aphasie
3. Sprachentwicklungsauffälligkeiten
4. Zitierte Literatur

### 1. Einleitung

Schon Francis Bacon hat erkannt, daß die Untersuchung des Pathologischen das Studium des Normalen fördert. In diesem Sinne können **Sprachstörungen** von Erwachsenen sowie **Sprachentwicklungsauffälligkeiten** bei Kindern psycho- und neurolinguistische Einblicke in das Wesen der Morphologie bieten, insbesondere in Prinzipien ihrer Speicherung und/oder Verarbeitung.

Doch können Daten von Sprachstörungen keine direkte Evidenz für oder gegen Hypothesen eines linguistischen Modells liefern. Dazu müssen solche Daten erst im Lichte verschiedener, aber miteinander zu verbin-

dender theoretischer Modellbereiche interpretiert werden:

- (a) eines neuropsychologischen bzw. neuro-psycholinguistischen Modells der entsprechenden sprachlichen Störung bzw. Entwicklungsauffälligkeit,
- (b) eines psycholinguistischen Modells normaler Sprachverarbeitung und -speicherung und unauffälligen Spracherwerbs,
- (c) eines linguistischen (insbesondere: morphologischen) Modells,
- (d) einer Brückentheorie, welche die Bereiche a) bis c) kombiniert bzw. interdisziplinär integriert (cf. allgemein Botha 1979).

Einen (inzwischen überholten) klassischen Ansatz dieser Art stellen die Arbeiten von Luria dar (Luria 1970 und später). Da man aber in sonstigen Arbeiten derartig vollständig integrierte Ansätze selten findet, bleiben Schlußfolgerungen aus Sprachstörungen für

morphologietheoretische Fragestellungen oft hypothetisch.

Theoretische Fragen, auf welche sich ein Morphologiemodell Antworten erwarten kann, betreffen den differentiellen, nicht-chaotischen Charakter spezifischer Sprachstörungen und Sprachentwicklungsauffälligkeiten. Diese können oder könnten erwartungsgemäß einzelne Bereiche ausschließlich oder vorwiegend (oder zumindest stärker) betreffen, z. B. a) die Grammatik, aber nicht Pragmatik oder Diskurs bzw. umgekehrt (s. 2.1), b) die Syntax oder die Morphologie oder das Lexikon (s. 2.2, 2.4, 3.1, 3.2) bzw. Morpheme gegenüber Wörtern, c) innerhalb der Morphologie die Flexion oder die Wortbildung (s. 2.4, 3.1), d) auch abstraktere Entitäten eines Morphologiemodells (s. 2.2, 3.1.2).

In diesem Beitrag beschränken wir uns auf die wesentlichen, in der Literatur am besten dokumentierten Sprachstörungen und Sprachentwicklungsauffälligkeiten mit Schwerpunkten in der Morphologie. Erwähnenswert wären überdies u. a. Tiefendyslexie (cf. Bayer & De Bleser 1989; Coltheart et al. 1980; Lecours et al. 1989); Demenz (cf. Blanken 1986; Hamanaka et al. 1985; Schwartz 1990, Hrsg.); Schizophrenie (cf. Kraus & Mundt 1991, Hrsg.; Lecours 1993). Eine allgemeine Bibliographie geben Dittmann & Tesak (1993), einen allgemeinen Überblick Blanken et al. (1993, Hrsg.).

## 2. Aphasie

### 2.1. Einleitung

**Aphasie** ist eine erworbene, differentielle Sprachstörung bedingt durch eine zentrale Störung des sog. Sprachzentrums, d. h. der sprachrelevanten Verarbeitungs- und Speicherungsareale im Gehirn. Diese liegen in der linken Hirnhälfte – außer bei manchen Linkshändern, bei denen die rechte Hirnhälfte die sprachdominante ist. Läsionen dieser Areale der sprachdominanten Hirnhälfte bewirken eine Aphasie, entsprechende Läsionen der nicht-sprachdominanten Hirnhälfte rufen nach gängiger Meinung Störungen der Pragmatik hervor. Die Fragestellung, wie die Grammatik und Pragmatik verbindende Morphopragmatik, etwa der Diminutive (cf. Dressler & Merlini Barbaresi 1994), bei Hirnläsionen gestört ist, hat in diesem Zusammenhang einen eigenen Stellenwert. Morphologie als wesentlicher Teil der Grammatik

stand stets im Zentrum der Interessen aphasologischer Forschung (cf. die Überblicke in Cholewa 1993 und Badecker & Caramazza 1993).

Bei der immer wieder umstrittenen Klassifizierung aphasischer Syndrome sind zumindest folgende Unterscheidungen wichtig:

- (a) Die Ätiologie der Aphasie, etwa Traumata (z. B. Schußwunden – in ihrer Wirkung oft eng eingegrenzt – spielten besonders nach dem Ersten Weltkrieg eine große Rolle in der klassischen deutschen Aphasielehre, die sich bei Jakobson (1941) niederschlug, oder nach dem Zweiten Weltkrieg bei Luria (1970); Schlaganfälle (vaskuläre Ätiologie, mit meist weniger umgrenzten Ausfällen); Tumore.
- (b) Die neurologische Lokalisierung der Läsion (z. B. im Frontallappen bei **Broca-Aphasie**, im Temporallappen bei **Wernicke-Aphasie**) spielt heute wegen der – in einer Brückentheorie unterzubringenden – schwierigen und mehrdeutigen Verbindung von Lokalisation und anderen Datenbereichen eine geringere Rolle als
- (c) die Symptomatik. So unterscheidet man aufgrund der Flüssigkeit der Sprachproduktion allgemein zwischen flüssiger Aphasie (*fluent aphasia*) und nicht-flüssiger Aphasie (*non-fluent aphasia*). Unter den flüssigen Aphasien ist die Wernicke- oder sensorische Aphasie mit ihrem **Paragrammatismus** in unserem Zusammenhang am wichtigsten (cf. 2.3). Kennzeichnend für die nicht-flüssige Broca- oder motorische Aphasie ist der **Agrammatismus**, benannt nach den dominanten Beeinträchtigungen in der grammatischen Produktion (cf. 2.2).
- (d) Einen weiteren Klassifizierungsfaktor bildet der Schweregrad der Störung. Zur Abgrenzung „pathologischer“ von „normaler“ Sprache sind neben Vergleichen von Aphasikern mit korrespondierenden (Alter, Bildung, Geschlecht, etc.) ungestörten Kontrollpersonen auch Vergleiche von aphasischen Fehlern mit alltäglichen sprachlichen Fehlleistungen (*speech errors*; s. Art. 164) wichtig, um festzustellen, ob sie sich nur quantitativ oder auch qualitativ unterscheiden (cf. Dressler 1987; Stemberger 1984).

### 2.2. Agrammatismus

Nach dem ursprünglichen Konzept der motorischen Aphasie handelte es sich dabei um ein reines Produktionsdefizit ohne Störung des

Sprachverständnisses (cf. z. B. Miceli et al. 1983; Nespolous et al. 1988; Tesak 1990). Die Sprachproduktion ist durch einen sog. Telegrämmstil oder Agrammatismus gekennzeichnet. Zu den klinischen Charakteristika des Agrammatismus gehören: Die langsame, stockende Produktion von Kurzsätzen, das Fehlen satzgrammatischer Funktionswörter (Artikel, Präpositionen, Auxiliarverben, nicht aber satzverbindender Konjunktionen) und das Fehlen sowie der Ersatz von Flexionsmarkern (cf. Menn & Obler 1990, Hrsg.), wie im folgenden Beispiel:

“ja! ich äh immer äh äh denken äh ihr? ihr Buch? aha! richtig! dann immer denken! und äh äh sprechen ... und äh und jemand äh zu Hause mein Mann und ich Einladung äh eingeladen.” (aus Peuser 1978: 127)

Inzwischen ist allgemein sichergestellt, daß die Mehrheit – aber eben nicht alle – der Patienten mit Agrammatismus parallele Grammatikdefizite auch beim Verständnis aufweisen (Ausnahmefälle ohne Verständnisprobleme in Kolk et al. 1985; Miceli et al. 1983; Nespolous et al. 1988).

Traditionell wurde der Agrammatismus als eine zentrale Störung der Syntax interpretiert. Inzwischen variieren die Meinungen über die Natur der zugrundeliegenden Störung sehr. Einerseits bestehen Divergenzen über den primär betroffenen sprachlichen Bereich: (a) die Störung betrifft sowohl Syntax als auch Morphologie (z. B. Miceli et al. 1983); (b) die Störung betrifft nur die Morphologie, indem der Zugriff zu den morphologischen Funktionswörtern und Affixen geschädigt ist (z. B. Bradley et al. 1980), was von Kean (1979) auf (c) phonologische Gründe zurückgeführt wird (cf. Nespolous & Dordain 1990); (d) die primäre Störung liegt am Schnittpunkt von Morphologie und Syntax, nämlich bei der Kongruenz, besonders wenn sie über die Nominalphrase hinausgeht (z. B. Bayer et al. 1987); (e) die primäre Störung betrifft die Syntax (nur sekundär die Morphologie) und besteht in einem Defizit der funktionalen Kategorien: Es fehlen die Kategorien selbst oder ihre syntaktisch-semantischen Merkmale, etwa Finitheit, Tempus, etc. (z. B. Caplan 1985; Grodzinsky 1984; Ouhalla 1993; s. auch Hackl 1996).

Andererseits siedeln immer mehr Ansätze die zugrundeliegende Störung nicht im sprachlichen Wissenssystem sondern in der Verarbeitung an. Dafür spricht die Tatsache, daß Agrammatiker bei Grammatikalitätsur-

teilen – auch in der Morphologie – wesentlich besser abschneiden als in Produktion und Verständnis (cf. Caramazza & Hillis 1989; Linebarger et al. 1983; Nespolous et al. 1988). Wichtige Informationen müssen demnach erhalten geblieben sein. Linebarger et al. (1983; s. auch Schwartz et al. 1987) schlagen eine Störung in der Übertragung syntaktischer Funktionen auf thematische Rollen vor (“*mapping*-Hypothese). Für Friederici (z. B. 1988) ist Agrammatismus die Folge eines pathologischen Verfalls der syntaktischen Information: Zwar ist diese vorhanden aber bereits nicht mehr parat im Zeitrahmen, in dem die morphologische Verarbeitung folgen sollte. Auch Kolk und Kollegen (z. B. Haarmann & Kolk 1994; Hofstede & Kolk 1994; Kolk et al. 1985; Kolk & Heeschen 1990) gehen in ihrer “Adaptionstheorie” und “*strategic variation*-Hypothese (cf. Isserlin 1922) von Beschränkungen in der Verarbeitung aus, an die sich Agrammatiker aufgabenspezifisch adaptieren – durch Vereinfachungen und Verwendung unterschiedlicher Register (Bastiaanse 1995).

### 2.3. Paragrammatismus

**Paragrammatismus** charakterisiert die Produktion bei der sensorischen oder Wernicke-Aphasie. Sie ist im Gegensatz zum Agrammatismus flüssig und in ihrer syntaktischen Komplexität vergleichbar mit normaler Sprache. Allerdings kommt es gehäuft zu Verschränkungen im Satz, die aus einem Zusammenbruch des Monitoring und aus anderen Defiziten in der Sprachverarbeitung resultieren dürften. Eine paradigmatische Selektionsstörung ist als Ursache für die typisch auftretenden Vertauschungen vorgeschlagen worden (Jakobson 1964). Ähnlich wie in Syntax und Lexikon werden auch Flexionsformen – ohne Rücksicht auf die syntaktische Struktur – miteinander vertauscht, und zwar sowohl in der Spontansprache als auch in Tests aller Art. So wie Wortvertauschungen zumeist im selben Wortfeld verbleiben, so gehören die miteinander vertauschten Affixe gewöhnlich derselben Klasse an, z. B. Suffixe werden nicht mit Präfixen vertauscht, verbale nicht mit nominalen Flexionsaffixen, und selten Wortbildungs- mit Flexionsaffixen, wie z. B. in *be-schlagen* für *ge-schlagen* (cf. Bayer et al. 1987; Butterworth & Howard 1987; Dressler & Denes 1987). Hingegen sind Substitutionen zwischen Suffixen derselben Klasse gut bezeugt, z. B. zwischen Flexionssuffixen in *ge-fang-t* statt dem Partizipium

des starken Verbs *ge-fang-en*. Wernicke-Aphasiker produzieren auch oft **morphologische Neologismen**, d. h. nichtexistierende, aber meist potentiell mögliche (legale) Wörter, mit Hilfe von Wortbildungsregeln oder Analogie (cf. Buckingham 1993). Auch **Kontaminationen** kommen vor, wie z. B. *plötzartig* ← *plötzlich* & *blitzartig*. Obwohl solche **Paraphasien** auch bei Broca-Aphasia auftreten (z. B. legal *patriarch-isch* statt *patriarch-alisch*, illegal *Hochschul-schaft* für *Hochschüller-schaft*), sind sie doch typischer für Wernicke-Aphasiker.

Eine Sonderform der sensorischen Aphasia ist die **Jargonaphasie**, bei der – jargonartig – viele Pseudowörter erzeugt werden, die in ihrer phonologischen Gestalt aktuellen Wörtern ähneln, aber zu diesen weder in morphologischen Beziehungen stehen, noch durch phonologische Substitutionen aus ihnen abgeleitet werden können. Diese Jargonwörter können allerdings korrekt flektiert werden (cf. Buckingham 1993; Badecker & Caramazza 1993: 184), z. B. Engl. Plural *chpicters*. Auch produktive Anwendung von Wortbildungsregeln ist bezeugt, z. B. in ital. *fratellismo* ‘Bruderschaft’ als Abstrakta-Bildung von *fratello* ‘Bruder’ (cf. Panzeri et al. 1990).

#### 2.4. Differentielle Störungen der Morphologie

Bei morphologischen Paraphasien als typischen Substitutionsfehlern bei Aphasia stellt sich die Frage, ob es sich um Substitutionen ganzer Wörter bzw. Wortformen oder einzelner Morpheme handelt (cf. Badecker & Caramazza 1993). Hier bietet die unterschiedliche Fehleranfälligkeit verschiedener morphologischer Konstruktionen gute Anhaltspunkte. Zu den Faktoren, die bei der variablen Fehleranfälligkeit eine Rolle spielen, gehört einerseits die Vorkommensfrequenz (*token frequency*), aber eben nicht nur diejenige von Wörtern bzw. Wortformen, sondern auch die von Morphemen (cf. Badecker & Caramazza 1993: 182). Andererseits spielt auch die morphosemantische und morphosyntaktische Transparenz komplexer Wörter eine Rolle (cf. Dressler & Denes 1987). Z. B. waren italienische Broca- und Wernicke-Aphasiker deutlich besser beim Verstehen und der korrekten Identifizierung von morphosemantisch transparenten Komposita des Typs *porta-lettere* ‘Briefträger’ als von opaken des Typs *mangia-preti* ‘scharfer Antiklerikaler’ (wörtlich ‘Priesterfresser’). Ebenso war die Produktion von morphotaktisch transparen-

ten Derivationen wie *vend-i-tore* ‘Verkäufer’ (zu *vendere* ‘verkaufen’) deutlich besser als von opaken wie *scrittore* ‘Schriftsteller’ (zu *scrivere* ‘schreiben’). Diese Auswirkungen sowohl von Frequenz als auch von Transparenz setzen Morphemzerlegung, d. h. die Verarbeitung der einzelnen Morpheme, voraus (cf. Cholewa 1993: 106–110).

Erwähnenswert sind auch differentielle Störungen von Wurzeln und Affixen (cf. Micieli 1995; Tyler et al. 1990) sowie von Flexion und Derivation (cf. Badecker & Caramazza 1993: 183 f.; Cholewa 1993: 114–118). So ist bei Broca-Aphasia die Flexion, nicht aber die Derivation beeinträchtigt (cf. Cholewa & De Bleser 1995; Laine et al. 1994; Menn & Obler 1990, Hrsg.; Tyler & Cobb 1987). Hingegen kommen bei der Wernicke-Aphasia und der **amnestischen Aphasie** (*anomia*, charakterisiert durch Wortfindungsstörungen) viel mehr Fehler in der Wortbildung vor (cf. Kudo 1992). Die isolierte Bewahrung der Morphologie einschließlich der Morphosyntax ohne Zugang zur lexikalischen Semantik bei sensorisch-transkortikaler Aphasia ist in Dogil et al. (1995) dokumentiert.

#### 2.5. Verschiedene Sprachen – verschiedene Störungen?

Die Tatsache, daß Agrammatismus signifikante Störungen der **Flexionsmorphologie** hervorruft, hat zur Folge, daß Sprachen mit reicher und komplexer Flexionsmorphologie, wie die flektierenden (z. B. Polnisch) oder die introflektierenden (z. B. Hebräisch) bei Agrammatismus ganz offensichtlich stärker betroffen sind als solche mit geringer Flexionsmorphologie, wie z. B. Chinesisch, aber auch Englisch. Sprachvergleichende Daten und deren Analyse zeigen solche Unterschiede (cf. Friederici et al. 1991 (Vergleich Deutsch, Französisch, Niederländisch); Ha-verkort 1993 (Japanisch, Englisch); Menn & Obler 1990, Hrsg. (Daten aus 14 Sprachen); Sonderheft 2 des *Nordic Journal of Linguistics* 16 (1993) zu skandinavischen Sprachen). Aufschlußreich sind auch Untersuchungen bilingualer Patienten (z. B. Laine et al. 1994).

Typologische Unterschiede in der einzelsprachlichen Flexionsmorphologie erklären auch Unterschiede in der relativen Häufigkeit von Auslassung versus Substitution von Flexionsendungen, da eine generelle Tendenz darin besteht, markierte durch unmarkierte Flexionsformen zu ersetzen. Je nachdem welche Form der unmarkierten Flexion vorliegt (Nullform/Grundformflexion versus eine spe-

zifische flektierte Form) kommt es entweder zu Auslassungen bzw. zu Substitutionen (z. B. die Auslassung der Verbendung *-s* bei der '3.SG.PRÄS' im Englischen versus der Ersatz der markierten ("starken") Partizipform *ge-fang-en* durch die weniger markierte ("schwache") Form *ge-fang-t*, nicht aber durch die endungslose Form *ge-fang*; cf. Stark & Dressler 1990: 367; Mimouni & Jarema 1995). Oberflächlich vergleichbare morphologische und morphonologische Phänomene, welche in typologisch unterschiedlichen Sprachen eine verschiedene Rolle spielen, sind erwartungsgemäß verschieden gestört: Z. B. ist der deutsche Umlaut in Flexion und Wortbildung bei Agrammatismus stark gestört, die ungarische Vokalharmonie, weil regelmäßig, so gut wie gar nicht (cf. Dressler et al. 1996).

### 3. Sprachentwicklungsauffälligkeiten

#### 3.1. Entwicklungs dysphasie

##### 3.1.1. Deskriptive Charakterisierung

Die Bezeichnung **Entwicklungs dysphasie** (*Spezifische Sprachentwicklungsstörung – SSES*; *developmental dysphasia, specific language impairment – SLI, developmental language disorder*) wird in der Literatur auf eine heterogene Gruppe von Kindern angewandt, bei denen isoliert die Sprachentwicklung verspätet einsetzt und mit einer Beeinträchtigung in der Entwicklung der Sprachproduktion und/oder des Sprachverständnisses einhergeht. Eine mentale Retardierung, eine Hörbehinderung, psychische Störungen wie z. B. Autismus, psychosoziale Beeinträchtigungen oder eine nachweisbare neurologische Störung liegen dabei nicht vor. Nach ihrem Erscheinungsbild lassen sich homogeneren Untergruppen unterscheiden: Einerseits eine vorwiegend expressive vs. eine expressiv-rezeptive Form; andererseits (a) eine rein morphologische/syntaktische Beeinträchtigung (Bishop 1994; Leonard 1989; van der Lely 1993; 1996) vs. (b) eine Form mit zusätzlichen artikulatorischen und/oder phonologischen Defiziten (Gopnik & Crago 1991) und (c) eine Form mit zusätzlichen semantisch-pragmatischen Auffälligkeiten (cf. Bishop & Adams 1989; Mills et al. 1992). Bis heute ist ungeklärt, ob es sich bei diesen Erscheinungsformen um unterschiedliche Beeinträchtigungen mit unterschiedlichen Ätiologien oder bloß um eine einzige Beeinträchtigung in ihren verschiedenen Gradausprägungen bzw. zu unterschiedlichen Entwicklungszeitpunkten

handelt (cf. Bishop et al. 1995). Auch wenn die Ätiologie/n für die Entwicklungs dysphasie bis jetzt unbekannt ist/sind, konnte zumindest in bestimmten Fällen eine erbliche Komponente nachgewiesen werden (cf. Tomblin 1997; in Zwillingsuntersuchungen, cf. Bishop et al. 1995; in Familien mit mehreren dysphasischen Generationen, cf. Gopnik & Crago 1991; Plante 1991; Tallal et al. 1989; 1991; Tomblin 1989; zu dysphasischen Familien siehe speziell Matthews 1994, Hrsg., Paradis 1997, Hrsg.; zur Dysphasie im Allgemeinen siehe auch Leonard 1998, Kamhi 1993, Menyuk 1993).

Als Hauptmerkmal aller Formen der Entwicklungs dysphasie (und deshalb auch zentraler Forschungsgegenstand) werden in der Literatur vorwiegend speziell ausgeprägte Probleme mit Flexionsmorphologie, grammatischen Funktionswörtern und Morphosyntax genannt (cf. Watkins & Rice 1994, Hrsg. für eine Übersicht der diesbezüglichen Literatur). Diese äußern sich in einem nicht-altersadäquaten, eingeschränkten Gebrauch von Flexionsmarkern und Funktionswörtern, die häufig nicht vollständig erworben werden. "Fehlertypen" und Erwerbsabfolgen sind in der Regel mit denen von jüngeren unauffälligen Kindern vergleichbar. Konkret werden in der Literatur folgende Charakteristika der Sprache von dysphasischen Kindern allgemein hervorgehoben:

- Auslassungen und die Verwendung von unmarkierten Formen sind typisch;
- Übergeneralisierungsfehler (z. B. durch Anwendung einer regelmäßigen Regel) treten laut den meisten Autoren nie auf (u. a. Gopnik 1994), laut anderen gibt es sie wohl, jedoch kommt es nie zu kategorieübergreifenden Fehlern (z. B. Leonard & Bortolini et al. 1992; Rice et al. 1995; Rothweiler & Clahsen 1994; Smith-Lock 1993);
- frequente sowie unregelmäßige Formen werden relativ besser beherrscht;
- neben extrem betroffenen Bereichen – wie z. B. Subjekt-Verb-Kongruenz, Auxiliare, Kopula, Artikel sowie Kasus- und Kongruenzmarkern in der Nominalphrase – zeigen sich andere morphologische Aspekte vergleichsweise weniger betroffen und dem jeweiligen Sprachentwicklungsstand des Kindes zumindest angemessen – wie etwa die Pluralbildung von Nomina, die Vergangenheitsformen von unregelmäßigen Verben, die Partizip-

bildung, der durative Aspekt auf *-ing* bei englischen Verben (cf. u. a. Bartke 1998; Clahsen et al. 1992; Goad 1998; Gopnik 1990; Gopnik & Crago 1991; Leonard 1989; Oetting & Rice 1993; Rice 1994; Rothweiler & Clahsen 1994; Ullman & Gopnik 1994).

Wie in 2.5 bei den Aphasien bereits angesprochenen, gibt es auch beim Erscheinungsbild der Dysphasie eine Abhängigkeit von typologischen Unterschieden in der einzelsprachlichen Flexionsmorphologie. So konnten z. B. die fürs Englische allgemein betonten, massiven Schwierigkeiten mit der Subjekt-Verb-Kongruenz bzw. der Verbflexion (d. h. anstelle von flektierten, finiten Verbformen werden vorwiegend Infinitivformen oder eventuell Verbstämme verwendet) zwar für viele andere – aber nicht für alle – untersuchten Sprachen bestätigt werden (cf. Miller & Leonard 1998): z. B. für Deutsch (u. a. Clahsen 1988; Rice et al. 1997), für Englisch (u. a. Rice et al. 1995), für Französisch (Gopnik 1990), für Inuktitut (Crago & Allen 1994), für Japanisch (Fukuda & Fukuda 1994), für Niederländisch (Bol & Kuiken 1990), für Schwedisch (Hansson 1992); nicht aber für Italienisch (Leonard & Bortolini et al. 1992; Bortolini & Leonard 1996) und Hebräisch (Dromi et al. 1993; Leonard & Dromi 1994). Diese sprachspezifischen Unterschiede decken sich mit entsprechenden sprachvergleichenden Daten von unauffälligen Kindern (cf. dazu auch Wexler 1994). Leonard (1998) widmet dem Thema "SLI across languages" sogar ein eigenes Kapitel.

Spezifische Auffälligkeiten in der Wortbildung wurden in der Literatur zur Dysphasie bislang negiert bzw. nicht erwähnt. Einzelne Untersuchungen berichten hier jedoch über ähnliche Probleme wie in der Flexionsmorphologie und vermuten demnach bei der Dysphasie ein allgemeines Unvermögen "to abstract bound morphemes (be they affixes or roots) and represent them as such" (Dalachakis & Gopnik 1995: 202).

### 3.1.2. Hypothesen über das der Dysphasie zugrundeliegende Defizit

Hypothesen über das der Dysphasie ursächlich zugrundeliegende Defizit gibt es in der Literatur viele und divergierende, zum Teil allerdings durchaus komplementäre (einen detaillierteren Überblick und Gegenüberstellung bieten u. a. Bishop 1992; 1997; Crago & Allen 1994; Gopnik 1994; Leonard 1998): Ei-

nerseits werden unterschiedliche, spezifische Probleme beim Erwerb des grammatischen Systems, andererseits mehr allgemeine Lern- und/oder Verarbeitungsdefizite postuliert.

Grammatikspezifische Ansätze erklären die morphologischen Auffälligkeiten der Dysphasie entweder als ein Defizit in der grammatischen Kongruenz ("grammatical agreement deficit"-Hypothesen) oder als ein morphologisches Musterbildungsdefizit. Das Kongruenzdefizit wird unterschiedlich bewertet: Es ist ein generelles (Clahsen 1988; Rothweiler & Clahsen 1994; Clahsen & Hansen 1997) oder besteht darin, daß syntaktisch-semantische Merkmale (wie Finitheit, Tempus, Aspekt etc.) fehlen und daher nicht markiert werden können ("feature deficit"-Hypothese, Gopnik 1990; Gopnik & Crago 1991). Merkmale mögen zwar vorhanden sein, aber ihre Abhängigkeiten – entweder insgesamt oder partiell – werden unzureichend verwaltet ("feature checking deficit"-Hypothese, Ullman & Gopnik 1994; ausschließlich "Spec-Head"-Kongruenz: Rice 1994; van der Lely 1994; 1996), oder Merkmale werden fälschlich als optional behandelt ("extended optional infinitive"-Hypothese, Rice et al. 1995; 1997). Dem morphologischen Musterbildungsdefizit wird entweder ein "paradigm formation"-Defizit zugrunde gelegt, oder es wird dafür eine "missing-rule"-Hypothese bzw. eine "impaired morphological rule-construction"-Hypothese vorgeschlagen (Gopnik 1992; 1994; Gopnik & Crago 1991; Ullman & Gopnik 1994; Gopnik et al. 1997). Demnach werden morphologisch komplexe Wörter unanalysiert gespeichert, keine morphologischen Regeln entwickelt und morphologische Defizite durch konzeptuell basierte Rekategorisierungen kompensiert.

Hypothesen, die die dysphasischen Probleme auf allgemeine Lern- und/oder Verarbeitungsdefizite zurückführen, nehmen einerseits ein nicht-sprachspezifisches, allgemeines Muster- und Regelbildungsdefizit an, woraus ein "unique language learning" (Connell 1987; Swisher et al. 1995) bzw. ein abweichendes sprachliches System resultiert (Restrepo et al. 1992). Andererseits werden spezifische Defizite in der auditiv-perzeptuellen Verarbeitung, Speicherung und Wiederabrufbarkeit vermutet: Zu geringe phonetische Substanz der morphologischen Marker (in der sog. "surface"-Hypothese, u. a. Leonard 1989; 1992; Leonard et al. 1987; Leonard & McGregor & Allen 1992; Leonard & Bortolini et al. 1992; cf. auch Fellbaum et al. 1995);

zu beschränktes phonologisches Gedächtnis (Gathercole & Baddeley 1990) oder Schwierigkeiten in der prosodischen Verarbeitung (Bortolini & Leonard 1996) werden als mögliche Ursachen für die Defizite genannt. In ihrer ursprünglichen Formulierung hat sich Leonards „surface“-Hypothese inzwischen – speziell auch im Sprachvergleich – als unhaltbar erwiesen (s. Leonard 1998: 246 ff. für eine kritische Auseinandersetzung damit). Die im Sprachvergleich beobachteten zwischensprachlichen Unterschiede bei *specific language impairment* werden neuerdings im Rahmen von sog. „morphological richness“ Ansätzen dahingehend erklärt, daß “[...] children with SLI devote their limited processing resources to a dominant property of the language and by necessity, allow other aspects of the language to falter“ (Leonard 1998: 257).

### 3.2. Mentale Retardierung

Zahlreiche Studien sprachunauffälliger Kinder (u. a. Schaner-Wolles & Haider 1987) und mental retardierter Personen liefern starke empirische Evidenz für die Modularitätsthese (cf. Fodor 1983; Chomsky 1982), d. h. für eine Unabhängigkeit bzw. Dissoziation von grammatischen und allgemein-kognitiven Fähigkeiten.

#### 3.2.1. Sprachliche Sonderbegabung bei mentaler Retardierung

Trotz mentaler Retardierung können ausgesprochen fortgeschrittene grammatische Fähigkeiten – auch morphologische – erworben werden, wie eine Reihe von Fallstudien sog. „hyperverbaler“ Personen (engl. *hyper-linguistic*) in der Literatur belegen: z. B. Laura (= Marta), Rick und Antony (cf. u. a. Curtiss 1988; Yamada 1990); Christopher (Smith & Tsimpli 1995); das Mädchen D. H. (Cromer 1994); Personen mit Williams-Betten-Syndrom (cf. u. a. Bellugi & Marks et al. 1988; Clahsen & Almazan 1998; Levy & Hermon 2000; und den Literaturüberblick in Schaner-Wolles 2000a); Françoise mit Down-Syndrom (Rondal 1994; 1995). Besondere Beachtung in morphologischer Hinsicht verdient Christopher, ein sog. „linguistic savant“, der im Alter von 33 Jahren trotz mentaler Behinderung neben Englisch als seiner Erstsprache zumindest 18 weitere Sprachen (genetisch und typologisch gestreut) erworben hatte (darunter eine zu Testzwecken eigens entwickelte Kunstsprache *Epun* mit SVO Struktur, aber einem äußerst komplexen Kongruenzsystem). Diese besondere Begabung

charakterisieren Smith und Tsimpli wie folgt: “One aspect of Christopher’s exceptionality resides precisely in his sensitivity to and learning of complex morphology” (Smith & Tsimpli 1995: 124).

Mehr oder weniger ausgeprägte Diskrepanzen zwischen unterschiedlichen grammatischen Bereichen dürften – wie auch bei der Entwicklungs dysphasie – bei mentalen Retardierungen typisch sein. Anders als bei Christopher ist bei einer solchen disharmonischen Entwicklung die Morphologie häufig selektiv beeinträchtigt: z. B. fortgeschrittene Syntax versus flexionsmorphologische Probleme bei Rick (cf. auch Cromer 1988); gute flexionsmorphologische Leistungen in der Produktion versus schwache bei Verständnistests bei Laura (Yamada 1990: 35–39); ausgeprägte morphologische Schwächen auch beim Down-Syndrom (cf. 3.2.2).

#### 3.2.2. Down-Syndrom

Abgesehen von wenigen Ausnahmefällen wie Françoise, einer damals 34-jährigen Frau mit Down-Syndrom (DS), deren grammatische (auch flexionsmorphologische) Fähigkeiten Rondal (1994; 1995) als normal oder quasi-normal bezeichnet, ist die Sprachentwicklung bei Down-Syndrom verzögert und erreicht auch im Erwachsenenalter höchstens den Entwicklungsstand eines 6–7-jährigen unauffälligen Kindes. Es zeigen sich Disharmonien zwischen den einzelnen sprachlichen Bereichen, wobei morphologische und speziell morphosyntaktische Fähigkeiten am stärksten zurückbleiben (cf. z. B. Fowler 1988; 1990; Fowler et al. 1994; Rondal 1994; 1995; Schaner-Wolles 1992; 1994; 2000 a; 2000 b). In der Entwicklung der einzelnen sprachlichen Fähigkeiten unterscheiden sich Personen mit Down-Syndrom jedoch qualitativ nicht von unauffälligen jüngeren Kindern. Dies gilt auch für die Morphologie (cf. Ergebnisse aus Flexionsmorphologie, Morphosyntax und Derivationsmorphologie von 82 deutschsprachigen Kindern, Jugendlichen und Erwachsenen mit Down-Syndrom in Schaner-Wolles 1989; 1992; 1994; Schaner-Wolles & Dressler 1986).

### 3.3. Hörbehinderung

Beim Erwerb oraler Sprache kommt es aufgrund des auditiven Wahrnehmungsdefizits generell zu einer zeitlichen Verzögerung. Speziell der Erwerb von unbetonten Flexionsendungen ist davon betroffen, da sie auditiv besonders schlecht oder überhaupt nicht wahr-

genommen werden können (cf. Cantwell & Baker 1987; de Villiers et al. 1994; Mogford-Bevan 1993; Wisch 1990.) Aber sogar gehörlosen Kindern ist es möglich, die wichtigsten morphologischen Strukturen ihrer Muttersprache vollständig zu erwerben, wobei weniger der Grad des Hörverlustes als vielmehr die Frühförderung den Erfolg bestimmt (cf. Peltzer-Karpf 1994).

Beim erstsprachlichen Erwerb einer Gebärdensprache (s. Art. 143) verläuft die morphologische Entwicklung parallel zu der von oralen Sprachen bei nicht-hörbehinderten, unauffälligen Kindern (cf. Newport & Meier 1985; Bellugi & van Hoek et al. 1988).

## XX. Morphologie in der Praxis Morphology in practice

### 168. Field work

1. Introduction
2. Getting to the language
3. Collecting the data
4. Identifying the meaning
5. Resistant problems
6. Technical helps
7. References

#### 1. Introduction

In this article methods of gathering and evaluating data will be presented. Such data serve as basis for the morphological analyses which are discussed in the other articles in this volume. Morphological analysis can be done from many points of view, and the results vary greatly according to what kinds of questions are asked of the data and in what framework the analysis is taking place. But any and all analysis has to be based on solid linguistic data, that which is phonologically correct, natural in language use, and for which the meaning of words, parts of words or other morphemes is clear.

Some methods of how to arrive at such a basis in a hitherto little or unknown language will be presented. Their main merit may well be that they have been tried and found useful.

Much of what has been written on the subject is found in scattered articles and in handbooks on language learning (for a partial bibliography see Goyvaerts 1986), or in introductory textbooks on linguistic analysis or translation. Not all will be mentioned here, but enough to contain the basic information in detail.

#### 2. Getting to the language

##### 2.1. The physical set-up

Many (but by no means all) “insufficiently studied languages” (Kibrik 1977: 1) are found in what is commonly called the Third World.

Thanks to air and road service many of them are fairly easily accessible, though travel to some of them is still an adventure. This is true not only for means of transport, but also for living conditions in general and, maybe most importantly, hygienic eating and drinking facilities. The investigator intending to spend only a few weeks in the area in which the language is spoken should therefore first investigate the physical aspect of his stay (Healey 1975, ed.) and prepare accordingly. He is wise if he strictly observes recommendations given him by authorities and other foreigners living in the area.

##### 2.2. The language assistant(s)

If possible a selection of potential language assistants (also known as “informants”, Samarin 1967) should be available. It is always good to work with more than one. The qualification of such assistants is of utmost importance. Even if the ideal persons may not readily be found, here is a partial list of their qualifications, some of them contradictory.

They should be native speakers of the language, preferably not from a “mixed marriage” where each parent speaks a different language, nor having lived out of the language area for too long as this may impair a speaker’s fine sense of feeling for his language. The best assistant would be a monolingual person who never set foot outside his area.

The assistants should be neither too young nor too old. Before puberty they may not yet have full command of the language. One too old might make a good story teller but be no longer capable of giving any other type of linguistic data.

They should not be ashamed of their language. An educated assistant might have gone through a school system in which use of the mother tongue was punished. Perhaps the official language was learned by means

of punishment. Use of the language may be forbidden and involve risks. Cases are not unknown of people “hiding” their language from foreigners by purposely giving out false information.

They should be reasonably bilingual in the official language of the country. If this language is foreign to both the investigator and the assistants, sources of misunderstanding abound, both because of linguistic and cultural differences.

There is also the matter of remuneration: the salary of a primary school teacher or of a secretary is a good basis on which to calculate it. The amount may have to depend on the educational background of the assistant. It is good to be informed about existing regulations and practices by other foreigners living in the area.

### 2.3. The investigator

The attitudes the investigator carries with him have a lot to do with his effectiveness in his work. In many – but by no means all – cultures the foreigner is received with a fair amount of friendship, coloured by previous experience with other foreigners. It is very important that he respects local traditional and civil authorities (as well as higher placed people in the cities). If he cannot develop a certain affinity for the people whose language he has come to study he might better change the language.

His education and position will usually place him in a higher social category than many of the people speaking the language he has come to study. Paternalism or arrogance is quickly felt by them.

His assistants and their families are real people with real needs – and he might be in a better position to do something about such needs than anyone else. On the other hand friendship also involves receiving. Respect and honest appreciation of the other person are often recognized keenly.

## 3. Collecting the data

### 3.1. The intermediate language

As already mentioned, data is best collected monolingually. This would mean that the investigator learns at least the rudiments of the language first, something that can be achieved superficially in a matter of weeks (thorough learning will take at least a year or more). Eliciting data monolingually enhances

the quality, for it keeps the assistant in the right context: he does not have to translate but can react from within the language in which the data is to be gathered.

The use of an intermediate language could also be avoided by collecting through an interpreter who himself fully understands what data is needed, so that he can trigger it in the language under investigation.

### 3.2. The questionnaire

Good preparation of the kind of data to be collected often includes a questionnaire in the intermediate language, to be translated into the language under investigation (Weiers 1980). Our knowledge of general traits and peculiarities of a language family allows us to prepare such elicitation tools quite well.

If a questionnaire is used to elicit straightforward translation, there are liable to be many pitfalls. Any data elicited without a natural context is easily misunderstood even in the intermediate language. And if misunderstanding is not the problem, a translation of what sounds natural in the official language might yield grammatical but quite unnatural data in the language under investigation – thus the data is falsified. The best data is not elicited via translation, but by a stimulus in the language under investigation.

### 3.3. The transcription

For a good transcription it is best not to use the orthography (provided there is one) unless it has been developed on the basis of sound phonological principles. A poor orthography might easily underdifferentiate the sounds, yielding homographs which are not homophones, causing different morphemes to appear to be identical. Thus, the investigator might look for similarities in meaning for words that have nothing to do with each other.

The investigator should have some practical knowledge of phonetic transcription including ear training so that he can accurately represent on paper what he hears. This training should include tone differentiation, should he work in a tone language. He should also have some basic training in phonological analysis. For a purely phonetic transcription might lead him astray in a different direction: he might not recognize that two utterances are the same though different phonetically and end up with more morphemes than warranted.

If the investigation is done through a translator or by a literate assistant himself, there might be no alternative to using the orthography he is familiar with. Being aware of the pitfalls might be enough to circumvent them.

#### 4. Identifying the meaning

No analysis is possible without being able to identify the meaning of the morphemes under investigation. One of the most important principles to remember is that the meaning changes according to context (Pike & Pike 1977: 173 f.).

##### 4.1. Lexical meaning

The lexical meaning is relatively easy to discover as it involves the first three of the basic semantic categories (Nida 1964: 62): the meaning of the nouns (for things), verbs (for events), and descriptives (for attributes) in a language. It is good to be aware of the fact that the name of any of the above is not necessarily a simple noun, it may be a derivation, a compound or a phrase, and yield all sorts of material for morphological analysis.

One word of caution: even though it may be obvious that a word is morphologically complex, a compound word or even a phrase, it is by no means obvious that the assistant can give a morpheme-by-morpheme or a word-by-word translation. To him more often than not the whole expression has one meaning; the break-down has to be supplied by the investigator.

Eliciting vocabulary with lexical meaning is best done by pointing and enacting on the one hand and by analogy on the other (Beekman 1968: 361 f.), like for example: Many *bees* are a *swarm*, what are many *dogs*? The opposite of *good* is *bad*; what else can it be? What is the opposite of *new*?

##### 4.2. Grammatical meaning

The last of the four basic categories, the relationships, are far more difficult to deal with. For they encode the grammar of the language (apart from word order). This category includes all sorts of affixes as well as the particles, many of them “pesky” ones (see 5.2; Grimes 1975: 93), because they are so hard to define. No direct questioning will yield them in the language, and only the rarest of assistants is able to give a translation, once they are encountered. Even then a translation is

only a starting point to find the “real” meaning or function. Who, for example, could easily fully define the use of *still* or *yet* in English?

The best chances for an equivalent in the intermediate language are found in such meaning bearers as pronouns, conjunctions, adpositions (prepositions or postpositions), singular/plural differences, negatives, question words, and maybe verb tenses. But translations are at best approximations. They do yield a beginning point for the analysis which will eventually bring to light the full meaning and use of the morpheme.

##### 4.3. A simple methodology

A quite simple method for identifying the morphemic forms and a first indication as to their meaning is that of substitution of recurring particles (Elson & Pickett 1983).

It consists of collecting a number of utterances (complex words, maybe) which contain the morpheme in question. Hopefully a meaning can be supplied for the complete form, maybe other forms without the morpheme can be found and their meaning ascertained. A comparison of the paradigm will yield the various forms of the morpheme(s) under investigation as in (1) from Tzeltal (Mexico):

(1)	<i>k'ab</i> 'hand'	<i>hk'ab</i> 'my hand'
	<i>akan</i> 'leg'	<i>kakan</i> 'my leg'
	<i>lumal</i> 'land'	<i>alumal</i> 'your land'
	<i>inam</i> 'wife'	<i>awinam</i> 'your wife'
	<i>k'op</i> 'language'	<i>sk'op</i> 'his language'
	<i>ar'el</i> 'work'	<i>yat'el</i> 'his work'

(Nida 1949: 16)

This tried and true method in the tradition of the guess-and-check procedures (Longacre 1964: 11, 101 f.) still serves to recognize the majority of the morphemes in any language, including their various forms which yield the morpho-phonemic rules. It is not quite so simple to identify their full meaning. For this it is necessary to find all the possible occurrences of the form under investigation and study their meaning nuances which might be caused by the presence or absence of that form.

#### 5. Resistant problems

##### 5.1. Homophones

A certain number of words and particles in any language sound exactly the same. Are they the same, or different morphemes? For

the lexicon this question is not quite so crucial; it is not that hard to distinguish *a fish* from *to fish*, one a noun the other a verb. If one of the pair is a grammatically functioning particle or an affix (and if a lexical meaning cannot be ascertained it always is), this question becomes relevant for the analysis and gains quite a different importance.

For example, in Kaingang (Brazil), are *mu-* 'go:PL' and *mu-* 'action in progress' the same morpheme or two different ones? Or, asked differently: in the utterance under examination, is the occurrence of *mu-* a verb or a particle or an affix? This difference might be all important in deciding on the "real" meaning of the utterance (as over against the general and vague translation provided by the assistant or guessed at by the investigator) and on the analysis of the structure of that utterance – be it part of the morphology or the syntax.

If the language is full of such homophones, this is one of the thornier questions to resolve. Certain verbs have a tendency to become particles (or, in an earlier stage, auxiliaries). If both members of the homophonous pair are particles or affixes, the solution is none the easier.

### 5.2. Pesky particles

Another difficult problem is that of particles for which the meaning is difficult to ascertain. The first question to decide is whether such particles belong into the syntax or the morphology. They often have some function within discourse rather than within sentence or phrase and are therefore difficult to pin down. Nevertheless their identification is important to the understanding of the grammar. There is only one way to study them: within natural texts.

### 5.3. Text as context

All morphemes can best be studied within the framework of text analysis, for this is where they occur most naturally. In order to do this different types of texts (Longacre 1976: 197 f.) need to be collected, recorded on tape, and transcribed if possible. Such texts are best charted according to different points of view (Wiesemann et al. 1992; Seminar für Sprachmethodik 1999): certainly a basic chart needs to be made, in which the clauses are grouped around the verbs in the text. Then an information chart lists the different types of information transmitted by the verbs in several columns, including highlighted information.

Texts charted this way are the best sources of contexts for affixes or particles for which the precise function is difficult to determine.

## 6. Technical helps

### 6.1. Recorders

The recording technique is one of the most useful helps in field work (Bouquiaux & Thomas 1976, eds.: 27 f.). Today analog (cassette recorders) and digital (MiniDisc, DAT, etc.) recorders are of such high quality and at the same time so small that they can be carried almost everywhere and used even in adverse circumstances, with or without electricity. A separate microphone improves the quality and is more versatile than the built-in one, particularly if suprasegmental sound features are to be observed. A moving coil microphone can stand difficult climates better than a condenser microphone (Wiesemann 1991: 195 f.). In order to transcribe tape recorded data it is necessary to listen to small stretches and return to the same utterance or part of the utterance several times (Gudsinsky 1967: 9). It should be possible to rewind a bit of the tape while the play button is held down.

### 6.2. Data books, lists

It is useful to gather the data in notebooks. To keep track of the chronological development of the data-gathering each page is numbered, each session dated, and the name of each assistant written down. It is not advisable to erase any of the attempts at writing down the data; corrections are rather written in under the original entry.

At first the phonetic notations will be full of errors; it takes a while for the ear to adjust to the sounds in the language. Even after a while doubts about individual sounds are bound to persist. These can be double checked with the help of lists for contrastive listening, a type of differential drill (Brewster & Brewster 1976: 309 f.). Words with what are either identical or very similar sounds are gathered in a list. The sounds to be compared should preferably appear in the same position in each word. As the assistant pronounces each word, the investigator listens to just that troubling sound. The lists may need to be rearranged several times, the assistant may be consulted as to which words, in his opinion, have the same sound and which sounds are different.

The morphological analysis may be done in the notebook or on separate sheets. Individual sheets are not helpful for data gathering but can easily be rearranged for analysis purposes.

### 6.3. Morphology files

In order to keep data handy and the analysis under control, a shoe box or something similar with subdivisions and a whole set of  $3 \times 5"$  very thin cardboard slips is very useful. On each slip a word is written (normally in the left hand corner), a grammatical designation (in the middle), and a gloss (in the right hand corner). In this way the lexicon can be gathered and kept in alphabetical order, the parts of words, their forms and meanings are easily retrievable. Filing with the help of punch cards (Day 1976) is even more versatile.

### 6.4. Computer programs

PCs are small and so powerful today, that they constitute another very useful technical tool for morphological analysis in almost any field situation. Even a small data bank can take the place of the morphology file. Specially developed programs (Weber et al. 1988; Wimbish 1990; Antworth 1990) assist in morphological analysis, glossing text and pulling out the contexts of whatever morpheme is to be studied (cf. also Art. 172):

- Shoebox and LinguaLinks are data base systems for field linguists and anthropologists. Among several facilities for the field worker both programs provide also lexical databases and tools for morphological analysis and interlinear transcription of words.
- PC-KIMMO is designed for generation and morphological parsing of words. The program is an implementation of the model of two-level morphology (see Koskenniemi 1983) and uses a lexicon, a module for the declaration of morphonological rules, and a module for the declaration of morphotactic rules.

## 169. Interlinear morphemic glossing

1. Basic concepts
2. Prerequisites of morphological analysis
3. Principles of interlinear glossing
4. Boundary symbols
5. Typographic conventions
6. Summary
7. References

### 1. Basic concepts

#### 1.1. Purpose

Given an object language L1 and a meta-language L2, then an **interlinear morphemic gloss** (IMG) is a representation of a text in L1 by a string of elements taken from L2, where, ideally, each morph of the L1 text is rendered by a morpheme of L2 or a configuration of symbols representing its meaning, and where the sequence of the units of the gloss corresponds to the sequence of the morphs which they render. Its primary aim is to make the reader understand the grammatical structure of the L1 text by identifying aspects of the free translation with meaningful elements of the L1 text. The ultimate purpose may be to aid the reader in grasping the spirit of the language, to control the linguistic argument the author is making by means of the L1 example or to scan a corpus for a certain gloss in order to find relevant examples.

#### (1) Latin

<i>exeg-i</i>	<i>monumentum</i>
<i>implement\PRF-1.SG</i>	<i>monument.N:ACC.SG</i>
<i>aer-e</i>	<i>perennius</i>
<i>ore.F-ABL.SG</i>	<i>lasting:CMPR:ACC.SG.N</i>

'I have executed a monument more durable than ore' (Hor. Od. 3, 30, 1)

(1) illustrates the typical use of an IMG. The first line of (1) contains the L1 text line; the second line contains the IMG, and the third line contains an idiomatic translation into L2.

Interlinear morphemic glossing is at the intersection of different communicative purposes. On the one hand, it is a kind of translation that accompanies the original. In this sense, it is comparable to the arrangement that one finds in synoptic editions of original and translation. On the other, it is a kind of linguistic analysis. In this sense, it competes with a fragment of a grammar. Its hybrid character leads to a number of problems and to different styles in interlinear morphemic glossing.

The aim of the following treatment is a standardization of an aspect of linguistic methodology on the basis of widespread usage as developed in the 20<sup>th</sup> century. To the extent that linguistics is a science, its methods are susceptible and in need of standardization. Interlinear morphemic glossing has to do with the representation of linguistic data, comparable in this with a phonetic transcription. Just as the latter has been successfully standardized by the IPA, so interlinear morphemic glossing should be standardized.

This will be done in the present article in the form of a set of rules, which are listed in section 6.1. Such a standardization only concerns linguistic science. Linguistic data are often presented to a lay public, with the purpose of education, entertainment or divulgence of the achievements of our science. Here some kind of interlinear glossing may be necessary, too. However, scientific formal-

ism tends to damage rather than serve the good cause. An example how interlinear glossing has been handled in a book directed to a non-specialist public is quoted in the next section (Finck 1909). The present article is biased in favor of a more formalized treatment, on the assumption that it will be easier to derive a less formal representation from the proposals made here than the other way round. The treatment is, however, not fully formal, since it focuses on interlinear glossing in printed texts. In the annotation of texts by markup languages for automatic retrieval, the same conceptual problems, but very different technical problems arise which will not be dealt with here.

Data are commonly quoted from sources in which they are already provided by an analysis. In linguistic publications, it has been wide-spread usage to quote data together with their IMG and their translation, even if their form or language is different from the one used in the quoting context. That is, such composite data representations have been treated as indecomposable blocks. Such scruples do not seem to be warranted. Primary data may be quoted and provided with the quoting author's analysis and translation (cf. Bickel et al. 2004: 1).

## 1.2. Precursors

Interlinear glossing has precursors in the descriptive tradition which link it up not with some kind of morphological representation, but with efforts to bring out the spirit of the language. The point there is not to provide a formal representation of a piece of linguistic data, but to render the language-specific construal of the world intelligible. To this end, literal translations were provided. For instance, G. Gabelentz (1901: 460), in a passage arguing that the personal verb suffixes in Semitic languages are possessive pronouns, gives the following Arabic example: “*ya-kft-ka-hùm* er genügt dir gegen sie (eig. er-genügt-dein-ihr)”.

The IMG is a late-comer in linguistics. Early grammars were intended as primers, the user was expected to work through them and learn the morphemes; so no glossing was necessary. Many scientific grammars, e.g. of Latin, Greek, Arabic etc., were meant for the initiated who needed no glossing either (not seldom even the free translations were spared). Even comparative studies, historical or typological, left the analysis of the examples of diverse languages to the reader. H. C.

Gabelentz, in the middle of a discussion of Lule, Osage and other languages, presents the following passage:

“Im Dakota (meine Grammatik der Dakotasprache § 34) dient die 3 Pers. Plur. Act. dazu, das Passivum auszudrücken, sogar wenn ein Actor im Singularis hinzuzudenken ist, z. B. *Jesus Jan eñ hi q ix Jordan watpa ohna baptizapi*, Jesus kam zu Johannes und sie tauften ihn (st. er wurde getauft) im Jordanfluss.” (H. C. Gabelentz 1861: 465)

Here the reader who does not have the grammar mentioned on his desk is given no chance.

Pace Gabelentz, IMGs are needed when two conditions coincide: the level of analysis is above morphology, and the reader is not expected to be familiar with the languages under discussion (which is generally the case in typology, but not in descriptive or historical-comparative linguistics). W. v. Humboldt (1836 [1963]: 534) invented his own device to help the reader identify L2 meaningful elements with L1 morphemes. He gives the following example from Classical Nahuatl:

1	2	3	4	5	6	7	8	9
ni-	c-	chihui	-lia	in	no-	piltzin	ce	calli
1	3	2	4	5	6	7	8	9
ich	mache	es	für	der	mein	Sohn	ein	Haus

While dispensing with the IMG proper, this method fails for L1 elements which cannot be rendered by L2 words.

Beside the literal translation illustrated above, G. Gabelentz (1901) uses a variety of techniques. He also has interlinear glosses, as when he says: ‘Der Satz “Ich bin Dein Sohn” heißt im Maya:

*a – meyen – en.*  
Dein Sohn ich,’  
(Gabelentz 1901: 383)

and occasionally (e.g. Gabelentz 1901: 400) he uses Latin as L2 in IMGs.

Finck (1909) is one of the first linguistic publications that illustrate the working of a language with a sizable text provided with a free translation and an IMG. The following sentence from his Turkish text (Finck 1909: 83) illustrates his glossing style (s. Fig. 169.1).

As may be seen, these forerunners have no grammatical category labels yet. Finck glosses Turkish *-m* ‘GEN’ by Germ. *der* because this word displays a morphological trace of the genitive. Similarly, Turkish *-up* ‘GER’ is glossed by *-enderweise*, maybe the closest to a gerund that German can muster. This pro-

<i>xodža - da</i>			
<i>Meister - auch</i>	<i>Der</i>	<i>Meister</i>	
<i>esbāb - un</i>	<i>dzümle - si - ni</i>	<i>ates - e</i>	<i>warf nun sämt-</i>
<i>Kleider - (der)</i>	<i>Gesamtheit - ihre - die</i>	<i>Feuer - zu</i>	<i>liche Kleider ins</i>
<i>vur - up</i>	<i>yak - ar</i>		<i>Feuer und ver-</i>
<i>werf = enderweise</i>	<i>verbrenn = end</i>		<i>brannte sie.</i>

Fig. 169.1

cedure is a tribute to the non-specialist readership that the booklet aims at, but necessarily falsifies the working of the language by attributing lexical meanings to its grammatical morphemes.

It took a long time until interlinear morphemic glossing became firmly established. In Bloomfield's *Language*, of 1933, examples abound, but they are presented like this: "Some languages have here one word, regardless of gender, as Tagalog [kapa'tid]; our *brother* corresponds to a Tagalog phrase [kapa'tid na la'la:kil], where the last word means 'male', and our *sister* to [kapa'tid na ba'ba:jil], with the attribute 'female'" (Bloomfield 1933: 278).

IMGs that fulfill most of the requirements set out below appear first in the sixties of the 20<sup>th</sup> century. From the eighties on, they become standard in publications dealing with languages whose knowledge is not presupposed. Editors and publishers increasingly require them even for languages like Latin, French and German that used to be well-known to linguists. The development is towards (not only translating, but even) glossing every language except English. This is apparently a symptom of a global development in which every language except English becomes exotic.

Good IMGs are relatively costly, both for the scientist and for the typesetter. Authors and publishers are therefore not too eager to produce them (well). There is at least one software on the market that aids the linguist in generating systematic IMGs for his texts, the interlinearizer that comes with the program Shoebox, from the Summer Institute of Linguistics (cf. Simons & Versaw 1988; Art. 168).

Since IMGs are fairly recent in linguistics, they have seldom been treated by linguistic methodology. The first treatise of the present subject is Lehmann (1982). Subsequent work

includes Simons & Versaw (1988), Lehmann et al. (1994), Lieb & Drude (2000), Bickel et al. (2004). They have been freely made use of in the present treatment.

### 1.3. Levels of representation

Interlinear morphemic glossing must be seen in the larger context of representation of linguistic data and, even more comprehensive, of the documentation of a language (cf. Lieb & Drude 2000). On such a background, an isolated example given in a descriptive context is a particularly constrained case of the edition and annotation (also called 'markup' for technical purposes) of a piece of primary linguistic data for posterity. In other words, a general-purpose edition of a linguistic corpus is a kind of maximum model, subject to the full set of rules for explicitness, detail and elaboration, from which the quotation of an isolated example in the context of some grammatical discussion represents a subset delimited by considerations of feasibility, usefulness and the like.

Every linguistic representation of some piece of raw data, even if it limits itself to a phonetic transcription, involves some linguistic analysis (Lehmann 2004). Insofar, no sharp boundary is to be drawn between the sheer representation of data and their analysis. Bearing this in mind, we can speak of various levels at which linguistic data may be represented. Presupposing spoken language data, at least the following are relevant:

- (a) raw data recording (video or audio tape),
- (b) phonetic transcription of the utterance,
- (c) orthographic representation of the utterance,
- (d) morph(ophon)emic representation of the utterance,
- (e) IMG of the utterance,
- (f) free translation of the utterance into the background language,

- (g) descriptive and explanatory comment on pragmatic or cultural aspects of the utterance.

This set may be supplemented by even more representations (cf. Lieb & Drude 2000). There may be a phonological representation distinct from both levels (b) and (d). There may be a syntactic representation, e.g. in the form of a labeled bracketing. And there may be a semantic representation instead of, or in addition to, representation (f). In such representations, the portion of linguistic analysis is probably even stronger than in the seven levels enumerated.

The raw data have a temporal structure which is projected onto a spatial line in written representations. These representations are synchronized more or less closely. For instance, representation (f) generally matches L1 sentences, units of level (g) may be associated with L1 units of any size, and representation (e) may match representation (d) morpheme by morpheme. This has different consequences for the typographic layout. For instance, units of level (g) may be associated with the running text by making full use of a multidimensional display, while representation (f) may be in a lateral column at the same height as its original, as is usual in synoptic editions and also practiced in the example from Finck (1909) given in section 1.2. Other representations should be arranged in lines one of which is beneath the other and runs in parallel with it.

For the purposes of descriptive and typological grammatical analysis and exemplification, the seven-level set is generally reduced to only three. What may be called the ‘canonical trilinear representation’ of linguistic examples involves:

- a representation of L1 at one of the levels (b), (c) or (d),
- an IMG in L2 (level e),
- an idiomatic translation into L2 (level f).

An IMG will seldom be paired with a phonetic representation, because this serves phonetics, while an IMG serves grammar. They therefore form an unequal pair. If both are required, they will generally be mediated by another representation, a morphophonemic or orthographic one.

It makes a difference for the glossing whether L1 is rendered in a morphophonemic representation or in conventional orthography. In the former case, the rules of

orthography do not apply, and the linguist may dress up the representation in such a way that a biunique mapping onto the IMG is facilitated. In the latter case, morpheme boundaries may be obscured by the orthography, and there will be delimiters such as blanks, hyphens and punctuation marks which do not necessarily represent grammatical boundaries and may interfere with the glossing. However, the choice between an orthographic and a scientific representation of a text is generally a higher-order choice which cannot depend on glossing requirements. In particular, an example may be quoted unchanged from a primary source (think of Sanskrit examples). It may then not be possible to insert boundary symbols and the like in the L1 text. Glossing conventions therefore have to be adjusted to use with orthographic representations.

If the first line representing the L1 text differs too much from a morphophonemic representation, then it is advisable to expand the canonical trilinear representation by an additional morphophonemic representation. It will then be this line that the IMG refers to.

The two languages involved will be called L1 and L2 throughout. However, it should be clear that the relationship between them is asymmetric: L1 is the object language, L2 is the metalanguage. The symbols occurring in an IMG have a different status from the elements of the text line that they gloss: For present purposes, the L1 text line consists of morphs, while the IMG consists of names of L2 morphemes and of grammatical categories (cf. section 3.2). There can, thus, be no question of “mirroring” the structure of the L1 expression by the sequence of the L2 elements. Instead, an element in an IMG serves as a kind of mnemonic hint to the meaning or function of its corresponding L1 element.

#### 1.4. Delimitation

The complete set of representations rendering an L1 text may be sufficient to derive a grammatical description from it (as postulated in Lieb & Drude 2000, § 1.1). However, given its inherent restrictions, an IMG cannot by itself compensate for a grammar (or just a morphology). Apart from the form of presentation, the most important substantive difference between a grammatical description and an IMG lies in the fact that the grammar treats of categories in the sense of classes, while the IMG identifies individual morphemes. For instance, a grammar treats of

the verbal category of aspect. An IMG contains a gloss for an individual aspect morpheme, e.g. *PERF*, neglecting the question of whether this is actually an aspect morpheme or rather a tense morpheme, and also leaving unanswered questions concerning other members of the paradigm, let alone the construction and use of the *PERF* morpheme. Some of these kinds of information may be given in other representations, e.g. a syntactic representation.

By the same token, the IMG does not indicate the syntactic category of a word form. For instance, the IMG of Germ. *laufend* is ‘run:PART.PRS’, showing that the form contains a morpheme whose function it is to mark a present participle. The gloss is not ‘run (part.prs)’ or anything of the sort, meaning that *laufend* is a present participle. While the latter is true, it is not the task of an IMG to give this information.

Moreover, the type of morphological unit is not an object of an IMG. Thus, concepts like ‘stem’, ‘root’, ‘prefix’ do not appear in IMGs. Such information may, to a large extent, be inferred from a proper IMG, since the gloss of a root differs typographically from the gloss of a grammatical formative.

Similarly, an IMG cannot replace a lexicon. Here again, elements appearing in an IMG are but names of elements appearing in the L1 line. They are not meant to exhaust the meaning of such an element.

Finally, an IMG is not meant to replace an idiomatic translation. Thus, it cannot and should not render closely the sense of an L1 item in the given context. An IMG is regularly accompanied by a free translation which fulfills precisely this purpose.

## 2. Prerequisites of morphological analysis

Interlinear glossing might appear to be just an elementary form of representing data. As a matter of fact, it presupposes a morphological analysis. The following analytic problems are directly reflected by the glosses.

### 2.1. Unmarkedness and zero morphemes

Where the L1 text contains a morph, the IMG contains an element rendering it. Where the L1 text contains nothing, the issue of rendering it is complicated by markedness theory. Germ. *Herr* may be glossed by ‘master’ or by ‘master(NOM.SG)’. Latin *mone-*

may be glossed by ‘warn-3.SG’ or by ‘warn (IND.ACT)-3.SG’ (according to R16). Moreover, one may believe that such forms contain zero morphemes and put thus: *Herr-Ø* ‘master-NOM.SG’, *mone-Ø-Ø-t* ‘praise-IND-ACT-3.SG’. All of these IMGs are formally correct. The choice among them is not a matter of appropriate glossing, but of morphological theory. For interlinear glossing, only the general rule R1 is relevant.

### 2.2. Allomorphy

If the L1 representation to be glossed corresponds to standard orthography, the analyst has no decisions to make in its regard. Otherwise, a good option for the representation (as well as for any writing system) is a morphophonemic representation which steers a middle course as far as allomorphy is concerned: Phonologically conditioned allomorphy is resolved (ignored), morphologically conditioned allomorphy is not resolved (is rendered).

The IMG, on the other hand, shows morphemes, not allomorphs. In order to understand what this implies, consider three examples. Modern Yucatec Maya expresses complete and incomplete aspect by suffixes on transitive and (one conjugation class of) intransitive verbs as follows:

	aspect valence	completive	incomplete
transitive		-ah	-ik
intransitive		-Ø	-Vl

Tab. 169.1: Aspectual suffixes in Yucatec Maya

For instance, *t-u hats'-ah* ‘PAST-SBJ.3 beat-CMPL (he beat it)’. One might think that the table contains four morphemes. Actually, however, transitivity is inherent in the verb stem and conditions allomorphy in the aspect suffix. The conditioning factor should not make part of the gloss. That is, the correct gloss for *-ah* is not ‘TR.CMPL’, but simply ‘CMPL’. See also 4.5.

Yucatec Maya also has personal clitics that precede nouns as possessive cross-reference markers and verbs as subject cross-reference markers. If the noun or verb starts with a vowel, a glide is inserted in its front. The choice between the two glides *w* and *y* is morphologically conditioned: If the pronoun is of first person singular or of second person, it

is *w*; if the pronoun is of third person, the glide is *y*. For instance, *in watan* ‘POSS.1.SG Ø:wife (my wife)’, *u yatan* ‘POSS.3.SG Ø:wife (his wife)’. It is also possible to regard the noun forms modified by the initial glide as stem allomorphs, in which case the glide would not even receive the gloss by ‘Ø’. However, in the third person, a pronominal clitic followed by the glide can be omitted. Thus, *yatan* by itself means ‘his wife’. (Historically, the glide is indeed a reflex of an older cross-reference marker). We therefore have *u y-atan* ‘POSS.3 Ø-wife’ ~ *y-atan* ‘POSS.3-wife’, and we face the problem that the same element is not even a morph in one context, but a full-fledged morpheme in another. Whatever the correct morphological analysis may be, the IMG presupposes it and brings it out.

Last, consider gender marking in a language such as Latin (cf. Art. 48). *Puellae bonae* means ‘good girls’, *pueri boni* ‘good boys’. Apart from motion, gender is inherent in a noun stem. It is, however, recognizable by the declension suffixes. Nevertheless, the gloss of the morph in question does not contain the conditioning category. The noun forms will be glossed ‘girl.F:NOM.PL’, ‘boy.M:NOM.PL’, implying that gender is a category of the stem, not of the suffix. What about the adjectives? Gender is not inherent in an adjective stem. We may therefore gloss them by ‘good:NOM.PL.F’ and ‘good:NOM.PL.M’. Then one and the same element would be a morpheme on adjectives, but a conditioned allomorph on nouns, and therefore it would get two different glosses. Since two different glosses for the same element are not admissible in interlinear glossing (R4), this would entail that there are two homonymous declension suffixes *-ae* in Latin, which is obviously undesirable. We may stop this consideration here, since the problem is obviously not one of glossing, but one of morphological analysis. R2 codifies the convention that IMG expressions represent morphemes, not allomorphs.

### 3. Principles of interlinear glossing

#### 3.1. General

In the canonical trilinear representation, one L1 text line is matched by two L2 lines, the IMG and the free translation. This entails a division of labor between the two L2 representations. The free translation is the idio-

matic semantic equivalent of the L1 line, the IMG is a representation of its morphological structure. There is consequently no need for the translation to be particularly literal, just as there is no need for the IMG to repeat the morphemes that appear in the translation. For instance, a polysemous L1 item will be rendered by its contextual sense in the free translation, but by its generic meaning in the IMG (R8). Unnecessary parallelism between the two L2 lines is redundant; the trilinear canonical representation offers an occasion to provide additional information.

In principle, the degree of detail displayed in an IMG depends on the purpose the example with its gloss is meant to serve. However, the author cannot foresee the purposes to which others will want to use his examples. A morphological detail that is not at stake in the current discussion may be essential for the argument another linguist may wish to base on the example. For this reason, the principle is to allow for as much precision and detail as seems tolerable (R3). The following rules specify the properties of a complete IMG. They do not exclude less detailed IMGs where they suffice. Cf. R13 and R23 for possibilities of underspecifying morphological structure.

The IMG of a morpheme is some sort of name for it, a name that alludes to its meaning or function and is insofar mnemonic or, at least, more helpful to the non-specialist than the L1 morph itself. It must therefore have a certain recognition value. R4, which actually is a tightening of R1, therefore requires that given a particular L1 morpheme, its gloss will be the same in all contexts; and apart from full synonymy, no two morphemes of L1 will have the same gloss. These points will be elaborated in the following subsections.

#### 3.2. Glossing vocabulary

Glosses are taken from a language L2 that serves as a metalanguage of L1. L2 is based on a natural language – in this article, English –, but with far-reaching deviations from natural language use. The glossing vocabulary consists of the following kinds of symbols:

- vocables:
  - L2 morphemes and stems
  - grammatical category labels
  - boundary symbols

The difference between the two kinds of vocables is the following: Morphemes and stems

are taken from natural L2 vocabulary and are meant to be translation equivalents (in a sense to be made precise below) of L1 items. For instance, the notation “Germ. *Schreibtisch* ‘write-table (desk)’” is to be interpreted thus: The German word form *Schreibtisch* ‘desk’ consists of two morphs, of which *schreib-* means ‘write’ and *tisch* means ‘table’. Grammatical category labels, on the other hand, are taken from scientific terminology and are meant to categorize the function of L1 items. For instance, “Germ. *schreib-en* ‘write-INF (write (inf.))’” is to be interpreted thus: The German word form *schreiben* ‘write (inf.)’ consists of two morphs, of which *schreib-* means ‘write’, while *-en* is an infinitive marker (that is, *-en* does not mean ‘infinitive’; it is the German word *Infinitiv* which means ‘infinitive’). To bring out this essential difference between the two kinds of IMG vocables, L2 morphemes and stems are written in straight orthography, while grammatical category labels are written in (small) capitals (R29).

A grammatical category label represents (i.e. is the name of) the value of a grammatical category (the latter being taken, technically, as a parameter or attribute). For instance, the label ‘ACC’ is the name of the value ‘accusative’ of the morphological category ‘case’. Just like a grammatical category label is a name of a value of a grammatical category, what is called ‘L2 morphemes and stems’ are actually names of L2 morphemes and stems. In the following, we will abide by the simpler way of speaking. The choice and use of vocables are treated in the following subsections; boundary symbols are treated in section 4.

### 3.3. Lexemes

An L1 lexeme is, in principle, glossed by an L2 lexeme (R5(a)). Sometimes more than one L2 word is necessary, for instance in Germ. *fabulieren* ‘invent.stories’. However, profusion is to be avoided. Adjectives that do not require a copula in predicative function are often glossed by adding a copula, e.g. West Greenlandic *anurli* ‘windy’ is glossed ‘be.windy’ in Fortescue (1984:65). This is only correct if a word of this class requires an attributor in attributive function. Otherwise it wrongly implies that there is no difference between adjectives and verbs, and it tends to obscure the fact that the language does not use a copula with adjectival predicates.

L1 cardinal numerals are glossed by Arabic numbers. An issue arises for proper names, which are often not glossed at all. However, there is no room here for an exception to the general rule: a proper name is rendered by its counterpart in L2. Some proper names have conventional counterparts that are specific to L2; Engl. *John* corresponds to Germ. *Hans*, and Engl. *Munich* corresponds to Germ. *München*. These then appear in the IMG. Whenever there is no such language-specific convention, the counterpart of an L1 name is usually the same word in L2.

If L2 is English, no problem arises for the form in which L2 lexemes are quoted in the IMG. In other languages, lexemes have a citation form in conformity with L2 conventions. If this is an inflected form, like the nominative for nouns or the infinitive for verbs, then it is excluded from an IMG by R5(b), and instead the bare stem must be used. The reason is that such a gloss would seem to imply that there is a nominative, or an infinitive, in the L1 line where actually just a stem is being glossed.

### 3.4. Grammatical formatives

L1 morphs are, in principle, glossed by citation forms of L2 morphemes. However, interlinear morphemic glossing crucially revolves around grammatical properties of L1 items. These will differ between L1 and L2. Even if, in a number of cases, the L2 stem appearing in a gloss has the same grammatical properties as the L1 morph that it represents, this cannot be expected and therefore not be relied upon. For instance, Latin *eum* could be glossed by Engl. *him*, and at the typological level, they do share a number of features. However, *eum* is accusative and can thus not be indirect object, while *him* is the form for direct and indirect object. Therefore, grammatical items of L1 are generally not glossed by grammatical items of L2, but by a configuration of symbols taken from the scientific metalanguage and representing their grammatical features, i.e. by grammatical category labels (R6). Thus, Latin *eum* may be glossed by ‘ANA:ACC.SG.M’.

No bound grammatical or derivational morphemes should appear in IMGs. Free grammatical morphemes may be used to render free grammatical morphemes. However, use of those in the second column of Tab. 169.2 is discouraged unless L1 happens to exhibit the same ambiguity as English:

word class	instead of	use
copulas, auxiliaries	<i>be</i> <i>have</i> (except to mean ‘possess, own’)	COP, PASS, PROG ... PF, OBLG ...

Tab. 169.2: Free grammatical morphemes

Some morphemes are extremely deeply entrenched in the semantic or pragmatic system of the language and simply have no translation equivalent in L2. Two common ways out are a) to repeat the significans of the item in the gloss, and b) to indicate the class of the item instead of its meaning. Thus, we find the German modal particle *eben* glossed either as ‘EBEN’ or as ‘PTL’. Both glosses are inadequate. If there is no translation equivalent in natural L2, then the linguist has a specialized metalanguage to describe such functions. For the sake of an IMG that is not devoted to modal particles in particular, a gloss like ‘REAFF’ (reaffirmed) will be fully sufficient and more helpful than either of the aforementioned.

A gloss is a proper name of an L1 morpheme. It does not give information on the grammatical class of the morpheme in question other than what is implied by the name itself. If a gloss is ‘ACC’, one assumes that the morpheme belongs to the grammatical class of the case morphemes. It is the task of the grammar to clarify whether or not this implication is correct in a particular case. The gloss will not be ‘CASE.ACC’ or anything of this sort. For the same reason, the gloss of the perfective aspect is simply ‘PRFV’ and not ‘PRFV.ASP’, and so on.

From this it follows that the gloss will not be ‘ASP’ either. In the literature, one frequently encounters glosses such as ‘PTCL’ (particle), ‘AGR’ (agreement), ‘ART’ (article). If

L1 possesses only one particle, agreement morpheme (hardly imaginable) or article (this is possible), then these glosses are sufficient. In all other cases, this kind of gloss is not helpful because it does not give the information on the meaning or function of the morpheme that a gloss is supposed to give. Moreover, the whole glossing becomes inconsistent, as some glosses name particular morphemes, while others name the class a morpheme belongs to. More on this in section 3.9.1.

### 3.5. Ambiguity

Each morpheme of L1 should be recognizable by its gloss. The reader is supported in this task if glosses are consistent within one publication. It will rather confuse him if Yucatec Maya *k'in* is once glossed ‘sun’ and the next time ‘day’. **Polysemy** is resolved in the idiomatic translation. The gloss renders neither the contextual sense nor the full meaning range of an item. Naturally, this does not apply to **homonymy**. Homonymous L1 morphs represent different morphemes and therefore receive different glosses. This is stipulated by R7, which follows from R4.

If the senses of an item are reducible to a **Gesamtbedeutung**, then this should be used in the gloss (R8). For instance, the Turkish dative/allative suffix *-a* is glossed by ‘DAT’. The **Gesamtbedeutung** rather than the **Grundbedeutung** should appear in the gloss, because it has better chances to fit all the diverse

contexts in which the item occurs. Sometimes, there is either no Gesamtbedeutung, or if there is, L2 does not have a term for it. In cases like Yucatec Maya *k'iin* 'sun, day', there are various alternatives. First, the Grundbedeutung may be used as the gloss; thus Yucatec Maya *k'iin* 'sun'. However, if all the occurrences of a polysemous morpheme in a particular publication reflect the same (derived) reading, then generally no useful purpose is served if it is consistently glossed by its basic meaning. For instance, all the occurrences of Yucatec Maya *k'iin* in a particular text might mean 'day'. Then this would be the appropriate gloss. Finally, any kind of reduction may seem misleading. Then two or even more senses may be indicated in the gloss, separated by a slash, e.g. Yucatec Maya *k'iin* 'sun/day'. (2) illustrates the same convention.

### (2) Korean

<i>Toli-nun kae-hako cal</i>
Toli-TOP dog-ADD often/well
<i>non-ta.</i>
play:PRS-DECL

'Toli likes to play with the dog.'

**Syncretism** often involves extensive polysemy and/or homonymy. If it should be made explicit in an IMG, then e.g. the gloss for Lat. *ancillae* would have to be 'maid.F:GEN.SG/DAT.SG/NOM.PL'. This may be appropriate if the discussion in the context deals with syncretism. Otherwise, only the category actually required by the context may be shown, e.g.:

### (3) Latin

<i>ancillae</i>	<i>orant</i>
maid.F:NOM.PL	pray:3.PL
'the maids	'pray'

In other words, in cases of syncretism the last two options of R8 must be resorted to.

A whole paradigm of markers may be used in two clearly distinct functions. For instance, a set of cross-reference markers may combine with a verb to reference its subject, and with a noun to reference its possessor. Here again, the two alternatives mentioned are open: either gloss the verb markers by 'SBJ' and the noun markers by 'POSS', or gloss them by 'SBJ/POSS' in both positions (which is, actually, never done). A third alternative – one that is actually resorted to in Mayan linguistics; cf. Art. 170, section 6.1.2 – is to coin

a concept and a term for a paradigm that is used in these two functions and use this in the IMG.

### 3.6. Features and functions

As remarked in section 1.4, an IMG cannot fill the place of a grammar. In particular, the **grammatical category label** that represents a morpheme in the gloss cannot possibly represent the full functionality of that morpheme. It can only serve as a mnemonic identifier for the reader. We just saw that the full polysemy of an item cannot be accounted for in a gloss. The same goes for functional information associated with a morphological position. If the slot filler is a verb agreement affix or cross-reference marker, then its meaning is in the sphere of person, number and gender. Consider conjugation endings as in Germ. *lieb-e* 'love-SBJ.1.SG', *lieb-st* 'love-SBJ.2.SG', *lieb-t* 'love-SBJ.3.SG'. The information that these suffixes cross-reference the subject is functional information associated with the morphological slot. It must be given in the grammar; the IMG may simply read *lieb-e* 'love-1.SG' etc.

The same would apply, in principle, if the verb cross-references more than one of its dependents. Here, however, it has become customary to distinguish the references of the cross-reference markers by indicating their syntactic function, as in (4).

### (4) Swahili

<i>ni-li-mw-on-a</i>	<i>m-toto</i>
SBJ.1.SG-PST-OBJ.CL.1-see	CL.1-child
'I saw the/a child'	

The information that the initial prefix references the subject, while the one following the tense prefix references the direct object must be contained in the grammar. The task of the gloss is to identify the particular element, not to specify the rules of its use. Insofar, adding functional information concerning the morphological slot itself – 'SBJ' and 'OBJ' in (4) – is a service to the reader that may be useful, but that also clutters up the gloss (cf. R3).

The distinction between morphological categories and syntactic or semantic functions is also relevant in the domain of case and valence. The frequent confusion among syntactic/semantic functions, cases and valence-derivational functions also manifests itself in glossing habits. One frequently encounters glosses such as Turkish *ates-in* 'fire-

POSS' instead of 'fire-GEN', *ates̩-e* 'fire-io' instead of 'fire-DAT' or '... -send-DAT ...' instead of (5). The quality of the glossing reflects the quality of the morphological analysis.

(5) Swahili

<i>Musa a-li-ni-andik-ia</i>
Musa SBJ.CL.1-PST-OBJ.1.SG-send-APPL
<i>barua</i>
letter

'Musa sent me a letter'

### 3.7. Derived stems

The morpho-semantic structure of a derived stem may be completely regular and transparent, as in Germ. *wolk-ig* 'cloud-ADJVR (cloudy)', or it may be opaque, as in Germ. *heil-ig* 'salvation-ADJVR (holy)'. If the discussion focuses on word-formation, then both of these words will be glossed as indicated. If the internal structure of stems is of no relevance, then it will not be shown in the L1 text line, and consequently the glosses can reduce to 'cloudy' and 'holy', respectively.

For opaque complex stems, morphological segmentation plus corresponding gloss often amounts more to etymology than to morphological analysis. It also unnecessarily obscures the correspondence of the gloss to the idiomatic translation. This should be borne in mind before one carries it through as a general principle in text editions.

In an ideal methodological situation, an IMG is taken from a lexicon, where the gloss constitutes one of the fields in the microstructure of each lexical entry. The German lexicon may contain, e.g., the three entries *Huf* 'hoof', *Eisen* 'iron' and *Hufeisen* 'horse-shoe'. If the latter occurs in an L1 text, then it may either be analyzed or not. In the former case *Huf* and *Eisen* will be looked up in the lexicon and will be matched by their glosses, while in the latter case *Hufeisen* will be looked up and be glossed accordingly.

### 3.8. Submorphemic units

There are two kinds of submorphemic units: parts of morphemes with a sound-symbolic value and strings of phonemes inserted between morphemes for euphonic or similar reasons. The former kind is not generally subjected to morphemic analysis and may therefore be left out of consideration here. The latter kind may be illustrated by the second element in forms such as French *a-t-il* 'has he' and Germ. *Weihnacht-s-gans* 'Christmas goose'. If the submorphemic unit is not

at stake in the context, then the first choice is to abstain from an analysis by regarding the submorphemic unit as part of a stem alternant: *Weihnachts-gans* 'Christmas-goose'. The second choice is to render the submorphemic unit by Ø, e.g. *a-t-il* 'has-Ø-he'. A euphonic submorphemic unit may be glossed by 'EU' instead of 'Ø'.

### 3.9. Grammatical category labels

#### 3.9.1. General

As was said in 3.4, the gloss for a grammatical item is generally not a grammatical item of L2, but a grammatical category label (R6). For instance Yucatec Maya *yàan* is not rendered by 'be', but by 'EXIST', one of the reasons being that L2 'be' is a copula, while Yucatec Maya *yàan* is not. While this poses few problems for such categories for which the European grammaticographic tradition possesses terms, it does pose a problem for certain classes of semi-grammaticalized items such as function verbs and coverbs. Coverbs are words which are grammaticalized from verbs to minor parts of speech, mostly adpositions. If they function as the latter, they may express a semantic role. In Mandarin, for instance, *yòng* has the lexical meaning 'use' and the grammatical meaning 'INSTR', as in (6).

(6) Chinese

<i>Tā yòng shǒu zǒu lù.</i>
he use/INSTR hand walk road
'He walks on his hands.'

This kind of problem is not solved by putting the lexical meaning in upper case ('USE'), since 'use' is neither a grammatical concept in L2 nor a term of the grammatical metalinguage. Applying R8 in such cases would imply opting in favor of the Gesamtbedeutung of the item, which in such cases is the grammatical meaning. The gloss would then be 'INSTR' (or some more language-specific grammatical category which may suit better this particular function). The problem remains, however, that the same word can occur as the sole predicate of a clause, in the meaning 'use' (e.g. *tā yòng shǒu* 'he uses his hand'). An IMG 'INSTR' would be hardly intelligible there. The alternative of only using the Grundbedeutung – 'use' in (6) and throughout – would be in conflict with the principle that morphological analysis must be kept distinct from etymology. Here the third alternative offered by rule R8 may be re-

label	intended meaning	comment
A	transitive subject	in morphemic glosses, the abbreviation is ERG
ADV	adverb	specify meaning
AGR	agreement	specify agreement categories
AGT	agent	this is not a value of a morphological category
ART	article	only if it has no determinative properties
ASP	aspect	specify particular aspect
AUX	auxiliary	only if there is only one auxiliary morpheme in the language
CARD	cardinal	only if it is a morpheme or grammatical feature
CLF	classifier	this is a word class
CLT	clitic	this is neither a morphological category nor a value of one
EP	epenthetic	has no morphological status, should not be separated in the first place
EVID	evidential	specify particular evidential
PAT	patient	this is not a value of a morphological category
PREP	preposition	this is a word class
PTL	particle	this is (at best) a word class
TNS	tense	specify particular tense

Tab. 169.3: Labels to be avoided

sorted to, viz. providing both meanings in the gloss of each occurrence of the item, thus: *yòng* ‘use/INSTR’.

An IMG identifies an L1 morpheme. It names a value, not a parameter. Mentioning the name of the generic category in the gloss instead of the specific value is nevertheless widespread usage. One finds both Japanese *yom-i* and *yon-de* glossed by ‘read-CONV’ (converb), which hinders the reader in his attempt to keep the converb forms apart. One finds Onondaga *wa?ha-ye?kwa-hni:-nu?* ‘he bought tobacco’ glossed as ‘TNS:he/it-tobacco:buy-ASP’ (Woodbury 1975: 10), which is of no use for somebody studying the interdependence of incorporation with tense and aspect.

IMGs not seldom contain labels that do not correspond to the principles introduced so far. Sometimes, elements without morphological status are separated and glossed. Sometimes, the parameter instead of the particular value of a grammatical category is identified. Sometimes, syntactic or semantic instead of morphological information is given. Here is an incomplete list of labels that have repeatedly been found in glosses but which should be avoided.

### 3.9.2. List of grammatical categories and their glossing labels

No list of grammatical category labels can be complete. The list following in Tab. 169.4

(which incorporates the list in Lehmann et al. 2019) only contains the most widespread categories. When more than one abbreviation is mentioned, they are given in the order of preference. To the extent that these abbreviations are or become wide-spread, they get the status of linguistic abbreviations like ‘NP’, which need not be defined when used. If a publication uses labels not contained in the following list, it must explain them in an individual list of abbreviations.

Grammatical category labels are subject to two conflicting requirements: they must be both distinct and short. The former requirement takes precedence. It is, for instance, not possible to use ‘COMP’ in one and the same publication to mean both ‘completive’ and ‘complementizer’. The list in Tab. 169.4 avoids such clashes. However, in an individual publication that has nothing to do with complementation, the aspect may, of course, be abbreviated by ‘COMP’ (instead of ‘CMP(L)’, as in the list). Parenthesized parts of an abbreviation are only necessary if a distinctness conflict arises.

Tab. 169.4 contains only such terms which may appear in an IMG. In other publications, similar lists of terms for syntactic categories and functions and for semantic and pragmatic functions may be found.

‘Cross-reference position’ means a morphological slot, usually on a verb, occupied by pronominal elements that agree with or

value	abbrev.	category	comment
1 <sup>st</sup> person	1	person

Tab. 169.4: Grammatical category labels

refer to a dependent in a specific syntactic function. 'Case' means a case relator that may take the form of a case affix or an adposition. Verb derivational morphemes get these glosses only if they are homonymous with nominal case relators.

#### 4. Boundary symbols

##### 4.1. Basic rules

Rules R1 and R4 guarantee correspondence between units in the L1 text and in the IMG.

They do not, however, insure that the vertical alignment works in a mechanical way. This is desirable in certain contexts such as automatic parsing. It can be guaranteed in a fully formalized representation, which would then take the form of a table (s. Lieb & Drude 2000). In less formal situations, it cannot be fully guaranteed because there may be good reasons not to insert morpheme boundaries in the L1 text while still representing each morph by a separate gloss (cf. R13). Correspondence of boundary symbols in the L1

and the IMG lines is therefore not generally an equivalence, but only an implication: boundary symbols in the L1 line are matched by corresponding boundary symbols in the IMG (R9). We will review the kinds of boundaries and their delimiters in turn.

The **word boundary** is shown by a blank in L1. This is repeated in the IMG, and conversely there is a blank in an IMG only if there is a corresponding blank in the L1 line. This particular rule (R10) is therefore stricter than R9. R10 prohibits two situations: a word being rendered by a sequence of two words; and a sequence of two words being rendered by one word. The first situation will be discussed in section 4.5. Sometimes a sequence of two L1 units (words or morphemes) corresponds to one L2 unit. In principle, this situation should not arise in the IMG because each of the L1 units should have its own gloss. However, it is possible that either the L1 units have no meaning in isolation or else mean something totally different than their combination, the latter being idiomaticized. In such cases, glossing them separately might give a misleading impression of the workings of the grammar. When the bisected L1 unit forms an orthographic unit (e.g. a compound), one may simply dispense with the analysis (cf. section 3.7). For instance, instead of Germ. *be-komm-en* ‘APPL-come-INF’, one can write *bekomm-en* ‘get-INF’. If the orthography requires a boundary, as in Yucatec Maya *le kah* ‘when’, the first choice is to gloss the items separately (in this case, ‘DEF SR’) and to leave the semantic interpretation to the idiomatic translation. The second choice is to indicate the semantic unity of the two L1 items typographically by replacing the blank by a boundary symbol that does not interfere with the orthography, e.g. by an underscore: *le\_kah* ‘when’ (R11). If L1 orthography links the two items by another symbol that is also an IMG boundary symbol, as in Engl. *vis-à-vis* ‘facing’, no satisfactory solution is known.

Apart from special cases to be noted, the **morpheme boundary** is shown by a hyphen in L1 (R12). This is repeated in the IMG; and here again the converse applies, too. Apart from the *vis-à-vis* type exception, this does not pose any problems. It does, however, happen that the L1 text contains a combination of two morphemes, but no boundary is shown between them. Various motivations for this are conceivable, be it that two morphemes are fused in a portmanteau morph,

be it that the position of the boundary is not clear or irrelevant, be it that the analyst does not want to disfigure L1 orthography with boundary symbols. In such cases, a colon in the IMG is a hint at a morpheme boundary existing, but not shown in the L1 line (R13). The purpose of R13 is to allow the analyst to forgo a segmentation while still saving R1 and insuring uniqueness of the other boundary symbols. Several examples may be seen in (1). The colon is also used to render a portmanteau morph, e.g. French *au* ‘DAT: DEF’. More on this in section 4.5.

Special symbols may be introduced to distinguish kinds of morpheme boundaries. For instance, the use of the plus sign to signal a boundary in **compounding**, as in German *Weihnachts+gans* ‘Christmas+goose’ is rather widespread; and occasionally it is also found in derivation, as in German *wolk+ig* ‘cloud+ADJVR (cloudy)’ (R14).

No orthography distinguishes **clitic boundaries** from word and morpheme boundaries. If L1 is represented in conventional orthography, then the simplest solution for an IMG is not to distinguish them either. Thus French *je le sais* ‘I know it’ will be glossed as ‘SBJ.1.SG DO.3.SG.M know.SG’, while Latin *itaque* ‘and so’ will be glossed by ‘so:and’. If clisis is important or the L1 representation is non-orthographic, then the clitic boundary will be shown by an equal sign both in the L1 text and in the IMG, thus: *ita=que* ‘so=and’ (R15).

If a **zero morph** or **morpheme** is represented in L1 by Ø (cf. section 2.1), no special measures need be taken. If it is not there represented, then its gloss is enclosed in parentheses (R16), like this: Lat. *timor* ‘fear.M (NOM.SG)’. In this example, a stem is accompanied by two (complexes of) grammatical category labels, ‘M’ and ‘NOM.SG’. The first is separated by a period because it corresponds to an inherent feature of the stem. The second is enclosed in parentheses because it corresponds to a separate morpheme.

#### 4.2. Discontinuity

Discontinuous units – words or morphemes – are like bisected units in that one semantic unit is represented by two expression units. However, they present the added difficulty that their parts are not adjacent, so the IMG has to make it explicit what belongs together. For a **discontinuous stem** or **affix**, diverse so-

lutions have been proposed in the literature. Among them is the proposal (Bickel et al. 2004) to repeat the same gloss under each part of the discontinuous item. However, this seems misleading, as the syntagmatic co-occurrence of synonymous L1 items is not at all rare – e.g. in hypercharacterization – and must be distinguished from discontinuity. An unambiguous solution for a **circumfix** is to set it off by angled brackets, like this: Germ. *ge>lauf<en* ‘<PART.PRF>run’ (run (part. prf.))’ (R17). Discontinuous words are rare. The first choice is to try and gloss each part independently, as done for the German circumposition *um ... willen* ‘for’ in (7).

## (7) German

<i>um unser-es</i>	<i>Heil-es</i>	<i>willen</i>
for our-GEN.SG	salvation-GEN.SG	sake
‘for (the sake of) our salvation’		

The second choice is to treat them by the same formalism as for circumfixes. Consider the case of preverbs. In several Indo-European languages, they may be distantiated from their host verb to yield a discontinuous verb stem. There are two options for glossing such discontinuous compounds: If the compounding is relatively transparent, one may prefer to provide the preverb and the base each with its gloss. If the compound is completely lexicalized, this might be misleading, and so it may be preferable to treat it as a discontinuous morpheme in the gloss, as in (8).

## (8) German

<i>es hör&gt;t</i>	<i>jetzt &lt;auf</i>
it <stop>3.SG	now
‘it stops now’	

**Infxes**, too, require a special boundary symbol in order to insure that the root bisected by them is perceived as a unit. This is achieved enclosing them in angled brackets as shown in (9)–(10) (R18).

## (9) Latin

<i>vi&lt;n&gt;c-o</i>
conquer<PRS>-1.SG
‘I conquer’

## (10) Indonesian

<i>t&lt;el&gt;unjuk</i>
<AGNR>point
‘forefinger’

The gloss of a left-peripheral infix precedes the gloss of its host, the gloss of a right-peripheral infix follows it (Bickel et al. 2004).

## 4.3. Reduplication

Reduplicative segments may have the same kinds of grammatical functions as affixes, and sometimes they are formally not easily distinguished from affixes. Therefore they must be glossed just like affixes, but at the same time they must be formally distinguished from affixes. This is achieved by providing the same kind of gloss for them as for grammatical formatives, but separating them by a tilde (R19; Bickel et al. 2004), as in (11)–(12).

## (11) Ancient Greek

<i>gé~graph-a</i>
PRF~write-1.SG
‘I have written’

## (12) Yucatec Maya

<i>k'úa~k'as</i>
INTNS~bad
‘wicked’

## 4.4. Other morphological processes

Morphological processes not covered by the above conventions comprise transfixation, internal modification, metathesis, subtraction and suprasegmental processes (cf. ch. VIII). These are like infixation in not being peripheral to the base, but they differ from it in that the grammatical meaning in question is not associated with a single string of segments which, if subtracted, leaves the base. The notation recommended here distinguishes them from the other morphological processes, but not from each other. Such a morpheme can hardly be signaled in the L1 representation. In the IMG, its gloss follows the gloss of the base, separated by a backslash (R20). An example of transfixation is the Arabic broken plural, as in *bujūt* ‘house\PL (houses)’. Apophony, metapophony, e.g. German *säng-e* ‘sing\IRR-1/3.SG (I/he would sing)’, and tone shift, as in Yucatec Maya. *háats* ‘beat\INTROV (beat (unspec. object))’ are treated in the same way.

## 4.5. Semantic and grammatical features

The gloss of a grammatical morph often consists of a set of symbols. They are separated by a period, as in Germ. *Tisch-es* ‘table-GEN.SG’ (R21). The same rule applies in the

situation mentioned in section 3.3, where an L1 lexeme is glossed by more than one L2 words. These, too, are separated by a period, as in Germ. *fabulier-en* ‘invent.stories-INF’.

Lexical stems fall into grammatical classes. Noun stems, for instance, have gender; verb stems have valence. If such grammatical categories are covert, this information is not deducible from (the gloss of) the lexical meaning. It therefore makes sense to represent it in the gloss of the stem. The Latin example *puellae* ‘girl.F:NOM.PL’ of section 2.1 shows how this may be done for gender. The same would be possible with transitivity. Instead of Yucatec Maya *hats'-ah* ‘beat-CMPL’ as shown in section 2.2, we might put ‘beat.TR-CMPL’. It does not seem necessary to have a rule here beyond R3 and R21.

The period between values of different morphological categories cumulated in one morpheme is dispensable between person, gender and number, provided the resulting letter sequence is unambiguous. Thus, Latin *lauda-mus* may be glossed as ‘praise (PRS.IND)-1.PL’ or ‘praise (PRS.IND)-1PL’.

Sometimes the period is used as a general-purpose symbol to hide the lack of an analysis, including the function of the colon as regulated by R13. This is not recommendable if – as is usually the case – the period is also used in the function regulated by R21. Given R21, the notation Lat. *orant* ‘pray.3.PL’ would imply that *orant* consists of a single morph. An IMG should at least make the distinction between a morph and a grammatical feature of a morph. In other words, if the author knows the number and order of morphs in an L1 form, then he should indicate them. If the author does not even know so much, he should probably not use the example. Still, in emergency situations, R23 may be viable, which allows for linking IMG elements by an underscore without any implications for L1 morphological structure. This would allow for putting *orant* ‘they\_pray’.

#### 4.6. Composite categories

Two cross-reference categories may share a morphological slot, as in (13).

#### (13) Mayali

*Kamak kan-bolk-bukka-n*  
good SBJ.2&OBJ.1-country-show-NPST  
*ke.*  
your  
'It is good that you will show me your country.' (Evans 1997: 400)

In principle, the case is analogous to one declension suffix showing both number and case. However, when actor and undergoer cross-reference is cumulated in one morpheme, sticking to R21 would lead to obscurity. Instead, information on the two dependents should be separated by ‘&’ or by ‘>’ (R22). The ‘greater than’ sign has two advantages here: it is iconic, and it dispenses with the use of function labels such as ‘SBJ, OBJ, ACR, UGR’ (simply ‘2>1’ in (13)). It has the disadvantage that the same symbol is used for discontinuous and infix material, which may lead to conflicts.

This case must be kept distinct from a portmanteau morph, viz. when two cross-reference categories that generally each have their own morphological slot fuse in one morph occasionally. There R13 applies.

#### 4.7. Constituency

The IMG abides at the level of morphology. The text may be represented at other levels in addition, if this is desired. Still, IMGs are used most frequently in publications on syntax, where not only morphological, but also syntactic properties of the examples are at stake. Very often it suffices to identify one constituent in the example, for instance the prepositional phrase or the relative clause that is the subject of analysis. Then no harm is done, but on the contrary the reader is helped in scanning the example, if constituency is shown by brackets. Thus in (14), the relative clause is identified by the bracketing.

#### (14) Yucatec Maya

*le máak chowak u ho'l-e'*  
DEF person [long poss.3 head]-D3  
'the person who has long hair'

In principle, this may be done either in the L1 line or in the IMG (it need not be repeated in both). However, since the IMG line is the one that contains the grammatical analysis, the bracketing seems more natural there (R24). In principle, an IMG may even be combined with a labeled bracketing; but above some rudimentary level, this will soon lead to illegibility.

#### 5. Typographic conventions

IMGs obey a number of typographic conventions all of which aim at facilitating the reader's task. First, if there are more lines of linguistic representation (cf. section 1.3), for instance one of syntactic constituency or lines

that show syntactic, semantic or pragmatic functions of the construction, then these follow the IMG, as stipulated in R25. Second, words (neither larger nor smaller units) of L1 are left-aligned with their glosses (R27). Further, since IMGs are generally longer than the L1 text they render, they are printed in a smaller type-face (R28), and grammatical category labels are abbreviated (R29).

Here is an example of a publication which does not observe these rules (Monod-Becquelin 1976: 138 on Trumai):

šyšyk letsi k'ate šy hai-ts šyšy-ka-ke  
“avec du piment, je rends le poisson piquant  
(regarde)”  
// piment / avec / poisson / *actualis.* / 1ère pers.  
erg. / piquant-causatif-marque d'adjectivisa-  
tion //

Furthermore, since IMG lines are not sentences, the relevant orthographic rules of punctuation, initial capitalization and syllabification do not apply (R30–R32).

## 6. Summary

Instead of a prose summary, a list of the rules and symbols proposed follows:

### 6.1. Rules

#### 6.1.1. Glossing principles

- R1. With the exceptions specified below, there is a symbol or a configuration of symbols in the IMG if and only if there is a morph in the L1 text that it corresponds to.
- R2. The IMG represents morphemes, not allomorphs. Therefore, the gloss of a grammatically conditioned allomorph does not contain the grammatical category conditioning it.
- R3. An IMG should be as precise and detailed as tolerable. The limits of precision and detail are defined by practical considerations of complexity and intelligibility.
- R4. There is a biunique mapping of individual L1 morphemes onto glosses.
- R5. (a) An L1 lexeme is glossed by L2 lexemes.  
(b) L1 stems are glossed by L2 stems.
- R6. The gloss of a grammatical morph is a configuration of grammatical category labels each of which represents the

value of a grammatical category. A grammatical morph should not be glossed by an L2 bound morpheme. It may be glossed by an L2 word if that has the same function as the L1 morph.

- R7. Homonymy is resolved in the IMG, polysemy is preferably not.
- R8. The gloss of a polysemous L1 item should represent, in the order of decreasing preference,
  - its Gesamtbedeutung,
  - its Grundbedeutung,
  - the set of its senses,
  - its contextual sense.

#### 6.1.2. Boundary symbols

- R9. Apart from R30, there is a boundary symbol of a certain type in the IMG if there is a corresponding boundary symbol in the L1 text. More strictly, there is a blank, hyphen, plus, equal sign, angled bracket and tilde in an IMG if and only if there is an identical symbol in the L1 text corresponding to it.
- R10. A word boundary is shown binniquely by a blank ( ).
- R11. Two successive orthographic L1 words which must be glossed by one L2 word are linked by an underscore ( \_ ).
- R12. A morpheme boundary is generally shown by a hyphen (-).
- R13. A morpheme boundary not shown in the L1 text is indicated by a colon (:) in the IMG. This applies also to portmanteau morphs.
- R14. A boundary in a compound stem, and possibly also in a derived stem, may be shown by a plus sign (+).
- R15. A clitic boundary may be shown by an equal sign (=).
- R16. A gloss of a zero morpheme or allo-morph is enclosed in round parentheses ( () ).
- R17. The string enclosed in a discontinuous L1 item P1 ... P2 is enclosed in inverted angled brackets (P1> ... <P2). In the IMG, P1 receives a gloss enclosed in angled brackets; P2 is not glossed.
- R18. An infix is enclosed in angled brackets both in the L1 text and in the IMG. The gloss of a left-peripheral infix precedes the gloss of its host, the gloss of a right-peripheral infix follows it.
- R19. A reduplicative segment is glossed like an affix (i.e. by a configuration of

- grammatical category labels) and separated from its source by a tilde (~).
- R20. A grammatical meaning expressed by a non-segmentable morphological process (transfixation, internal modification, metathesis, subtraction, suprasegmental process) is not set off in the L1 representation. Its gloss follows the gloss of the base, separated by a back-slash (\).
- R21. Elements of an IMG that represent components of one L1 morph are separated by a period (.)
- R22. As a special case of R21, components of one L1 cross-reference morph that have distinct reference are separated by the ampersand ('&') or, where no conflict with R17 and R18 arises, by the greater-than sign ('>') for actor and undergoer cross-reference.
- R23. An L1 word form whose morphological structure is not represented in the IMG may be represented by a set of symbols whose status as representing morphs or features is ignored and whose sequence has no implications as to L1. Such symbols that jointly correspond to an L1 word form are joined by an underscore (\_).
- R24. If constituent structure is to be displayed, square brackets ([ ]) can be inserted in the IMG.

## 6.2. Symbols

L1	IMG	meaning
x y	x y	word boundary between x and y
x_y	z	x and y are two orthographic words, but one lexical word
z	x_y	x and y jointly render z without morphological analysis
x-y	x-y	morpheme boundary between x and y
x+y	x+y	x and y form a compound or a derivative stem
x=y	x=y	x and y are joined by clisis
z	x/y	x and y are alternative meanings of ambiguous z
xy	x:y (x)	morpheme boundary between x and y not shown in the L1 text x does not have a significans in the L1 text
a<x>b	ab<x>	x is an infix in ab
x>a<y	<xy>a	xy is a circumfix around a
z	x\y	y is a non-segmentable morphological process on lexeme x
z	x.y	x and y are semantic or grammatical components of z
z	x&y (x>y)	x and y are grammatical components of z cross-referencing two different dependents
x	[x]	x is a syntactic constituent
x	[x]Y	x is a syntactic constituent of category Y

### 6.1.3. Typographic conventions

- R25. The IMG is in the line immediately below the corresponding L1 text line.
- R26. The distance between an L1 text line and the line immediately preceding it is greater than that between it and the IMG line belonging to it.
- R27. Each L1 word form is left-flush with the L2 word or complex of symbols rendering it. If such an arrangement is impossible, the following is a minimum requirement: If there is, in an IMG, an equivalent to an element of an L1 text line, it is contained in the line immediately below that line.
- R28. The IMG is printed in a smaller typeface than the L1 text. If this is impossible, then at least grammatical category labels are in small capitals.
- R29. Grammatical terms appearing in IMGs are abbreviated, without a period at the end, and set in (small) capitals.
- R30. There is no punctuation in an IMG. Parentheses including optional material in the L1 line are not repeated in the IMG, either (cf. R16).
- R31. There is no sentence-initial uppercase in an IMG.
- R32. There is no syllabication either in the L1 line or in the IMG.

### 1. General problems

#### 1.1. Basic concepts

Like many scientific and, especially, linguistic terms, the term ‘grammar’ is ambiguous in designating both a sector of the object area of linguistics and also a scientific account of this sector. Grammar<sub>2</sub> is, thus, at a meta-level with respect to grammar<sub>1</sub>, which is its object. The grammar<sub>1</sub> of a language is the systematic part of the way the language maps meanings

onto expressions. The grammar<sub>2</sub> of the linguist is a scientific representation of this part of a language – in the form of a book, a computer program or some other suitable medium –, whose locus within a comprehensive presentation of a language will be characterized more precisely in 3.

**Grammaticography** is an activity related to grammar<sub>2</sub>. This term, too, is ambiguous in the same way. At the object level, grammaticography is (the practice – experience or art – of) grammar writing. At the meta-level, it is the investigation of methodological principles that reconcile this practice with linguistic theorizing. Because of the analogous ambiguity, the term ‘lexicography’ has been coupled with the term ‘meta-lexicography’; and the same could be done for ‘grammaticogra-

phy'. **Metagrammaticography** starts from two ends: On the one hand, it takes stock of successful grammars and distills from them the grammaticographic principles that they follow. On the other hand, it takes successful models of language description as a theoretical basis and deduces from them requirements for an adequate grammar<sub>2</sub>. Grammaticography is related to investigation of grammar just as lexicography is related to lexicology (investigation of the lexicon).

Metalexicography has had a firm position in (applied) linguistics for several centuries. While grammaticography in the sense of 'production of grammars' goes back to antiquity, metagrammaticography is a fairly recent discipline. The earliest treatment known to us is Gabelentz (1891/1901, Zweites Buch, esp. VI. Capitel): "Die Darstellung der Einzelsprache". The term 'grammaticography' does not appear much earlier than Cherubim (1973). This disproportion between lexicography and grammaticography is not easy to account for. In systematic terms, neglect of grammaticography is simply unjustified and detrimental both to the linguistic discipline and to the quality of actual grammars. In terms of the history of linguistics, there has apparently been a disequilibrium between lexicon and grammar: Research into the former started out as a practical concern, i.e. as lexicography; and only towards the end of the 19<sup>th</sup> century did lexicology in the modern sense begin. Research into grammar started out as **theory of grammar** with the modists of the 13<sup>th</sup> century. The beginnings of modern grammaticography with Gabelentz (1891) were taken up by O. Jespersen, but remained largely inconsequential otherwise. Theory of grammar<sub>1</sub> got an even stronger position in the second half of the 20<sup>th</sup> century. The complete neglect of linguistic methodology during the period of the dominance of generative grammar included the complete neglect of grammar<sub>2</sub>; the concept or problem of grammaticography did not surface in linguistics. As a consequence, most grammars<sub>2</sub> actually published, while incorporating conceptions of theories of grammar<sub>1</sub> en vogue at their time, do not in their general organization reflect any theoretical foundation at all.

In assessing the relationship between the practice of grammar writing and linguistic theorizing, we may recognize that the last third of the 20<sup>th</sup> century has brought a significant progress in grammar writing. Apart from many noteworthy monographs, the

series *Lingua Descriptive Studies* alias *Croom Helm Descriptive Grammars*, *Cambridge Studies in Linguistics*, *Mouton Grammar Library* and *London Oriental and African Language Library* may be singled out, as they are devoted to comprehensive accounts of hitherto underdescribed languages. This progress in the quality of descriptive grammars can be attributed not so much to some particular model or theory of grammar, but, rather, to a general agreement to keep grammars comprehensible for those outside a particular framework and/or jargon. Roughly since the forties of the 20<sup>th</sup> century, a certain amount of grammatical descriptions of minority languages had appeared that applied some model of structural or – less often – transformational linguistics. It was soon recognized that these grammars were not even used by linguists, let alone by laymen. Since the seventies of the 20<sup>th</sup> century, most comprehensive grammars stick to what their authors call "traditional grammar". It was recognized that "traditional" descriptive grammars remain up-to-date and readable much longer than any model-oriented grammars. Such grammars also do not strive for the precision sometimes attributed to formal descriptions. Neglect of precision in itself is not a virtue, but historically it must be seen as a reaction to a kind of hollow precision that served to conceal lack of insight.

In theory, grammaticography and theory of grammar inform each other. In practice, mutual awareness leaves much to be desired. Still, good grammar writing does apply the achievements of linguistic theorizing. Some new concepts and approaches (or more elaborated old ones), presentational techniques, empirical domains to be looked at and included in a grammar, etc. have established themselves as part of recent grammaticographic tradition. To the extent that these innovations are picked up from various models of grammar, this approach is eclectic. Grammars have to be both consistent and comprehensive, and these goals are sometimes in conflict. The **eclecticism** often practiced in contemporary grammaticography may appear as a symptom of inconsistency, but is more properly seen as a consequence of the fact that none of the available theories of grammar suits all languages and all empirical domains equally well. Natural languages comprise heterogeneous phenomena which favor different models and methods. If a grammarian is able to choose the most pow-

erful approach for each descriptive domain and to combine them in the compilation of a comprehensive grammar, this is a virtue rather than a vice. Moreover, this approach to writing grammars is actually the only way to determine the borders of applicability of theoretical concepts and models and their relations to one another, and thus to achieve theoretical progress. In this sense, metagrammaticography provides an interface between the practice of grammar writing and the theory of grammar. On the other hand, metagrammaticography can be viewed as a sort of self-reflection inside the field of descriptive linguistics, which can help to accumulate positive experiences and most suitable (technical) solutions to be applied in future grammatical descriptions.

Like most disciplines concerned with the practical application of scientific insights, and like metalexicography in particular, metagrammaticography is at least as much a prescriptive discipline as it is a descriptive one. It is descriptive insofar as it is faced with actually published grammars and with the esteem these are held in, a datum which it has to take into account lest it become escapist. It is, however, prescriptive in that it converts both the principles distilled from grammaticographic practice and the theorems of grammatical theory into instructions of grammar writing (cf., e.g., Mosel 2003, Noonan to app.). Metagrammaticography is part of the methodology of linguistics. Consequently, the present treatment will account for observable practice, but will also derive recommendations from it.

## 1.2. Universalism and particularism

The description of a language has two opposite tasks: to bring out the uniqueness of this language and to render it comparable with other languages. To achieve the former task, the description must not identify the categories and operations of the language with those of other languages, but rather describe the language in its own terms. To achieve the latter, the description has to characterize the language in terms of a linguistic type, presupposing and referring to universal parameters of human language as a background against which the peculiarities of the language stand out. To do this, it must describe the language in the same terms as other languages. The two tasks seem, thus, irreconcilable. Consequently, many existent grammatical descriptions sin by an overemphasis on either **particularism**,

**universalism**, which renders the language different from anything that may be familiar to the reader and, thus, unintelligible, or on **universalism**, which converts the language into just another instance of something well-known to the reader and, thus, uninteresting. Both extremes miss their target (cf. also 1.6.1). Many of the grammaticographic principles discussed below revolve around this problem.

The purpose of a language description is not only to tell the reader the facts to any desired degree of detail, but, at a more general level, to convey to him an impression of what this language is like. This evaluation proceeds against the general background of ‘le langage’, shared by author and reader, and possibly against the comparative background of other languages, too. In the former respect, the grammar will take for granted many aspects of the language that it shares with all other languages (e.g. the sheer existence of word formation, and its most general cognitive and communicative functions). In the latter respect, many grammars, especially textbooks, even presuppose as deserving no comment those features of the language that it shares with the metalanguage of the description. Thus, few grammars of French will bother to mention that it lacks infixation or that clause structure follows the accusative model of fundamental relations.

## 1.3. Purpose and kinds of grammar

Grammars may be classified according to a variety of parameters. The first distinction is between a comparative grammar and a grammar limited to one language. There are various kinds of comparative grammars according to the purpose and method of comparison: a **general comparative grammar** is a systematic survey of grammatical phenomena in the languages of the world. A **historical-comparative grammar** traces the evolution of the grammar of a proto-language into its daughter-languages by comparing these. A **contrastive grammar** compares grammatical phenomena of two languages, mostly with some practical application in mind. In contrast to comparative grammars, grammars devoted to just one language are sometimes called descriptive grammars; but of course such a grammar can also be prescriptive; see below.

A grammar of one language may take the synchronic or the diachronic perspective. A grammar that does the latter is a **historical grammar**. In contradistinction to a language history, a historical grammar is normally not

subdivided according to stages of the language, but may rather have the same structure as a synchronic grammar. A historical grammar usually defines one stage of a language – not seldom an ancient stage – as the end point of its scope and differs from a synchronic grammar in tracing the properties of that stage back to the relevant proto-language.

Focusing now on non-comparative synchronic grammars, we may distinguish between what has been known traditionally as **textbook** vs. **reference grammar**. A textbook (German *Sprachlehre*) aims at teaching the language. It arranges grammatical material in the sense of some didactic progression; and grammatical information may be intertwined with other didactic material such as lessons, cultural information and exercises. A reference grammar, on the other hand, gives a systematic and comprehensive overview of the grammatical system or even the whole system of a language, but is limited to that. Its purpose is to provide orderly access to information on the language system rather than to help the user learn the language. It may presuppose some familiarity with the language or with linguistics. There also used to be a distinction between linguists' vs. learners' ("scientific" vs. "pedagogical") grammars. This has lost somewhat in significance because it has been recognized that writing for colleagues is compatible with the requirement of user-friendliness (cf. also the notes on recent developments in 1.1).

The orientation of a grammar may be descriptive or prescriptive. A **descriptive grammar** is based on data that are independent from the analyst and describes these. Its purpose is to ascertain and systematize the facts in some empirical domain. A **prescriptive grammar** represents what the author considers correct. Its purpose is to orient the reader towards the norm of the language.

While the distinction between descriptive and prescriptive linguistics is clear in principle, there are some factors that tend to blur it in practice. Firstly, no grammar (descriptive or other) can account for all the variation that occurs in its object area. It will exclude at least speech errors, false starts, hesitation phenomena etc.; and it may exclude youth language or archaic ritual language from its scope. This delimitation amounts to the identification of a norm. This does not necessarily coincide with the highest norm in the entire speech community; it simply means

the identification of a prototypical manifestation of the variety under study and the marginalization of other varieties. The exclusion of some facts from the variety being described is similar to the decisions made in a prescriptive grammar. Secondly, most users of a grammar, even of a descriptive grammar, require reliable information on what is grammatical in the language or, at least, what is normally said. They want to be given rules. To satisfy this need, the author has to distinguish manifestations of the norm from deviations from it and has to formulate rules for grammatical constructions. This, again, is what a prescriptive grammarian does.

In this article we will concentrate on descriptive reference grammars. However, a good portion of the following metagrammatocigraphy applies to other types of grammar as well.

#### 1.4. Data and variation

Data are the empirical basis of a grammar (see Lehmann 2004 a). There are different kinds of them, and they play different roles in grammars. This is determined, first and foremost, by the orientation of the grammar in the sense of 1.3. In a descriptive grammar, data function as the empirical basis and the object of research. Therefore the data must exist independently from the production of the grammar. A descriptive grammar is therefore based on a corpus of data. In a prescriptive grammar, on the other hand, data have the function of illustrating the norm. They may be taken from a corpus of texts that is conceived as representing the norm – for instance the works of classical writers; but if the author considers herself master of the norm, then she may simply make up illustrative examples, which are then no data in the strict sense. Some descriptive grammars, it is true, are also based on material produced by the author of the grammar. In this case, however, the data are not independent from the scientist, which means they are not reliable data by scientific standards.

The **corpus** on which a descriptive grammar is based may essentially be of two kinds. It either exists prior to the grammar as a body of texts available in the speech community; or it is collected by the linguist in fieldwork (in the broadest sense). In morphology as opposed to syntax and discourse structure, many data may be systematically elicited in informant work, rather than drawn from texts (see Art. 168).

The object of a grammatical description is a certain language, more precisely, some particular **variety** of a language. The first task of the linguist is to delimit this variety in synchronic and diachronic terms. However narrowly she may delimit it, her empirical data will necessarily be only a sample of the object of description. With a corpus collected in a small village of the Mexican state of Quintana Roo, one may publish a grammar of the speech of those male peasants of that village who were born between 1940 and 1950; or one may publish a grammar of Yucatec Maya. It commonly corresponds both to the purpose of the author and to the interest of the readership to situate the variety described at a rather high level of generality. It is, then, the responsibility of the author to guarantee that her data actually represent her object, i.e. that they are valid. This presupposes some homogeneity of the object. The description of Yucatec Maya based on that sample will be valid to the extent that an observationally similar description could have been produced with data from Valladolid (Yucatan). *Mutatis mutandis*, the same goes for a grammar of French or Latin.

The actual sources of the examples – informants or texts – have to be identified (the former, if they agree to it). If their representativity could be an issue, it has to be demonstrated that they do represent the object of description. For instance, many a linguistic description is based on a corpus of narrative texts, and it is by no means to be taken for granted that such a corpus does truly represent the language in question. Again, young fieldworkers tend to cooperate with young informants, whose speech usually represents just one sociolect in the community. Therefore, the sociolinguistic coordinates of the data have to be indicated.

It is essential that the data sources be made entirely explicit. The usage observed in traditional grammars of giving examples without indication of the source is no longer acceptable. To put it differently, an example without indication of its source will be regarded as made up by the author of the description and insofar unreliable (no matter whether she is a native speaker or not).

### 1.5. Topicality

Scientists are all but resigned to seeing new theories and analyses pop up every day only to be superseded by even newer theories and analyses, so that most of scientific work be-

comes irrelevant not only to the general public but even to the scientific community itself. Things are different for a grammar (and likewise for a dictionary). First of all, for most languages of the world the publication of a grammar is an event that is not likely to be repeated within a generation. For all those languages that are threatened by extinction, a comprehensive description is the only chance for them to be revived and the only way to protect them from falling into oblivion after their extinction. Secondly, a grammar is a scientific product of potential importance for the general public, since it may and must be the basis of the development of a norm and the composition of primers. All of this heightens the responsibility of the grammarian. The main virtue of the grammarian is (alas) not originality and inspiration but consistency and reliability.

To the extent that grammarians have become aware of these conditions, they have refrained from tying their work to some fashionable model and from concentrating too much on trendy issues. The grammarian has the unenviable task of keeping herself informed on progress in general comparative linguistics but free of ephemeral trends. Fortunately this task has been facilitated in the past decades by comprehensive and up-to-date surveys of general comparative grammar such as Shopen (1985, ed.) and Payne (1997).

### 1.6. Concepts and terms

At least two issues arise with respect to the use of concepts and terms in grammatical descriptions: (a) What is the appropriate attitude towards conservatism and neology? (b) What degree of familiarity with concepts and terms should be presupposed?

#### 1.6.1. Conservatism and neology

Originality is a value in science that does not include terminology. Established terminology must be used. Most phenomena in the languages of the world, whether or not they happen to be known to the analyst or to the particular philological or linguistic school that she has been raised in, are actually known in general linguistics and have a term to them which, at least sometimes, is appropriate and well-established. For instance, the semantic relation often called *purposive* had been called ‘*destinative*’ by Finno-Ugricists half a century earlier. It is among the duties of the analyst to get informed about estab-

lished terminology before she coins her own terms. Sometimes, it is true, established terminology is inappropriate. For instance, the term ‘possessive classifier’ was deemed inappropriate even by its coiner, but for want of a better term continues to be used. It is most important that distinct concepts be designated by distinct terms and that these be unequivocal; questions of beauty of terms have less priority.

Secondly, the question regularly arises whether the particular phenomenon in the language being described is simply an instance of something known from other languages. Here, a middle course between two extremes must be steered (cf. 1.2). One is **particularism**. From the concept of the ‘langue’ which is both historically and systematically unique, and of the language sign which is arbitrary and unlike anything to be found in other languages, this position deduces that every category of the language must be named by a term of its own in order to avoid misleading identification with something known from other languages. This position has been cherished to the extreme in Russian and American structuralism. It renders a description unusable and blocks comparison of the language with other languages. The other extreme is **universalism**. It assumes a universal grammar and subsumes every phenomenon of the language under pre-established concepts and terms. For instance, the concept of ‘case’ is stretched to cover (non-morphological) syntactic properties of noun phrases; and then sometimes what used to be called case is renamed ‘surface case’. This position is well-represented in generative grammar, but not alien to some brands of functionalism either.

The appropriate middle course is characterized by two propositions: (a) descriptive concepts belong to the level of linguistic types; (b) descriptive concepts are prototypical in nature. Take the concept of ‘dative’ as an example. For it to be a typological concept means that it is not a universal property of human languages, that some languages have a dative and others don’t, that ‘dative’ is a type of which there are concrete instantiations in the languages and that there are partial functional equivalents to the dative both inside a language that has it and across languages. Being a typological concept for a (value of) a grammatical category, i.e. for a (kind of) linguistic sign, ‘dative’ is characterized both by its meaning or function

(roughly ‘case whose basic meaning (Grundbedeutung) is the recipient and whose generic meaning (Gesamtbedeutung) is a participant related indirectly to the situation’) and by its structure or form (which for the dative is the same as for ‘case’, i.e. a grammatical morpheme bound to a nominal expression that marks the latter’s syntactic or semantic function in the clause). The prototypicality of such concepts relates to both sides of the linguistic sign. For the meaning or function, it necessitates the Jakobsonian distinction between basic meaning and generic meaning, as just exemplified for ‘dative’. For the structure or form, it may involve the identification of a focal instance on a scale of grammaticalization, with some range of variation at both sides. For instance, a case is typically marked by an agglutinative affix, but may be marked by a highly general adposition, on the one hand (as in Japanese or Hawaiian), or by more fusional morphological means, on the other hand (as in Sanskrit).

Of course, such definitions are not always available for grammatical concepts, and often it is the task of the analyst to decide whether an established term covers her particular phenomenon. Extensions of traditional usage are allowed and necessary, because in the last analysis, most of these terms were originally conceived for Greek and Latin and must necessarily be extended in their meaning if they are to be applied to any other language at all. If this were not so, we could never speak of conjugation or of passive formation in English. What is essential here is that such extensions be controlled, i.e. that a general definition (at the typological level) of the kind alluded to be provided, from which it may be deduced that the term is indeed applicable to the particular phenomenon under analysis. If terms are used in this way, then neology in a grammatical description may be kept to a minimum.

The most strongly grammaticalized categories are, at the same time, the most deeply entrenched in a particular language system and consequently the most arbitrary and language-specific ones. Here the question of whether such a language-specific phenomenon should be subsumed under a category known in typology can become a real issue. An example is provided by the German verb category whose values are traditionally called ‘subjunctive I’ or ‘present subjunctive’ (e.g. *singest*) and ‘subjunctive II / past subjunctive’ (e.g. *sängest*). These terms are actually

not helpful as far as the functions of these categories are concerned. If German happened to be an exotic language first described in the second half of the twentieth century, then these categories would probably be called ‘hearsay evidential’ and ‘irrealis’, respectively. Consider the two sets of cross-reference markers in Mayan languages as another example. Members of the first set precede the finite verb, members of the second set (displayed in Tab. 170.9 below) follow it. Mayan linguistics, which originates in American structuralism, calls these two paradigms by purely arbitrary labels ‘set A’ and ‘set B’, in order to avoid any functional implications. The two sets do combine heterogeneous functions. In Yucatec Maya, set A cross-references the transitive subject and the subject of an intransitive verb in one aspect-mood category, while set B cross-references the subject of a nominal clause, the transitive object and the subject of an intransitive verb in another aspect-mood category. Relating this to certain ergativity-splits, one may say that set A cross-references the subject, while set B cross-references the absolute. However, this is odd, because a transitive verb would then be flanked by a subject and an absolute index. Moreover, set A also precedes nouns, cross-referencing the possessor. This function can certainly not be subsumed under the denominator ‘subject’. In other words, concepts provided (so far) by typology do not help here; language-specific concepts and terms have to be coined. The only question that remains is whether they must be as empty as ‘set A/B’.

#### 1.6.2. Definitions

In principle, the explicit introduction of concepts and terms of general linguistics, especially of analytic concepts such as ‘infix’ or ‘completive aspect’, is not the task of a grammatical description, but of genres such as terminological dictionaries and studies in general-comparative grammar. If one could presuppose a systematic methodological organization of linguistic science, a descriptive grammar should only have to categorize its phenomena by the concepts of general-comparative grammar and designate them by the corresponding terms. However, such rigor is not practicable. On the one hand, the extent to which familiarity with established concepts and terms may be presupposed obviously depends on the intended readership of the description. If non-specialists are addressed, technical terminology either has to be intro-

duced explicitly or must not be used at all. On the other hand, established usage may be insufficient with respect to the language being described. Then modifications to it must be made explicit. Still, a grammarian must sometimes be reminded that she is not writing an introduction to linguistics. Specific suggestions on morphological terminology are found in Art. 169, section 3.9.2.

#### 1.7. Description and argumentation

A grammar is not the kind of treatise that has a point. The data are not used to argue for a particular analysis, the analyses are not arranged in a way to convey a certain theoretical insight or to demonstrate a certain method. All of this is necessary and justifiable in other kinds of scientific treatises. A grammar is, in the first place, a systematic encyclopedia of the grammatical functions and structures of the language.

Consider the French clitic personal pronouns as an example. The grammarian, of course, has a position on the issue of whether they are affixes or clitics. In an article devoted to the subject, it would be appropriate to assemble the evidence for her thesis and argue for it. In a grammar, these pronouns will just be called clitic pronouns (or personal affixes), their various properties will be described, both those like their fixed relative order which are more affix-like and those like their alternative prethematic or postthematic position which are more clitic-like. It is not necessary to turn the description into a persuasory discourse, as is done in some grammars like Cole (1982) and McGregor (1990). Neither is a grammar the place for a linguist to teach linguistic methodology or to demonstrate that she has applied it. What matters is that her analytical decisions be transparent. This is chiefly done by means of examples that exhibit the phenomenon some descriptive statement attributes to the language. It is normally also not necessary to back statements on obligatory rules with ungrammatical examples of constructions that violate them. What is important is that it be made explicit under which conditions the rule applies. True, there will always be cases where the grammarian has not been able to ascertain these conditions. In order not to mislead the reader, she should admit this, for instance by modifying a descriptive statement by the phrase ‘under unclear conditions’.

Several grammaticographic treatments (e.g. Comrie & Smith 1977; Noonan to app.)

require that the analyst note those properties that the language does not possess. In a comparative grammar, such statements are natural by-products of the comparison. In a monolingual grammar, such statements involve an implicit comparison. Moreover, there is no limit to the things that a language does not have. A feasible form of complying with the requirement is to limit such negative statements to such features that might be expected on genetic, areal or typological grounds and to relate them to the description of some feature the language does possess. Thus, in the section on counting of an onomasiological grammar of German it would be mentioned that the nouns *Stück* ‘piece’ and *Mann* ‘man’ can replace the counted noun generically and anaphorically under certain conditions. This may naturally be rounded off by a statement to the effect that this is the closest to numeral classifiers that the language can muster.

## 2. Grammaticographic problems in morphology

### 2.1. Tasks of a morphological description

Basically, the core task of the morphological part of a grammar is to describe:

- A. (i) the internal structure of word forms (grammatical words) (**morphological structure**), and
- (ii) the form and the meaning of grammatical items (non-lexical **morphemes**).

These aspects of a morphological description overlap to the extent that (a) the grammatical items of a language are **bound morphemes**, and (b) the internal structure of word forms in this language can be described in terms of these morphemes (typically as a construction of a lexical stem and a chain of bound grammatical items). Since the domain covered by these two conditions is fairly large in many languages, the usual practice of grammarians is not to separate tasks A(i) and A(ii) from one another for descriptive purposes. As a result, those sub-domains where one of these conditions does not hold commonly come out in the periphery of a morphological description (as represented by sections on, e.g., prepositions or compounding).

Generally, preference is given to what may be termed **word-oriented morphology** (as in A(i)), that is, the word is taken as a starting

point for the description. Grammatical items thus fall into two strictly distinct groups which are described quite differently, viz. those which are constituent elements of word structure and those which are words themselves. Within this approach, the very existence of a bound grammatical item constitutes a descriptive statement about word structure. An alternative approach, which may be termed **morpheme-oriented morphology**, would be to start from the morpheme, so that the class of words as well as word classes emerge as a result of the distributional analysis of morphemes. No grammar takes this approach exclusively. However, many grammars contain sections which consist of an annotated list of grammatical formatives. For instance, McGregor (1990), in the relevant sections of his chapter 3, has various lists of grammatical items for each of which he provides the significans, a functional label and a list of functions fulfilled in various constructions. Each item of the latter list contains a reference to other sections where the item is treated in its relevant context.

The word-oriented approach implies a distinction between the morphological description proper (as outlined in A) and two “classificatory” tasks:

- B. (i) delimiting the class of linguistic units to be referred to as **words** (both in the sense of ‘word form’ and of ‘lexeme’; cf. Art. 26), and
- (ii) a classification of lexemes into **parts of speech** (cf. Art. 70) and further grammatically relevant sub-classes, at least inasmuch as morphological patterns vary by word class.

Quite commonly, classificatory solutions are just incorporated into the general structural outline of a grammar, rather than constituting a subject of description in its own right; in other words, the classes of linguistic units dealt with in morphology are presented as established a priori. There are obvious theoretical grounds for this well-established tradition:

First, these tasks are scarcely solved by purely morphological criteria; syntax and semantics play quite a role in an appropriate classification of linguistic units. In this sense, this classification can be regarded as “external” with respect to morphology proper (tasks A). Secondly, this way of presentation overcomes a certain circularity which is apparently inherent in grammatical reasoning,

whereby relevant classes are distinguished on the basis of distribution and associated morphological categories, the latter being, in their turn, defined with respect to and in terms of pre-established grammatical classes. However this problem may be solved in the process of grammatical analysis, the usual descriptive practice is to take both the level of the word and the word classes for granted.

On the other hand, classificatory solutions adopted in a given descriptive grammar do constitute autonomous descriptive claims and are even argued for in case they deviate from a “traditional” one, be it a language-specific or the general-linguistic tradition. In addition, minor (sub-)classifications which are relatively or exclusively language-specific (as, e.g., inflectional classes) are more likely to be presented as a subject of morphological description than the major ones. That is, many grammarians take the classificatory tasks to have (at least to some extent) a default solution which can be applied without special discussion. This default solution is in fact very close to the most traditional parts of speech. By accepting the default solution, a grammarian virtually refrains from a language-specific classification of linguistic units; that is, it is not considered a task of a particular descriptive grammar, but rather a universal ready-made structural template for describing languages.

However, the impact of classificatory solutions on the quality of grammatical description can hardly be overestimated:

- (a) They play a major role in structuring the morphological description and thus determine the general outline of the grammar (cf. 2.2).
- (b) They strongly affect the descriptive solutions (tasks A), insofar as **morphological patterns** and **categories** can be defined only with respect to the word classes; once a classification is established, lots of further descriptive solutions are predetermined.
- (c) They serve as a basis for the **morphology-syntax interface**, inasmuch as syntactic constructions often make reference to a word class and/or a further morphological sub-class of the elements involved.
- (d) Last not least, these solutions establish the **grammar-lexicon** interface, in the sense that they determine a system of grammatical indices to be provided for items listed in a lexicon (cf. 3.1).

This means that if a language does not fit the default classificatory solution, the consequences of adopting this solution can turn out harmful for the whole enterprise. On the other hand, the default solution is, in a sense, the most user-friendly one, in that it facilitates obtaining information from the grammar, since the reader is faced with a familiar structural outline: the key words (commonly constituting chapter headings, cf. 2.2) tend to be exactly those he expects to find. Thus, a grammarian normally has to weigh the default solution against its descriptive cost in order to find an appropriate compromise. This problem, although often not pronounced as such, seems to be fundamental for descriptive morphology.

A classification into word classes as represented in the morphological part of a grammar is often far more detailed than is needed for morphology proper. The usual descriptive practice is to introduce all more or less grammatically relevant classifications of words by structuring a chapter where the morphological patterns associated with some of these classes are described. In this sense, a description of the internal structure of word forms and a grammar-oriented classification of lexemes are not distinguished in the practice of grammarians, although these – obviously overlapping – descriptive domains presumably never coincide exactly. This practice has the advantage of highlighting the correlation between classifications based on distinct parameters (morphological, syntactic, semantic), the descriptive significance of which is beyond doubt.

To sum up: the practice of descriptive morphology combines three distinct domains of language structure: the word structure, the grammatical items, and the grammar-oriented classification of lexemes, the latter constituting the skeleton of a morphological description. As will be seen below, this combination, however well-motivated, involves some descriptive problems which could be avoided otherwise.

## 2.2. Structuring a morphological description

The well-established tradition of structuring morphological descriptions is based on a simple and elegant idea of converting grammar-oriented classifications of linguistic units into the section headings of a grammar. This idea makes it possible to combine two descriptive domains (word classes and word structure) in

- 
1. Open word classes with rich morphology:
    - 1.1. (Optional:) a general overview of morphological structure (e.g., in terms of a general structural template comprising slots for constituent morphemes).
    - 1.2. Further (functional) sub-classification, if relevant for morphology (e.g., transitive vs. intransitive verbs).
    - 1.3. Inflectional paradigm:
      - 1.3.1. The structure of the paradigm(s), i.e., the set of grammatical categories associated with the word class under description and their possible values.
      - 1.3.2. Further (formal) sub-classification into inflection classes (if any) and how the items of the paradigm are constructed for each inflection class.
      - 1.3.3. Exceptions, defective paradigms etc.
      - 1.3.4. (Optional:) semantics and usage of inflectional categories can be picked up as a special issue.
    - 1.4. Word formation (sections organized first by the category of the output of a process, second by the category of the base).
      - 1.4.1. Compounding
      - 1.4.2. Derivation:
        - 1.4.2.1. Regular (productive) derivation; the internal structure is close to a semantically ordered morphemic lexicon (a morphological item + its meaning and distribution).
        - 1.4.2.2. Irregular (non-productive) derivation.
      - 1.4.3. Reduplication, conversion, etc.
    - 1.5. (Optional:) some important semantic and/or derivational sub-classes (e.g., reflexive verbs).
  2. Open word classes with little or no morphology:
    - 2.1. Semantic sub-classes (e.g., spatial adverbs, temporal adverbs, etc.).
    - 2.2. Correlated structural features (if any) and word formation (often including etymology, grammaticalization notes, etc.).
  3. Closed classes:
    - 3.1. A general semantic and syntactic overview.
    - 3.2. (Optional:) exhaustive listing of items with their meanings and distribution, ordered according to functional (e.g., interrogative pronouns, indefinite pronouns etc.) or syntactic properties (e.g. postpositions with dative, postpositions with genitive etc.).
      - 3.2.1. If the items are inflected, the paradigm is given for each.
      - 3.2.2. (Optional:) distinctive structural features of each group (if any) and word formation techniques (e.g., conversion, grammaticalization, etc.).
- 

Tab. 170.1: Types of morphological chapters with respect to their internal structure

a rather natural fashion, inasmuch as it can be assumed that different word (sub-)classes are associated with distinct morphological patterns; hence, the morphological information is appropriately distributed over these (sub-)classes. The internal structure of chapters varies according to the word class. Roughly, they fall into three groups: open classes with rich morphology, open classes with no or little morphology, and closed classes. A schematic representation of how the respective chapters are most commonly structured is given in Tab. 170.1.

As shown by this scheme, the morphological parts of grammars contain rather heterogeneous chapters: some are morphological in the word-oriented sense, since they deal with the internal structure of words (cf. the dis-

tinction introduced in 2.1); others are morphological in the morpheme-oriented sense, since they describe the form and the functions of closed-class (= grammatical) items; and, finally, there are chapters which are concerned almost exclusively with (non-morphological) sub-classifications of a word class. This may be seen as a direct consequence of the fact that the three descriptive domains combined in morphology (cf. 2.1) remain essentially distinct. Not only do the respective chapters differ in their internal structure, they are bound to take distinct descriptive approaches. In some cases, a semantic classification seems to appear in a grammar just because there is nothing morphological to say about a class. The well-established tradition of providing a semantic classification of

adverbs independently of its grammatical significance is a case in point. Also, it seems that if a language has no nominal morphology, the chapter on nouns is much more likely to contain their semantic sub-classification. In fact, a chapter subdivision is the form of introducing a comprehensive classification, but it seems bizarre to leave a section thus generated empty.

A more consequential drawback of the structuring scheme outlined above is that it provides no natural way of accounting for morphological items shared by distinct classes (e.g., for person/number paradigms attached to both verbs and nouns, as, for example, in Yucatec Maya). Another instance of the same problem is represented by grammatical items which function both as a free morpheme (hence, have to be described in a separate chapter of the closed-class type) and as a bound morpheme (hence, a constituent element of some morphological pattern related to a certain word class); cf., e.g., locative prepositions vs. applicative suffixes on verbs in Rwanda (Art. 141, section 3.5.1). Various ways to overcome this drawback of the traditional approach have been applied in different grammatical descriptions. The options are:

- (a) Introduce **generalized word classes** comprising several word classes sharing some morphological categories (e.g., “nominals”). This solution has a limited domain of applicability because of its hierarchical nature. If the distribution of morphological patterns in a given language does not follow any hierarchical classification (e.g., a sub-class of nouns has an adjectival paradigm, as in Russian), this strategy does not work.
- (b) Select a “locus” for the description of an item – a morphological category, a single morpheme, or whatever – (for example, the noun for the category of case), and refer to this description in all other relevant chapters (in this case, for instance in the section on pronouns). This solution may work if the semantic and formal properties of the item in question do not vary by word class. If comparable items are even slightly different, a reference will not suffice.
- (c) Link the descriptions of similar items by cross-references. This is a solution widely

applied, obviously necessary, but not sufficient, since it does not provide a way to describe the item with several instantiations as a whole.

- (d) Separate word formation (for all word classes) from the main body of description and treat it in a special chapter. This compromise solution can overcome the drawbacks of the word-oriented approach at least for derivational morphemes.
- (e) Separate morphological semantics from the main body of description and treat it in a special chapter. This is a very strong, but rarely applied solution, presumably because of its “ambitious” flavor.
- (f) Create a **morphemicon** as part of the morphological description as described below (3.5).

The last three structuring solutions tend to be applied in one or another form in recent descriptive grammars. They are, in fact, a concession to the morpheme-oriented approach to grammar. In any case, an appropriate structure for a grammatical description can be achieved only by means of an appropriate combination of various solutions.

### 2.3. Identification of grammatical items

The task of describing the morphological structure of a word form (cf. A(i) in 2.2) is almost never addressed directly in descriptive grammars. Instead, it is decomposed into several distinct sub-tasks. The most widely applied decomposition is based on the distinction between **inflection** and **word formation** (in particular, **derivation**; see Art. 38). Its controversial theoretical status notwithstanding, this distinction is widely applied in morphological descriptions. Not only are these types of phenomena often rigidly distinguished (cf. 2.2); these sub-domains of morphology are commonly described in quite disparate fashion:

- (a) To describe the inflection of a language means to describe each word class in terms of the associated **paradigms**, that is, the inflectional patterns are considered properties of pre-established word classes. To describe the derivation is to describe the semantic impact and distribution of each single **derivational morpheme**; hence, a word sub-class to which some derivational morpheme applies is

- viewed as a property of that morpheme (this includes the issues of productivity, regularity, etc.).
- (b) Inflectional forms of different words can be identified as representing the same item of a paradigm independently of their formal similarity; the identity of a paradigm is grasped in terms of certain semantic-functional labels (even if these only imply an approximation of the respective meanings), not in terms of formal identity. In contrast with this, the derivational sub-task involves a semasiological description of particular morphemes, which usually presupposes formal similarity of its various allomorphs.
- (c) The semantics of inflectional items is assumed by default to be independent of the semantic properties of the word; they are allowed to have a few, usually context-dependent functions. Conversely, a derivational morpheme can have a variety of meanings depending on individual stems it is applied to.

These properties can be traced back to the concepts of “prototypical” inflection and derivation and the role they are assumed to play in the grammar and, in particular, in the grammar-lexicon interface (Art. 36). The distinction between inflection and derivation thus determines the choice of a descriptive perspective. That is, there is a considerable difference in how inflectional and derivational items are treated in descriptive grammars, from the identity of an item up to the types of information to be provided.

In particular, the concept of inflection implies a more function-oriented identification procedure, that is, both formal identity of items even in case of clearly related meanings, and an obvious formal contrast are very easily disregarded, as far as the inflection is concerned (hence, multiple non-distinctions within paradigms; see Plank (1992) for an overview of this problem, and Zaliznyak (1967: 19–34, 129–148) for case paradigms). Here is an example: Russian is an aspect-dominated language in the sense that the grammatical category of tense works differently for perfective and imperfective verbs. Tense allows for two different ways of description, schematically represented in Tab. 170.2 by the tense forms of the verb pair *delat'* ‘make/do (impfv.)’ and *sdelat'* ‘make/do (prfv.)’:

(a) form-based description

+Past	<i>dela-l</i> , <i>s dela-l</i>
–Past	<i>dela-et</i> , <i>s dela-et</i>
Imperf. Future	<i>budet delat'</i>

(b) function-based description

	imperfective verbs	perfective verbs
Past	<i>dela-l</i>	<i>s dela-l</i>
Present	<i>dela-et</i>	—
Future	<i>budet delat'</i>	<i>s dela-et</i>

Tab. 170.2: Russian tense: alternate paradigms

Basically, the two accounts differ in how they treat forms like *s dela-et* ‘PFV:make-FUT/NPAST.3.SG (will make, will have made)’. Variant (a) highlights the formal identity between this item and the Imperfective Non-Past *dela-et*. They are identified as instantiating the same item of the tense paradigm and get the same functional label (Non-Past) (see Comrie 1978: 66 f.). Yet these forms are clearly distinct semantically: the form of perfective verbs can refer only to the future, while with imperfective verbs it is employed basically for reference to the present (although the future meaning is not excluded). Thus, the descriptive cost of this solution is a dependency of the range of functions of an inflectional item on the verb class.

By contrast, variant (b) disregards the formal identity between the items under discussion. Instead, it highlights their functional distinction and, accordingly, the functional similarity between the Perfective Non-Past (Future) of the perfective verbs and the Imperfective (analytical) Future. The latter pair of forms are assigned the same position in the paradigm and get the same functional label (Future), despite the obvious formal contrast. The dependency on the aspectual meaning of the verb stem is thereby built into the structure of the paradigm, instead of constituting an independent descriptive statement. The descriptive cost of this solution is (i) the formal heterogeneity of the Future and (ii) the unmotivated formal identity of the Perfective Future and the Imperfective Present (which would show up recurrently in the description of multiple formal variants of this marking, only one of which is represented in Tab. 170.2).

Variant (b) is apparently preferred in existent descriptions of Russian (even though

some of them do suggest variant (a), most often the formal identity between the Imperfective Present and the Perfective Future is not mentioned). In other words, the paradigm is defined in such a way as to simplify the semantic description at the cost of somewhat artificial formal complexity.

Formal identity of this type is never neglected as easily for derivational formatives; to continue with Russian examples, its verbal suffix *-s'a/-s'* expresses an extremely wide variety of meanings in combination with different verb stems (middle, reflexive, reciprocal, anticausative, dispersive, to mention only some of them). Yet these are commonly treated as instances of the same linguistic unit.

In view of this difference in descriptive perspective, the well-known problem of delimiting inflection and derivation gets a new kind of relevance: how a grammatical item is identified and described depends on its affiliation with inflection vs. derivation, at least above a certain degree of discrepancy between form and meaning. It might be the case that these two sub-domains of morphology are in fact delimited in descriptive grammars depending on which approach seems more “suitable” for a given item. On the other hand, the choice of one or another perspective can affect the very properties of the items identified (as they would be described in the grammar), inasmuch as the prototypical features of inflection vs. derivation are embodied in the identification procedure.

### 3. Structure of a grammar

#### 3.1. Comprehensive presentation of a language

No grammar can be complete. Given limitations of every kind, the author has to set priorities. These follow from the main purpose of the grammar and from external conditions. Needless to say, on the basis of available publications, one may decide to produce a partial description. However, the aim may be to produce a comprehensive presentation of the language. Assume a field structured in a hierarchical fashion. For an account of it to be comprehensive means that it is balanced in terms of the amount of detail provided for each of the sections at a given level of the hierarchy. In this sense, a grammar such as McQuown (1990) (of Totonac), which comprises 64 pages on phonology, 107 pages on

morphology and 11 pages on syntax is unbalanced and therefore not comprehensive.

A comprehensive account of a language is articulated on the three levels shown in Tab. 170.3.

level 1	the <b>documentation</b> of the language, which is a corpus representing (analyzed) primary data;
level 2	the <b>description</b> of the language, whose object are the data of level 1;
level 3	a <b>methodological reflection</b> on the description, whose object is the account of level 2.

Tab. 170.3: Levels of presentation of a language

The levels are, thus, in a meta-relation to each other. The reflection of level 3 has the function of accounting for the purpose of the description, the conditions under which it was carried out, including the achievements of previous scholarship, its theoretical and methodological prerequisites, the many choices and decisions that the author has made; and as mentioned in 1.4, it reflects on the character and limitations of the data base. Most of this part commonly takes the form of an introduction to the description. Some of it may be relegated to an appendix.

The corpus on which the grammar is based (level 1) will normally not be reproduced in full. Good modern presentations of a language contain an appendix that presents some specimina of representative texts (see Mosel 2002, § 6.2 for the scientific importance of such a collection). These are provided in the form of video or audio recordings and rendered in the canonical trilinear representation as explained in Art. 169 (more on the relationship between the corpus and examples in the running description in 4.5).

The descriptive part of a comprehensive account of a language (level 2) consists of two subparts, the system of the language and the setting of the language. Here we may be brief on the latter. The **setting of the language** comprises an explanation of relevant glossonyms, the genetic affiliation of the language and its dialects, its ethnographic situation (i.e. the situation of its speech-community), its cultural situation (including, importantly, its written tradition) and its sociolinguistic situation, i.e. its internal stratification, its status in the speech community and its areal relations. This part of the description provides a referential background for paramet-

ricization by diachronic, diatopic, diastratic and diaphasic variables that will prove necessary in the account of the language system. It is, at the same time, the one part of a comprehensive presentation of a language that is most likely to take a historical perspective even if the rest is purely synchronic.

The **language system** has two main parts, the expressive subsystems and the significative subsystems (corresponding to Martinet's second and first articulation, respectively). The primary expressive subsystem is the phonology (with the phonetics), the secondary one is normally the writing system. (This is, of course, also true for [ancient] corpus languages.) The significative subsystems are not alternative, but jointly exhaustive: the grammar and the lexicon. They are significative because their units embody a mapping of meanings onto expressions. The significative subsystems are articulated in terms of levels of complexity: At the level of the word form and below, we have morphology, which – in the form of inflection – is an essential part of the grammar and also – in the form of word formation – of the lexicon (see Art. 36). At higher levels, we have the syntax as part of the grammar, and phraseology as its counterpart inside the lexicon.

Since there is, in principle, no borderline between grammar<sub>1</sub> and lexicon, there is also overlap between a grammar<sub>2</sub> and a dictionary of a language. The morphology describes the word-formation patterns of the language. Their products are nevertheless listed in the dictionary. Only in the limiting case of a word-formation process that applies completely regularly and productively – e.g. formation of certain verbal nouns – may one renounce to representing each of the products in a lexical entry of its own. Contrariwise, the dictionary will contain a couple of entries that result from a word-formation process that is no longer productive in the language. Mentioning it in the morphology would entail repeating the same list of items that is in the dictionary. In such cases, redundancy is preferred to parsimony. The drawbacks of redundancy are that it induces inconsistency and that it may be uneconomical. They are outweighed by the advantages, which include user-friendliness and theoretical soundness (the mental grammar and lexicon are redundant in the same way). Moreover, we are not talking about a literal repetition of material in two parts of the description, since the ordering principles and, conse-

quently, the ways of accessing the information are entirely different between dictionary and grammar<sub>2</sub>.

Another important relationship between the grammar and the dictionary is that the former introduces and defines the terms that appear in the cells on grammatical information of the microstructure of a dictionary entry. This concerns such categories as noun class, gender, countability, *akitionsart*, inflection class etc. Technically speaking, this kind of specification in a dictionary entry determines whether the item can be used in a certain construction described in the grammar.

### 3.2. Onomasiology and semasiology

As we said in section 1.2, the fundamental problem of grammaticography is to provide a common format for descriptive grammars while at the same time taking care not to obliterate the individuality of the language being described by forcing it into a Procrustean bed. The general task of a language is to provide a mapping between meanings and expressions. The meanings have an extra-linguistic substrate (i.e. one independent either of language altogether or at least of particular languages) in cognition and social interaction (communication). The expressions have an extra-linguistic substrate in phonetics and semiotics. It is the mapping itself, achieved in the grammar and in the lexicon, that is proper to each language. There can therefore be a universal system of cognitive and communicative domains coded by languages and a universal system of expression techniques and sounds used by languages. There cannot be a universal system of grammar.

A system of lexical and grammatical description that provides comparability of the object language with other languages can therefore be either based on a system of cognitive and communicative domains and then describe how the language in question manifests each facet of these in its expressions; or else it can be based on a system of expressive (structural) devices and then describe what each of them is used for in the object language. The former approach is traditionally called **onomasiological** (or synthetic, more recently 'functional'), the latter **semasiological** (or analytic, more recently 'structural') (cf. first Gabelentz 1891/1901: 84–104 and, more recently, Lehmann 1980, <sup>2</sup>2002: § 1.2.1 and Mosel 2003: §7). Each of these approaches is in itself coherent and capable of providing a complete description. Many grammars stick

to one of them. For instance, Jespersen (1937) is a purely semasiological grammar, while Givón (1993) is a purely onomasiological grammar. However, each of these approaches is one-sided, as the onomasiological approach corresponds to the viewpoint of the speaker, while the semasiological approach corresponds to the viewpoint of the hearer. Thus, an onomasiological grammar answers questions of the type “how can I express such and such a thought, or fulfill such and such a communicative function, in this language?”, while a semasiological grammar answers questions of the type “what does such and such an expression of this language mean?”. Since grammars, just as dictionaries, are generally meant to serve both the speaker and the hearer, the ideal grammar<sub>2</sub> consists of two parts, an onomasiological and a semasiological one. It should be clear that such an arrangement is also maximally user-friendly, because whatever question a user may pose to a grammar is posed either in the speaker or in the hearer perspective. Moreover, most of the descriptive problems reviewed in 2 resolve themselves if the twofold approach is chosen.

A couple of published grammars approach this ideal to some extent. Despite appearances and declarations of the author, Gabelentz (1881), a grammar of Classical Chinese, is relatively far off his own mark because the “synthetic grammar” is not really onomasiological, but just a construction-based syntax. McGregor (1990), a grammar of Gooniyandi, organizes its chapters in the familiar bottom-up fashion appropriate for a semasiological account. However, some syntactic chapters and part of a final chapter on semantics take an onomasiological perspective on the items introduced in lower-level sections. The chapter on morphology in Haspelmath (1993), a grammar of Lezgian, contains sections on noun morphology and verb morphology, each of which is subdivided into a form-based and a function-based subsection; but otherwise the grammar mixes the two approaches. Lehmann (2002) is not a grammar, but just a description of possession in Yucatec Maya. It is subdivided into a chapter that introduces the relevant structures in a semasiological perspective, and three chapters that take the opposite perspective. It must be said that to this day, most grammars mix the two approaches in uncontrolled ways (cf. Lehmann 2004 b).

It is nowadays standard to tie the distinction between morphology and syntax to the distinction between levels of grammatical complexity. However, it has often been associated with the distinction between an onomasiological and a semasiological grammar. From traditional grammars of the nineteenth century to our day, many a grammarian has said that her morphology deals with the system and structure of linguistic forms, while her syntax deals with their use. It might thus appear that the morphology of such a grammar is semasiological, while the syntax is onomasiological. However, such systematicity is only apparent. Most traditional morphologies contain chapters on functional categories such as person and tense – and to this extent they are onomasiological. And the typical traditional syntax has a chapter on the use of the cases, thus starting off from a structural concept introduced in the morphology and tracing its functions – and to this extent it is semasiological.

Actually, the canonical level-dependent distinction between morphology and syntax can only be made in a semasiological grammar. A semasiological grammar is organized according to the hierarchy of structural complexity of linguistic units. For all those languages which possess the word form as a level of grammatical structure, the section of semasiological grammar devoted to this and lower levels will be the morphology. In the last quarter of the twentieth century, there have also been functional (i.e. onomasiological) grammars that presupposed a distinction between morphology and syntax; e.g. Comrie & Smith (1977) and the series of grammars based on it. Since this distinction cannot be made in an onomasiological grammar, it introduces inconsistency into it. For instance, the grammar of many languages manifests the concept of definiteness, but some do so at the level of morphology, while others do so at the level of syntax.

In the twentieth century, many structural (thus, semasiological) grammars were published. Contrariwise, there are as yet few purely functional grammars. A theory of cognitive and communicative domains of language started to be developed only in the last quarter of the twentieth century, and for most of these domains we still lack both a solid foundation and an internal structure adequate for linguistic description. The present handbook tries to partly compensate for this shortcoming by organizing those of its

chapters that are devoted to grammatical categories and operations (XII and XIV) according to an onomasiological perspective. It is inevitable that the articles of those chapters break the boundaries between morphology and syntax. The handbook on syntax in this series might have done the same with equal or greater justification.

### 3.3. Structure of a semasiological grammar

Much of the language system is structured in terms of hierarchies of levels of complexity. This concerns, first of all, the system of grammar<sub>1</sub> as mentioned in 3.1; but it may also include, with some imprecision, the distinction between expressive and significative systems. This yields the well-known series ‘phonology – morphology – syntax – discourse’, and inside grammar the sequence ‘stem – word form – phrase/syntagm – clause – (complex) sentence’. The history of linguistics has, *cum grano salis*, followed this progression. Syntax was a step-child of linguistic description up to the end of the nineteenth century, and even the 20<sup>th</sup> century has seen many “grammars” that actually boil down to a phonology plus a morphology. Discourse has come to be studied systematically only in the last third of the 20<sup>th</sup> century. The progression is deeply entrenched in the awareness of linguists, who think it must shape the organization of their grammar. Almost all grammars work essentially bottom-up (cf. Mosel 2003: § 5.2). This seems to correspond to a didactic progression which starts from elementary units and proceeds stepwise to complex units. A top-down progression, as it is prescribed in Comrie & Smith (1977) and followed in *Lingua Descriptive Studies*, seems unnatural because in the treatment of a given unit (e.g. the complex sentence) one is forced to appeal to constituent concepts (the clause, in this case) which have not yet been introduced.

However, the picture must be modified slightly. The bottom-up approach corresponds to analytical thinking, which combines elementary units according to rules and aims at constructing a complex whole in a compositional fashion. The top-down approach corresponds to holistic thinking, which starts from a whole and understands its parts in terms of their function in the whole. As is well-known, the two approaches do not exclude, but complement each other. To give an example: A cleft-sentence is best understood if one knows what contrastive focus is and what it entails for semanto-syntac-

tic structure. One can then identify the structural constituents in terms of their role in the complex construction. Contrariwise, it will be hard to construct the purport of a cleft-sentence in a bottom-up fashion, starting from a copular predication over an empty subject that combines with something that looks like a relative clause. More precisely, although the chapter on the cleft-sentence does presuppose the notions of copula clause, relative clause and complement clause, it is not the case that the grammar can build on one of these and expand it into a cleft-sentence. The external grammatical relations of a given unit – the subordinate clause in this example – are not treated in the chapter dealing with this unit, but instead in the chapter of a higher unit whose internal relations they are and of which the given unit is a constituent. This responds to the principle – last put forth in construction grammar – that the formation of complex constructions is goal-directed.

The same goes for the morphology. The semasiological description of word-formation does not start from a certain derivational suffix, combine it with bases of different categories and then look what the category of the result is. Instead, there is a section on stems of a certain category, e.g. the adjective. The category has certain elementary members, i.e. adjectival roots. Next there are possibilities of forming adjective stems by various formal processes, e.g. by suffixal derivation. One of them is our derivational suffix. Finally, it is seen that it may combine with bases of various categories to yield the result at stake.

The general principles of such an arrangement of a semasiological description may be formulated as follows.

- (a) The description works bottom-up through the **hierarchy of grammatical levels**.
- (b) For the grammatical unit of each of these levels, the categories into which it is articulated are identified. For each of the potentially complex categories, its internal syntagmatic structure is analyzed: First, a set of constructions according to kinds of syntagmatic relation is enumerated. For each of these constructions, the nature and distribution of its elements is set forth. Finally, given a certain construction of elements of two categories, one of the categories may comprise a grammatical (in particular morphological) para-

- digm of elements. Such paradigms are discussed as part of the description of the particular construction.
- (c) Only the internal syntagmatic structure of a given unit is part of the treatment of that unit. Any structural phenomena which concern the relation of a given element to its context are treated at the point where the including construction – the one which provides the context – is treated.

To give a final example: At the level of the word form, categories such as ‘finite verb form’ are identified. There are kinds of finite verb forms according to their internal structure, e.g. periphrastic forms and synthetic forms of different kinds. One of these is the synthetic form that consists of a tensed stem and a personal ending. In the latter position, there is a paradigm of morphemes whose internal structure is treated now. It may be seen that this approach combines a bottom-up progression to ever more complex constructions with a top-down analysis of each of these constructions.

#### 3.4. Structure of an onomasiological grammar

The cognitive and communicative domains that are coded in language comprise concepts and operations a subset of which manifest themselves in grammatical structure. These are such concepts as the addressee or directed motion and such operations as abstraction or making a question. Such concepts and operations are assembled in **functional domains**. They are by now well-researched in functional typology, so that they can be tentatively enumerated. Since they provide the highest-level subdivision of an onomasiological grammar, this will be done here in Tab. 170.4.

Onomasiological description proceeds from very general cognitive and communicative functions as indicated in the central column of Tab. 170.4 through more specific subareas such as those of the right-hand column down to the functional categories and processes of the language under description. These are finally mapped onto the structural devices and grammatical formatives introduced in the semasiology. For instance, in a grammar of German, the chapter on possession treats, among other things, possessive pronouns, the genitive attribute and its equivalents, the possessive dative, possessive predictions with

*haben* and *sein* etc. Most of these structural devices recur also in other chapters of the onomasiological description; but this chapter is where the question is answered how German expresses an attribution of possession as in Turkish *vakt-im var* ‘time-POSS.1.SG EXIST (I have time)’.

#### 3.5. Additional parts of a grammar

The subdivision of a grammar follows mainly from the overall organization of the presentation of a language as outlined above. Since the term ‘grammar’ is not seldom used in a broad sense almost equivalent to ‘language description’, it bears repeating that, conceptually, the data corpus, on the one hand, and the methodological reflection, on the other hand, are not part of the grammar; and neither are the account of the setting of the language, the lexicon, the phonetics, phonology and orthography. What remains is simply the morphology and the syntax. Of the morphology, inflection is properly included in grammar, while word formation could, in principle, be treated either in the dictionary or in the grammar. For practical reasons, it is always included in the grammar (if it is treated at all).

An important challenge taken up in many modern grammars written on a typological background is to present an epitome of what the language is like and how it works, i.e. to present the language as instantiating a **linguistic type**. From what has been said in 1.7 it follows that the overall presentation style of a reference grammar does not by itself fulfill this task. It is therefore widespread practice to provide an additional chapter – usually at the beginning of the grammar – that characterizes the language at the typological level. While the main body of a grammar is descriptive, this chapter provides the opportunity to compare the language with other languages and to answer the Humboldtian (1836: 417) question “auf welche Art [sie] die hauptsächlichen Fragen löst, welche aller Spracherzeugung als Aufgaben vorliegen”.

Furthermore, a description of a language system contains a number of lists. The most important of these is, of course, the list of significative units (signs) of the language. It comprises the lexemes (including phraseologisms) in their citation form plus the morphemes, i.e. the roots and the grammatical and derivational formatives, including the affixes. The question is in which part of the

domain	basic functions	representative concepts and operations
apprehension & nomination	an entity is grasped by categorizing and individuating it; it is named by a label or a descriptive expression	categorization, types of concepts, empathy
concept modification	a concept is enriched, or an object is identified	attribution, apposition, relativization
reference	a representation is related to and delimited within the universe of discourse	determination, deixis, reference tracking
possession	the relation of an entity to another one is established or inheres in one of them	possession in reference, possessive predication, external possessors
spatial orientation	an entity is localized in space statically or dynamically	reference points, local relations, spatial and gestalt properties of objects
quantification	the extent of the involvement of a set of entities in a predication is delimited	quantification in reference and in predication; counting, ordering
predication	information is attributed to a referent	existence, situation, characterization
participation	a situation is articulated into an immaterial center and a set of participants and circumstances related to it and to each other	control & affectedness, central vs. peripheral roles, alignment of fundamental relations
temporal orientation	a situation is designed with respect to its internal temporal structure and limits and temporally related to another situation	situation types, aspectuality, temporal relations
illocution, modality, evidentiality	a proposition is rendered relative to speaker, hearer and reality	speech acts, obligation, volition, possibility, toning, evidentiality
contrast	a concept or proposition is assessed qualitatively by comparison with similar ones	negation, comparison, gradation, intensification
nexion	a situation is expanded into a complex one, or several situations are linked together	speech reproduction, complementation, interpropositional relations
communicative dynamism	a proposition is articulated in foreground and background	discourse structure, functional sentence perspective (topicalization, focusing, emphasis)

Tab. 170.4: Functional domains

overall description and in which way these lists are presented.

In the ideal situation, there is a **dictionary** of the language beside the grammar. If so, then the dictionary contains entries for all of these items. It then properly includes a **morphemicon** (inventory of morphemes), i.e.

morphemes are lemmata just like stems or citation forms of words. For the sake of user-friendliness, not only morphemes, but also variants are conceded an entry, the latter reducing to a reference to the main entry. A dictionary entry refers to the grammar in two ways: (a) implicitly by the grammatical cat-

ategorization and other grammatical information provided in the microstructure of each entry (see 3.1); (b) explicitly in the form of references to the relevant sections of the grammar for such entries which are grammatical formatives. In such a situation, the grammar contains no morphemic. Instead, each grammatical morpheme is introduced in the semasiological description as part of its construction and paradigm. The distribution of information on individual grammatical items between dictionary and grammar is then a question of fine-tuning. There must be a certain amount of overlap as regards generic properties. Details on meaning and function, especially idiosyncratic properties, are provided in the lexicon, details on distribution and conditions of variation are provided in the grammar.

If there is no extra dictionary, then a number of second-best solutions are available. Of these, the relative best is a **glossary** or vocabulary appended to the grammar that contains all the lexemes and morphemes that are mentioned in the grammar, including the examples, each coupled with its meaning or function. Again, variants are listed, too; and for the grammatical items there are references to all the places where they are discussed. The absolute minimum requirement is an alphabetical **index of grammatical items** at the end of the work, again with the relevant references.

Among the indices there is also a **subject index**. While this is nothing special of books on grammar, it does assume a special role here. If the grammar is bipartite and both the semasiology and the onomasiology are organized hierarchically according to established conceptions, then the user can retrieve the information by systematic search through the table of contents if this is sufficiently detailed. Even then the grammar probably needs an index, as there are liable to be at least some concepts and terms that are language-specific or appear in unwonted contexts. But as long as grammars are not organized in such a way, an index of functional terms is necessary in a structural grammar to compensate for the lack of the opposite perspective; and vice versa for a functional grammar.

Another kind of list that is often attached to a grammar – and not seldom also to a dictionary – is the list of inflection paradigms (mostly of the specimen type; see 4.3) of various word classes and their subclasses. If the language has a relatively complicated

inflectional morphology, as e.g. Ancient Greek conjugation, then it makes sense not to interrupt its systematic description by pages filled with conjugation tables and instead to relegate these to an appendix.

Among the various lists that a grammar shares with other genres, such as lists of tables, figures, primary text sources, bibliographical references and the like, the list of **abbreviations** is of special interest. Among all the abbreviations used in a grammar, the (abbreviations of) grammatical category labels form a distinct subset. Whether or not other kinds of abbreviations are listed, the latter must certainly be listed, and they may constitute a list of its own. A separate list of grammatical category labels also helps the author to be consistent.

#### 4. Descriptive devices

##### 4.1. Representation of a single grammatical item

###### 4.1.1. Representation of the significans

Basically, one representation type is chosen for the whole grammatical description (i.e. excepting the phonetics and phonology). The primary choice is between a standard **orthographic representation** and a (technical) linguistic representation. The former is generally preferred because it makes the description more accessible to the speech community and other non-linguists interested in the language. Sometimes, standard orthography is supplemented by additional diacritics, e.g. to mark word stress.

There are, however, situations where a linguistic representation is necessary or preferable, if a language has no orthography or if using traditional orthography would complicate comprehension of the grammar and is not in accordance with its descriptive tasks (cf., e.g., recent Chinese grammars). In this case, authors choose a basic representation trying to obtain a compromise between its theoretical ambitions, convenience for descriptive purposes and user-friendliness (especially in a learner's grammar, the latter includes easy rules of reading). Sometimes printing (publishing) facilities prove to be a limiting factor. If the representation is based on linguistic principles, it is either a **broad phonetic transcription** or a **phonemic** or a **morphophonemic representation**. Use of a phonetic transcription as the basic representation in a grammar is very rare and essentially lim-

ited to situations in which a grammar is published before a satisfactory phonological analysis of the language is available. In general, a morphophonemic representation is to be preferred to a phonemic one, but lower-level representations are, of course, necessary in those sections that deal with lower level variation. In phonetic representations, symbols are chosen from the International Phonetic Alphabet. At higher levels and if a certain phonetic distinction is irrelevant in the language, usually less technical letter symbols are preferred.

The basic representation is used throughout a grammar; yet, a description of morphology often involves more or less significant deviations from this representation. In particular, an orthographic representation can prove insufficient for an adequate and sufficiently detailed morphemic segmentation, either in a language with intricate morphophonology or in case the traditional orthography obscures certain morphological phenomena. Hence, some additional elements can be incorporated into representations of some forms or even phrasal examples in order to provide a transparent morphemic segmentation.

For example, Russian orthography makes use of graphemes like *я*, *ю* which stand for combinations /ja/, /ju/ after a vowel or for single phonemes /a/, /u/ after a palatal consonant (very loosely, in the latter environment these graphemes are employed to signify the palatalization of the preceding consonant, in contrast with their plain equivalents *a*, *y* which occur after non-palatal consonants). This spelling convention makes the orthographic representation unsuitable for morphemic segmentation and for the representation of single morphemes, as is necessary, i.a., in combination with interlinear morphemic glossing (Art. 169). In a strictly orthography-based Russian grammar one would find numerous items like an “ending -*a/-*я*”, a representation which suggests allomorphy, but in fact just reflects the fact that the ending /a/ occurs both after non-palatal and palatal consonants (in particular, after /j/). In order to avoid such misleading representations, a spelling convention can be employed which renders /j/ between vowels as well as palatal consonants in a more transparent fashion (Zaliznyak 1967: 201–294). As an example, consider the following forms, where morphemic borders are indicated as imposed by the orthographic representation:*

	student	father-in-law	hero
sg.nom	студент	тесь	герой
sg.gen	студент-а	тест-я	repo-я
sg.dat	студент-у	тест-ю	repo-ю

Tab. 170.5: Russian declension in standard orthography

The phonemic representation is:

	student	father-in-law	hero
sg.nom	stud'ent	t'es't'	g'iroj
sg.gen	stud'ent-a	t'es't'-a	g'iroj-a
sg.dat	stud'ent-u	t'es't'-u	g'iroj-u

Tab. 170.6: Russian declension in phonemic representation

It is now clear that the endings do not vary between these words; yet the transcription cannot help but contain deviations from the orthography which are of no relevance here and can only be misleading (cf., e.g., /i/ for *e* in the last column). Now consider the same forms in an alternative spelling (the deviations from the established convention are shown by capital letters):

	student	father-in-law	hero
sg.nom	студент	тесь	герой
sg.gen	студент-а	тестЬ-а	героЙ-А
sg.dat	студент-у	тестЬ-у	героЙ-У

Tab. 170.7: Russian declension in adapted orthography

The orthographic representation is brought closer to the phonemic one in order to show that the three nouns follow the same inflection pattern, yet the deviations are reduced to a necessary minimum. The symbols reflecting a distinct representation type are underscored either by capitalizing or by using symbols from another alphabet (continuing the Russian example above, the symbols /l/ and /j/ might be used instead of *Л* and *Й*). Such mixed representations may be used as a compromise between the incompatible requirements of using a standard orthography and providing an adequate morphological analysis.

Another side of the same problem is the representation of a morpheme abstracted from its morphological environments; that is, technically speaking, a unitary representation

of a set of allomorphs. Several techniques (which may also be combined) are in use:

- (a) Regular phonemic alternations are ignored (a technique normally favored by the use of the orthographic representation).
- (b) For more or less regular morphonemic phenomena, special symbols for morphemes are employed, commonly, a capitalized phoneme symbol (for instance to abstract from vowel harmony phenomena).
- (c) The allomorphs are just listed, commonly separated by a slash.

There seems to be no established means to represent the significans of non-segmental items (e.g. metaphony).

#### 4.1.2. Representation of the significatum

The meaning of a grammatical morpheme may be rendered in several ways, among them:

- by using an appropriate functional (mnemonic) term, e.g. ‘iterative’, ‘ablative case’, etc., which may then be referred to by means of a conventional abbreviation, e.g. ITER, ABL etc., where upper case identifies (abbreviations of) grammatical category labels;
- by translating it into the metalanguage (e.g. ‘constantly’, ‘from’).

The choice of a name for a category may be determined by a language-specific terminological tradition or by a desire to keep the terminology as transparent and “speaking” as possible (see 1.6.1).

Semantic information in morphology almost never reduces to naming categories appropriately (although, in some cases, a reference to the syntactic part of grammar is considered sufficient). The semantics of derivational morphemes is commonly described in terms of processes and operations. This is appropriate wherever operations apply in a regular and productive way, yet it can be misleading in the case of fossilized patterns. In the latter case, restrictions on the distribution should be carefully described (sometimes, just a list of relevant items seems the best solution, to be sure, with comments on their semantic motivation). The semantics of inflectional items is commonly described in terms of grammatical features structuring the respective paradigm (cf. 4.2).

To visualize the range of meaning of a polysemous (multifunctional) morpheme, a **semantic map** is a useful descriptive device (see Haspelmath 2003). This is a language-independent n-dimensional (mostly with  $n = 2$ ) arrangement of monosemic grammatical functions by their similarity. A semantic map of a particular case, e.g. the Latin dative, will cover a contiguous area that comprises a subset of case functions (recipient, addressee, experiencer etc.) appearing on the map. A similar map can be drawn for the dative of another language, e.g. Turkish, and then the semantic expansion of the dative in the two languages may be easily compared. Such a semantic space is also the locus for diachronic semantic variation.

#### 4.2. Category and feature

Rules of syntax may refer to a morphological category or **grammatical feature** that a constituent bears. The formulation of such rules often presupposes the specification of such categories in a parameter-value format, where a grammatical category constitutes a parameter, and its subcategories, the values (s. Art. 28). Thus, the inflectional information of a Latin verb form may be represented as follows:

*cantaveritis*

2	person
m	number
u	tense
m	anteriority
m	mood
u	voice

Fig. 170.1: Inflectional information of a Latin verb form

Another task of a morphological description is to provide an appropriate system of **inflection classes** to be picked up in a lexicon (cf. 2.2 and Art. 65). The following duties await the analyst here:

- (a) The inflection classes have to be brought into a hierarchy. Wherever a language has some complexity in this area, major inflection classes usually have minor subclasses, and these have a few totally irregular members. For instance, one of the major conjugation classes in Latin is the consonantal conjugation. One of its subclasses is constituted by a perfect formation which involves lengthening of the

- root vowel. This, in turn, has *emō* ‘buy’ as a member, which is slightly irregular in having an epenthetic consonant in the perfect participle *emptum* ‘bought’.
- (b) The inflection classes have to be named by appropriate terms. Since the conditioning factor of an inflection class is often the stem final, this is suitable as a label of the class, as in the Latin *a* conjugation. The concept of a particular inflection class reflects its position in the taxonomy, e.g. ‘consonantal conjugation with lengthening perfect’. This, of course, leads to cumbersome terms which may be abbreviated by numbers and letters, e.g. ‘3e’ (third conjugation, subclass e). The abbreviations are needed, among other things, in the section of grammatical information of the lexical entry of such a verb.
- (c) For didactic purposes, those inflected forms of the paradigm are identified from which one can deduce the entire inflectional paradigm. For this reason, Latin nouns are often quoted not only in the nominative, but also the genitive, e.g. *gēnus, gentis* ‘stem’. For German, one even needs the nominative plural in addition (*Hahn, Hahns, Hähne* ‘rooster’). For many semiregular Latin verbs, if one knows the first person singular present indicative active, the first person singular perfect indicative active and the perfect participle, then one can conjugate the verb correctly through all of its categories. Traditional grammars and dictionaries therefore specify the forms of these categories for semiregular verbs, e.g. *emō – ēmi – emptum* ‘buy’. Instead of such a set of word forms, it is also possible to mention a set of allomorphs appearing in such word forms. For instance, a German apophony class may be identified by *i – a – u* (as in *singe – sang – gesungen*).

#### 4.3. Paradigms

Inflectional morphology is commonly represented in terms of paradigms arranged as one- or multidimensional tables. For each word class, the set of tables has the same structure in terms of number of columns and rows and their category labels. There are two linguistic forms of such tabular representations. In the traditional paradigm, a plain example word is represented in the forms of all the values of the categories, as in Tab. 170.8.

	number	singular	plural
person			
1		<i>laud-o</i>	<i>laud-amus</i>
2		<i>laud-as</i>	<i>laud-atis</i>
3		<i>laud-at</i>	<i>laud-ant</i>

Tab. 170.8: Specimen paradigm of Latin personal endings

This kind of representation is the original linguistic sense of the Greek term *parádeigma* ‘example’. It is still used in textbooks or if the morphology is so fusional that inflectional markers are hard to represent separately.

This leads us to the second form of representing a paradigm, in which the cells of the table are occupied just by inflectional morphemes, as in Tab. 170.9.

	number	singular	plural
person			
1		<i>-en</i>	<i>-o'n</i>
2		<i>-ech</i>	<i>-e'x</i>
3		–	<i>-o'b</i>

Tab. 170.9: Marker paradigm of Yucatec personal suffixes

This kind of representation is more abstract and proper to linguistic science. It is viable for agglutinative morphology. The **specimen paradigm** is, in a sense, a definition *per ostensionem* that appeals to intuitive understanding. The **marker paradigm** only works to the extent that the information that it presupposes is made explicit in the grammar. This concerns, in particular, syntagmatic information on the way the markers combine with the stem (see 4.4). If complex morphophonemics are involved, it is prudent and user-friendly to complement the rules by a specimen paradigm.

For a given morphological category, the order in which its values are enumerated is fixed by tradition in many cases; e.g. ‘1<sup>st</sup>, 2<sup>nd</sup>, 3<sup>rd</sup> person’, ‘nominative, genitive, dative, accusative, ablative, vocative case’. A properly linguistic criterion for their arrangement is **syncretism** (Art. 66). Especially for semantically motivated syncretism, it is convenient if the syncretistic category values are adjacent in the table. Tab. 170.10 and Tab. 170.11 are two examples to illustrate ways of displaying syncretistic paradigms:

case \ number	singular	plural	dual
vocative	<i>deva</i>	<i>devās</i>	
nominative	<i>devas</i>	<i>devān</i>	<i>devau</i>
accusative	<i>devam</i>		
instrumental	<i>devena</i>	<i>devais</i>	
dative	<i>devāya</i>	<i>devebhyaṣ</i>	<i>devābhyaṁ</i>
ablative	<i>devāt</i>		
genitive	<i>devasya</i>	<i>devānām</i>	
locative	<i>deve</i>	<i>devesu</i>	<i>devayos</i>

Tab. 170.10: Declension of Old Indic *a*-stems (paradigm of *deva-* ‘god’)

The tables representing paradigms are at most two-dimensional. For agglutinative morphology (e.g. the Turkish case paradigm), even a one-dimensional table suffices to represent the set of values that each morphological category can take. If two morphological categories are cumulated in a morpheme, as e.g. person and number in many conjugation paradigms, a two-dimensional table becomes necessary. If more than two categories are fused in a morpheme, or if inflection classes are involved in addition, a suitable combination of two-dimensional tables is chosen, as also shown in Tab. 170.11.

Although such complex paradigms are not necessary for agglutinative morphology, it is prudent at least to give a couple of examples of morphologically complex word forms to render the formulas concrete.

#### 4.4. Syntagms

The accurate statement of the combination of a morphological marker (of a certain category) with its host may require specification of the category of the base, the conditions for the combination and specification of the resulting category. This may take the form of a

rule or **instruction** how to construct a certain morphological form. E.g., concerning the Latin supine II like *dictū* ‘to be said’: in order to make the supine II of a verb, form its passive participle, convert this into a stem of the *u*-declension and form the ablative singular of this stem.

Syntagmatic relations are commonly analyzed in terms of constituency or dependency and accordingly visualized by **tree diagrams** or **dependency stellmatia**, each illustrated here with an example:

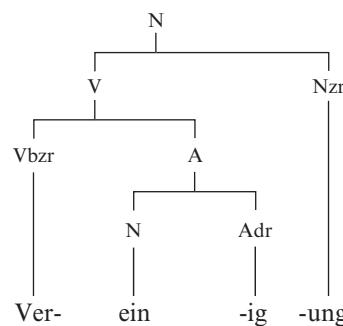

Fig. 170.2: Constituent structure of complex stem

Fig. 170.3: Dependency structure of complex stem

The **valence class** of a verb or some other relational word is, above all, a syntactic property. However, in many languages, valence classes coincide with inflection classes, so that specification of a valence class may be relevant for morphology, too. This may be done in the form of a construction formula, e.g. for a trivalent verb: [NP]<sub>Sbj</sub> — [NP]<sub>dir.Obj</sub> [AdvP]. Such valence classes may also con-

tense	number	gender person	present	past		
			m/f/n	m	f	n
sg.	1		<i>čítáju</i>			
	2		<i>čítáeš</i>	<i>čítál</i>	<i>čítála</i>	<i>čítálo</i>
	3		<i>čítáet</i>			
pl.	1		<i>čítáem</i>			
	2		<i>čítáete</i>			
	3		<i>čítájut</i>	<i>čítáli</i>

position category	5	4	3	2	1	0
	negation	subject	tense/aspect	relative	object	stem

Fig. 170.4: Swahili verb prefixes

rank category	0	1	2	3	4
	stem	ADN/NUM*	relational <sup>0-2</sup>	modal <sup>0-2</sup>	(associating/complementizing)

Fig. 170.5: Kayardild nominal suffixes

tribute to an account of the function of a given case.

There are two basic types of **sequential order** of elements, scope order and template order. **Scope order** presupposes a binary construction consisting of a head and a dependent one of which has scope over the other, and specifies the position of the dependent as against the head. Thus, the position of an adnominal relative clause is determined with respect to its head nominal, and the position of the complement NP with respect to an adposition. At the morphological level, this convention is replaced by specifying the position of bound morphemes with respect to their hosts, or of grammatical formatives with respect to a lexical root or stem. In a syntagm such as Fig. 170.3, the relative order of the suffixes *-ig* and *-ung* is a contingent consequence of the fact that each of them has scope order with respect to the operand preceding it. This may be summarized in a formula like [ [ X ]<sub>N/V</sub> -ig ]<sub>A</sub>.

**Template order** is the relative order of elements which do not form a construction with each other. It is typical of clitics which attach to whatever their host is, in a fixed order that does not reflect any semantic scope. Therefore template order cannot be specified in the same straightforward way as scope order. Instead, a schema is set up consisting of a fixed sequence of slots, a **slot** being a syntagmatic position for an element. For instance, the order of the prefixes on the Swahili verb may be described by the template in Fig. 170.4.

The interpretation of such a template is straightforward: Each of the five prethematic slots is reserved for an element out of the paradigm designated by the slot label. If a slot remains unoccupied, this does not concern the order of the other elements.

Some morphological systems are so complex that different ranks of complex stems may be assumed such that affixes may be added at each rank. The suffix positions of the Kayardild noun may be schematized as in Fig. 170.5 (according to Evans 1995: 122).

At the first rank, the stem may be followed by any number of adnominal case and number suffixes. At rank 2, up to two relational cases, and at rank 3, up to 2 modal cases may follow. At rank 4, there may be either an associating or a complementizing suffix.

Templates are necessary when the sequential position of elements is not in consonance with their semantic scope. Structuralist accounts of the middle of the 20<sup>th</sup> century often give templates even for constructions which are decomposable into binary constructions in each of which scope order obtains. An example would be ‘stem – past tense – personal ending’ for the German regular finite verb. This is helpful in visualizing a complex form as a whole, but should be preceded by a separate account of each of the elementary constructions involved.

#### 4.5. Illustrative examples

Abstract or formal statements should be supplemented by example expressions from the language being described. One of the most conspicuous differences between older and modern linguistic descriptions is the growing extent to which this principle is heeded. One might suppose this to be a trivial issue. Actually, however, descriptions that contain no examples are very often not intelligible and, to this extent, worthless. Since most linguistic statements fail in one or another respect and simply do not do justice to the real complex-

ity of the language, an example can teach more than an ever so neatly formalized rule.

Above a certain degree of syntagmatic complexity, such an example should be presented in the canonical trilinear representation (cf. Art. 169), i.e. the text should be provided with an interlinear morphemic gloss and an idiomatic translation. While this was practically never done in traditional descriptions and even in structural linguistics, modern grammatical descriptions, especially those written in a functional or typological framework, often abound in analyzed illustrative examples. In this respect, there has been a real progress in descriptive linguistics.

There is a certain amount of trade-off between the corpus specimina as presented in the appendix and the examples in the running descriptive text. First of all, extensive illustration in the description can be reduced and be replaced by references to the corpus. Generally, such segments from the corpus are copied as illustrative examples in the running text which represent frequent patterns and do not involve any additional complications irrelevant to the issue at hand. Second, not all of the levels of representation figuring in the edition of the text corpus need be repeated in an example of the running text. For many purposes and especially for simple examples, some representation of the significans (orthographic or morphological, i.e. phonological with morpheme boundaries marked) coupled with a translation as a shorthand semantic representation will be sufficient. Thirdly, wherever uniformity of a set of examples is required, for instance in a conjugation paradigm, examples will not (entirely) be drawn from the corpus, but will rather complement it.

Normally, the illustration of a morphological phenomenon does not require a whole example sentence. Very often, a word form or, at most, a phrase will do. Where a sentence appears to be needed to adequately exemplify a grammatical phenomenon, this is a hint at the syntactic rather than morphological nature of the phenomenon. Also, while a corpus sentence may appear to be a more natural piece of language use, it may also distract, by its complexity, from the morphological phenomenon that is at stake. The situation is, of course, different in syntax. There the author bears heightened responsibility if she simplifies corpus sentences for illustrative purposes.

## 171. Lexicography

1. Morphology in dictionaries
2. Morphological models
3. Morphology and lexicography
4. References

### 1. Morphology in dictionaries

#### 1.1. Monolingual dictionaries

We begin our discussion of the contribution of morphology to **lexicography** with a review of the treatment of inflection (cf. Mugdan 1989–1990 a) and word formation in **monolingual dictionaries** intended for native speakers. The questions that need to be asked are: What kinds of morphological information do dictionaries contain? How do they present them?

##### 1.1.1. English

Our starting point is the second edition of the *Oxford English Dictionary* (Simpson & Weiner 1989, eds.). Each “main word”, i.e. headword or primary entry, begins with its “identification”, which includes:

“The inflections, i.e. plural of substantives, and principal parts of verbs, when other than the ordinary -s, -ed.” (Simpson & Weiner 1989, eds.: xxvii)

Irregular inflections only are indicated for nouns and verbs. In the area of word formation, the OED distinguishes “combinations”, i.e. compound words, and “derivatives”, i.e. words formed by suffixation. Combinations are treated as main words if they have a specialized meaning which cannot be deduced from the meanings of their elements and therefore require a full definition, or if they have multiple senses. Otherwise they are treated as run-ons, at the end of the article for the main word constituting the first element of the combination. The category of derivatives does not include words derived by prefixation, since, because of the alphabetical ordering of the dictionary, these must be treated as main words in their appropriate place. Derivatives by suffixation are also treated as main words, unless they are of infrequent occurrence or have only one or a small number of meanings directly relatable

to the meaning of the main word from which they are derived; in which case they are treated in the article for the main word in a separate paragraph at the end. Also given main word status are prefixes, suffixes and combining forms that are especially productive in the formation of derived and compound words.

The practice of the OED in the treatment of morphological information is followed in broad terms by other British English dictionaries, though with some significant variations. In the treatment of inflections, *Collins English Dictionary* (Hanks 1979, ed.; Treffry 1998, ed.), *Chambers English Dictionary* (Schwarz et al. 1988, eds.) and the *Concise Oxford Dictionary* (Allen 1990, ed.; Pearsall 1999, ed.) give not only those formed irregularly but also regular formations which are likely to cause confusion or difficulty, e.g. where the final consonant of the root doubles with the addition of the inflectional suffix (*dragging*) or where a letter is dropped from the root (*arguing*) or where the addition of a suffix changes the pronunciation of the root (*younger*). The inflections of adjectives are treated as well as those of nouns and verbs, and the *Concise Oxford* at least indicates which two-syllable adjectives regularly take the *-er/-est* comparative and superlative suffixes. These dictionaries also enter irregularly inflected forms of words as headwords, with a cross-reference to the base or citation form. The treatment of compounds and derivatives is, however, variable. *Chambers* treats all compounds and suffixed derivatives as run-ons; prefixed derivatives are headwords, except that derivatives with productive prefixes, like *re-*, *sub-*, *un-*, are listed without definition at the bottom of the page unless they require definition by virtue of a specialized or particularly complex meaning. *Collins* enters all compounds as headwords and all suffixed derivatives, unless the meaning of the derivative is clear from the root, when it is treated as a run-on under the root. It also, like *Chambers*, has lists of prefixed derivatives at the bottom of the page. The *Concise Oxford* has prefixed derivatives only as headwords, and suffixed derivatives are treated in the same way as in *Collins*. With compounds, however, the *Concise Oxford* uses a spelling rather than a meaning criterion: if the compound is written solid it is treated as a headword, otherwise it is treated as a run-on under the first element.

The treatment of inflection is particularly detailed in *Webster's Third New International*

*Dictionary* (Gove 1961, ed.). All inflectional forms are indicated in the dictionary, whether irregular or regular. Regular inflections are given only by suffix, but where any inflected form of a word is irregular all the forms are given in full. If an inflected form would fall in the alphabetical sequence "more than five inches" from its root, then it is entered as a headword and cross-referenced to the root. These practices also mean that all adjectives which form their comparative and superlative by suffixation have that indicated. In addition to the inflectional information in the dictionary entries, the front matter to *Webster's Third* contains two pages of detailed spelling rules for forming the plurals of nouns. It also contains two pages of detailed rules for writing compounds. All types of compound – solid, hyphenated and open – are entered as headwords, as are suffixed derivatives where they need separate definition.

### 1.1.2. French

English has a relatively limited inflectional morphology, with a small number of irregularities, affecting only the plural morpheme in the noun and the past tense and past participle morphemes in the verb (cf. Art. 119). It is, therefore, practicable to indicate, where necessary, the irregular forms in the dictionary entries themselves. French, however, shows a more complex inflectional morphology, especially in the verb (cf. Art. 121). The *Grand Larousse* (Guilbert et al. 1971, eds.) contains a "Tableau des Conjugaisons", covering several pages, to which the verb entries in the dictionary are cross-referenced. For example, *acquérir* is indicated as belonging to conjugation 13. This dictionary also contains in its front matter extensive discussion of the word formation processes of prefixation, suffixation and compounding, from both a diachronic and a synchronic perspective. An alternative solution to the inflectional question is found in *Le Petit Robert* (Rey 1973, ed.; cf. Drivaud 1997, ed.). For nouns and adjectives, the feminine form and the plural form (when it is not the regular *-s*) are given near the beginning of the entry for the word (e.g. *journal*, *aux*; *jumeau*, *elle*). For verbs, a number of strategies are employed: there is an appendix containing the "Conjugaisons des Verbes Français"; regular *-er* and *-ir* verbs have their inflections given only in the table of conjugations; verbs with minor irregularities, such as the inclusion of *-e-* in *bougeons* (1<sup>st</sup> person plural present of *bouger*) or the *ç* in *plaçons*,

have these irregularities given in the dictionary entry for the verb; major irregular verbs are referred to a prototype, e.g. “PRODUIRE, conjug. *conduire*”, where the forms for that group of irregular verbs are given, as well as in the table of conjugations. *Le Petit Robert* includes derivational prefixes and suffixes as headwords and also contains a table of suffixes as an appendix.

### 1.1.3. German

In German, the inflectional forms are yet more diverse and varied (cf. Art. 120). In the *Deutsches Wörterbuch* (Wahrig et al. 1980–1984, eds.), the front matter contains numbered tables for the declension of nouns and pronouns, for the declension of adjectives and indefinite pronouns, and for the conjugations of verbs, which are used for cross-reference from the dictionary entries. Each noun entered in the dictionary is marked for gender, and the genitive singular and the plural inflections are given; uncountable nouns (i.e. with no plural inflection) are marked as such, as are nouns occurring only in the plural form; for the adjectival and nominal declension of nouns the user is referred to the declension tables. A similar cross-reference is made for adjectives, where three tables are devoted to regular patterns and five to deviations from these. In the case of verbs, so-called “weak” verbs are regarded as the regular category, and there is no cross-reference to a conjugation table, though one is provided. In the case of “strong” or irregular verbs, the entry for the verb contains a number which cross-refers to a conjugation table. Irregular inflectional forms are entered as headwords in the dictionary, with an indication of their form and the citation form to which they belong, e.g. “brachte <1, 3 Sg Ind Prät von> bringen”. Clearly, in the case of German, and to some extent of French, an important question is how and where to show the inflectional forms of words, whether in the dictionary entries themselves or in the tables outside of the main body of the dictionary with cross-references in the entries. It is a question to which we shall return (cf. 3.2).

### 1.2. Learners' dictionaries

**Learners' dictionaries** are a particularly English phenomenon, though a French and a German learners' dictionary will be referred to below. They aim to be a comprehensive and detailed guide to usage for, mainly, ad-

vanced foreign learners. Care is, therefore, taken to ensure that all necessary information, especially grammatical information, is included (Jackson 1988: 174–191). The first in the marketplace, in 1948, was A. S. Hornby's *Oxford Advanced Learner's Dictionary*, now in a much revised fifth edition (Crowther<sup>5</sup> 1995, ed.). In this dictionary, irregular inflections are shown and where the addition of an inflectional suffix causes spelling changes, e.g. the doubling of a stem-final consonant. All words with irregular inflections are listed as headwords, with cross-reference to the stem form. There is a table of irregular verbs as an appendix. All adjectives forming the comparative and superlative in -er/-est are said to be marked for this, though the dictionary (4<sup>th</sup> edition, cf. Cowie<sup>4</sup> 1989, ed.) is less than consistent in practice (Bolinger 1990: 135). In the area of word formation, suffixed derivatives are entered as run-ons after a distinctive triangle symbol, if the meaning is clear from the root word; otherwise a derivative is entered as a separate headword, as it is if the spelling connection is not clear, e.g. with *satisfaction* from *satisfy*. Compounds are usually listed as run-ons under the first element and are preceded by a distinctive square symbol; however, if the first element of a compound is not a headword, or if the compound is a loanword or has an idiomatic meaning, then it is entered separately. Affixes and combining forms are listed as headwords and accompanied by explanations and examples.

The second advanced learners' dictionary was the *Longman Dictionary of Contemporary English* in 1978, now in a third edition (Summers<sup>3</sup> 1995, ed.). It has the same information on inflections as its Oxford competitor, except that it contains no information about adjective inflections in the entries apart from irregular ones. In word formation, suffixed derivatives are entered as run-ons if the meaning is derivable from the root, but compounds are always entered as separate headwords. The dictionary (2<sup>nd</sup> edition, 1987) contains a ten-page appendix on word formation, including alphabetical listings of “word beginnings” and “word endings”. Common affixes and combining forms are listed as headwords and cross-referenced to the appendix.

The third English advanced learners' dictionary was the *Collins Cobuild English Language Dictionary* (Sinclair<sup>2</sup> 1995), which, in its construction – based on a large computer

corpus – and in its presentation of information, marked a significant departure from conventional lexicographic practice. Inflectional forms are given in full, at the beginning of the entry, for all words that have inflections, both regular and irregular. Each entry is for a single orthographic word; there are no separate entries for a word form belonging to more than one word class. There is one entry for *play*, for example, with the inflectional forms *plays*, *playing*, *played*; the form *plays* indicates both ‘noun plural’ and ‘verb 3<sup>rd</sup> person singular present tense’. In word formation, a suffixed derivative is entered as a run-on, after a distinctive diamond symbol, only if the meaning is directly derivable from the stem; otherwise, if the derivative is very common or has a different meaning from the stem, it has a separate entry. Compounds always have separate headword status, as do common prefixes and suffixes (including combining forms).

A fourth advanced learners’ dictionary in English is the *Cambridge International Dictionary of English* (Proctor 1995, ed.). For inflection the general principle is that, in the case of nouns and verbs, only irregular inflections are given in the dictionary, but regular inflections are described in the front matter and boxed “language portraits” in the body of the dictionary add further information. In the case of adjectives, all those that can form comparative and superlative with the suffixes *-er/-est* are so marked in the dictionary, as are ungradable adjectives. One of the features of the *Cambridge International* is the multiple entry of headwords with more than one core sense. Derivatives are entered, each on a separate line, below the sense to which they relate. Additionally, there is a “language portrait”, entitled “Combining Forms”, which describes the main derivational prefixes and suffixes of English. Compound words all have headword status.

English learners’ dictionaries both reflect and vary the diversity of practice in the treatment of morphological information that was evident in the monolingual dictionaries of English. The same is true of the French learner’s dictionary, *Dictionnaire du Français Contemporain* (Dubois et al. 1971, eds.). It contains in its front matter tables of “Conjugaisons des Verbes” and “Suffixes et Préfixes”. In the dictionary entries, if a verb has an irregular conjugation, it is cross-referenced by number to the table of conjugations, e.g. “*sortir* (conj. 28)”. An interesting

feature of this dictionary are the boxed articles in the body of the dictionary on derivational prefixes, e.g. *archi-*, *hypo-*, *in-*.

A first German advanced learners’ dictionary appeared in 1993, *Langenscheidts Großwörterbuch Deutsch als Fremdsprache* (Götz et al. 1993, eds.). The inflections of all nouns (genitive and plural) and of all verbs (simple past and perfect tenses) are given; additionally the “3<sup>rd</sup> person singular present tense” is given for irregular verbs where it differs from the stem of the infinitive headword. This dictionary has paid particular attention to aiding the learner understand the word formation processes of German. A larger number of prefixes and suffixes are entered as headwords, with a label indicating how productive they still are, and with some typical examples. Common compounds are listed within the entries for words, after a *K*- (for “Komposita”) symbol where the word is the first element of a compound, and *-K* where it may be the second element.

### 1.3. Bilingual dictionaries

In **bilingual dictionaries**, inflectional information is normally given for headwords. In a French/English bilingual dictionary, for example, inflections are given for French words in the French-English side of the dictionary, and for English words in the English-French side; though this does not invariably apply. In the *Collins-Robert French/English Dictionary* (Atkins et al. 1987, eds.), the irregular or unobvious plurals of nouns are indicated in this way. However, for gender variants, the feminine and masculine forms of a French noun are given on the English-French side if they could both be the translation of an English noun, e.g. “*singer .. n chanteur m, -euse f*”.

The feminine forms of French adjectives are also given on the English-French side, if they are not formed regularly. In the case of verb inflections, the *Collins-Robert* follows the respective monolingual traditions: French verbs with irregular inflections, on the French-English side of the dictionary, are given a number, which refers the user to the tables of verb conjugations in the appendix; the inflections of irregular English verbs are given at the entry for the verb in the English-French side of the dictionary, though there is also an appendix of irregular English verbs. Inflected forms of nouns and verbs that cannot be easily related to the root form are en-

tered as headwords, with a cross-reference to the citation form.

The separate monolingual traditions are also followed in the *Collins German Dictionary* (Terrell et al. 1980, eds.). The genitive and plural inflections are given for all German noun headwords, on the German-English side, except for certain regular noun inflections, indicated in a table in the front matter. For English, the irregular plurals, and only these, are given for nouns on the English-German side. Similarly, the irregular, or “strong” verbs have their inflections given in the entries for the simple verb. This means that verbs which are derived by prefix or compounding from a simple irregular verb are cross-referenced to that verb for the inflectional information. German verbs that have regular inflections apart from not forming the past participle with *ge-* are marked with an asterisk, e.g. *bedienen\**, *hantieren\**. Irregular inflectional forms are listed as headwords and cross-referenced to the citation form.

In bilingual dictionaries, the need to provide the information that a user requires at the most convenient place vies with the pressing need to keep the dictionary within manageable bounds of both volume and cost. Inflectional information would most conveniently, from the user's point of view, be provided at the point of look-up, e.g. for German verbs on the English-German side of the dictionary. But providing information there would mean either increasing the volume of the dictionary or leaving something else out. The user must therefore look in two places to discover, for example, the past tense form of the German translation of *speak*: in the English-German side to discover that the equivalent in German is *sprechen*, and in the German-English side to discover that the past tense form is *sprach*. How to present inflectional – and word formation – information in an accessible way is an important question, to which we shall return below (in 3).

## 2. Morphological models

### 2.1. Dictionary entries

Before we consider which of the **models of morphology** is most used in describing morphological data in dictionaries, it will be useful to consider the nature of a **dictionary entry**. A dictionary entry consists of a headword and an accompanying article that gives

a lexical description of the headword. The lexical description includes phonological, morphological, syntactic, lexicological, semantic and pragmatic information (Jackson 1988: 35–47; but cf. Dubois & Dubois 1971: 90).

The headwords of a dictionary usually include the “simple” words (i.e. the root forms that have not undergone any word formation processes) of the vocabulary in their citation form (see 3.1), some compound words, and some derived words. Compounds and derivatives are usually given separate headword status if their meaning has diverged from that of the root so that it can no longer be deduced directly from the form of the word itself. Otherwise, compounds and derivatives are treated as run-ons under the simple word, i.e. as part of the morphological/lexicological description of the simple word.

Headwords may also include inflected forms of words (for cross-reference purposes), affixes and combining forms, abbreviations, and so on. This raises the question whether dictionaries take the word or the morpheme as their basic unit of description. The vast majority of headwords in dictionaries, for European languages at least, are words, in their citation form, though what counts as a dictionary word is not always a simple matter to decide (Dubois & Dubois 1971: 61–65). Other items that appear as headwords (prefixes, suffixes, and so on) are included because they are deemed to represent useful reference material for dictionary users; they are sometimes included additionally or instead in an appendix to the dictionary. Whether the word is the appropriate basic unit for highly inflecting languages like Swahili is another question (Bwenge 1989).

Some of the information contained in the article that accompanies a headword may be morphological. This includes the inflectional forms of the headword, usually if these are not formed on the regular pattern for the word class concerned (Jackson 1988: 148). It also includes the words that have been formed from the headword by the word formation processes of compounding and derivation, where the resulting forms do not require separate definition. In the case of derivation, however, it is only suffixed derivatives that are included in the article; words derived by prefixation have separate headword status. This discrepancy arises from the exigencies of the alphabetical ordering of dictionary entries and the assumption that a user

cannot be expected to make a morphological analysis of a word, i.e. recognise the presence of a derivational prefix, before looking it up.

## 2.2. Word and paradigm

Dictionaries for European languages operate with words as their basic unit (Zgusta 1971: 159). The implicit working model of lexicographers tends therefore to be the **word-and-paradigm** model of morphology (Zgusta 1971: 119). This is most obvious in the French monolingual dictionaries reviewed in 1.1.2, where the inflections of verbs are indicated in the dictionary entry merely by a number, which refers the user to a paradigm in the table of conjugations at the front or back of the dictionary. But it is equally the model implicit in the indication of irregular inflections in the dictionary entry itself. First of all, a regular paradigm of inflections is assumed – the “declension” of nouns, the “conjugation” of verbs – which is either listed in the front or back matter of the dictionary or assumed to be in the general knowledge of the dictionary user (Hoenigswald 1967: 109). Secondly, the inflectional forms are given in the articles for irregularly inflected words that enable the user to construct the appropriate paradigms for each word. For example, the “principal parts” of verbs in German and English are given (3<sup>rd</sup> person singular present tense, past tense, past participle), from which the paradigms for the various tenses can be worked out (Lyons 1977: 515).

What the word-and-paradigm model does not always make explicit, because of the assumption of a regular paradigm, is that there may be gaps in the paradigm even for some regularly inflected words (Hoenigswald 1967: 109). Not all verbs in English have the full paradigm forms: stative verbs (e.g. *know*) do not usually form progressive tenses; modal verbs (e.g. *can*) do not have non-finite forms. There are nouns that have no plural forms (German *Armut*, English *poverty*), usually marked in learners’ dictionaries as “uncountable”.

The word-and-paradigm model assumes a language whose major word classes inflect and where a dictionary user can either be referred to an appropriate table or be given some principal parts from which to construct the paradigms. Where a language does not have a series of inflected forms, the paradigm model is irrelevant, e.g. for Burmese (Zgusta 1971: 162). The model really only has something to say about the inflectional aspects of

morphology; it does not treat the forms that arise by regular or irregular derivational processes (Hoenigswald 1967: 106).

## 2.3. Word formation

One reason why the word-and-paradigm model does not apply well to derivation and other types of word formation is that it is essentially a static model. **Word formation** is conceived in terms of processes. General monolingual synchronic dictionaries are static descriptions; they record the products of word formation processes, rather than the processes themselves. However, there are ways in which dictionaries can indicate the process nature of word formation. Firstly, the process by which a compound or derivative comes into being may be indicated in the etymology of the word (see Art. 174). Secondly, dictionaries often list affixes and combining forms as headwords, or in an appendix, with an implication that they continue to be productive in the processes of forming new words. With compounding, that is more difficult. There is much that the practice of lexicography can learn from the linguistic investigation of morphology (Jackson 1988: 250) and *vice versa*; it is to this we now turn.

# 3. Morphology and lexicography

## 3.1. Citation forms

The form of a word that is entered as the headword is known as the “citation form” (Lyons 1977: 513; Jackson 1988: 9) or the “canonical form” (Zgusta 1971: 119; Landau 1989: 76). For words that undergo inflection, the **citation form** represents the paradigm (Landau 1989: 76; Zgusta 1971: 119). In that sense they may be regarded as “theoretical units” (Dubois & Dubois 1971: 62), since a headword (e.g. *biscuit*) stands for all the possible forms of the word (i.e. singular *biscuit* and plural *biscuits*).

In English dictionaries, the citation form is the stem to which the inflectional suffixes are added (Lyons 1977: 513). So, for regular verbs in English, the citation form is the infinitive without *to* (e.g. *play*), to which the inflectional suffixes are added (e.g. *plays*, *played*, *playing*). In German and French dictionaries, the citation form is also the infinitive (e.g. *jouer*, *spielen*); but in these languages it is not the stem to which the inflectional suffixes are added. The infinitive suffix, *-er* and *-en* respectively, has to be

removed to produce the stem forms (*jou-*, *spiel-*). In *Der Sprach Brockhaus* (see Brockhaus<sup>8</sup> 1972), however, verbs are entered in the 1<sup>st</sup> person singular present tense form (e.g. "ich spiele"). In the case of Swahili, it is by no means clear what the citation form should be (Bwenge 1989: 5 f.). Nouns in Swahili, for example, whether singular or plural, always have a prefix that marks number, but which also acts as a gender/class marker: should the headword be the stem form, without prefixes, or the singular form? The former would make it difficult for a user of the dictionary to locate a word unless they knew which noun class it belonged to. The latter would group together in the dictionary all the nouns belonging to the same class, and it assumes that the user will then recognise the root and be able to deduce the plural form.

What the citation forms should be in any particular instance is not always immediately obvious. The choice will be informed both by the insights of morphology and by the practical demands of the dictionary. This is why it is important, for example, for inflected forms, if they are not readily relatable to their stem, to be entered as headwords and cross-referenced to the citation form. Such a practice is especially necessary in bilingual dictionaries, where the users may not be familiar with the word that they are looking up (Landau 1989: 77).

### 3.2. Inflectional variants

It is well-established that, as part of the idiosyncratic information about words that dictionaries contain, inflections are included, especially if they are irregular (Jackson 1985: 54). Idiosyncratic information is not predictable from the general rules of grammar; in the case of inflections, the declension of a noun or adjective or the conjugation of a verb is not predictable from the phonological form of a word (Bauer 1983: 192). The requirement on a dictionary is that it should be possible to construct the whole paradigm of a word from the information given in the entry (Zgusta 1971: 121). This is usually interpreted to mean that regular inflections need not be given, since the dictionary user is assumed to know them; *Webster's Third* (Gove 1961, ed.) and *Collins Cobuild* (Sinclair<sup>2</sup> 1995, ed.) are exceptions to this generalisation. For irregular inflections, enough information needs to be given for the complete paradigm to be deduced, as the principal parts of "strong" verbs in German allow the para-

digm for all the tenses to be constructed. However, this is not always or not always obviously the case.

In German dictionaries it is customary to give for nouns the genitive singular inflection and the plural inflection (e.g. *Blick* -(e)s, -e; *Genosse* -n, -n). Unless a user knows the way in which the singular paradigm for German nouns works, he will not be able to conclude that in the case of *Blick* the dative singular form is *Blick*, but in the case of *Genosse* it is *Genossen*. And if he knows that, he hardly needs the information that is given in the dictionary (Wiegand & Kučera 1982: 309 f.).

What information does a dictionary user need to have about inflections? There are two different look-up questions in respect of inflections that a user might come to a dictionary with (Mugdan 1983: 180). The user may come with an inflected word form and want to find the corresponding headword or citation form (lemma). Alternatively, the user may come with a citation form and want to know what the inflected forms of the lemma are (cf. Bergenholz & Mugdan 1982: 29 f.). To satisfy the first query, a dictionary needs to contain a grammatical description that includes inflectional paradigms, as well as entering irregularly inflected forms as headwords with cross-reference to the citation form (Mugdan 1983: 182 f.; cf. Cowie 1983: 101). To satisfy the second query, again the grammatical description needs to be included in the dictionary, and, if possible, an indication of irregular inflections needs to be given at the entry for the citation form (Mugdan 1983: 187 f.). There appears to be a strong argument for including a brief grammatical description in the dictionary, to which dictionary entries can be cross-referenced (cf. Bergenholz & Mugdan 1982: 19). This is customary practice for the conjugations of verbs in French dictionaries (see 1.1.2), but because the complexities are too great to be able to handle in the entries themselves rather than for any principled reason. The inclusion of such a grammatical sketch in bilingual dictionaries may be a solution to the problem of where to indicate the inflectional information in these dictionaries (cf. 1.3; Mugdan 1983: 189).

A particular problem – though it is probably not unique – is posed by the adjective inflection in English. First of all, there is an alternation in forming the comparative and superlative forms between an inflectional suffix (-er, -est) and *more/most* before the adjec-

tive (Jackson 1985: 54 f.). The inflectional suffix is usual with words of one syllable and with some two-syllable words; the periphrastic form is obligatory with three-syllable words and longer. Dictionaries need to indicate, at least for two-syllable words, where *-er/-est* is allowed and where not, as in the *Cambridge International* (Proctor 1995, ed.) (see 1.2). But the inflectional suffix may not be possible even for some one-syllable words, but not for any morphological reason (Bolinger 1990: 135): e.g. *souer* or *wronger* do not “sound right”. Further linguistic investigation and guidance would greatly aid lexicographers in instances like these.

### 3.3. Derivatives

**Derivation**, as a word formation process, is of great interest to dictionary compilers. They are keen to include in their works all new words that have become lexicalised (accepted into the language) since the previous edition of a dictionary. Because the number of derivatives can greatly enhance the calculation of the number of “references” included, they may be used to inflate the claimed size of a dictionary (Landau 1989: 78; Mugdan 1984: 241; Jackson 1998: 27). In their function as a record of the vocabulary of a language, dictionaries are naturally much concerned with word formation processes. Dictionaries need clear policies and practical guidance on several matters relating to the treatment of derivatives and compounds.

One of the matters concerns the relationship between derivation and inflection, “a key point in the linguistic theory of word formation” (Ilson 1985: 163). The sharp boundary that is implied by the separate treatment of inflection and derivation in this article does not exist in reality (Zgusta 1971: 129); it is in many respects considered to be controversial (Lyons 1977: 521). The point can be illustrated from the present and past participles in a number of languages (Dubois & Dubois 1971: 63; Landau 1989: 91). The participles are usually considered to be inflectional forms of the verb; so they do not merit an entry in a dictionary unless they are formed irregularly. However, some participles are used more commonly than others as adjectives and, in this function, may develop a meaning that differs in some respect from the meaning of the verb to which the participle is related, e.g. French *étonnant*, English *surprising*. Such participles would warrant being entered as separate headwords, which implies

a lexical derivation rather than a grammatical inflection. From the perspective of derivation, many derivational processes are highly regular and predictable, e.g. *un-* as a negative-forming prefix in English, or the *-ish* suffix added to adjectives, neither of which involve a change of word class of the item to which they are affixed. To that extent they are like inflections (Zgusta 1971: 127), and a dictionary of contemporary Polish did not intend to include regular derivations (Saloni et al. 1990: 7). However, derivational rules tend to be less productive than inflectional ones, and they sometimes lead to unpredictable semantic effects (Lyons 1977: 524). A lexicographer has to decide at what point to count an item as a different word and therefore deserving a separate entry in the dictionary.

How then are derivatives treated in dictionaries? Prefixed derivatives, because of the alphabetical ordering of dictionary entries, are separated from the stem to which they are related, “so that the user loses the chance to grasp with a quick glance the combinatory potentialities of the given stem” (Kahane & Kahane 1967: 257). Suffixed derivatives are treated in two ways, and dictionaries differ in how individual derivatives are handled. The first way is to include a derivative in the article for its stem as a run-on entry, in bold type but usually with no, or minimal, definition. Derivatives whose meaning is directly related to that of the stem are normally handled in this way. The second way is to accord a derivative separate entry status as a headword, thus confirming the derivative as a different word. Derivatives whose meaning differs from that of the stem or whose use requires more extensive explanation are normally handled in this way (Landau 1989: 78). How a dictionary treats individual derivatives may depend on practical considerations of economy and retrievability and the weight given to these by the lexicographer (Cowie 1983: 102). The inconsistency in the treatment of prefixed as against suffixed derivatives and the implications this has for the view that a user has of derivational processes needs further attention from linguists and lexicographers. (Cf. the comments on the treatment of word formation in learners’ dictionaries by Prcic (1999).

### 3.4. Affixes and combining forms

Should the elements of word formation processes, though they are not words themselves, be accorded headword status in the dictio-

nary? The practice of doing this is variable (Bergenholtz & Mugdan 1982: 31), but their inclusion is seen as highly desirable (Benson et al. 1986: 236; Mugdan 1984: 300). The arguments for inclusion include the fact that they are meaning-bearing items (Müller 1982: 156), and that their inclusion may enable the dictionary user to decode new derivatives that are not yet lexicalised (Bergenholtz & Mugdan 1982: 32; Müller 1982: 167). For example, the inclusion of the combining form *-ectomy* will enable a user who knows the meaning of *tonsil* to decode the derivative *tonsilectomy* (Benson et al. 1986: 236).

The information included for affixes and combining forms needs to indicate not only their meaning, but also how they form new words (Benson et al. 1986: 236, cf. Bauer 1983: 193). Arguably, this kind of explanation may be more satisfactorily handled in an appendix, where all word formation processes can be considered together, as in some French dictionaries (see 1.1.2) and learners' dictionaries (see 1.2). To provide adequate points of access for users, it may be necessary to provide a three-fold treatment of derivatives: the inclusion of lexicalised derivatives as words; the inclusion of affixes and combining forms as headwords; and the treatment of word formation processes in an appendix.

Lexicographers usually make a distinction between affixes and combining forms, though some dictionaries operate just with the labels "prefix" and "suffix", or more unusually just with "combining form" (Proctor 1995, ed.). It is not certain that this is a distinction that all linguists would make (Ilson 1985: 164). There needs to be some clarification for lexicographers of the distinctions between inflectional affix, derivational affix, and combining form. They probably form a continuum from the obviously inflectional affix (like the English plural *-s*), through the inflectional affixes like English present participle *-ing*, through highly productive derivational affixes like the agentive *-er*, to the more obviously lexical *re-* ("again") and combining forms like *-ology* ("study of") (Ilson 1985: 164).

### 3.5. Compounds

In contrast to derivatives, one of the crucial issues in the treatment of **compounds** in dictionaries is deciding when a word + word or root + root combination constitutes a word or lexical item in its own right and therefore warrants entry in a dictionary. On the one hand this issue is connected with the general

problem of the definition of a lexical unit, when this is not a simple word nor apparently a syntactic phrase (Dubois & Dubois 1971: 30). On the other hand, it is connected with the criteria that might be applied to decide that a combination should be regarded as a compound. Spelling is no guide in English (Cowie 1983: 103; cf. Mugdan 1984: 285 for German), though some dictionaries use that as a criterion, requiring a compound to be written "solid" or at least "hyphenated", but not "open". More acceptable and reliable criteria include the requirement that a compound should have a semantic unity or form a semantic unit (Dubois & Dubois 1971: 30) or have a "unity of signification" (Cowie 1983: 104), as well as the requirement that a compound should be stable (Zgusta 1971: 135) or institutionalised (Lyons 1977: 535). This last criterion excludes occasional or nonce compounds, which may be readily produced in some languages but are bound to the context in which they are coined. Only if they subsequently become generally accepted by use – institutionalised or lexicalised – do they merit inclusion in a dictionary; but the lexicographer is faced with deciding when that point has been reached (Lyons 1977: 536), and it may in any case be indeterminable (Mugdan 1984: 245).

The other important issue for lexicography is how to treat compounds in the dictionary. Should they all be accorded headword status, or can they be included as run-ons under one or other of the constituent roots? From the user's perspective, a strict alphabetical ordering of headwords is probably ideal (Mugdan 1984: 290). But economy usually dictates that the second course is followed as far as possible. In that case, are there any criteria for deciding which element of the compound it should be entered under? If, for example, it is considered desirable to indicate the relationship between a compound like *fruit-picking* and the construction from which it derives (e.g. "They picked fruit"), then this compound needs to be entered under the verb *pick* rather than the noun *fruit* (Cowie 1983: 99). But compounds are usually entered under the first lexical constituent. Not only may this be arbitrary, but it also implies a relationship between compound and the item (Lyons 1977: 537), when the compound may have developed a specialised meaning that is no longer relatable to either of its constituents; though that may be a reason for entering the compound as a separate headword. Another approach to this question is to take

the practical perspective of the dictionary user: where would a user expect to find a particular compound? It may be necessary to enter a compound in more than one place, or to take account of the strategies that users employ. It would appear that strategies differ from language to language (Bogaards 1990: 79 ff.); French speakers, for example, take more account of a constituent's or word's frequency, while Dutch speakers are more sensitive to a word's class, tending to look for an item under a noun element before an adjective or verb element.

### 3.6. Conclusion

That morphological information should be included in dictionaries is without dispute. Such information includes at least the inflectional properties of headwords (Lyons 1977: 517), and additionally derivational features (Saloni et al. 1990: 5). Another proposal specifies as the morphological information about lexical items: structure in terms of morphemes or alternating phonological structures; irregular morphological structures linked to particular morpho-syntactic features; partial similarities to other words (in derivatives and compounds); cliticizing properties (Hudson 1988: 311). These are the areas where linguists and lexicographers can fruitfully interact in assembling the information that needs to be included in a dictionary.

More particularly lexicographical are the considerations of how to present this information, both to be true to the data and its description, and to take account of the practical needs of the dictionary user. How much of the information should be included in the dictionary entries? How extensive should the cross-referencing be? What is the place of grammatical descriptions in the front or back matter of the dictionary? Perhaps there is an argument for every dictionary to contain a brief grammatical sketch to which the entries can cross-refer (Bergenholtz & Mugdan 1982; Mugdan 1989–1990 b) or even for there to be a reference book that is dictionary and grammar combined (Lemmens & Wekker 1991).

### 1. Computational linguistics

It is useful to distinguish in Computational Linguistics between applications and modules. Applications are geared toward a specific user-oriented goal (e.g., automatic translation, or dialogue with an information system), whereas modules are necessary in a wide range of applications. For example, syntactic parsing as a module is useful in the development of both Machine Translation systems and Dialogue Systems. Modules can be characterised by a transformation between different linguistic representation levels, e.g. from text to speech, or from a string of words to a tree structure representing the sentence's structure. The goal of much work in Computational Linguistics is to design efficient and accurate computational models for such transformations. In developing a syntactic parser, for example, we may build a model using a grammar, a lexicon and a heuristic search procedure which together transform strings of words (the input representation) into labeled trees representing the syntactic structure (the output representation).

In this article, I will treat morphology as one such module, which can operate in two directions. In morphological analysis, a complex word form is transformed into a string of morphemes with a characterisation of the structural relations between the different morphemes (possibly represented in a tree structure), and its stem or citation form. In

morphological synthesis (or generation), a stem or root form of a morphological paradigm and a set of grammatical features is taken as input, and the corresponding complex word form is generated.

At a general level, all morphological processing modules will need a lexical database associating morphemes with linguistic information, a model of the combination possibilities of morphemes and the effects thereof on spelling and pronunciation (mostly in the form of rules, and a search procedure using this information to actually generate or analyze words.

In this article, I will briefly discuss the kind of models that have been proposed for designing the morphological module in Computational Linguistics applications (cf. 2), go into the different application areas where morphological modules are used (cf. 3), and give an overview of tools which could help morphologists in their research (cf. 5). I will also provide pointers to some recent work on “learning of morphology” which seems to attract the attention of both linguistic and computational morphology (cf. 4). There are several good introductions to the field of Computational Linguistics in general (Jurafsky & Martin 2000; Manning & Schütze 1999; Allen 1995).

### 2. Models of morphology in computational linguistics

As Computational Morphology focuses on developing models that achieve one of the morphological mappings discussed earlier (segmenting a string into its parts and disambiguating the parts in morphological analysis, construction of a string on the basis of lexical and morphological information in

morphological analysis	
<i>surprisingly</i>	(( <i>surprise</i> )Verb <i>ing</i> )Adjective <i>ly</i> )Adverb
<i>took</i>	( <i>take</i> )Verb-Past
morphological synthesis	
<i>establish</i> (past participle)	<i>established</i>
<i>clean</i> (superlative)	<i>cleanest</i>

Tab. 172.1: Morphological analysis vs. synthesis

morphological synthesis), theoretical linguistic distinctions like inflection versus derivation (cf. Art. 38) do not play an important role. Formalisms developed for modeling morphology focus on the concrete construction processes involved (concatenation, Ab-laut, root-and-template interleaving, suppletion, etc.; cf. Art. 53), on the spelling and phonological changes these processes produce (cf. Art. 35, 44), and on the constraints under which all this occurs (morphotactics; cf. Art. 42). Issues of productivity (cf. Art. 33) will be reflected in Computational Morphology by a particular choice of the division of labour between lexical storage and rule-based processing. We will only briefly describe the main types of models here. More technical and broader overviews of the field of Computational Morphology can be found elsewhere (Sproat 1992; 2000).

### 2.1. The role of lexical databases

In any Computational Morphology model, there is a trade-off between the contents of the lexical database and the size of the rule set. In languages like English with a relatively poor morphology, it is feasible to construct a lexical database with complete paradigms of complex word forms rather than morphemes (a full form lexicon). The construction can be done semi-automatically (by morphological synthesis, which is easier than analysis), leading to an analysis by synthesis approach. All inflectional and most of the derivational processes can then be solved by lexical retrieval rather than computation. However, for most languages this is not a feasible solution. For example, compounding is extremely productive in languages like German and Dutch, and for languages like Turkish and Finnish, inflection and derivation cannot be solved by this “pre-computation” and lexical storage approach. Moreover, the approach fails for words (stems) not contained in the lexicon.

For implementation, lexical databases tend to be represented as **letter tries** (Fredkin 1960). A trie is a tree data structure with nodes representing a position in a word, and arcs leaving a node representing letters that can follow the corresponding position in the word. The root node represents the start position, and individual words are paths in the trie. Leaf nodes represent the lexical information associated with the word the path of which ends at that node. This way the redundancy in the spelling of words is used to com-

press the lexicon into a data structure that is small and that can be searched efficiently.

Fig. 172.1 is an example of the trie structure representing the five words *ask asking away be became*. Note how the redundancy is removed.

### 2.2. Finite-state morphology

The most influential model developed for morphological analysis and synthesis to date is **finite-state morphology** (FSM), also called two-level morphology. It was developed by Koskenniemi (Koskenniemi 1983; 1984) for Finnish and other languages, inspired by unpublished work by Martin Kay and Ron Kaplan, published only much later (Kaplan & Kay 1994). The model consists of a trie lexicon structure and a set of rules implemented as a finite-state transducer, and can perform both analysis and synthesis.

The most important ideas in this approach were that all or most morphological phenomena can be described with regular expressions, and that the morphological mappings can be described with only two levels: a lexical representation, and a surface (spelling or speech) representation. Traditional linguistic descriptions like generative phonology (Chomsky & Halle 1968) made use of an ordered series of rewrite rules with intermediate representations to transform lexical representations into surface forms, where each rule works on the output of the previous rule, thereby giving rise to complex rule interactions. In addition, the expressive power of the formalism used to describe each rule (context-sensitive grammar) was obviously higher than needed, and in a computational perspective, this type of rule only works in one direction (from lexical to surface). A further advantage of finite-state approaches is that the computational machinery involved is language-independent, and not *ad hoc* for a specific language.

In finite-state morphology, each rule is implemented as a bi-directional Finite-State Transducer linking the lexical and surface representation, making it useful for both analysis and synthesis, and all rules are applied in parallel. The base unit of a two-level rule or constraint is a pair of symbols, one from the alphabet of the lexical representation, one from the alphabet of the surface representation. E.g. the pair *n:m* (a lexical *n* corresponding to a surface *m*), or *V:0* (a lexical vowel deleted at the surface level). See Fig. 172.2 (a), which represents an assimila-

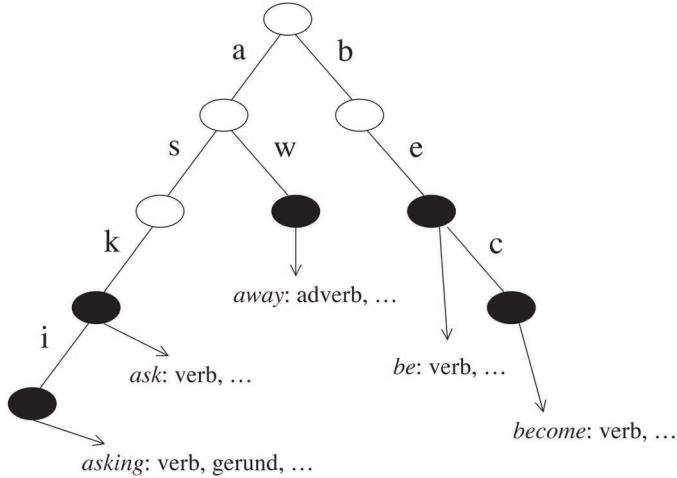

Fig. 172.1: Example of a trie data structure containing the lexical items  
ask asking away be became

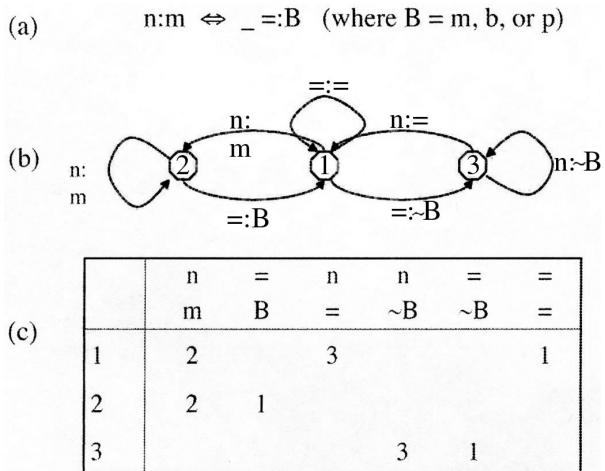

Fig. 172.2: Three representations of a finite-state morphology rule; two-level rule (a), transition network (b), and transition table (c)

tion rule: a lexical  $n$  has to be realised as a surface  $m$  when followed by a bilabial consonant ( $B = m, b$ , or  $p$ , the symbol  $=$  can refer to any symbol). Fig. 172.2 (b) and (c) show the corresponding Finite-State Transducers as a network (transitions show how states are allowed to change) and as a transition table. The automatic compilation of two-level rules into finite-state transducers is not trivial, but can be done. The strength of the approach is that two-level rules can refer to the lexical as well as to the surface representations for defining their context.

A finite-state morphology model consists of a set of rules of this type. In morphological synthesis, the rules get a series of lexical symbols as input and produce all surface forms allowed by the rules, in morphological analysis, they get a surface form as input, and produce all possible lexical representations (constrained by the lexicon). The lexicon in finite-state morphology consists of a list of stem forms, and a number of affix lexicons (lists of inflectional and derivational suffixes). Lexicon entries contain associated lexical information, including a list of pointers to contin-

uation lexica (lexica which can follow this lexicon entry).

The model has been applied to many languages and many morpho-phonological phenomena, and has proven to be an elegant and practical approach to Computational Morphology. Many overviews, tutorial material, extensions, and references are available (Gazdar 1985; Ritchie et. al. 1992; Antworth 1990). An extension for morphologically motivated phenomena like Umlaut is presented in Trost (1991). Despite its success, finite-state morphology is not without problems; the lexicon system leads to redundant representations, and some processes like reduplication and root-and-template morphology cannot be described without complicating the formalism.

The success of finite-state approaches in Computational Morphology no doubt contributed to the investigation of the applicability of finite-state methods to syntactic analysis and in applications such as shallow semantic interpretation (Abney 1996; Karttunen et al. 1996; Roche & Schabes 1997, eds.). Together with statistical approaches, finite-state methods dominate Computational Linguistics today.

### 2.3. Hierarchical lexicons

Another popular approach to computational morphology makes use of the concept of taxonomies and inheritance of properties to represent morphological knowledge. The basic insight here is that irregular words normally deviate only in a few characteristics from regular words. E.g., an irregular verb like *run* is just like a regular verb like *work* (compare *run, runs, running to work, works, working*), except that the past tense and past participle are formed in a different way. This “elsewhere condition” type of reasoning, so common in linguistic morphology, can be modeled elegantly with inheritance networks (Daelemans et al. 1992). Although there are many general-purpose knowledge representation and programming languages (of the frame-based or object-oriented type) that allow the implementation of this type of reasoning, the most important exponent of this approach is DATR (Evans & Gazdar 1996), a special-purpose programming language for lexical knowledge representation. DATR was guided in its design by formal adequacy goals (explicit declarative semantics and explicit theory of inference), and notational adequacy goals (it should be expressive enough

to describe all relevant generalizations). Another concern was efficient implementation. DATR fragments have been developed for the morphology of various languages.

Both approaches are complementary as the finite-state approach is limited in the mechanisms it allows for handling morphotactics, which is what most DATR work focuses on. Not all models can be assigned to one of these approaches; one successful morphological analysis module in the context of speech synthesis, DECOMP (Allen et al. 1987), uses ad hoc weights to improve disambiguation. I will return to the problem of morphological ambiguity resolution in the section on morphology learning (cf. 4).

### 3. Morphology in language technology

Morphological analysis is a basic component in many language technology applications. In Word Processing applications, for example, the accuracy of hyphenation, spelling checking, and grammar checking is highly dependent on the presence of some form of morphological analysis. Morphological processing can also be considered a core component in any language processing system, from speech synthesis over information retrieval to machine translation.

Depending on the sophistication of the morphological processing involved, different terms have been used in language technology. The term **stemming** or **suffix stripping** is used to refer to a sort of “poor man’s” morphological analysis involving simple rules (often without a lexicon) to reduce an inflectional form of a word to its stem. A classical example of this approach, adapted to many languages is the Porter stemmer (Porter 1980). This approach is of course only feasible with some accuracy for languages like English which have a simple morphology. The term **lemmatization** refers to a more advanced process in which a complex word form is reduced to its lemma (or citation form) and the possible morphosyntactic classes it can have as retrieved from the lexicon and deduced from the rules. In this case the structure of the word is not further analyzed. So whereas full morphological analysis would analyze *optimalizations* as “((((*optimal*)Adjective -ize) Verb -ation)Noun -s)Noun-plural”, a lemmatizer would output “*optimalizationNoun-plural*”, depending on the contents of the lexicon, and the definition of the rules, of course.

### 3.1. Word processing

**Automatic hyphenation** is the process of splitting words at the end of lines in order to minimize whitespace when right justification is used. Although the process is conventional, it is mostly based on linguistic units like syllables and morphemes. In languages like English where hyphenation is morpheme-based, morphological segmentation is required. However, given the poor morphology of English, a good computational solution is to use a set of splitting patterns found in a dictionary rather than full morphological analysis (Liang 1983). In a language like Dutch, however, where hyphenation is based on syllabification and morphological structure, the situation is much more complex. It is fairly easy to implement the basic syllabification rules for Dutch (based on the maximal onset principle and a language-specific rule avoiding syllables ending in a short vowel). It is sufficient to collect a list of possible syllable onsets. Interestingly, these rules are overridden by morphological rules. In compounds and some derivations, e.g. with the suffix *-achtig* (transl. *-ly*), the morphological boundary overrides the syllable boundary, giving rise to oppositions like *groe-nig* (*groen* + *ig*, ‘greeny’) versus *groen-achtig* (*groen* + *achtig*, ‘greeny’) where in the first case the maximal onset principle is preserved, and in the second case the morphological boundary has precedence over the syllable boundary in hyphenation. A fairly accurate morphological analysis is required to solve this problem in principle, in this case splitting patterns will necessarily be error-prone because of the high incidence of new compounds in Dutch, as can be witnessed every day in Dutch newspapers (Daelemans 1988).

**Spelling Checking** is based on a very simple principle to detect errors. Given a list of words of the language, every word encountered in a text which does not belong to the list is a spelling error. In languages with a productive morphology, this leads to an annoying “overkill”; the software continuously flags correct words as errors. Especially compounding is a problem. Extremely productive in languages like German and Dutch, this morphological process is responsible for the creation of many complex words which are used *ad hoc* in a text, and never gain enough frequency to warrant their inclusion in the word list. Morphological analysis is the only way to solve this problem. Similar arguments hold for languages with an extensive deriva-

tional or inflectional morphology like Finnish or Turkish, where storage of all word forms in a word list is impossible. Kukich (1992) describes the role of natural language processing in spelling correction.

In **Grammar Checkers**, software that checks the grammatical correctness of sentences in a text, morphological analysis is essential to be able to detect agreement errors, e.g. between subject and verb in many languages, and between modifiers and nouns in languages like German and French.

Processes very similar to morphological analysis are also necessary in word processing of languages like Chinese, and Japanese and Korean when written with Chinese characters, where word boundaries are not marked by spaces or other typographical means. A further good example is Vietnamese: it is written in Latin characters, but white space indicates syllable boundaries rather than word boundaries.

### 3.2. Module in larger systems

Morphological analysis is a necessary component in complete Natural Language Processing systems (for speech recognition and synthesis, language understanding, language generation, language translation, information retrieval, etc.), mostly as a means to increase the **lexical coverage** of such a system.

For example, a syntactic parser needs lexical information about every word in a sentence to be parsed. In case words are not in the lexicon, morphological analysis helps extract useful lexical information from these unknown word forms (often complex forms of known words), increasing the “virtual” coverage of the lexicon. In speech processing, morphological analysis is important as well. In Speech Recognition as a means to keep the recognizer lexicon small, in Speech Synthesis as a means to increase lexical coverage and solve ambiguous pronunciations like *th* in *nothing* versus *ant hill*.

With the availability of the WWW, **Information Retrieval** has become a ubiquitous technology. In search engines, keywords can be input to retrieve a number of documents containing them, ranked according to relevance according to statistical or heuristic measures. The reliability of an information retrieval engine is measured in terms of **recall** (how many of the documents relevant for my query did I get) and **precision** (how many of the documents returned by the system actu-

ally were relevant). Morphological processing is one way of increasing the recall of search engines. By expanding a keyword to all its morphologically related forms (by morphological synthesis) on the basis of its stem (found by morphological analysis), a wider range of (possibly relevant) documents is found, increasing recall.

#### 4. Morphology learning

The last decade, statistical approaches have started dominating the field of computational linguistics (Manning & Schütze 1999). The field has evolved from **deductive** to **inductive**. Recently, machine learning methods have been added to the tools of inductive computational linguistics. Machine Learning is a subfield of Artificial Intelligence concerned with the design of algorithms that learn from examples (Mitchell 1997). When used for building a linguistic model explaining some set of data, machine learning algorithms and linguists share the same task and purpose, which makes the approach potentially interesting for linguistics.

Machine Learning algorithms can be **supervised**, in which case they get examples of available input and required output, or **unsupervised**, in which case they only get examples of available input, and have to figure out useful groupings or clusters of the data. The goal of a learning approach is to use the examples to find useful generalizations about the input-output mapping to be learned. In an example of supervised machine learning applied to morphological analysis (van den Bosch & Daelemans 1999), a morphological analysis system is induced based on a large set of examples of complex words and their corresponding morphological analysis from the CELEX lexical database (Baayen et al. 1993, eds.). It can reconstruct the analyses it used for training, and apply the same systematicity to previously unseen complex words with high accuracy. The approach has been applied to English, German, and Dutch, and shows that even complex spelling changes can be handled in this classification-based way. Daelemans et al. (1997) is an example of a similar approach for morphological synthesis. In this case, the output of the learning is a rule system for diminutive formation in Dutch which is very similar to linguistic solutions proposed for the problem.

Supervised learning methods solve a problem which approaches like finite-state trans-

ducer leave basically unsolved: the disambiguation problem. Even in languages with a minimally complex morphology, a morphological analysis system can lead to many possible analyses (different segmentations into morphemes, different assignments of grammatical classes to morphemes), many of which are spurious. A supervised machine learning approach implicitly uses frequency information from the data it was trained on to make probabilistic disambiguation decisions.

Especially in **unsupervised** learning of morphology, a lot of progress has been achieved the last few years. Starting from a list of complex words, several unsupervised learning techniques have been experimented with to automatically extract information like lists of stems and affixes, and of how they can be combined (Goldsmith 2001; Kazakov & Manandhar 2001; Yarowsky & Wicentowski 2000). An exciting new approach in between supervised and unsupervised learning would start from a bilingual corpus, semi-automatically aligned. Suppose a morphological analyzer exists for German and not for Dutch. Once a bilingual aligned corpus German – Dutch is collected, the analyses generated for German can be projected to the Dutch part of the corpus and used to induce a morphological analyzer for Dutch (Yarowsky & Ngai 2001).

#### 5. Morphology tools for linguists

Some of the approaches used in Computational Morphology are at the heart of what constitutes a linguistic approach to morphology (finding the right generalizations and morpheme inventories for describing the morphology of a language, and looking for formalisms which allow describing them in sufficient detail). It is therefore not surprising that many Computational Morphology researchers have tried to build reusable tools that will be of interest to linguists as well. In this section a (probably incomplete) overview of the most important ones is given (cf. also Art. 168).

Finite-state morphology is a well-developed field which has spun off many useful tools. The Xerox Research Center in Europe (XRCE) has developed tools for morphological analysis in many languages, based on finite-state technology and is also active in research in this area. Evan Antworth of SIL

provides a useful two-level morphology software package called PC-KIMMO. Finite-state tools for inflectional morphological analysis and synthesis of English implemented using widely-available unix utilities are available from the University of Sussex (Minnen et al. 2001).

Also many implementations for DATR have been developed. Dafydd Gibbon provides an implementation called Zdatr, and the developers of DATR (Roger Evans and Gerald Gazdar) maintain a web portal with tutorial information, references, and references to implementations. Simpler application-oriented tools like Porter stemmers are widely available as well.

Many implementations of Machine Learning algorithms are available as well, but are generally not directly usable for linguistic research. Systematic evaluation is only just starting (Maxwell 2002). BOAS is a user-friendly environment for the development of morphological analyzers which makes use of Machine Learning (Oflazer et al. 2001). Interactive demonstrations of the supervised learning approach of van den Bosch & Daelemans (1999) are available as well via the demonstrations section of their website.

## XXI. Morphologie und Nachbardisziplinen

### Morphology and related fields

#### 173. Namenkunde

1. Eigennamen und ihre Funktionen
2. Interne onymische Morphologie
3. Externe onymische Morphologie
4. Zitierte Literatur

##### 1. Eigennamen und ihre Funktionen

**Eigennamen** (auch *Propria*, *Onyme*) werden unter die Substantive subsumiert und erfüllen spezifische referentielle Funktionen. Im Gegensatz zu den **Appellativen** (Gattungsbezeichnungen) wie z. B. *Mensch* oder *Stadt*, die eine ganze Klasse von Gegenständen bezeichnen, referieren Eigennamen prototypischerweise nur auf ein einziges Denotat (Monoreferentialität), z. B. *Goethe* oder *Frankfurt*. Im Falle mehrfacher Referenz werden feste Erweiterungen vorgenommen: Bei Familiennamen kommt der Rufname hinzu (*Fischer* → *Joschka Fischer*), bzw. bei Rufnamen der Familienname, bei Toponymen weitere Spezifikationen (*Frankfurt (am) Main* vs. *Frankfurt (an der) Oder*). Während Appellative ihr semantisches Potential nutzen, um die Referenz zu leisten, kommt Eigennamen in der Regel keine Semantik zu (s. jedoch Christoph 1987).

Diese idealtypische Generalisierung ist bei genauerem Hinsehen einzuschränken: So können Spitznamen durchaus ein motiviertes semantisches Potential besitzen (z. B. *Schlaffi*

für einen wenig dynamischen Menschen), doch müssen sie dies nicht (man kann theoretisch auch jeden anderen Gegenstand *Schlaffi* nennen). In manchen Sprachen wie z. B. dem Deutschen müssen Rufnamen den Sexus des Referenten anzeigen (*Christian* vs. *Christiane/Christine*). Auch sog. Gattungseigennamen (*Teutoburger Wald*, *Goethestraße*) enthalten semantische Strukturen.

Zwar können Eigennamen lexikalische Rest- oder Scheinstrukturen enthalten – was aus ihrer diachronen Abkunft aus Appellativen oder aus volksetymologischen Umformungen resultiert –, doch unterstützen diese keineswegs die Identifikation: Ein Lehrer kann *Fischer* heißen und eine Großstadt *Düsseldorf*. Potentielle semantische Strukturen werden also beim Eigennamen neutralisiert. Doch kann es, gerade bei eher außergewöhnlichen Eigennamen, zu Resemantisierungen kommen, etwa wenn ein Anwalt *Mörder* heißt; doch geschieht dies seltener im umgekehrten Fall, also wenn ein Mörder den gewöhnlichen Namen *Richter* trägt. Auch in Wortspielen, Witzen und der Literatur werden transparente Strukturen (re)motiviert. In der Regel gilt jedoch: Eigennamen individualisieren, Appellative generalisieren und charakterisieren (s. Abb. 173.1).

Der gestrichelte Pfeil deutet den potentiellen Restbestand lexikalisch-semantischer

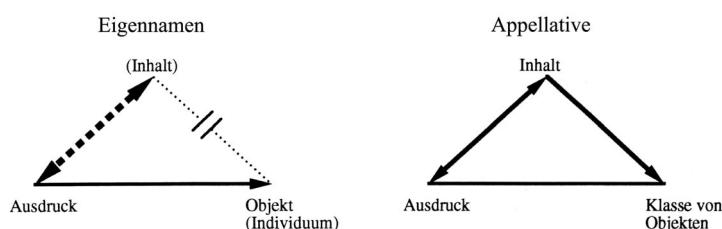

Abb. 173.1: Die unterschiedlichen Referenzleistungen von Eigennamen und Appellativen

Strukturen an, der jedoch unmotiviert bleibt und nicht zur Referenzleistung beiträgt (s. die unterbrochene gepunktete Linie). Die Identifikation des Objekts verläuft direkt vom Ausdruck zum Objekt (Direktreferenz; s. den durchgezogenen Pfeil). Damit können Eigennamen zwar über transparente, doch nicht über motivierte Strukturen verfügen (vom genuinen Gattungseigennamen abgesehen). Eigennamen benennen, identifizieren bzw. etikettieren ein Objekt. Ihre Funktion entfalten sie nicht auf der Basis semantischer Merkmale.

Monoreferenz kann auch mit anderen Mitteln hergestellt werden: Zum einen durch definite Beschreibungen mithilfe appellativischer Ausdrücke (z. B. *Deutschlands größtes Bankenzentrum für Frankfurt*), wobei diese häufig onymische Bestandteile enthalten; zum anderen durch Indikatoren, d. h. Deiktika und Proformen, die jedoch auf einen Ko- bzw. Kontext verweisen und damit einen solchen zur Voraussetzung haben (*diese Stadt hier* für ‘Frankfurt’; *er* für ‘Goethe’) (Werner 1974). Eigennamen haben diesen Verfahren gegenüber den Vorteil der Eindeutigkeit, des kurzen Ausdrucks und der Ko(n)textunabhängigkeit. Daher leisten sich alle Sprachen den “Luxus” von Eigennamen; dabei erhalten nur relevante Objekte einen Namen, in aller Regel Personen, der menschliche Lebensraum und vom Menschen verfertigte Objekte. Gemäß der Beschaffenheit des Denotats unterscheidet man zwischen Anthroponymen (Rufnamen, Familiennamen, Pseudonymen, Spitznamen etc.), Toponymen (Städte-, Straßen-, Flur-, Gewässernamen etc.), Ergonymen (Produktnamen, Bücher-, Filmtitel etc.), Praxonymen (Kriege, Abkommen etc.) und Phänonymen (Wetterhochs und -tiefs, Tai-fune etc.). Dabei nimmt die Prototypik von Eigennamen nach hinten hin ab: Konkrete, distinkte Objekte wie Personen und Örtlichkeiten bilden die Objektgruppe, die am ehesten onymisch realisiert wird. Da man immer wieder mit neuen Personen, Örtlichkeiten etc. in Kontakt kommt, ist man wie bei keiner anderen Wortart lebenslang mit dem Erwerb neuer Einheiten befaßt: Eigennamen bilden kein geschlossenes Inventar. Auch wenn sie in der Regel nicht bzw. nur rudimentär in Wörterbüchern verzeichnet werden, so gehören Eigennamen dem Sprachsystem im Allgemeinen und dem Lexikon im Besonderen an. Auf der anderen Seite gehören Eigennamen zu den Wörtern, die man am ehesten wieder

## XXI. Morphologie und Nachbardisziplinen

vergibt, vor allem dann, wenn man sie nicht häufig gebraucht.

Die Onomastik hat sich wie kaum eine andere linguistische Disziplin bisher in fast ausschließlicher Weise mit diachronen Gesichtspunkten befaßt (Fleischer 1970). In der Regel geht es um Fragen der Etymologie (s. Art. 174), da die meisten Namen appellativischen Ursprungs sind, sich jedoch im Laufe der Zeit zu mehr oder weniger opaken Ausdrücken entwickelt haben. Daß es dabei auch zur Herausbildung interner morphologischer Strukturen kommen kann, ist erst in jüngster Zeit ins Blickfeld geraten. Prinzipiell gilt es, zwei Domänen onymischer Morphologie zu unterscheiden: interne Morphologie, die die Binnenstruktur des Onyms selbst betrifft bzw. die Markierung der Proprialität (s. 2), und externe Morphologie, die die spezifisch onymische Flexion und Wortbildung zum Gegenstand hat, z. B. die Pluralbildung von Eigennamen oder die Bildung von Adjektiven aus Eigennamen (s. 3).

### 2. Interne onymische Morphologie

Da Eigennamen nur Benennungsfunktion haben, sollte erwartbar sein, daß interne Morphologie afunktional ist. Dennoch lassen sich verschiedene morphologische Strukturen erkennen, die nicht nur Relikte einstiger appellativischer Morphologie darstellen. Diese morphologischen Strukturen tragen jedoch nicht dazu bei, das Referenzobjekt zu identifizieren, sondern sie markieren die Proprialität des Wortes, also seinen Eigennamenstatus. Dabei handelt es sich gemäß Dressler (2000) um extragrammatische Morphologie. Die Erfassung interner morphologischer Strukturen ist bisher sowohl von der Onomastik als auch von der Morphologie vernachlässigt worden.

#### 2.1. Der Eigename im Spannungsfeld zwischen Motivierbarkeit, Transparenz und Opakheit

Das “Dilemma” von Eigennamen besteht darin, daß sie zwar eine grundlegend andere Funktion als Appellative ausüben, ihre diachrone Quelle jedoch in aller Regel in der Appellativik besteht. Dies schließt nicht aus, daß es auch Phantasienamen gibt (z. B. Spitznamen, Pseudonyme, Tiernamen) oder arbiträre Zahlen- und/oder Buchstabenkombinationen (z. B. Autokennzeichen, Identitätsnummern), doch ist dies ein wegen seiner ho-

hen kognitiven Kosten realiter selten verwendet. Namentyp: Eine arbiträre und womöglich lange Zahlen- oder Buchstabenfolge stößt schnell an die Grenzen der Memorierbarkeit. Der prototypische Eigenname rekrutiert sich in seiner Entstehungsphase aus motivierter appellativischer Lexik (*Eichstatt*, *Homburg* < (zer) hohen Burg, *Becker*); dabei kann es sich auch um Fremdlexik handeln (*Köln* < lat. *Colonia Agrippinensis* ‘Kolonie des Agrrippa’). Um der Verwechslungsgefahr mit einem Appellativ zu entgehen, sollte der Eigenname idealerweise möglichst weit entfernt vom Appellativ sein. Dem kommen gerade opake Namen wie *Köln*, *Tolsterglope*, *Golodkowski* nahe. Doch haben solche Namen, vor allem wenn sie mit Länge gekoppelt sind, hohe kognitive Kosten: Ein Familienname wie *Becker* ist leichter memorierbar als *Golodkowski*. Ist es ein weitgehend opaker Name, so bildet man Merkhilfen, d. h. man schafft sich sekundär transparente Strukturen.

Weder totale Opakheit noch potentielle Motivierbarkeit können als propria Ideale betrachtet werden. Üblicherweise bewegen sich die Eigennamen zwischen diesen beiden Polen, was sich wie folgt skizzieren läßt:

Man geht davon aus, daß zu germanischer Zeit die zweigliedrigen Rufnamen motiviert waren im Sinne sog. Heilwünsche, z. B. *Theoderich* bzw. *Dietrich* ‘im Volke mächtig’. Dabei herrschten semantisch, morphologisch, syllabisch und euphonisch gesteuerte Abfolgeprinzipien und Restriktionen (Seibicke 1985; Greule 1996). Eine solche motivierte Rufnamenvergabe findet sich heute z. B. in China.

Viele Eigennamen enthalten volltransparente Strukturen, ohne daß Motivierbarkeit, ein sinnvoller Bezug zum Objekt, möglich wäre: Familiennamen wie *Beckenbauer*, *Neumann*, ebenso Städtenamen wie *Mannheim*, *Würzburg* bestehen aus bekannten lexikalischen Bausteinen, ohne damit eine Identifikation des Referenzobjekts vollziehen zu können. Das schwedische Familiennamensystem hat diese Strategie zum Prinzip erhoben: Namentkomposita wie *Sjöberg* ‘Seeberg’, *Sjögren* ‘Seeast’, *Lindström* ‘Lindenstrom’ etc. gehören nicht nur zu den häufigsten Namentypen, sondern sie werden bei dem in Schweden einfachen Familiennamenwechsel sogar explizit empfohlen (Nübling 1997).

Partielle Transparenz besteht, wenn appellativische Bestandteile leichte formale Veränderungen erfahren: *Schmitt/Schmidt/Schmitz*

zu *Schmied*, *Eichstatt* zu *Eiche* und *Stadt/Stätte*. Hierzu gehören auch Abweichungen in der Akzentposition (*Ebersfelde*), Apokopen (*Ulm*), Erweiterungen (*Schilfa*, *Oberhausen*), Abweichungen in der Graphie (<*Duisburg*, *Becker*, *Mueller*>) etc. Solche formal leicht dissozierten und damit noch identifizierbaren Morphe bezeichnet man als Pseudomorphe (Nübling 2000: 130) oder Paläomorphe (Tournier 1985: 87 f.).

Auch Semitransparenz bildet eine vielgenutzte Kompromißlösung zwischen motivierten und opaken Strukturen: Hier ist mindestens ein Glied opak und ein Glied transparent (meist das letzte): *Klinsmann*, *Kullmann* bzw. *Hamburg*, *Homburg* etc.

Vor dem Endstadium totaler Opakheit sind solche Eigennamen anzusiedeln, die noch morphologische Strukturen erkennen lassen, doch deren Einzelmorphe opak sind. So interpretiert man das Toponym *Tolsterglope* als Kompositum (als *Tolster-* + *-glope*), ohne daß der Sprecher einen dieser Teile an bekannte Lexik oder Onymik anschließen könnte.

Eigennamen sind morphologisch erstarrt. Morphologische Operationen, wie sie bei Appellativkomposita möglich sind, sind bei Onymen nicht mehr gegeben, wie etwa Koordinierbarkeit: \**Morgen fahre ich erst nach Ham- und dann nach Homburg*. Das Erstglied solcher zweigliedrigen Komposita steht in der Regel der Appellativik ferner und weist eine höhere morphologische Bandbreite auf, während das Letzтglied eher an die Appellativik anschließt, einem begrenzteren Inventar angehört und eher Rückschlüsse auf den Eigennamentyp zuläßt. Ähnlich wie in der Wortbildung scheint es auch hier das Letzтglied zu sein, das den kategorialen Status markiert. Häufig sind gerade bei deutschen Toponymen Erweiterungen zur Dreigliedrigkeit, wobei dann meist ein transparentes, oft sogar motiviertes Erstglied präponiert wird: *Oberjosbach* – *Niederjosbach*. Prinzipiell scheint im Deutschen die Peripherie eines morphologisch komplexen Toponyms eher der Appellativik nahezustehen, während das Zentrum (-*jos-*) opak ist.

Auf einer Skala von (potentieller) Motivierbarkeit (*Koch*, *Neustadt*) bis hin zu totaler Opakheit (*Stratz*, *Tolsterglope*) sind es diese drei dazwischenliegenden Verfahren der vollen, der partiellen und der Semitransparenz, die am meisten genutzt werden. Hierdurch entgehen die Eigennamen potentieller

Verwechslungsgefahr mit den Appellativen, nutzen jedoch gleichzeitig deren Bekanntheit, was der Memorierbarkeit zugute kommt.

## 2.2. Integration proprialen Materials

Eine häufig genutzte Technik der Eigennamenbildung besteht in der Nutzung bereits bestehender Eigennamen: Toponyme verwenden anderweitiges toponymisches oder anthroponymisches Material; entsprechend nutzen auch Anthroponyme anderes anthroponymisches oder toponymisches Material: *Rhein* → *Rheinhausen, Rheinfelden* etc.; *Ludwig* → *Ludwigsburg, Ludwigshafen*; *Peter* → *Petersen, Peters*; *Hessen* → *Hesse, Hess* etc. (s. 3.2). Bisher wurde noch nicht hinreichend untersucht, in welche Richtung diese onymischen Wander- und Entlehnungsbewegungen verlaufen.

## 2.3. Spezifisch onymische Morphe

Von besonderem Interesse sind **spezifisch onymische** (auch: propriae oder onomastische) **Morphe**. Diese haben keinen synchronen Bezug zur Appellativik. Indem sie ausschließlich Propriätät markieren, erfüllen sie extrem kategoriale Funktionen. Daher werden diese Verfahren der internen Morphologie zugerechnet; allerdings ergeben sich hier Übergänge zur externen onymischen Morphologie (zu den Techniken s. 3.3).

In manchen Sprachen sind Rufnamen produktiv aus Appellativen ableitbar, d. h. sie bilden kein festes Inventar (Onomastikon), aus dem geschöpft wird. Im Kinyarwanda (s. Art. 141), einer Klassensprache, besteht ein Appellativ üblicherweise aus einem Präfix, einem Präfix und einem Stamm, während der Eigename durch die Abwesenheit des Präfixes gekennzeichnet wird: *umuhuungu* bedeutet 'Junge', segmentierbar als *u-mu-huungu*; *Muhuungu* dagegen ist ein Eigenname; ebenso *amabuye* 'Steine' (*a-ma-buye*) vs. *Mabuye* als Eigenname. Eine umgekehrte Markierung findet sich in einer anderen Klassensprache, dem Zulu: Hier erhält der Eigenname ein sekundäres Präfix, *u-*, wobei der anlautende Vokal des ursprünglichen (appellativen) Suffixes schwindet: *intombi* 'Mädchen' vs. *uNtombi* als Eigenname (Kuhn & Serzisko 1982).

Onymische Affixe zeigen nicht nur Propriätät an, sondern sie können auch Auskunft über die Art des Eigennamens und damit – indirekt – des Referenzobjekts erteilen. Die polnischen Familiennamen machen besonders intensiven Gebrauch von onymi-

schen Suffixen: Zu den häufigsten zählen *-ska* (für weibliche Träger) und *-ski* (für männliche Träger), die ursprünglich aus Beinamen von Adligen hervorgingen und deren Besitz anzeigen (z. B. *Tarnów* → *Tarnowska, Tarnowski*). Damit hatten sie ein Toponym als Basis. Später breitete sich dieses Suffix auf Toponyme aus, die die Herkunft (nicht mehr den Besitz) der betreffenden Person bezeichneten, und schließlich entwickelte es sich zum häufigsten aller polnischen Familiennamensuffixe, indem es sich ab dem 16. Jh. auch mit Rufnamen und Appellativen verband, z. B. *Wiśniewski* aus *wiśnia* 'Sauerkirsche' (Szczepaniak 2002).

Auch das Schwedische kultiviert mit *-son* ein Familiennamensuffix, dessen appellative Herkunft zwar noch ersichtlich ist, doch das sich formal davon dissoziiert hat (keine Homophonie mehr mit dem Simplex *son* 'Sohn'). Suffigiertes *-son* in *Gustavsson* bedeutete ursprünglich 'Sohn von' und ist als Onym längst auch auf Frauen beziehbar. Mit dieser Desemantisierung ist es zu einem Indikator für Familiennamen geworden. In jüngster Zeit wird es sogar produktiv gemacht, indem es auch in Verbindung ganz anderer Erstglieder auftreten kann (*Lindson, Balson*).

Das Deutsche liefert gerade bei den Toponymen viele Beispiele für onymische Morphe: Bei Eigennamen auf *-ach, -itz, -a, -ow* [o:], *-wang(en), -holt*, in der Schweiz *-ikon*, kann es sich nur um Siedlungsnamen handeln (allenfalls um sekundäre Familiennamen). Das bekannteste toponymische Suffix dürfte *-ing(en)* sein (*Tübingen, Gundelfingen, Freising*), das sich aus einem Zugehörigkeitssuffix entwickelt hat und ursprünglich mit (männlichen) Rufnamen verband: *Gundolf + -ingen* (> *Gundelfingen*) bedeutete ursprünglich 'die Leute/die Siedlung des Gundolf'.

Daß onymische Suffixe morphologischen Status besitzen, erweist sich bei volksetymologischen Prozessen: *Rellingen* ist eine sekundäre Neubildung aus *in Reinlage, Ording* aus (*in*) *Urden, Heida* und *Wiesa* (aus *Heide, Wiese*) wurden sekundär neugebildet nach Toponymen wie *Vechta* (s. 2.4).

Bei der Entlehnung und Integration von Toponymen aus fremdsprachlichem Material ins Deutsche sind auffällige Strukturbildungen beobachtet worden: Sowohl bei Entlehnungen aus dem (Gallo-) Romanischen am Südwestrand Deutschlands als auch aus dem Slawischen im Osten Deutschlands kommt es zu strukturellen Übereinstimmungen, besonders bzgl. des Letztglieds: So enden viele To-

ponyme trotz unterschiedlicher Etyma auf *-atsch* (z. B. *Fillatsch* im Westen, *Trebatsch* im Osten), *-itsch*, *-an*, *-aun*, *-un* etc. Dies läßt auf eine gewisse “Gestaltung des onymischen Systems des Deutschen” (Eichler 2001:165) schließen. Auffällig ist auch, daß sich viele Ortsnamen trotz ihrer fremdsprachlichen Herkunft in zwei Glieder segmentieren lassen, d.h. daß sekundär pseudomorphologische Strukturen mit meist bekannten onymischen Morphemen entstehen (z. B. *-en* und *-in* wie in *Wilthen* und *Berlin*).

#### 2.4. Sekundäre Herstellung von Transparenz und onymischer Morphologie: Volksetymologie

In ihrer theoretischen Tragweite unterschätzt wurden bisher die gerade im onymischen Bereich ausgesprochen häufig auftretenden Prozesse sog. Volksetymologie. Unzutreffend ist der alternative Terminus der *sekundären Motivierung*. Wenn – meist opake – Eigennamen volksetymologisch umgeformt werden, so entstehen dabei keineswegs adäquatere Beschreibungen des Referenzobjekts, sondern es entstehen nur Strukturen, die an Bekanntes anschließen und – hierin dürfte der Sinn liegen – die Memorierbarkeit erleichtern. Beispiele aus der deutschen Toponymik sind *Hiddensee* < dän. *Hiddens-o*, eigentlich ‘Hiddens-Insel’, *Sauerland* < *Suderland*, *Venusberg* < *Vennsberg*, *Meerholz* < *Mērold* etc., aus der Anthroponymik *Augstein* < *Augustin*, *Wohlrabe* < *Wallraff* etc. (Bach 1953; Leys 1966; Olschansky 1996; Vennemann 1999). In keinem der (beliebig zu vermehrenden) Beispiele entsteht erhöhte referenzsemantische Adäquatheit im Sinne motivierter Strukturen, sondern sie verharren auf der Stufe der formalen Transparenz. Koch (1963) geht so weit, gerade den Mangel an Sinn als bestes Indiz volksetymologischer Umbildung zu bewerten: “Eben das Widersinnige und Ungeheimte eines ON. [Ortsnamens] ist das beste Kennzeichen der Volksetymologie. Deren Wesen muß also woanders liegen als beim Sinngeben oder Sinngebenwollen” (Koch 1963:165). Auch er sieht die Funktion in mnemotechnischer Erleichterung. Zu diesem Komplex besteht noch großer Forschungsbedarf. Stichprobenhafte Untersuchungen zeigen, daß die opake Vorlage meist mehrere Silben umfaßt (was die Anforderungen an die Memorierbarkeit und damit den Bedarf an Herstellung vermehrter Transparenz erhöht), und daß es meist die Silbengrenzen sind, die

die späteren (sekundären) morphologischen Zäsuren vorgeben.

Wie das Beispiel *Venusberg* < *Vennsberg* zeigt, können auch sekundäre onymische Strukturen entstehen. Damit werden sämtliche Verfahren der Markierung von Propriät durch volksetymologische Umformungen produziert. Dies läßt den Schluß zu, daß es sich um funktionale Strukturen handelt.

### 3. Externe onymische Morphologie

Eigennamen können Basis für unterschiedliche morphologische Prozesse sein. Solche Prozesse können (1) Flexionsformen ein und desselben Namens (*Goethe-s* Genitiv Singular) hervorbringen (s. 3.1) oder durch die Wortbildungstechniken der Derivation (Personename *Leverkus* → Ortsname *Leverkus-en*) und Komposition (*Rhein-hausen*) zu (2) Eigennamen einer andern Kategorie (tsch. *Hrabal-ová* movierter Familienname) und (3) Appellativen einer gleichen oder andern Wortart (*Benz-in*, *boykott-ieren*) führen (s. 3.2). Ein Sonderfall von (1) sind onymische Pluraliatantum (*die Azoren*), aus denen kein Singular zurückgebildet werden kann (\**eine Azore*). Lexikalische Techniken der Bedeutungs-Konversion wie bei *Pegnitz* (Flußname → Ortsname) zu (2) oder *Manchester* (Ortsname → Stoffbezeichnung) zu (3) werden ebenfalls berücksichtigt, auch wenn hier keine explizit morphologischen Mittel eingesetzt werden. Für die explizite deonymische Morphologie spielen solche Vorgänge eine Rolle, wenn die zu Appellativen umgedeuteten Eigennamen Basen morphologischer Prozesse sind: Personename *Krösus* → Appellativ *Krösus* ‘reicher Mann’ (Singular) → *Krö-suss-e* (Plural). Ob “Personengruppennamen” wirklich onymisch sind, ist umstritten (s. 1). Der propriale Status von Ethnonymen (*Kamerun-er* ‘Bewohner des Landes *Kamerun*’) ist fragwürdiger als der von Kollektivbezeichnungen für die ‘Mitglieder einer Familie’ ((*die*) *Buddenbrook-s*).

#### 3.1. Flexion

Eigennamen teilen als Unterklasse der Substantive deren grammatische Kategorien. Invariant ist die Person (immer 3.), variant sind Numerus, Kasus und Genus. Plural und oblique Kasus werden in der Regel morphologisch overt symbolisiert. Genus ist inhärentes Merkmal, kann aber ausdrucksseitig z. B. in typischen Endungen reflektiert sein (*Michael-*

*a* ‘feminin’ zu *Michael*; *Claudi-us/Claudi-a* ‘maskulin/feminin’). Morphosyntaktische Auswirkungen haben die namensubstantivischen grammatischen Kategorien insofern, als sie die Deklination ihrer Begleiter bestimmen (*ewig-es Rom*).

Numerus als eine stark semantische Flexionskategorie zum Ausdruck natürlicher Ein- bzw. Mehrzahligkeit (s. Art. 100) kollidiert bei Eigennamen in pluralischer Form mit dem für Propria konstitutiven Faktum der Monoreferentialität. Dennoch bleibt ein Plural wie (*die*) *Mann-s* (zum Familiennamen *Mann*) ebenso Eigename (‘Kollektiv, das von den zu dieser Familie *Mann* gehörenden Personen gebildet wird’) wie ein geographisches Namen-Pluraletantum *die Azor-en*. In Redeweisen wie *die zwei Deutschlands* (BRD, DDR) dagegen handelt es sich um appellativischen Gebrauch.

Im Deutschen kommt Kasus von Eigennamen fast nur in Form des attributiven Genitivs vor (*Goethe-s; Polen-s*). Vom Verb regierte syntaktische Kasus sind anders als etwa im Polnischen (*Golęb-owil-a* Dativ/Akkusativ Singular) archaisch (*Goethe-n* Dativ/Akkusativ Singular). Es gibt die Tendenz, Eigennamen möglichst in ihrer Nennform und dadurch unflektiert zu gebrauchen, d. h. – den Kasus betreffend – den Nominativ auch da stehen zu lassen, wo syntaktisch ein anderer Kasus gefordert wäre: (*in einem Bericht*) *des “Neuer Tag”* statt *des “Neuen Tags”*.

Nicht eindeutig der Kasus- oder Numerusflexion zuzuordnen sind wegen der Homonymie der Suffixe die Bildungen auf *-s* vom Typ *Fischer-s Fritz* ‘Fritz Fischer’. Die Paraphrasen ‘Fritz aus der Familie der *Fischer-s*’ oder umgangssprachlich ‘den *Fischer-s* ihr Fritz’ sprechen für pluralisches *-s*, die syntaktische Konstruktion und die Paraphrase ‘(Vater) *Fischer-s* Sohn Fritz’ dagegen für genitivisches *-s*. Möglicherweise ist aber dieses Suffix bei Eigennamen weder numeralisch noch kasuell, sondern konstituiert eine eigene (Misch-)Kategorie ‘kollektiv-genealogisch’ o. ä., wobei ‘kollektiv’ nur Affinität zu ‘pluralisch’ und ‘genealogisch’ ebenfalls nur Affinität zu ‘genitivisch’ (‘herkunftsmäßig’) aufweist.

Eigennamen mit flexivischer Kennzeichnung weichen gegenüber der Flexion von Appellativen oft ab. Das wird besonders deutlich, wenn es zu Eigennamen homonyme Appellative gibt (von denen jene z. T. herkommen): vgl. proprial/appellativisch *die Mann-s / die Männ-er; die Herz-en-s* (mit phonotaktisch bedingtem *-en-* zwischen den Sibilan-

ten) / *die Herz-en; des Karl Rabe / des Rabe-n*. Zusätzlich fällt die allomorphe Armut der Namenflexive gegenüber den appellativischen Flexiven auf: proprial *die Mann(-s), Rabe(-s), Zahn(-s)* vs. appellativisch *die Männ-er, Rabe-n, Zähn-e*.

Das *s*-Suffix ist hier wie in andern Spezialbereichen des Wortschatzes, wo die formale Identität des Lexems möglichst unangetastet bleiben soll (etwa bei Fremdwörtern), das probate Mittel. Es erhöht die Silbenzahl nicht, führt nicht zu möglichen Hiatusproblemen zwischen Stammauslaut und Suffix, ist nicht mit konkomitanten Änderungen des Basismorphems verbunden (wie etwa *-er* mit Umlaut des Stammvokals bei *Männ-er*) usw. Entsprechenden Appellativen nachgebildete Plurale wie *die Liebermänn-er* sind spielerischer Natur.

Daran, daß pluralische Formen wie *Mann-s (kommen)* oder genitivische Formen wie (*Thomas*) *Mann-s (Werk)* artikellost gebraucht werden können bzw. müssen und bei Artikelgebrauch ein nichtsymbolisierter Plural *die Mann-Ø (kommen)* möglich bzw. ein nichtsymbolisierter Genitiv *des Thomas Mann-Ø* zwingend ist, sieht man, daß im Deutschen bei Phrasen mit Namen ebenso ‘Monoflexion’ (Admoni 1982) anzutreffen ist wie bei Phrasen aus Artikel und Adjektiv (*d-er groß-e* vs. (*ein-Ø*) *groß-er*).

Genus (s. Art. 98) kann ausdrucksseitig mit (Pseudo-)Suffixen korrelieren, die zu bestimmten, vom Genus mitkonstituierten flexivischen Klassen passen, z. B. *Ann-e* ‘feminin’ (vgl. appellativisch *Nicht-e, Kann-e* ‘feminin’; s. 2 zur ‘internen’ onymischen Morphologie). Genus ist ausdrucksseitig auch mit derivativischen Suffixen verbunden, die Genus determinieren wie bei *Lott-chen/Fritz-chen* ‘neutrumb’ (vgl. appellativisch *Töchter-chen/Söhn-chen, Lämp-chen/Stühl-chen* ‘neutrumb’) oder Sexus symbolisieren und mit dem passenden Genus einhergehen wie bei tsch. *Hrabal-ová*, dt. archaisch (*Luise*) *Müller-in*, dt. *Michael-a*, alle ‘feminin’ (s. 3.2 zur ‘externen’ onymischen Wortbildungsmorphologie).

### 3.2. Wortbildung

Eigennamen unterliegen als Basen für Wortbildungsprozesse keinen prinzipiell anderen Beschränkungen als die appellativischen Substantive, d. h. sie können explizit und implizit abgeleitet sowie zu Kompositionen verwendet werden. Die Wortbildungsprodukte können wiederum Eigennamen sein oder Appellative

	Derivation	Konversion	Komposition
Eigennamen	(Hermann) Bayreuth-er Personenname	Bayreuth Eigenname Synonym für die Wagner-Festspiele	Neu-Bayreuth Eigenname Synonym für die Nachkriegs-Festspiele
Appellative	(allelein) Bayreuth-er Einwohnerbezeichnung  Bayreuth-er (Studenten) bayreuth-ische (Lande) Relationsadjektive	(es gibt inzwischen viele) Bayreuth-s 'Festspiele mit Merkmalen, die ursprünglich nur die Bayreuther Festspiele aufwiesen'	Bayreuth-Besucher 'Besucher der Stadt oder der Festspiele'

Tab. 173.1: Der Ortsname *Bayreuth* als Basis für die Bildung von anderen Eigennamen und Appellativen

werden. Beispielbasis für die folgenden deonymischen Bildungen ist der Ortsname *Bayreuth*:

Derivationen von Eigennamen aus Eigennamen dienen u. a. den Zwecken der Movie rung (tsch. *Hrabal-ová*), der Personennamenbildung aus Ortsnamen (*Oppenheim-er*), der Ortsnamenbildung aus Personennamen (*Leverkus-en*), der Namen-Diminution (Kosenname *Ton-i* aus *Anton*; *Änn-chen* aus *Ann-e*). Die derivativen Mittel zur deonymischen Bildung von neuen Eigennamen sind spezifisch proprial bei *Hrabal-ová*, *Ton-i*, *Leverkus-en*, homomorph mit solchen zur Bildung von appellativischen Substantiven bei *Oppenheim-er*, *Änn-chen* (vgl. *Städt-er*, *Töchterchen*). Derivierte Eigennamen können zu Appellativen konvertiert werden (*Hein-i* 'Klein Heinrich' → 'Mensch mit seltsamem Ver halten').

Ziel der meisten deonymischen Derivationen (s. Art. 89) sind Appellative. Eine große Gruppe machen hier die Einwohnerbezeichnungen aus. Im paradigmatischen Verhältnis der Ableitungen zu ihrer toponymischen Basis lässt sich auch deren mögliche morphologische Binnengliederung erkennen.

- |                  |                         |
|------------------|-------------------------|
| (1) Ortsname     | → Einwohnerbezeichnung  |
| <i>Bayreuth</i>  | → <i>Bayreuth-er</i>    |
| <i>Veron-a</i>   | → <i>Veron-es-e</i>     |
| <i>Damask-us</i> | → <i>Damasz-en-e(r)</i> |
| Ländername       | → Einwohnerbezeichnung  |
| <i>Schweiz</i>   | → <i>Schweiz-er</i>     |
| <i>Israel</i>    | → <i>Israel-i(-s)</i>   |
| <i>Chin-a</i>    | → <i>Chin-es-e(-n)</i>  |
| <i>Marokk-o</i>  | → <i>Marokk-an-er</i>   |

Einwohnerbezeichnungen müssen nicht de (top)onymisch gebildet sein. Sie können auch

primär vorliegen und ihrerseits Basis für die Ableitung von Orts- und Ländernamen sein: Einwohnerbezeichnung [*bei den*] *Franke-n* (Dativ Plural) → Orts-/Ländername *Frank-en* (vgl. auch den Typ [*der*] *Grieche-n Land* → *Griechen-land*). Die hier angezeigten Ableitungsrichtungen entsprechen der diachronischen Entwicklung, sind aber auch synchronisch gerechtfertigt, wenn man die längere Form als Wortbildungsprodukt annimmt, die kürzere als Wortbildungsbasis. Eine rein auf Proportionalanalogie begründete Morphologie sieht aber auch synchronisch rückbildungende deonymische Ableitungen kürzerer Ethnonyme aus längeren Ländernamen vor:

- |                         |                      |
|-------------------------|----------------------|
| (2) <i>Afghan-istan</i> | : <i>Afghan-en</i> = |
| <i>Usbek-istan</i>      | : x                  |
|                         | x = <i>Usbek-en</i>  |
| <i>Finn-land</i>        | : <i>Finn-en</i> =   |
| <i>Lett-land</i>        | : x                  |
|                         | x = <i>Lett-en</i>   |

Eine große, kaum blockierte Gruppe deonymisch abgeleiteter Appellative sind die einwohnerbezeichnenden Substantive (*Bayreuth-er* Singular/Plural, *Chin-es-e(n)*) und die aus den Ländernamen abgeleiteten Adjektive (*Bayreuth-er/bayreuth-isch, chin-es-isch*). Die Beziehung zwischen adjektivischem und (letztem) ethnonymschem Suffix ist hochgradig regulär (-er, -e, -i, wird durch -isch ersetzt vice versa): s. zu obigen Einwohnerbezeichnungen die Adjektive *bayreuth-isch, veron-es-isch, damasz-en-isch, chin-es-isch, marokk-an-isch, israel-isch* (*schweiz-er-isch* ist eine der wenigen Ausnahmen). Die Basen für die Ableitung der Bewohnerbezeichnungen und der Adjektive aus Toponymen sind also in der Regel identisch und können intern noch ein-

mal aus toponymischem Stamm und einer Endung bestehen: Der intern strukturierte Derivationsstamm *chin-es* (zu *Chin-a*) ist Basis für *Chin-es-e* und *chin-es-isch* (Fuhrhop 1998: 141 ff.). Allomorphie des toponymischen Stamms kommt vor (*Damask-* vs. *damasz-*).

Eine andere Gruppe von deonymischen Derivaten bilden aus Personennamen abgeleitete appellativische Substantive wie *Benz-in* (zu *Benz*) oder Verben wie *mendel-n* (auf Basis der Grundform *Mendel*), *röntg-en* (auf Basis des Stamms *Röntg* von *Röntg-en*). Detponymisch ist etwa *finnland-is-ier-en*.

Konversionen (s. Art. 90) aus Eigennamen können intra-onymisch vor sich gehen, so wenn aus Personennamen Firmen- und Markennamen gebildet werden (*Ford*®), aus Ortsnamen Vereinsnamen (*Liverpool*), aus Flussnamen Ortsnamen (*Pegnitz*), und sie können zu Appellativen werden wie der Markenname *Uhu*® für ‘Flüssigklebstoff’. Oft ist schwer zu entscheiden, ob ein Name direkt konvertiert wurde oder das Ergebnis einer Rückbildung aus Komposita mit diesem Namen ist: *Diesel* für (und aus?) appellativisch *Diesel-motor*, *Diesel-kraftstoff*.

Auch Komposition (s. Art. 87) unter Beteiligung von Eigennamen kann entweder neue Eigennamen hervorbringen oder Appellative. Beispiele für Komposita aus mehreren Namen sind kopulative Bildungen wie *Leuthäuser-Schnarrenberger* (Familienname + Familienname), *Castrop-Rauxel* (Ortsname + Ortsname), *Frankenpfalz* (Ländername + Ländername; oberfränkisch-oberpfälzisches Grenzgebiet) und determinative Bildungen wie *Karl-Rüdiger* (in einer Reihe mit *Wolf-/Heinz-Rüdiger* usw.) zur progressiven Differenzierung von *Rüdiger* oder wie *Müller-Lüdenscheid* (Personenname + Ortsname) oder *Baden-Baden* (Ortsname + Ländername) zur regressiven Differenzierung der vielen Personen namens *Müller* bzw. mehrerer Orte namens *Baden*. Beispiele für Komposition unter Beteiligung von Appellativen sind determinative Bildungen wie *Ober-/Unterammergau* (Adjektiv + Ortsname → Ortsname), *Klein-hans* (Adjektiv + Familienname → Familienname), *Karl-s-ruhe* (Personenname + Fuge + Substantiv → Ortsname) zur progressiven Differenzierung eines Eigennamens (*Klein-hans*) bzw. eines Appellativen durch einen Eigennamen (*Karl-s-ruhe*) oder Bildungen wie *Davos-Dorf*, *Davos-Platz* zur regressiven Differenzierung. Aus ursprünglich regressiv-determinierend erscheinenden Reihenbildungen

wie *Hans-dieter*, *Hans-veit*, *Hans-jürgen* entwickelt sich eine Art Halbpräfix *Hans-*. Dreigliedrige weibliche Familiennamenkomposita wie *Greiner-Petter-Memm* sind kopulativ aus den unmittelbaren Konstituenten *Greiner-Petter* und *Memm* aufgebaut, wobei *Greiner-Petter* selber eine Struktur aufweist, in der *Petter* den im Thüringischen häufigen Familiennamen *Greiner* regressiv determiniert. Beispiele für Komposition unter Eigennamenbeteiligung, die Appellative hervorbringt, sind etwa *Otto-Motor* mit der Struktur Personename + Substantiv oder *Grüß-August* mit der Struktur Verb + Personename, wobei *August* schon vorher zum Appellativ konvertiert gewesen sein kann (Vorname → ‘unbeholfener Mensch’).

### 3.3. Morphologische Typen deonymischer Prozesse

Im Prinzip unterscheiden sich deonymische Prozesse morphologisch nicht von deappellativischen. Hier wie dort sind davon die Stammposition (*Mailand/Mailänd-er* wie *Land/Länd-er*) und die Suffixposition betroffen, an der es additive, modulatorische und – mit den selben Einschränkungen wie in der appellativischen Morphologie – subtraktive Prozesse gibt.

Was den Sprachbau betrifft, sind die additiven und subtraktiven Prozesse dem agglutinierenden Typ und dem Grundform-Prinzip zuzuordnen, die modulatorischen dem alternierenden Typ und dem Stamm-Prinzip (Harnisch 2001). Die in Tab. 173.2 zusammengestellten Prozesse operieren mit morphologischen Einheiten, wenn auch z. B. das *Jo-* von *Joseph* allenfalls sekundär morphologisch interpretiert sein kann: s. die scherhaft proportionanalalogische Reihe *Sepp/Jo-seph*, *Hansl/Jo-hann*, *Kurt/x*; *x* = *Jo-kurt*. Bei *-seph/Sepp* oder *Urs-/Usch-* (über *Ursch* mit Sibilantenassimilation) liegt Stammallomorphie vor.

Andere Prozesse an Eigennamen operieren mit rein lautlichen Mitteln. Die lautliche Entstellung der Urformen von Eigennamen ist ein automatischer Prozeß, der mit den semantischen Besonderheiten und den besonderen Gebrauchsbedingungen der Eigennamen zu tun hat (s. 1). Motiviert dagegen sind lautliche Manipulationen an Eigennamen, wie sie v. a. bei der Herstellung von Koseformen zu Personennamen vorgenommen werden. Neben den Vorteil, den gekürzte Formen bei häufigem Gebrauch im kommunikativen Nahbereich haben, tritt das Prinzip der laut-

additiv	modulatorisch	subtraktiv
<i>Hans</i>	<i>Ägypt-en</i>	<i>Mark-us</i>
<i>Hans-i</i>	<i>Ägypt-er</i>	<i>Marc</i>
additiv-modulatorisch	additiv-subtraktiv	modulatorisch-subtraktiv
<i>Chin-a</i>	<i>Jo-seph</i>	<i>Urs-ul-a</i>
<i>Chin-es-e</i>	<i>Sepp-i</i>	<i>Usch-i</i>

Tab. 173.2: Suffixmorphologische Prozeßtypologie

lichen Verringerung als Ikon der semantischen Verniedlichung. Das hindert nicht, daß morphologische Substanz, die von der Lautsymbolik her geeignet ist, ‘Kleinheit’ anzudeuten, wie das *-i*, wieder hinzutritt: *Joseph* → *Sepp* → *Sepp-i*. Ideale Grundeinheit rein langer Verkürzungen ohne Rücksicht auf eine eventuell vorliegende interne morphologische Struktur sind offene Silben, die entweder ohnehin vorliegen wie bei *Fe.li.ci.tas* → *Fe.li* (Silbentilgung), *Lie.se.lo.tte* → *Li.lo* (Wahl auseinanderliegender betonter Silben), *E.li.sa.beth* → *Li.li* (Reduplikation) oder erst hergestellt werden wie bei *Hans-Joachim* → \**Hansjo* → *Hajo*). Offensichtlich werden Zweisilbler mit vokalischem Auslaut angestrebt, s. auch *Fe.li.ci.tas* → *Zi.ta*, wo das *s* lautlich und nicht als \*-s-Suffix getilgt wird. Wo ein typischer Namenausgang durch die Kürzung nicht schon angeboten wird wie bei *Rü.di.ger* → *Rü.di*, wird er hergestellt: *Ru.dolf* → *Ru.di*.

Diese vokalischen Wortausgänge werden dann morphologisch reanalyisiert und sekundär motiviert (s. 2.4), hier als typisch weibliches Vornamenssuffix *-a* (*Zita* → *Zit-a* wie *Paul-a* zu *Paul*), als typisch diminuierendes Kosesuffix *-i* (*Feli/Rudi* → *Fel-i/Rud-i* wie *Hans-i* zu *Hans*), als untypisch weibliches oder typisch männliches, aber immer reihenbildendes Suffix *-o* (*Lilo* → *Lil-o* in der Reihe [*Ca.ro.lin* →] *Caro* → *Car-o* usw.; *Hajo* → *Haj-o* in der Reihe *Brun-o*, *Ud-o*, usw.). Daß solche (pseudo)suffixischen Muster wahrgenommen werden, zeigen Namenmoden wie die gleichzeitige Beliebtheit von Namen auf *-ian* (*Christ-ian*, *Sebast-ian*, *Flor-ian* usw.).

## 174. Etymologie

1. Was ist Etymologie?
2. Etymologie und Wortbildungslehre
3. Etymologie und Wortgeschichte
4. Die Wortprägung
5. Theoretische Voraussetzungen
6. Erschließungsmethoden
7. Zitierte Literatur

### 1. Was ist Etymologie?

Die Etymologie ist der Teil der Sprachwissenschaft, in dem Entstehung (und Geschichte) der Wörter einer Sprache untersucht werden. Im strengen Sinn beschreibt die Etymologie nur die **Entstehung der Wörter**; doch verlangt eine verwertbare Beschreibung der Entstehung eine Ergänzung durch die Behandlung der darauffolgenden **Wortgeschichte** mindestens in dem Umfang, in dem der Zugang zu der Bildung des Wortes von der betrachteten Sprachstufe aus beeinträchtigt wird. Soll also etwa die Etymologie des neuhighdeutschen Wortes *Kiefer* (= Nadelbaum) beschrieben werden, so ist einerseits auf die Bildung des althochdeutschen Wortes *kien-foraha* einzugehen: Es ist ein Kompositum aus *foraha*

'Föhre' und *kien* 'Kienspan' ('die Föhre, aus der Kienspäne vor allem als Beleuchtungsmittel gewonnen werden'); dann müssen aber, um diese Erklärung der Bildung mit dem heutigen Wort zu verbinden, die besondere Lautentwicklung, die morphologische Verdunkelung und die Veränderung von der Benennung einer besonderen Art Föhre zu einem undurchsichtigen Pflanzennamen beschrieben werden, also die Wortgeschichte (oder zumindest ein Teil von ihr). In einem solchen Fall wird das Material zur Beurteilung der Etymologie, die **Vorform**, aus der Überlieferung der betreffenden Sprache selbst gewonnen, in anderen Fällen wird die Beurteilungsgrundlage durch den Vergleich von Wörtern gleichen Ursprungs in verwandten Sprachen (im Rahmen einer **Wortgleichung**) erst erschlossen. Während sich die traditionelle etymologische Wissenschaft fast ausschließlich um die Wortentstehung gekümmert hat, wurde vor allem in der romanistischen Etymologie nicht ohne Grund die Wichtigkeit der Geschichte des Wortes betont; denn die tiefgreifenden Entwicklungen der französischen Sprache lassen bei früh ent-

standenen Wörtern eine bloße Herkunfts-Etymologie in der Tat als unbefriedigend erscheinen. Der Gegensatz zwischen den beiden Interessenschwerpunkten wurde dabei schlagwortartig ausgedrückt durch **étyologie-origine** und **étyologie-histoire du mot** (Baldinger 1959 [1977: 219]). Diese Umorientierung führte in der romanistischen Sprachwissenschaft dazu, daß nun umgekehrt die Wortentstehung vernachlässigt wurde (indem z. B. bei Erbwörtern mit lateinischer Vorform das französische Wort lediglich bis zu dieser zurückgeführt wurde und die Erklärung der Entstehung der lateinischen Etymologie überlassen blieb). Eine befriedigende Etymologie wird aber (in der oben geschilderten Weise) immer beide Aspekte miteinander verbinden müssen. Dabei ist jedoch zu berücksichtigen, daß zur Erklärung der Entstehung (also der Wortbildung) das Quellenmaterial ergiebig genug sein muß. Deshalb hat z. B. Kluge (1911 [1977: 106]) bloßen Wortgleichungen, die die Erschließung der Bildung nicht erlauben (weil keine Basis erkennbar ist), einen „etymologischen Gehalt“ abgesprochen, sie also von der Etymologie im engeren Sinn ausgeschieden, selbst wenn die Zahl der an der Gleichung beteiligten Sprachen ein hohes Alter des betreffenden Wortes sichert. Es ist jedoch zweckmäßiger, auch in solchen Fällen von einer Etymologie zu sprechen, dabei aber zu vermerken, daß der Bildungsvorgang nicht erschlossen werden kann. In den neuesten Auflagen des etymologischen Wörterbuchs von Kluge (231995) wird dies mit dem Vermerk *Herkunft dunkel* getan. Allerdings können die Wörter einer Sprache auch auf andere Weise als durch Wortbildung entstehen. Solche Möglichkeiten, die für eine Behandlung im Rahmen der Morphologie nicht einschlägig sind, sind die Entlehnung, die Urschöpfung (z. B. Lautnachahmung), die Bedeutungs-Übertragung und -Verschiebung, das Erstarren syntaktischer Fügungen und die Wortkürzung. In der Regel wird auch die Entstehung unselbstständiger Morpheme (etwa der Suffixe) der Etymologie zugerechnet, doch könnte dieser Bereich zweckmäßiger in einer historischen Wortbildungslehre (und einer historischen Flexionslehre) behandelt werden.

## 2. Etymologie und Wortbildungslehre

Damit berührt sich ein Teil der Etymologie (nämlich die Etymologie derjenigen Wörter, die als in der betreffenden Sprache oder einer

Vorstufe zu ihr gebildet erwiesen werden können) sehr eng mit der Wortbildungslehre (der verschiedenen Stadien dieser Sprache). Eine naheliegende, aber nicht ganz richtige Abgrenzung weist dabei die Etymologie der historischen, die Wortbildungslehre der synchronisch beschreibenden Sprachwissenschaft zu. Dieser Standpunkt verkennt, daß die Etymologie einen wichtigen synchronischen Aspekt in sich schließt, nämlich die Frage, wie die Sprecher einer Sprache neue Benennungen finden, und welche Möglichkeiten sie dabei auswählen. Zur Beantwortung dieser Frage bietet die Wortbildungslehre die allgemeinen Muster, die zur Gewinnung eines neuen Wortes herangezogen werden können (und dieser Aspekt ist zugleich auch ein etymologischer); doch sucht die Etymologie darüber hinaus die nicht nur mit dem Bildungstyp, sondern auch mit dem speziellen Wort verbundenen Fragen zu klären: die des Benennungsmotivs (s. 4.), die der Abgrenzung im Wortfeld oder gegenüber sonstigen Konkurrenten, die der Auswahl aus verschiedenen Bildungsmöglichkeiten und ähnlichem. Die Wortbildungslehre hebt das an dem Bildungsvorgang Typische heraus und erfaßt auf der semantischen Seite in der Regel nur die **systematische Bedeutung** (die durch die Bedeutung der Elemente und die Funktion der Bildungsregeln voll erschließbar ist). Die Etymologie hebt vor allem auf der Bedeutungsseite heraus, wie mit Hilfe dieser systematischen Bildung ein Zugriff auf das mit dem Wort speziell Gemeinte möglich ist. Deshalb ist es durchaus sinnvoll, nach der Etymologie eines ganz neuen Wortes zu fragen, z. B. nach der Etymologie von *Freischwinger* (womit Stühle bezeichnet werden, bei denen Sitzfläche und Lehne auf einem elastischen Gestell ruhen, weshalb sie schwingen können). In vielen Fällen ist nämlich auch bei neuen Wörtern die Etymologie nicht klar (während die Wortbildung je nach der Stellung, die man der Semantik in ihrem Rahmen einräumt, gegebenenfalls als eindeutig aufgefaßt werden kann). Solche Wörter sind etwa *Geisterfahrer* oder *Radler(maß)*. So gesehen beschreibt die Etymologie synchronisch den Vorgang der Wortentstehung, zumindest bei den Wörtern, die gebildet werden, um etwas Bestimmtes zu bezeichnen (die **Wortprägungen**); voll systematisch gebildete und verwendete Wörter, wie etwa Abstrakta zu Verben und Adjektiven, sind an sich kein Gegenstand der Etymologie; ihre Bildung wird durch die Wortbildungslehre voll erklärt. Sie

können allerdings im Gebrauch Besonderheiten annehmen, die zu Lexikalisierungen führen (**Entfaltung** nach Seibold 1981: 56 f.); für diesen Vorgang ist dann wieder die Etymologie zuständig. Da auch die Prägung von Wörtern nicht notwendigerweise zum normalen Sprachgebrauch gehört und die meisten Sprecher neue Wörter als bereits gebildete vorfinden, sind für sie die Bildungsvorgänge auch ‘Geschichte’, deshalb ist von der Einstellung der Sprecher her gesehen die Einordnung der Etymologie in die historische Sprachwissenschaft gerechtfertigt.

### 3. Etymologie und Wortgeschichte

Von der Etymologie zu verlangen ist, wie ausgeführt, so viel von der Wortgeschichte, daß Form und Bedeutung des Wortes zum Zeitpunkt der Bildung mit seiner Form und Bedeutung in der zu untersuchenden Sprache eindeutig in Zusammenhang gebracht werden können. Im Rahmen einer Wortgeschichte kann natürlich noch viel mehr relevant sein, etwa das Auftreten und die Verwendung des Wortes in bestimmten literarischen Bereichen, seine Häufigkeit, die Herausbildung bestimmter syntaktischer Verwendungen usw. Es ist also durchaus möglich, eine von der Etymologie unterscheidbare Wortgeschichte als Bestandteil der historischen Sprachwissenschaft zu betreiben. Allerdings sind von diesen wortgeschichtlichen Feststellungen die meisten in irgendeiner Weise auch für die Etymologie und ganz besonders für die Erschließung der Etymologie relevant, so daß es unzweckmäßig wäre, in zwei verschiedenen Bereichen der historischen Sprachwissenschaft fast das gleiche zu tun. In der Regel wird deshalb zwischen Wortgeschichte und Etymologie kein systematischer Unterschied gemacht. Mit dem Aspekt ‘Wortgeschichte’ gehört die Etymologie selbstverständlich voll in die historische Sprachwissenschaft.

### 4. Die Wortprägung

Sucht ein Sprecher einer Sprache eine Benennung für eine neue Sache (oder eine neue Benennung für eine bereits benannte Sache), so hat er bereits zwei Vorgaben für den Bildungsvorgang: Er sucht erstens ein Wort, also eine Benennung für eine Klasse ähnlicher Gegenstände (Vorgänge, Eigenschaften usw.), nicht einen Eigennamen (für etwas Individuelles), nicht eine Typenbezeichnung

(die Austauschbarkeit der bezeichneten Einheiten voraussetzt) und nicht einen Fach-Terminus (der nur strikt nach Definition verwendet werden darf). Zweitens hat der Sprecher den ungefähren Bedeutungsumfang vorgegeben: Er will etwas Bestimmtes benennen. Das heißt nicht, daß die Bedeutung bereits festliegt – sie wird erst durch den Gebrauch (durch die Abgrenzung vom Gebrauch teilweise konkurrierender Wörter) im einzelnen bestimmt; aber eine ungefähre Vorgabe (sei es in Form von Prototypen oder in Form von Klassen) ist vorauszusetzen. Dieser Bedeutungsumfang wird nun bei der hier zu betrachtenden Art der Wortgewinnung erfaßt durch eine Wortbildung, die als solche zunächst eine systematische Bedeutung hat. Diese systematische Bedeutung kann den geplanten Bedeutungsumfang mehr oder weniger deutlich wiedergeben: In einem Fall wie *Holzstuhl* fallen beide mehr oder weniger zusammen: Ein *Holzstuhl* ist ein Stuhl aus Holz, und jeder Stuhl aus Holz kann *Holzstuhl* genannt werden. Bei *Freischwinger* dagegen ist lediglich eine charakteristische Eigenschaft genannt: daß er schwingt, wenn man sich hineinsetzt (und es ist durchaus nicht gesagt, daß nach der Absicht des Wortbildners jeder Stuhl, der schwingt, wenn man sich hineinsetzt, *Freischwinger* genannt werden soll, und schon gar nicht ist alles, was frei schwingt, z. B. ein Pendel oder eine Schaukel, ein *Freischwinger*; nur ein Stuhl, der frei schwingt, wird so genannt). Dieses zur Benennung herangezogene Merkmal ist das **Benennungsmotiv** (weniger genau sagt man auch **Bezeichnungsmotiv**). Natürlich hat auch *Holzstuhl* ein Benennungsmotiv (‘besteht aus Holz’), doch ist diese Feststellung hier trivial. Das Benennungsmotiv muß durch die systematische Bedeutung erfaßt werden, und dafür gibt es meist verschiedene Möglichkeiten. Bei *Säugetier* oder *Säuger* (als Benennung einer Tierklasse) ist das Benennungsmotiv ‘säugt seine Jungen’; das wird im Deutschen durch den Rückgriff auf das Verb *säugen* erfaßt, im Französischen und Englischen durch die Erwähnung der Zitzen (lat.  *mammae*, deshalb frz. *mammifère*, engl. *mammal*), im Russischen durch die Feststellung der Ernährung der Jungen mit Milch (russ. *mlekopitajuščee*) – das Benennungsmotiv ist gleich, die **Benennungsmittel** sind verschieden. Bei der Erschließung des Benennungsmotivs sind nun zumindest bei neueren Wörter (wie *Geisterfahrer*) die Benennungsmittel ohne weiteres zu erkennen (*Geister* + *Fahrer*), während die

Präzisierung des Benennungsmotivs häufig Kenntnis der benannten Sache wie auch einen Zugriff durch historische Belege erfordert. Was die Kenntnis der bezeichneten Sache anbelangt, so wird bei der Wortprägung in der Regel nach dem auffälligsten oder am charakteristischsten erscheinenden Merkmal benannt, wobei vor allem die Gebrauchsmöglichkeit eine große Rolle spielt (die Preiselbeere z. B. wird regional als *Steinbeere* bezeichnet, weil sie als Heilmittel gegen Steinleiden (Gallensteine, Nierensteine) galt; ohne Kenntnis dieses Sachverhalts ist das Benennungsmotiv nicht erschließbar). Das bedeutet gleichzeitig, daß das Erfassen des Benennungsmotivs beim Erwerb des Wortes zugleich etwas über die bezeichnete Sache verrät, und das ist einer der Gründe des starken Interesses auch von Nicht-Sprachwissenschaftlern an der Etymologie.

Während sich nun der Gebrauch des Wortes nach den notwendigen Abgrenzungen auf den ursprünglich vorgegebenen Bedeutungs-umfang einpendelt (**Gebrauchsbedeutung**), hat die systematische Bedeutung der Bildung (**Bildungsbedeutung**) beim Gebrauch an sich keine Funktion mehr; sie kann vernachlässigt werden (obwohl das die Sprecher in der Regel nicht tun) und wird bei zunehmender Lexikalisierung des Wortes mehr oder weniger undurchsichtig (die Bildungsbedeutung und damit das Benennungsmotiv etwa von *Junggeselle* ist einem nicht historisch geschulten Sprecher des Deutschen nicht mehr zugänglich; s. Art. 150). Solange sie den Sprechern noch durchschaubar ist, kann sie aber den Gebrauch steuern. Im Normalfall ist diese Steuerung (**Verdeutlichung** nach Seibold 1981: 223–230) nicht zu erkennen, weil sie naheliegende Folgen hat; erkennbar wird sie erst, wenn die Steuerung infolge falscher Anschlüsse durch die Sprecher einen Verlauf nimmt, der durch die Herkunft des Wortes nicht gerechtfertigt ist. Dies ist besonders häufig beim falschen Anschluß von Fremdwörtern der Fall (z. B. *irritieren*, ursprünglich ‘reizen, erregen’, durch falschen Anschluß an *irre* in Richtung auf ‘unsicher machen, beunruhigen, irre machen’ gesteuert). Das Aktivieren der Bildungsbedeutung bei den Sprechern (das für den normalen Sprachgebrauch nicht notwendig ist) kann eine Reihe von Funktionen haben: Es erleichtert das Verständnis des Wortes, unterstützt die Organisation des Wortschatzes beim einzelnen Sprecher, hält aktive Muster für weitere Wortbildungen bereit, ermöglicht Wortspiele usw. Die Verfüg-

barkeit über die Bildungsbedeutung wird häufig “Motivation/Motivierung/Motiviertheit” (s. Art. 150) oder auch “Durchsichtigkeit” genannt, doch sind diese Begriffe nicht sehr präzise gefaßt: Sie beziehen sich in erster Linie darauf, wie nahe die Bedeutung eines Wortes der vorauszusetzenden systematischen Bedeutung steht, wobei aber nicht unterschieden wird, ob die Zurückdrängung der systematischen Bedeutung auf nachträglicher Lexikalisierung oder auf einem schwer oder gar nicht erkennbaren Benennungsmotiv beruht.

## 5. Theoretische Voraussetzungen

Auf die für die synchronische oder diachronische Betrachtung von Sprache allgemein vorauszusetzenden Theorien soll hier nicht eingegangen werden, doch ist eine für die Etymologie speziell wichtige Konzeption besonders zu erwähnen: Die etymologische Untersuchung geht immer von einem Wort einer bestimmten Sprache aus, das etymologisiert werden soll; und im Falle eines nach Wortbildungsregeln gebildeten Wortes ist das Ergebnis der Untersuchung ein Bildungsvorgang, der unter Umständen zeitlich sehr weit zurückliegt, und dessen unmittelbares Ergebnis unter Umständen sowohl lautlich wie auch semantisch von dem Wort der zu untersuchenden Sprache stark verschieden sein kann. Unter diesen Umständen ist es die Frage, ob das Wort der zu untersuchenden Sprache und die gefundene oder erschlossene Bildung der früheren Sprachstufe als das gleiche Wort aufgefaßt werden können (genauer: ob und inwieweit das Wort der späteren Sprache als Nachfolger des Wortes der früheren Sprache aufgefaßt werden kann). Von den Erfordernissen der Etymologie her gesehen können zwei Wörter dann miteinander identifiziert werden, wenn ihre jeweilige Überlieferung auf denselben Bildungsvorgang oder dieselbe Lexikalisierung einer ursprünglich systematischen Bildung zurückführt (**Herkunftsgleichheit**). Eine gewisse Beeinträchtigung der Gleichheit, die aber durch die Beschreibung ausgeglichen werden kann, besteht bei Bedeutungs-Übertragungen und -Verschiebungen, bei Beeinflussungen durch andere Wörter (**Attraktion**) und ähnlichem. Keine Gleichheit im etymologischen Sinn können dagegen parallele Bildungen zu verschiedenen Zeiten und/oder an verschiedenen Orten beanspruchen, selbst wenn sie das glei-

che Sprachmaterial auf gleiche Weise verwenden (**materielle Gleichheit**). Andernfalls würde materielle Gleichheit von Wörtern in verwandten Sprachen eine Rekonstruktion in der gemeinsamen Grundsprache erfordern, was in solchen Fällen zu Ungereimtheiten führt. Dieselbe Schwierigkeit liegt vor, wenn in der Überlieferung dieser Wörter Entlehnungen (s. Art. 152) aufgetreten sind (**Verbreitungsgleichheit**). So haben etwa die nordgermanischen Sprachen materiell gleiche Wörter für die Briefmarke (dän. *frimærke*, schwed. *frimärke*, norw. *frimerke*, isl. *fímerki*), die selbstverständlich auf sekundärer Verbreitung beruhen und nicht die Erschließung eines urnordischen \**frija-mark-ja-* (*n*) ‘Briefmarke’ erlauben, denn Briefmarken gibt es auch in den nordischen Ländern erst seit der Mitte des 19. Jahrhunderts. Ein anderer Fall, bei dem die oberflächliche Gleichheit bei der Etymologie aufzugeben ist, ist die **Homonymie**, besonders wenn eine zusätzliche **Attraktion** der Bedeutungen eingetreten ist. So ist etwa das Wort *Spieß* in der Bedeutung ‘Jagdspieß’ etymologisch ein anderes Wort als in der Bedeutung ‘Bratspieß’ (mhd. *spiez* und *spiz*). Ähnlichkeit in Form und Bedeutung, die für den Sprachgebrauch durchaus eine Identifizierung als gleiches Wort zulassen (**Gebrauchsgleichheit**), sind für die Etymologie erst auf ihre historische Haltbarkeit hin zu prüfen. Selbstverständlich ist die Bestimmung als herkunftsgleich oder materiell gleich nicht (oder zumindest nicht immer) unmittelbar aus dem Befund ablesbar, sondern Ergebnis der etymologischen Analyse. (Ausführlicher zu solchen Fragen: Seibold 1981: 26–35).

## 6. Erschließungsmethoden

Für die Erschließung und Beschreibung der Etymologie sind im Prinzip dieselben Methoden verwendbar wie für die Wortbildungsslehre, die (Wort-) Semantik, die Lautgeschichte, die Morphologie-Geschichte usw., sofern den besonderen Erfordernissen der Etymologie (Benennungsmotive usw.) entsprochen wird. Besonderheiten ergeben sich, wenn für das betreffende Wort eine Basis nicht oder nicht unmittelbar erschlossen werden kann. Terminologisch wäre die Möglichkeit der Erschließung einer Basis als **Anschluß** zu bezeichnen. Liegen verwandte Wörter vor, die auf eine entsprechende Basis zurückführbar sind, die Basis selbst aber nicht, so ist

dies eine (etymologische) **Verknüpfung** (man spricht auch von **Wurzeletymologie**, doch ist dieser Ausdruck mehrdeutig und etwas irreführend). Am ungünstigsten ist die Beleghlage, wenn nur Wörter der gleichen Struktur verglichen werden können, aber weder eine Basis noch aus der gleichen Basis gebildete andersartige Wörter vorliegen (**reine Wortgleichung**). In diesem Fall sind in morphologisch einigermaßen durchschaubaren Fällen etymologische Hypothesen möglich, die aber in der Regel nicht ausreichend zu sichern sind (eine Sicherung wäre z. B. durch gewichtige Parallelen möglich).

Eine Bemerkung ist noch am Platz zu der Analyse in [Wurzel + Affixe] gegenüber der Analyse in [Basis gegenüber Bildung]. In den modernen Sprachen ist es angemessen, bei der Bildung eines Wortes seine Basis, sein Grundwort, aufzuweisen und dann den Bildungsvorgang zu beschreiben. In der älteren Etymologie wurde statt dessen vielfach mit dem Konzept der **Wurzel** operiert, d. h. einem abstrakten Morphem, das allen Bildungen der betreffenden Wortfamilie gemeinsam ist und eine entsprechend abstrakte Bedeutung hat. An diese Wurzel konnten **Primärsuffixe** treten, um **Stämme** zu bilden, an diese wiederum **Sekundärsuffixe**, die Sekundärstämme hervorriefen. Als Wort konnten sowohl die Wurzel (**Wurzelverb**, **Wurzelnomen**) wie auch ein Stamm verwendet werden. Diese Analyse geht auf die indischen Grammatiker zurück, die auf diese Weise das Sanskrit und das Vedische grammatisch beschrieben (vgl. Art. 5). Nun wird eine solche Analyse durch die Struktur des ältesten Indischen tatsächlich nahegelegt, weil diese Sprache z. B. bei den primären Verben (die bei weitem den Hauptbestand der altindischen Verben ausmachen) kein festes Paradigma kennt, sondern nach Bedarf Verbalstämme, wie Präsens, Perfekt, Aorist usw. und auch nominale Ableitungen bildet, so daß eine Grundform (als die wir im Deutschen etwa das Präsens oder den Infinitiv ansehen) nicht zu existieren schien und dadurch das abstrakte Konzept der Wurzel nahegelegt wurde. Diese Analyse-Art ist aber schon bei dem mit dem Altindischen nahe verwandten Altgriechischen nicht mehr zweckmäßig, weil dort die Paradigmen wesentlich stärker ausgebildet sind, und bei den modernen Sprachen, wie Deutsch, Englisch oder Französisch, sind die Paradigmen so fest, daß keinerlei Anlaß besteht, mit abstrakten Wurzeln statt mit konkreten Wörtern zu operieren. Die Gefahr bei Wurzel-

Analysen besteht hauptsächlich darin, daß sie durch ihren abstrakten Charakter leichter an irgendwelche hypothetischen Annahmen anzupassen sind, während konkrete Wörter mit erheblich größerer Präzision (besonders im Bereich der Semantik) bei der Analyse eingesetzt werden können.

Die etymologische Forschung hat viel mit frühen, ja, wo dies möglich ist, sogar mit erschlossenen Sprachzuständen zu tun und setzt deshalb eine umfassende Kenntnis der Sprachgeschichte und der Verwandtschafts- und Entlehnungsverhältnisse der betrachteten Sprache voraus. Für die früheren Sprachstadien und ganz besonders für die erschlossenen Sprachstufen ist sie die wichtigste und vielfach einzige Quelle der Erschließung der Wortbildungslehre (und anderer Teile der Sprachbeschreibung). Dies ist nicht nur wichtig für die Beschreibung von unproduktiv gewordenen Affixen und dergleichen, sondern auch für Wortbildungsmittel, die in den lebenden Sprachen der betreffenden Sprachfamilie gar nicht mehr faßbar sind, so etwa für das Deutsche die Vriddhi-Bildung (ein Bildungstyp für Zugehörigkeitsbildungen, der durch Dehnung oder sonstige Verstärkung des Vokals der ersten Silbe charakterisiert ist; Beispiele wären *Huhn* zu *Hahn* oder *Schwager* zu *Schwieger*), Konsonanten-Geminierung bei emphatischen Bildungen, Wortbildung durch Akzentversetzung und ähnliches. Auf der anderen Seite bietet die präzise Erfassung eines Wortbildungstyps im Rahmen der Wortbildungslehre der Etymologie nicht

nur ein Mittel der Untersuchung und Beschreibung, sondern auch der Bewertung: eine Bildung, deren Merkmale nicht denen ihres Bildungstyps folgen, ist in besonderem Maße erklärbungsbedürftig und möglicherweise falsch eingeordnet. Auf diese Weise sind Etymologie und Wortbildungslehre (auch allgemeiner: und Morphologie) gegenseitig von einander abhängig und können sich gegenseitig erhellen.

## 175. Schriftsysteme

1. Sprachsystem und Schriftsystem
2. Morphologische Aspekte in logographischen Schriftsystemen
3. Morphologische Aspekte in phonographischen Schriftsystemen
4. Zum Parameter der "Tiefe"
5. Zitierte Literatur

### 1. Sprachsystem und Schriftsystem

Der überkommenen Auffassung zufolge wäre eine breite Transkription die ideale Schrift – wenn die Schriftzeichen direkt die kleinsten lautsprachlichen Einheiten abbilden, d. h. *grosso modo* den Phonemen entsprechen.

Dementsprechend wurde die Geschichte der Schrift als Fortschreiten hin auf das Ideal einer reinen Alphabetschrift gesehen (die klassische Darstellung ist Gelb 1963). Schriften, in denen die Schriftzeichen Wörter, Silben, Morpheme, nur Konsonanten etc. repräsentieren, haben dieser Auffassung zufolge den höchsten Entwicklungsstand noch nicht erreicht. Umgekehrt gelten Alphabetschriften, in denen vom phonographischen Ideal (ein Schriftzeichen – ein Laut bzw. Phonem) abgewichen wird, als in beklagenswerter Weise defizient (vgl. z. B. Saussure 1916).

Diese Sichtweise ist im letzten Viertel des 20. Jahrhunderts zunehmend kritisiert und

revidiert worden. Wiewohl der Schrift ihr phonographischer Charakter nicht abgesprochen werden kann, ist dieser doch nicht auf eine linear-eindimensionale Abbildung der Phonemebene zu reduzieren. Zudem ist die Abbildungsfunktion der Schrift nicht ihre einzige, übernimmt sie doch gleichzeitig auch Modellfunktion für die Analyse (Olson 1993) und Entwicklung der gesprochenen Sprache (Koch & Oesterreicher 1994). Zu unterscheiden ist zwischen einem semantischen Aspekt (Schriftzeichenfolgen repräsentieren Bedeutungen), einem phonographischen Aspekt (Schriftzeichenfolgen repräsentieren die lautive Seite der Sprache), und einem grammatischen Aspekt (Schriftzeichenfolgen repräsentieren die grammatische Organisation von Äußerungen) (vgl. Maas 1992; Günther 1995). Als Schriftsystem einer Sprache wird die Gesamtheit der die schriftliche Ausdrucksseite der Sprache betreffenden Mittel bezeichnet (Eisenberg 1996 a: 1368 f.), von denen einige in der Lautsprache nicht originär sind (z. B. Abkürzungen, abstrakte Symbole, Groß-/Kleinschreibung, Determinative). Moderne Schriftsysteme weisen stets semantische, phonographische und grammatische Aspekte gleichzeitig auf. So sind die arabischen Ziffern, wo immer sie in Texten verwendet werden, grundsätzlich semantisch bestimmt; in den modernen Alphabetschriften sind die Wortkörper durch die Buchstaben phonographisch, die Interpunktions- und der Gebrauch von Großbuchstaben dagegen grammatisch bestimmt. Im folgenden soll anhand exemplarischer Beispiele die Rolle der Morphologie als Brücke zwischen phonographischem und grammatischem Aspekt in Schriftsystemen dargestellt werden.

## 2. Morphologische Aspekte in logographischen Schriftsystemen

Im Hinblick auf die Grundbezugsebene lassen sich drei Schrifttypen unterscheiden: In **logographischen** Schriften beziehen sich die Schriftzeichen in erster Linie auf Bedeutungsträger (z. B. Chinesisch); in **Silbenschriften** bilden die Schriftzeichen Silben ab (z. B. die japanischen Kana); in **Alphabetschriften** sind die Schriftzeichen auf Phoneme bezogen (Eisenberg 1996 a: 1372).

Der Terminus "logographisch" besagt wörtlich, daß die einzelnen Schriftzeichen dazu dienen, Wörter zu bezeichnen. In den meisten logographischen Schriften wird aber

eher davon die Rede sein, daß Schriftzeichen Morpheme bezeichnen. In isolierenden Sprachen wie dem Chinesischen wird damit im Prinzip jedes Morphem durch ein Schriftzeichen repräsentiert. In flektierenden Sprachen wird dagegen in der Regel nur die Wortbasis durch ein Logogramm repräsentiert. So wird in der sumerischen Schrift anfänglich ein Logogramm für alle möglichen grammatischen Formen eines Lexems verwendet; wenn aber später "syllabisch ausgedrückte grammatische Elemente obligatorisch zu den Logogrammen treten, wird deren Funktion auf den Ausdruck der Wortbasis eingeengt" (Krebernik & Nissen 1994: 279). Das Zitat kennzeichnet eine Veränderung, die überall beobachtet werden kann, wo von einer semantischen hin zu einer phonographischen Schreibweise übergegangen wird: Die ausschließliche Verwendung von Zeichen für Inhaltswörter wird ergänzt durch silbische Elemente; solche Schriftsysteme werden häufig als "morpho-syllabisch" bezeichnet. Denn die Schriftzeichen für Flexionselemente repräsentieren nicht in direkter Weise Flexionsmorpheme (ein Zeichen pro Morphem), sondern indirekt durch Kennzeichnung der Aussprache.

Es gibt verschiedene Verfahren, die den Übergang zu einem morphosyllabischen und damit jedenfalls teilweise phonographischen System kennzeichnen. Der bekannteste Fall sind sog. Rebusschreibungen: Ein Wortzeichen wird nach seinem Lautwert, nicht seiner Bedeutung gelesen, besonders bei Homonymen. So wird im Sumerischen das (ursprünglich piktographische) Schriftzeichen für *sar* 'Pflanze' dann auch benutzt für ein homophones Verb mit der Bedeutung 'schreiben' (Cooper 1996: 42; mit weiteren Beispielen). In der späteren Zeit werden logographische Zeichen auch für gleich oder ähnlich lautende Flexionselemente verwendet, z. B. dient dann das Logogramm für *ga* 'Milch' auch dazu, als Silbenzeichen den Auslaut der Form *duga zu du* 'sagen' zu schreiben (Krebernik & Nissen 1994: 285).

Ein weiterer uneigentlicher Gebrauch logographischer Schriftzeichen sind semantische Determinative (auch Komplemente genannt). Hier wird einem Logogramm für einen homonymen Ausdruck ein weiteres Zeichen aus dem gleichen Bedeutungsfeld beigegeben, das die Lesart indiziert; in einer logographischen Schrift für das Deutsche würde man z. B. dem Wortzeichen für *Schloß* das Zeichen für *Schlüssel* beigegeben, um die Lesart

*Türschloß* zu spezifizieren. In der ägyptischen Hieroglyphenschrift stehen einmal etablierte Determinative auch bei nicht ambigen Zeichen, um sie inhaltlich näher zu spezifizieren; so kann dem Wort *'fd.t'* ‘Kasten’ ein semantisches Determinativ hinzugefügt werden, das ihn als aus Holz, Stein oder Metall gefertigt kennzeichnet (Ritner 1996: 77); es wird so ein umfangreiches semantisches Klassifikationssystem aufgebaut, das in der gesprochenen altägyptischen Sprache keine Entsprechungen hat (Schenkel 1994: 291). Es läßt sich hier durchaus von einer morphologischen Kennzeichnung semantischer Klassen in der Schreibung sprechen, die es im Mündlichen nicht gibt.

Eine systematische Aufteilung der logographischen und der phonographischen Ebene bietet das japanische Schriftsystem (vgl. Stalp 1996). Es besteht aus drei funktional und formal differenzierbaren Schriftzeichensets. Das eine, *Kanji* genannt, ist eine heute auf knapp 2000 beschränkte Menge von Logogrammen, denen durch vielfache Homonymie ca. 4000 Bedeutungen entsprechen (Stalp 1996: 1415 f.). *Kanji* stellen praktisch immer Basismorpheme dar. Daneben stehen zwei homologe, funktional differenzierte Syllabare. Das eine, *Katakana* genannt, dient der Schreibung von Namen, Fremdwörtern, Dialektismen etc., also rein phonographischen Zwecken. Das andere, *Hiragana* genannt, dient der Repräsentation grammatischer Aspekte (Hilfswörter, Verbalsuffixe, Konjunktionen) und repräsentiert mithin (auch) die Flexionsmorphologie des Japanischen. Eine so eindeutige funktionale Aufteilung der Schriftzeichen ist in den Schriften der Welt eher selten.

### 3. Morphologische Aspekte in phonographischen Schriftsystemen

#### 3.1. Der Parameter der Tiefe

Die Abbildung der Phoneme auf die Buchstaben gilt als Endstufe der phonographischen Entwicklung. In der reinsten Form verkörpert wohl das Altgriechische der vorklassisch-klassischen Periode dieses Prinzip: Hier scheint es keinen Bezug auf die Bedeutungsseite zu geben. Dies wird besonders deutlich durch das Prinzip der *scriptio continua*: Quasi den mündlichen Sprachstrom direkt abbildend werden im Gegensatz zu semitischen Vorbildern keine Wortgrenzen markiert (vgl. Ludwig in Vorb.). Die Schriftgeschichte zeigt

indes, daß dies nicht der Endpunkt der Entwicklung ist: Wenn sie länger in Gebrauch sind, entwickeln sich in allen alphabetischen Systemen Auszeichnungsmethoden, die mehr als die Darstellung der Lautseite der Sprache zum Ziel haben. Durch typographische Mittel, Einführung der Worttrennung durch das Spatium, Groß-/Kleinschreibung, Interpunktion u. a. m. wird in der schriftlichen Form die “grammatische Artikulation des Textes” repräsentiert (Maas 1992): Absätze organisieren den Textfluß, initiale Majuskel und Schlußpunkt gliedern den Satz als die maximale syntaktische Einheit aus, das Spatium markiert minimale syntaktische Einheiten (Wörter), etc.

Auch die Repräsentation morphologischer Aspekte gehört zu diesen Mitteln. Neuerdings wird hier mit dem Konzept der **Tiefe eines Schriftsystems** gearbeitet. Wohl im Anschluß an die Konzeption einer Tiefenphonologie (Chomsky & Halle 1968) gelten Schriftsysteme als um so flacher, je direkter die Buchstabenfolgen die Oberflächenphonologie einer Sprache reflektieren. So werden im modernen Neuhochdeutschen morphonemische Phänomene wie die Auslautverhärtung in der Schrift nicht ausgedrückt, die noch im Mittelhochdeutschen und Frühneuhochdeutschen auch im Schriftbild erschien, vgl. das Wort *Tag*:

- (1) (a) mhd. [tak] [tages]  
 <tac> <tages>
- (b) nhd. [ta:k] [ta:ges]  
 <tag> <tages>

Es wird davon gesprochen, daß das Mittelhochdeutsche eine flachere Graphie als das Neuhochdeutsche aufweist.

Die systematischsten neueren Untersuchungen zum Parameter der Tiefe von Schriftsystemen in linguistischer Hinsicht stammen von Trudel Meisenburg. Abb. 175.1 kennzeichnet den Ansatz.

Unterschieden werden zunächst zwei durch den Parameter der Tiefe verbundenen Ebenen, eine (oberflächen-)phonologische und eine morphosemantische Ebene. Eine dritte (phonetische) Ebene ist zwar ebenfalls anzusetzen, aber ohne große praktische Relevanz (Meisenburg 1996 a: 25). Außerdem ist zu unterscheiden, ob die Tiefe des jeweiligen Systems in diachroner oder synchroner Hinsicht betrachtet wird. Für die verschiedenen Ebenen werden Beispiele aus dem Lateinischen gegeben (<v> signalisiert im Lateini-

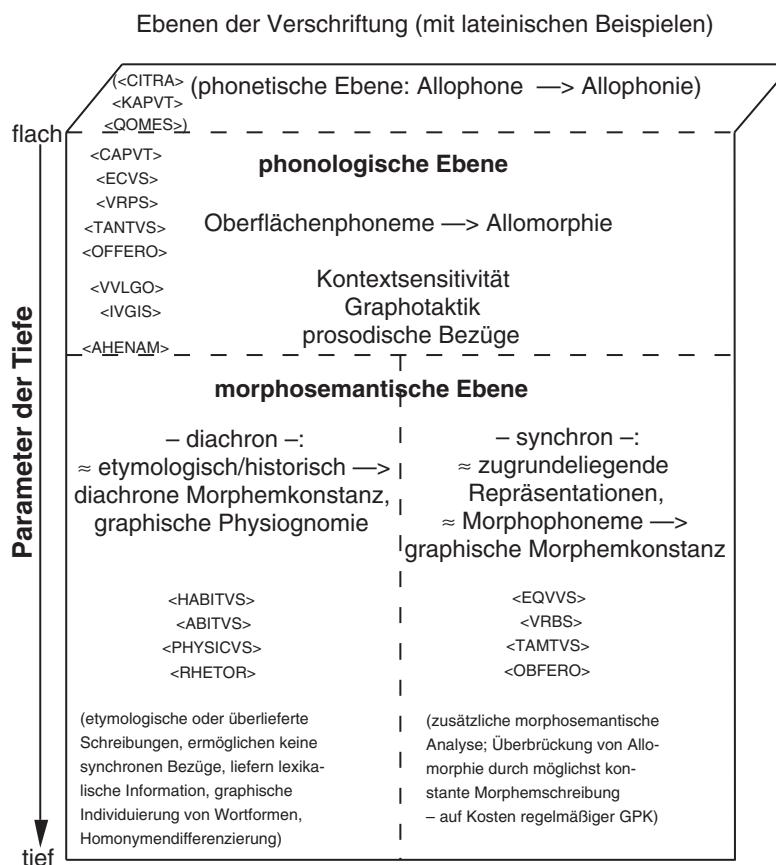

Abb. 175.1: Der Parameter der Tiefe (aus Meisenburg 1998:45)

schen sowohl /v/ als auch /u/). Da gibt es zunächst in <citra, kapvt, comes> die Wiedergabe phonetisch bedingter allophonischer Variation durch auch unterschiedliche Schriftzeichen: In den älteren Zeugnissen steht für /k/ vor vorderen Vokalen <c>, vor hinteren <q>, vor Konsonanten <k> – eine Praxis, die aber schon sehr früh aufgegeben wird: <k> verschwindet, und <q> wird nur noch vor <v> verwendet (Meisenburg 1996 a: 39). Auch oberflächenphonologische Variation wird anfänglich berücksichtigt, z. B. *urbs* ‘Stadt’ Nom. Sg. <vrps> vs. Gen. Sg. <vrbis> wegen Entstimmung des zugrundeliegenden /b/ vor /s/ in der Nominativform (/urbs/ -[urps]), später nicht mehr; ähnlich die anderen Fälle. Entgegen dem Eindruck der vereinheitlichten Klassikerausgaben gibt es in klassischer und nachklassischer Zeit Schreiberunterschiede bezüglich der “tieferen” Schreibung, z. B. <obfero> trotz der vorherrschenden Schreibung nach der Aus-

sprache [offero] wegen der morphologischen Struktur *ob* + *fero*, oder, wiewohl selten, <tamtus> trotz der Dissimilation [tantus] wegen des Bestandteils *tam* (vgl. ausführlich Meisenburg 1996 a: 35–47).

Die bisher angeführten Beispiele betreffen Schreibungen, die synchron nachvollziehbar sind. Andere Mechanismen beziehen sich u. a. auf die diachrone Ebene (vgl. ausführlich zur lateinischen Graphie Meisenburg 1996 a: 31–47). Dazu gehört z. B. die Kennzeichnung (ursprünglich) fremder Wörter durch fremde Buchstaben(kombinationen), etwa wenn aus dem Griechischen entlehnte Wörter mit <ph> und <y> erscheinen wie in <physicus>, obgleich wohl nur Gebildete dem <y> auch den entsprechenden, dem Lateinischen fremden Laut [y] zuordnen konnten; die Normalaussprache dürfte [fiskus] gewesen sein (Meisenburg 1996 a: 46). Es findet sich auch Homonymendifferenzierung, z. B. [abitus]

<habitus> vs. <abitus> wegen der Ableitungsstruktur *ab-ire*.

Im folgenden soll der Parameter der Tiefe in Anschluß an Meisenburg (1996 a; 1998) exemplarisch an einigen Schriftsystemen erläutert werden. Die Anordnung soll die zunehmende Tiefe der Systeme spiegeln.

### 3.2. Spanisch

Das spanische Schriftsystem wird von Meisenburg diachron (1996 a) und synchron (1996 b) als nahezu idealtypisch flaches System gekennzeichnet. Die Elemente eines relativ einfachen Phonemsystems werden meist direkt durch lateinische Buchstaben repräsentiert. Allomorphien, ohnehin eher selten und unsystematisch, werden durchgängig schriftlich repräsentiert, ebenso Neutralisierungen oder Assimilationen. Systematisch phonologiebezogen ist auch die graphische Markierung des relativ freien und teilweise distinktiven Wortakzents. Die synchrone Flachheit des spanischen Schriftsystems wird lediglich durchbrochen bei der Akzentmarkierung homophoner Funktionswörter. Eine geringfügige diachrone Tiefe erhält das System durch aus dem Lateinischen stammende Alternationen, die keine morphophonemischen Entsprechungen haben, z. B. <tocar>, <toques> trotz der gleichen Aussprache [to'kar], [to'kes].

### 3.3. Koreanisch

Das moderne koreanische Schriftsystem *Han'gul*, im 15. Jahrhundert entwickelt, ist in vieler Hinsicht einzig unter den alphabetischen Schriftsystemen (vgl. King 1996). Die Basis des koreanischen Schriftsystems ist eine quasi ikonische Abbildung der artikulatorischen Geste bei den Konsonanten; die genaue Abbildung der Lautstruktur ist Ziel dieser Schriftform (vgl. Günther 1988: 54–58). Anders als in Lateinschriften werden (ähnlich wie in indischen Schriften) die alphabetischen Symbole zu Silben repräsentierenden Schriftzeichen zusammengefaßt, deren Form und Größe an chinesische Schriftzeichen erinnert.

Trotz der Zielsetzung einer möglichst genauen Darstellung der Lautebene gab es von Anfang an auch Bestrebungen, morphologische Aspekte zu berücksichtigen (King 1996: 223). Aufgrund der Zusammenfassung einzelner Phoneme zu Silben ergeben sich bei flektierten Formen nämlich unterschiedliche Schriftzeichen. So lautet der Lokativ des Wortes *saram* ‘Mensch’ *saram-ege* ‘Mensch-LOK’. Ersteres ergibt die Silbenfolge *sa-ram*,

letzteres *sa-ra-me-ge*. Die zweite Silbe ist also in der Grundform *ram*, in der flektierten Form *ra*. Dies aber ergibt unterschiedliche Zeichen: Zwar sind in beiden Silbenzeichen die Elemente für /r/ und /a/ enthalten, doch die Verwendung des Zeichens für /m/ hängt ab von der Syllabifizierung, so daß das komplexe Zeichen unterschiedlich aussehen kann (vgl. Abb. 175.2). In der modernen koreanischen Orthographie gilt die morphemische Schreibweise.

(a) *saram* ‘Mensch’

사	람
sa	ra
	m

(b) *saram-ege* ‘Mensch’, Lokativ

morphemische Schreibweise	silbische Schreibweise
사 람	사 라
ra e	ra me
ge	ge

Abb. 175.2: Schreibweisen des Wortes *saram-ege* in *Hang'ul*

Das koreanische System ist also, betrachtet man die Komponenten der einzelnen Schriftzeichen, wie das Spanische sehr flach; betrachtet man die Komposition der Silbenzeichen, so ergibt sich eine gewisse morphologische Tiefe, die aber die phonologische Flachheit nicht tangiert (s. 4).

### 3.4. Deutsch

Das deutsche Schriftsystem ist durch das Prinzip der Morphemkonstanz bestimmt (Günther 1988: 86–94), das in 3.1 schon am Beispiel der deutschen Auslautverhärtung erläutert wurde: Mit wenigen Ausnahmen haben deutsche Wortstämme im Geschriebenen eine konstante Form ungeachtet der Variation in der phonetisch-phonologischen Realisation. Instruktiv ist das Morphem /kɔ:nig/. In der Standardsprache wird /ig/ im Auslaut [iç] ausgesprochen, also lautet die Basisform [kɔ:niç]. Die Ableitung mit Movierungssuffix /kɔ:nig + in/ wird [kɔ:nigin] ausgesprochen, das denominale Adjektiv /kɔ:nig + lic/ lautet [kɔ:nikliç]. Für das Stammorphem gibt es also drei phonetische Realisierungen, aber stets die gleiche Schreibung <könig>; synchron repräsentiert die Schreibung direkt die morphologische Ebene.

Auch in anderen Fällen signalisiert die geschriebene Form morphologische Struktur,

die an der lautsprachlichen Oberfläche nicht sichtbar ist. So gibt es im gesprochenen Nhd. keine konsonantischen Geminate; wo sie aus morphologischen Gründen auftauchen würden, werden sie im Gesprochenen vereinfacht, in der Schrift jedoch nicht, vgl. *Tief-flug* [ti:flu:k], *verraten* [ve:ra:tn], etc. In der Flexion gibt es zwar auch im Geschriebenen Geminatenvereinfachungen, vgl. <er rät> /re:t + t/, <du feixt> /feiks + st/, doch bleibt auch hier die Stammkonstanz erhalten.

Ein etwas komplexerer Fall ist der Umlaut. Bei vokalischer Alternation gibt es im Nhd. (anders als im Englischen, s. 3.6) keine graphische Morphemkonstanz, vgl. *singe* – *sang* – *gesungen*; *ziehen* – *Zug*, etc. Die Vokale [ɛ], [ø] und [y] und die entsprechenden Langvokale alternieren in einer Reihe von Fällen, z. B. der nominalen Pluralbildung, mit [a], [o] und [u], vgl. /bart/ – /bərtə/, /korb/ – /kɔrbə/, /hu:t/ – /hy:tə/, teilweise auch in Derivationen, vgl. /alt/ – /eltlich/, /to:t/ – /tɔ:tn/, /vu:t/ – /vy:tɔri/. Die umgelautete Form wird mit dem Basisvokal plus Trema als Diakritikon geschrieben: <bärte>, <körbe>, <hüte>, <ältlich>, <töten>, <wüterich>. Im heutigen Deutsch ist der Umlaut morphologisch, nicht mehr phonologisch geregelt (s. Art. 147; Wurzel 1984). Außerdem müssen <ä>, <ö> und <ü> in der nhd. Orthographie als Grapheme gelten, weil sie auch ohne Umlaubasis vorkommen, vgl. z. B. <lärche, dünn, könig>, wozu es keine \*<larch, dunn, kon> gibt. Natürlich sind diese Schreibungen diachron als Umlaut erklärbar; dies ändert nichts am graphematischen Status der Umlautbuchstaben. In der seit 1998 gültigen neuen Rechtschreibung werden in einigen Fällen diachron erklärbare Fälle synchron umgedeutet, so ist z. B. früher <bendel> (zu ahd. *bentil*) nunmehr <bändel> zu schreiben, weil es synchron zu <band> gestellt wird, d. h. der Bezug der Umlautbuchstaben auf die Basisvokale wird als morphologisches Schreibprinzip angesehen.

In die diachrone Dimension gehört die Morphemkonstanz u. a. bei unproduktiven Ableitungen, z. B. das <h> bei <draht> (historisch zu *drehen*), da das Dehnungs-*h* nur vor <l, m, n, r> auftritt (vgl. Eisenberg 1996 b). Hierher gehört auch die Verteilung von <f> und <v> zur Bezeichnung von /f/ im Anlaut im indigenen Wortschatz: Dem unmarkierten Fall der <f>-Schreibung stehen eine Handvoll <v>-Schreibungen gegenüber, die jedoch großteils sehr häufige Wörter

bezeichnen (vgl. Günther 1988: 94–97). Diachrone Tiefe durch Homonymendifferenzierung (*Saite* – *Seite*, *Mohr* – *Moor*, etc.) ist offenbar im 17. Jahrhundert erheblich stärker ausgeprägt gewesen als heute. Ein orthographisches Problem bietet schließlich die Fremdwortschreibung: Fremde Wörter werden zunächst grundsätzlich in der Originalschreibung wiedergegeben, wodurch diachrone Tiefe erreicht wird; die allmähliche (und unsystematische) phonologische und morphologische Angleichung an das deutsche Schriftsystem führt hier zu Inkonsistenzen (z. B. ist die eingedeutschte Form *Frisör* heute wieder veraltet; das Duden-Rechtschreibwörterbuch (2000) verzeichnet es als Hauptlemma *Fotografie* mit dem Verweis „auch *Fotographie*“, dagegen als Hauptlemma *Lithographie* mit dem Verweis „auch *Lithografie*“; etc.).

Daß im heutigen Deutsch in der Tat die konstante Morphemschreibung systematisch dem phonographischen Oberflächenbezug vorgeordnet ist, belegt das Kuriosum der Schreibung von <fünf, elf, zwölf, doof>. Phonologisch ist stets von stimmhaftem Auslaut auszugehen, denn es heißt standardsprachlich z. B. im Plural <doofe> [do:və]. Da jedoch die Grundformen mit <f> geschrieben werden (wohl, weil diese Stämme fast nur so vorkommen), wird die Schreibung auch in den anderen Formen beibehalten, obgleich <f> im Deutschen stets /f/, nie /v/ bezeichnet (vgl. Günther 1988: 96 f.). Insgesamt ist das Deutsche tiefer als z. B. Spanisch oder Koreanisch, aber flacher als die beiden im folgenden besprochenen Schriftsysteme.

### 3.5. Französisch

In noch stärkerem Ausmaß als im Deutschen ist im Französischen graphematische Morphemkonstanz gewahrt. Dies betrifft insbesondere nicht hörbare, aber geschriebene Morphologie, etwa das Plural -*s*, vgl. <enfant – enfants> [afɑ̃] ‘Kind(er)’, <le – les> [lə; le] oder den Genusmarker -*e*, vgl. <petit – petite> [pə'ti – pə'tit]. Verkompliziert wird das Ganze durch das Phänomen der Liaison; vor vokalisch anlautenden Folgewörtern wird z. B. das Plural -*s* hörbar, vgl. *les Etats Unis* [leze:'tazy:'ni] ‘USA’. Da die Wortgrenze überschritten wird, wenn nur geschriebene Morpheme hörbar werden, spricht Eisenberg (1996 a: 1376) vom Wortformenbezug des Französischen. Wenn unterschiedlich lautende Allomorphe durch graphische Morphemkonstanz aufeinander bezogen bleiben, vgl. z. B. <champ – champêtre> [ʃã –

šā'peṭr] ‘Feld – ländlich’ oder <hasard – hasarder> [a'za:r – aza:r'de] ‘Zufall – aufs Spiel setzen’, spricht Catach (1996: 1448 f.) von ‘Morphogrammen’. Bezuglich diachroner Tiefe ist vor allem die morphemidentifizierende Distinktschreibung von Homonymen zu nennen, vgl. z. B. die verschiedenen Schreibungen der [köt] ausgesprochenen Morpheme in <conte> ‘Märchen’, <comte> ‘Graf’, <compte> ‘Rechnung’, wodurch zugleich derivationelle Zusammenhänge verdeutlicht werden, vgl. <conter> ‘erzählen’, <comtal> ‘gräflich’, <compter> ‘zählen’. Eine systematische Darstellung der diachronen Entwicklung der französischen Graphie bis heute bietet Meisenburg (1996 a: 68–206).

### 3.6. Englisch

Englisch ist für viele Autoren der Prototyp eines “tiefen” Systems; als “deeply morphologized” wird es in Stubbs (1996: 1442) bezeichnet. Die Auffassung, daß es sich um ein notorisch irreguläres System handelt, ist spätestens seit der Behauptung, es handele sich um ein “near to optimal system” (Chomsky & Halle 1968: 49) zumindest fragwürdig geworden. Aufgrund der englischen Sprachgeschichte ist insbesondere die diachrone Tiefe des englischen Schriftsystems wohl einzigartig (zur historischen Entwicklung vgl. Scragg 1974). Hier sind insbesondere zwei Aspekte zu nennen. Der eine ist die Zusammensetzung des Wortschatzes aus einem angelsächsischen und einem romanischen Teil mit unterschiedlichen Wortstrukturen und orthographischen Konventionen, vgl. z. B. die Schreibung des Auslauts [šən] in <freshen> [frēʃən] und <nation> [neiʃən]. Der andere ist der Umstand, daß durch den Drucker Caxton die englische Orthographie schon im 15. Jahrhundert weitgehend festgelegt wurde; die nachfolgenden gravierenden Lautveränderungen, insbesondere der “great English vowel shift”, wurden in der Schreibung nicht berücksichtigt. Ähnlich wie das Französische archiviert so das englische Schriftsystem in Paaren wie <sign – signature> oder <divine – divinity> morphologische Zusammenhänge, die in der gesprochenen Sprache nicht mehr erkennbar sind, vgl. [sa:n – signətʃər], [di've:n – di'venɪtɪ]. Ein weiterer morphologischer Aspekt ist die Worttrennung am Zeilenende, wo nicht wie in vielen anderen Alphabetschriften Schreibsilben abgetrennt werden (vgl. Eisenberg 1996 b), sondern Flexionssuffixe, sofern sie

Vokale enthalten, vgl. *read-ing, walk-ed, substitu-tion*.

Obgleich solche Beispiele morphologischen Bezug aufweisen, muß doch festgestellt werden, daß ihre Reichweite und Systematizität ungleich kleiner ist als z. B. im Deutschen oder auch im Russischen (dazu Meisenburg 1998). Es ist deshalb eher davon zu sprechen, daß die Tiefe des englischen Schriftsystems sich auf die Wortebene bezieht; “the invariant unit of English spelling is not the morpheme, but the word” (Stubbs 1996: 1442). In der Tat sind einzelne Autoren so weit gegangen, das englische als ein logographisches Schriftsystem zu bezeichnen – sicherlich ein Unfug, denn jenseits der Unrichtigkeit von G.B. Shaws Behauptung, das Englische sei so unregelmäßig, daß z. B. auch <ghoti> als [fiʃ] gelesen werden könne – [f] wie in <tough>, [i] wie im Plural <women>, [š] wie in <nation> –, gibt es auch im Englischen eine phonographische Grundebene; die Buchstabenfolge <tomb> kann niemals genauso wie <grave> (beides kann ‘Grab’ bedeuten) gelesen werden (Beispiel von Daniels 1996: 654).

### 4. Zum Parameter der “Tiefe”

Betrachtet man die vorstehenden Beispiele im Zusammenhang, so wird deutlich, daß die so einfache scheinende Dimension von morphologisch flach bis tief keineswegs homogen ist. Schon in Abb. 175.1 (Meisenburg 1998) werden zusätzlich die synchrone und die diachrone Ebene unterschieden. Letztere ist überdies höchst disparat: Fremdwortschreibung, Homonymendifferenzierung und etymologische Schreibung können nur a posteriori zusammenwirken. Ein einheitliches Gebiet bilden sie nicht; zudem ist morphologischer Bezug für keinen der Bereiche konstitutiv. “Verallgemeinerungen über den Ebenenbezug alphabetischer Schriftsysteme sind [...] noch ein Forschungsdesiderat” stellt dementsprechend Eisenberg (1996 a: 1376) fest, so daß die von ihm tentativ formulierten Tendenzen noch der Bestätigung harren:

- Sprachen mit wenig Allomorphie neigen eher zu flachen Schriftsystemen (Spanisch).
- Isolierende Sprachen und solche mit segmental schwer faßbarer Morphologie neigen zu Wortformbezug (Französisch, Englisch, Arabisch).

- (c) Sprachen mit segmentaler Morphologie neigen zu Morphembezug (Deutsch, Russisch).

Die Notwendigkeit weiterer Forschungen liegt auf der Hand. Naheliegende Umkehrschlüsse z. B. sind offenbar nicht zutreffend. So ist das serbokroatische Schriftsystem ähnlich flach wie das spanische, obgleich es erheblich mehr Allomorphie gibt, z. B. durch die Palatalisierung, die hier im Unterschied zu anderen slawischen Sprachen in der Schrift angezeigt wird (vgl. Comrie 1996), vgl. z. B. <ruka – ruci> ‘Arm’; <snaha – snasi> ‘Schwiegertochter’ (jeweils Nom./Dat. Sg.). Die phonographische Genauigkeit geht so weit, daß sogar Unterschiede zwischen serbischen und kroatischen Dialekten graphisch repräsentiert werden, vgl. serbisch <mleko>, kroatisch <mljeko> ‘Milch’. Wohlgemerkt gilt dies für die serbokroatische Schrift seit ihrer grundlegenden Reform im 19. Jahrhundert (Feldman & Barac-Cikola 1996).

Eine besondere Stellung nehmen die semitischen Schriftsysteme ein. Auch wenn es Ansätze zur Schreibung von (Lang-)Vokalen gibt, sind sie systematisch als Konsonantenalphabete zu kennzeichnen. Aufgrund der semitischen Morphologie mit (extrem vereinfacht!) drei Konsonanten als Wurzel und vocalischer Variation zur Kennzeichnung von Flexion und Derivation wird die morphologische Ebene in besonderer Weise ausgezeichnet (das Konsonantengerüst signalisiert morphologische Beziehungen); das System scheint morphologisch “tief”. Eine Kennzeichnung der arabischen Schriften als Morphemschriften aber ist unangemessen. So spricht Eisenberg (1996 a: 1376) von einer morphologischen Analyse, die aber erst auf der Ebene der Wortformen strukturbildend wirkt, und ganz explizit wehrt sich Bauer (1996: 1435) gegen die landläufige Vorstellung, “die arabische Schrift diene vor allem zur Schreibung von Wurzeln”. Die vielen Details, worin dies sich zeigt, können hier nicht ausgeführt werden; wesentlich ist das Ergebnis: “Die durch die Defektivschreibung des Arabischen entstehende Tiefe der Schrift ist [...] eher lexikalischer als morphologischer Natur” (Bauer 1996: 1455). Ähnlich war in 3.6 das englische Schriftsystem als weniger morphologisch und vielmehr lexikalisch tief gekennzeichnet worden.

Eine solche differenzierte Betrachtung des Parameters der Tiefe ist insbesondere deshalb wesentlich, weil er auch in anderen Wissen-

## XXI. Morphologie und Nachbardisziplinen

schaften eine Rolle spielt. In der psychologischen Leseftorschung etwa ist er weitgehend als reguläre vs. irreguläre Graphem-Phonem-Korrespondenzen interpretiert worden (z. B. Katz & Feldman 1996). Eine entwicklungspsychologische Interpretation besagt dann, daß Schriftsysteme um so leichter zu lernen seien, je flacher sie sind (Wimmer & Goswami 1994 zum Vergleich von Englisch und Deutsch), und eine kognitionspsychologische Deutung vermutet, daß der Erwachsene in flachen Systemen beim Lesen phonologisch rekodiert (Katz & Feldman 1996) oder in tiefen Systemen morphologisch zerlegt (Schreuder et al. 1989; s. Art. 162). Die oben gegebenen Hinweise lassen es als ratsam erscheinen, im jeweiligen Fall genau zu spezifizieren, was unter “flach” bzw. “tief” zu verstehen ist.

Schon Bolinger (1946) war die besondere Rolle von “visual morphemes” bewußt. Es scheint, als ob die Analyse von Schriftsystemen in besonderer Weise geeignet ist, die Rolle der Morphologie als Interface von Bedeutung und Form in der menschlichen Sprache und ihre unterschiedliche Ausprägung in den Sprachen zu kennzeichnen.

In den letzten Jahren ist die Erforschung der Schriftsysteme weiter vorangetrieben worden, insbesondere die Rolle der Schreibsilbe zwischen segmentaler und morphologischer Ebene steht im Zentrum der Aufmerksamkeit. Systematisch wird dies am Deutschen exemplifiziert in Eisenberg (1998: 286–311); einen guten Einblick in verschiedene Ansätze vermittelt der Sammelband von Neef et al. (2002, Hrsg.).

## 176. Terminology in special languages

1. Introduction
2. What are 'special languages'?
3. The lexicon in special languages
4. Term formation: morphological trends
5. Standardisation in term formation
6. Appendix
7. References

### 1. Introduction

Special languages are heavily dependent for their development on creative word formation processes. While the specialised vocabulary encountered in special languages has the same range of morphological structures as the general lexicon, it exhibits far greater regularity as a result of the deliberate and often systematic techniques of term creation.

This article outlines the distinguishing characteristics of specialised designation (cf. 2) and briefly examines the nature of the lexicon in special languages (cf. 3). The semantic content of these designations and the motivations for their expression forms are explored, and a description is provided of the prevalent morphological variations encountered in English term formation (cf. 4). (For German and French term formation see Drozd & Seibicke 1973; Hoffman 1988; Kocourek 1982.) An appendix (cf. 6) presents guidelines for the creation of terminology in which certain preferences in practical term formation are motivated.

The linguistic examples given are drawn from a variety of specialised subject domains since our objective is to make statements which apply to special languages in general.

### 2. What are 'special languages'?

**Special languages** (or **sublanguages**) are semi-autonomous, complex semiotic systems based on and derived from general language. Their use presupposes special education and is restricted to communication among specialists in the same or closely related fields (cf. Sager et al. 1980).

The features of special languages implied in this definition, namely special reference, special speech acts, special message forms and special pragmatic situations belong to quite separate aspects of language. From the point of view of function and structure, special languages highlight the referential and

systematic nature of language, maximally exploit the communicative and classificatory use of language and aim at a clear distinction between their three favoured intentions of speech acts, i.e. the informative, evaluative, and directive. This functional restriction of language use permits deliberate planning of special languages by means of rules for the creation and use of specialised linguistic forms.

### 3. The lexicon in special languages

The lexicon of special languages has developed its own particular characteristics which set it apart from the general lexicon. These characteristics reflect and arise from the referential and classificatory needs of special languages.

#### 3.1. Special reference

A description of the particular referential needs of special language is fundamental to an account of the lexical trends in specialised designation. (For a detailed exposition of the theory of reference in special languages see Sager et al. 1980: 70–86.)

The lexicon of a special subject language reflects the organisational characteristics of the conceptual domain by tending to provide as many lexical units as there are distinct concepts conventionally established in the knowledge structure of the domain, and by restricting the reference of each such lexical unit to a well-defined entity within it. It is this enhanced rigour which characterises **special reference**, and distinguishes it from **general reference**, where "general knowledge" tends to have a less well-defined, less "disciplined" structure.

In addition to a large number of items which have the property of special reference (**terms**), the lexicon of a special language also contains items of general reference which are not usually specific to any discipline and whose referential properties are vague or generalised (**words**). The criterion which determines whether a particular lexical item is a term or word is thus the nature of its reference within the discipline concerned.

The creation of new lexical items in special languages is a conscious and deliberate process carried out by subject specialists and is

thus part of the scientific method. Consequently, the naming of concepts is as subject to procedural regulation and systematisation as scientific investigation and has its own special rules and recommendations (cf. BS 3669 1963 and ISO 704 1986). The standardisation of terminology is discussed further in 5 and 6.

### 3.2. Linguistic modes of designation

Designation in special languages aims to achieve transparency and consistency. The structure of a designation often reflects the major conceptual features it represents, and related terms often have a comparable expression form.

The most common mode of term formation is determination, which operates by means of compounding and by derivation. On the basis of the superordinate concept (hyperonym), it creates a more specific term whose designation is motivated by systematic criteria, e.g. according to material (*iron chain*), function (*safety chain*), location (*door chain*), etc. Consecutive stages of determination produce sequences of terms in hierarchy.

Determination by means of pre-modification can use any word category as the specifying element (*pre-edit*, *virtual storage*, *T-iron*, *four square*, *feed hole*, *preshrunk fabric*, *programming language*). When a concept is determined by more than one modifier, it may be necessary to make use of hyphens to clarify the relationship (*wide-angle lense*). In some cases, the determined element is omitted and the new concept is represented solely by the modifier (*floppy disk* → *floppy*).

Conjunction is a much less frequent technique of term formation, although it does occur in designations of chemical compounds (*nickel steel*) and of dual purpose devices (*lifting and forcing pump*). Disjunction, which joins the extensions of two or more concepts into a new hyperonym by presenting two alternatives as a single concept, is used to express an ‘either-or’ relationship (*glide-sail parachute*).

## 4. Term formation: morphological trends

The three main linguistic methods of designation are:

- (a) the use of existing resources;
- (b) the modification of existing resources;
- (c) the creation of new resources.

The following description of the usage of these various modes of designation in English special languages is not intended to be exhaustive but is rather indicative of the range of possibilities (cf. Sager 1996: 250–253 for further references on scientific and technological word formation).

### 4.1. Use of existing resources

The creation of new designations by narrowing or widening the meaning of existing linguistic resources is frequent in pre-scientific enquiry and in popular expositions of science. The two principal methods used are polysemy and redefinition.

Simile is a common method of new designation which highlights a distinguishing feature of a concept through comparison (*G-clamp*, *star wheel*). Special language also uses many metaphoric expressions based on form, function or position (*ear of a hammer*). Metaphors are also common in popular naming in biology (*bluebell*, *seahorse*).

Other transfers of meaning occurring in special reference include the use of proper names to designate objects and measurements (*machmeter*, *watt*), the form of an object for another object of that form (*square*, *bulb*), and the name of the material for the object made of it (*glass*, *iron*).

The process of redefinition usually entails reducing the extension of a general language word. For example, *speed* and *velocity* are used synonymously in general reference, but in special reference they designate two distinct concepts (cf. Sager et al. 1980: 255 f.).

### 4.2. Modification of existing resources

The principal method of designation in special reference is the modification of existing resources by means of affixation, compounding, conversion or compression.

#### 4.2.1. Affixation

Affixation is a particularly important method of designation in special languages because of its ability to contribute to precision of expression and systematic reference.

Affixes are far more numerous in special languages than in general language, largely because of the borrowing or adaptation of neoclassical words and methods of word formation, many of which are not required in general language. English freely assimilates word elements and words from other languages, and in science and technology, in particular, makes substantial use of Greek

and Latin prefixes, suffixes, and stems (cf. Nybakken 1959; Flood 1960; Hogben 1969).

**Prefixes** make an important contribution to the systematic structuring of special vocabularies. Contrasting sets of terms can be created easily by the negatives *un-*, *in-*, *dis-*, *a-* (*synchronous/asynchronous*, *organic/inorganic*), the privatives *un-*, *de-*, *dis-* (*stable/unstable*, *code/decode*), the prefixes of degree or size *super-*, *sur-*, *sub-*, *hyper-*, *ultra-*, *mini-* (*subsonic*, *hypersonic*, *supersonic*), the locatives *super-*, *sub-*, *inter-*, *trans-* (*amination*, *transamination*), the temporal or sequential *pre-*, *post-*, *re-* (*post-emphasis*, *pre-emphasis*), and the numerals *uni-*, *mono-*, *bi-*, *di-* (*monovalent*, *divalent*), etc. Such sets maintain terminological unity and appear to be transparent. However, prefixes are not always used systematically and some prefixed words take on special meanings in the process of terminologisation (*denature* in chemistry means to render ethanol unfit for human consumption).

In special languages, certain neoclassical stems are so frequently used that they can be considered prefixes from the functional and structural point of view (*auto*, *equi*, *ext(e)r*, *iso*, *macro*, *mega*, *meta*, *micro*, *pan*, *para*).

The noun-noun transformation **suffix** *-ing* is highly productive in the conversion of countable nouns to mass nouns in order to indicate an assembly of objects (*wire* – *wires* – *wiring*). Concrete nouns are also derived from verbs by means of the suffix *-er* and its neoclassical alternative *-or* (*scanner*, *collator*). In this way, terminological agreements can be established between the action and the instrument of the action.

The causative Latin-derived pattern *-fy*, *-fier*, *-fication* also contributes to systematicity by providing names for action verbs, agents or instruments and the corresponding processes (*amplify* – *amplifier* – *amplification*). Agent nouns can also be formed by *-ant* and often have matching verbs in *-ate* (*penetrate* – *penetrant*). Most process nouns end in *-ation* or *-ion* (*collation*). They can also end in *-ing* but this is less desirable in specialised designation because of the danger of confusion with the identical concrete nouns designating the product (*carving*, *fitting*).

Properties are designated by adjectives derived from nouns, and by nouns derived from adjectives. Adjectival derivations in *-al*, *-ic*, *-ive*, and *-ous* are particularly prevalent (*trinomial*, *concentric*, *coercive*, *contiguous*). Property nouns are derived from adjectives ending mainly in *-al*, *-ent*, *-ic*, *-ous* (*trinominality*, *absorbency*, *concentricity*, *contiguity*).

Terms designating measurable properties frequently end in *-ance* or *-ivity* (*capacitance*, *inductivity*). Measuring devices are commonly designated by suffix-like expressions which indicate the method of measurement, e.g. *-meter* (*spectrometer*), *-graph* (*thermograph*).

Certain suffixes are restricted to one field in which they are used exclusively or with a special meaning (*-ase*, *-ate*, *-ol*, *-ose* in chemistry; *-asis*, *-itis*, *-oma*, *-ectomy* in medicine). However, even within a single field suffixes may have more than one function (*-ine* and *-ic* in chemistry).

#### 4.2.2. Backformation

The process of **backformation**, or back-derivation, permits the formation of complex verb forms which correspond very closely in their range of reference to nominal concepts of processes. It thus achieves a great deal of concentration of information while maintaining terminological accuracy.

Backformation in special languages occurs most often in complex nouns and in technology rather than science where there is a greater need for verbs to describe processes. It is closely linked to the process of compound verb formation which often terminologises verbs by narrowing their range of reference. The first element may designate the instrument or agent (*steam-bend*), the purpose (*test-drive*), the method (*colour-code*), or the location (*factory-test*).

#### 4.2.3. Compounding

**Compounds** play a very important role in special language designation where their potential for systematicity and regularity is maximally exploited to create coherent terminological systems.

The vast majority of special language compounds are nouns. Noun compounds provide an ideal basis for the building of terminological systems as the nucleus indicates the category to which the concept belongs and the determinant the criterion for the subdivision of the category (cf. Art. 87).

Three major types of noun compounds can be identified: those which designate entities, those which designate properties, and those which designate operations and processes. Most noun compounds fall into the first of these groups which exhibits the greatest variety of relationships between determinant and nucleus. Thus, the determinant may compare the nucleus to another object (*daisy wheel*); specify the material of which the nucleus is

made (*steel band*); express an inherent property of the new concept which is not inherent in the nucleus (*pneumatic drill*); specify the use to which the nucleus is regularly put (*splitting axe*); specify the object of an instrument or agent noun (*card punch*); express the product which is regularly associated with the nucleus (*cotton mill*); specify the mode of operation of the nucleus (*tumble-drier, slide-rule*); refer to the whole of the nucleus as a part (*brake lining*); assert identity with the nucleus (*fuel oil*) (for further exemplification of these and other possible relationships see Sager et al. 1980: 267–271).

Eponymic noun compounds are also frequent in special languages. While having the advantage of precision through unique differentiation, these compounds lack systematic import (*Venn diagram, Eddy's theorem*).

Compounds with particles occur in all word categories and form a large number of specialised terms (by *-chamber, -effect, -product; on -line, -stream*). There are also many phrasal compounds linked by prepositions (*on the fly printer*).

Compounds are often made up of two, three or more elements, but five- or six-element compounds are rare. Multiple-element compounds occur in schedules for classificatory purposes but in other text types they are shortened because contextual reference resolves any possible ambiguity.

Compound adjectives are rarely ambiguous and are therefore frequently used in special language where there is a need for economy and transparency of expression. Such compounds are used to determine processes and operations, and to identify new entities (*heat-resistant, lead-free, voice-activated*).

Most compound verbs in special languages are formed by backformation (cf. 4.2.2) or conversion. A third major group are compounds with the particles *out, over, under* (*underwrite, output, overcoal*).

#### 4.2.4. Conversion and compression

**Conversion** occurs most frequently from verb to noun and vice versa (*a drill, to telex*), but there are also cases from adjective to noun (*a solvent*), from noun to adjective (*imitation, model*), and from adjective to verb (*to dry, to smooth*). The productivity of conversion is reduced in scientific English where there is a high proportion of terms derived from Latin and Greek word elements with identifiable noun endings which are unsuitable for conversion.

Lexical **compression** in special languages is achieved by abbreviating existing expression forms, omitting elements in compounds, creating letter symbols, combining letters and numbers into short designations, and by using pictograms (cf. Sager et al. 1980: 277–280).

#### 4.3. The use of new resources

Absolute invention in special language designation is rare since it is appropriate to reflect in new designations the relationships of new concepts to existing ones. In English, the creation of neologisms is often hard to distinguish from Greek and Latin borrowing.

The principal methods of creating special language neologisms are the combination of existing English and anglicised Greek or Latin word elements (*videodisc*); the use of Latin or Greek stems (*apex*); blending (*transceiver*) (cf. Art. 91); the use of eponyms (*Mach number*); the use of letters, singly or in compounds (*beta-ray*); the rare use of absolute invention (*quark*).

Borrowing from other languages is relatively infrequent in contemporary English, but is widespread in languages which import new technology, often together with English terminology. Of morphological interest are the methods by which foreign borrowings are adapted to the requirements of inflection or derivation in the target language. This process is relatively smooth in English because of its limited inflectional endings, its weak requirements for identifying word classes and its great openness to conversion. The spelling is anglicised if a word enters into general usage, but even this offers no problems with the dual English tradition of Germanic and Romance vocabulary (cf. Rey 1995: 3–85).

#### 5. Standardisation in term formation

Once the validity of a new concept is generally acknowledged, it becomes established within the specialist community which usually regularises it by agreeing on a suitable linguistic designation. **Standardisation** is a separate process by which users reach ‘public’ agreement on the adoption of a given term for use in specific circumstances. In addition to fixing meaning, standardisation may also involve a choice from among competing terms using the criteria of economy, precision or appropriateness (cf. Cabré 1998: 194 ff.).

The mandatory fixation of form and meaning of a group of terms is exceedingly rare and can be as limited in application as a single legal document (contracts with definition clauses), or cover the entire activities of a professional group (the language used for formal communication between aircraft pilots and air traffic controllers). Contrary to appearances and popular belief, the terminology of so-called "standard vocabularies" is only rarely made mandatory. In most cases it represents a set of terms recommended, for use as established in a sequence of object or procedural standards and collected in the first instance to preserve consistency of reference in an extended series of interrelated standards (cf. Sager 1996: 114–128).

## 6. Appendix

The "Recommendations for the Selection, Formation and Definition of Technical Terms" (BS 3669 1963) issued by the British Standards Institute are guided by three principles: **appropriateness**, to the circumstances of communication, **precision**, of expression as demanded by specialised topics of communication, and **economy**, of expression as suitable for discourse among specialists.

The most important recommendation is that terms should be created systematically with respect to their morphological, syntactic, semantic, and pragmatic characteristics. Terms should conform to the morphology, spelling, and pronunciation conventions of the language for which they are intended, and should not give rise to ambiguities in pronunciation or irrelevant associations. They should be capable of permitting the creation of derivatives so that the expression and content forms can be made consistent wherever possible. Latin or Greek roots are particularly useful for this purpose.

Terms should be as short and concise as the requirements of precision and systematicity will permit. As function, mode of operation, production, and even origin can vary, it is recommended that in a complex term the determined constituent should be the genus of the new concept. In running text or spoken language terms may be abbreviated provided that the context is clear.

A term should represent only one concept. Homonymy may occur when a general language designation becomes a term or when a term from one area is applied in another. Homonyms should be avoided when two

## XXI. Morphologie und Nachbardisziplinen

meanings are very similar, when they may occur in the same context or when a term from one special subject is applied in another with a different definition.

A single concept should preferably be expressed by a single term. The creation of synonyms should be avoided because they may create confusion about the identity of a concept and because they burden the memory.

Once a term has gained wide acceptance it should not be changed without compelling reasons and a strong certainty that the new term will become accepted as a full substitute.

## 177. Sprachunterricht

1. Eingrenzung des komplexen Themas
2. Konzepte für das Lehren und Lernen einer Sprache
3. Konzepte pädagogischer Grammatiken für den Fremdsprachenunterricht
4. Grammatik im muttersprachlichen Unterricht
5. Zitierte Literatur
  
1. Eingrenzung des komplexen Themas

**Sprachunterricht** ist in der Praxis wie in der Theorie ein hochkomplexes Geschehen, sowohl was den Unterricht selbst, das Lehren und Lernen, als auch was den Unterrichtsgegenstand, die Sprache, als auch was die Unterrichtsziele, das Beherrschende der Sprache in Wort und Schrift, betrifft.

Praxis und Theorie des Sprachunterrichts, des muttersprachlichen wie des fremdsprachlichen, können zudem auf eine lange Geschichte zurückblicken. Sie ist faßbar bereits in den antiken Grammatiken (Art. 6), von denen Donat und Priscian eine überragende Rolle für die Vermittlung des Lateinischen ebenso wie für die allmähliche Herausbildung nationalsprachlicher Grammatiken und Lehrbücher zur Vermittlung der europäischen "Nationalsprachen" gespielt haben, den antiken Rhetoriken, von denen Cicero und Quintilian intensiv rezipiert wurden (s. Gwynn 1926), schließlich auch in den antiken literarischen Werken selbst, insofern an und mit ihnen im Lateinunterricht Sprache gelernt wurde. Die Ziele, die in diesem Unterricht verfolgt wurden, sind vielfältig: Die Lernenden sollten diese Texte verstehen und bei entsprechendem Lernerfolg selbst Texte (prosaische wie Briefe, Reden, Traktate, Verträge und poetische wie Epigramme, Epen, Oden, Dramen) nach den antiken Exempla verfassen können. Außerdem sollten sie, spätestens seit dem Beginn des Humanismus in Italien im 15. Jahrhundert, das Lateinische als *lingua franca* in Europa in Wissenschaft, Verwaltung, Politik möglichst vollkommen in Wort und Schrift, rezeptiv wie produktiv, zu beherrschen lernen.

Während die Komplexität des Unterrichtsgegenstandes "Sprache" keiner weiteren Erläuterung bedarf, ist die Komplexität des Unterrichtsgeschehens selbst wenigstens stichpunktartig anzudeuten: Unterricht zielt durch

Lehrverfahren vielfältiger und unterschiedlichster Art darauf, Lernprozesse anzustoßen, zu ermöglichen, zu steuern, zu sichern, zu evaluieren. Die über der Praxis des Sprachunterrichts operierenden Theorien rezipieren und integrieren in vielfältiger und zum Teil unterschiedlicher Weise Erkenntnisse und Konzepte verschiedener wissenschaftlicher Disziplinen, insbesondere der Pädagogik, der Psychologie, der Linguistik, der Literaturwissenschaft. Insofern es sich um Fremdsprachenunterricht handelt, integrieren sie zudem fremdsprachendidaktische Konzepte sowie Ergebnisse der Zweitsprachenerwerbsforschung (s. Art. 166) und der Fremdsprachenlehr- und -lernforschung.

Erst vor dem Hintergrund dieses komplexen Geflechts interdependent Einflußfaktoren läßt sich das Thema "Sprachunterricht" so eingrenzen, daß seine Behandlung in dem vorgegebenen Rahmen nicht als inadäquate Verkürzung oder Simplifizierung mißverstanden wird. Der Beitrag fokussiert die folgenden Aspekte:

- Konzepte für das Lehren und Lernen einer Sprache (insbesondere im fremdsprachlichen, aber auch im muttersprachlichen Unterricht) in Vergangenheit und Gegenwart in Auswahl und im Vergleich mit dem Schwerpunkt auf der Morphologie (s. 2),
- Konzepte pädagogischer Grammatiken für den Fremdsprachenunterricht (s. 3),
- Grammatik im muttersprachlichen Unterricht (s. 4).

### 2. Konzepte für das Lehren und Lernen einer Sprache

#### 2.1. Überblick

Überblickt man die Konzepte für das Lehren und Lernen einer Fremdsprache seit der Antike, so lassen sich immer wiederkehrende Grundpositionen feststellen, die einander zum Teil zu widersprechen scheinen:

- (a) monolinguale Konzepte vs. bilinguale Konzepte (s. 2.2),
- (b) Konzepte induktiven Lernens, das von Texten ausgeht und Regularitäten durch die Lernenden selbst entdecken läßt, vs. Konzepte deduktiven Lernens, das von den durch die Grammatik und die Leh-

renden zu vermittelnden Regeln und grammatischen Kategorien ausgeht, diese auswendig lernen und danach erst auf Beispielsätze und Texte anwenden läßt (s. 2.3),

## 2.2. Monolinguale vs. bilinguale Konzepte

### 2.2.1. Monolinguale Konzepte

**Monolinguale Konzepte** propagieren die möglichst ausschließliche Verwendung der Zielsprache im Unterricht und außerhalb des Unterrichts. Sie versprechen sich davon vor allem zweierlei: (a) das Zurückdrängen interlingualer, potentiell Fehler verursachender Interferenz der Muttersprache auf die zu erlernende Fremdsprache sowie (b) einen dem Erwerb der Muttersprache vergleichbaren direkten Erwerb der Fremdsprache.

Prominente Beispiele aus dem 20. Jahrhundert sind (a) die im Kontext der Reformpädagogik der zwanziger Jahre propagierte Direkte Methode, (b) die in den vierziger Jahren in den USA entwickelte "Army Method" für die schnelle Vermittlung von Grundfertigkeiten in ganz unterschiedlichen Sprachen an Angehörige der US-Army, die nach dem Zweiten Weltkrieg zur Audio-lingualen Methode mit dem Fokus auf dem Hören und Sprechen weiterentwickelt wurde, und (c) die in Frankreich am CREDIF ausgearbeitete Audio-visuelle Methode als Variante der Audio-lingualen Methode, die sich im Anfängerunterricht in extensiver Weise visueller Hilfen in Form von Bilderfolgen in Dia-Reihen zur "unmittelbaren" Bedeutungsvermittlung sowie zum Einprägen und Memorieren ganzer Dialoge anhand dieser Bilderserien bedient.

Angestoßen wurde die Entwicklung dieser Methoden aber bereits im 19. Jahrhundert, insbesondere durch die unter dem Pseudonym "Quousque tandem" publizierte grammatische Schrift des Anglisten Wilhelm Vietor mit dem Titel "Der Sprachunterricht muß umkehren", der eine radikale Abkehr von der im 19. Jahrhundert im Unterricht der klassischen Sprachen Latein und Griechisch praktizierten Lehr- und Lernverfahren forderte, die angeblich nur auf die Lektüre antiker Literatur und deren Übersetzung auf der Basis intensiven Grammatikunterrichts zielten.

Allerdings greift diese Auseinandersetzung, historisch betrachtet, zu kurz. Denn mit Sicherheit bis weit in das 18. Jahrhundert hinein zielte der Unterricht im Lateinischen auch auf die produktive Beherrschung der la-

teinischen Sprache in Schrift und Wort, war sie doch über Jahrhunderte hinweg die *lingua franca* Europas, die Sprache nicht nur der Kirche, sondern vor allem auch der Wissenschaften, in der sich die Vertreter aller Fakultäten mündlich wie schriftlich verständigten und ihre Werke publizierten. Das belegen die Unterrichtswerke selbst (beispielsweise schrieb Melanchthon für zwei seiner adeligen Privatschüler eine Grammatik des Griechischen für Lernzwecke in lateinischer Sprache), die überlieferten Unterrichtskonzepte (beispielsweise Comenius 1642) und die Schulordnungen für die Lateinschulen jener Zeit, in denen ausdrücklich gefordert wurde, daß sich die Schüler nicht nur in der Schule, sondern auch außerhalb der Schule des Lateinischen befleißigen sollten. In diesen Schulen wurde von Anfang an lateinisch gelesen, geschrieben, gehört und gesprochen; ja selbst die Grundlagen der Grammatik wurden mündlich im katechetischen Verfahren gelehrt und gelernt, bei dem die Schüler ihren Lehrer und der Lehrer seine Schüler nach festgelegten Mustern fragte:

"Partes orationis quot sunt? Octo. Quae? Nomen pronomen verbum adverbium participium coniunctio praepositio interiectio. Nomen quid est? Pars orationis cum casu corpus aut rem proprie communiter significans. Nomini quot accident? Sex. Quae? Qualitas comparatio genus numerus figura causus. ... Comparationis gradus quot sunt? Tres. Qui? Positivus, ut doctus, comparativus, ut doctior, superlativus, ut doctissimus ..." (Donati de partibus orationis ars minor, Keil 1864, Hrsg.: 355)

Der Unterschied zwischen diesem einsprachigen Konzept des Lateinlernens und den einsprachigen Konzepten zur Erlernung moderner Fremdsprachen ist freilich gravierend: In diesem Lateinunterricht wurde zunächst und vor allem das grammatische Kategoriensystem der acht Wortarten, meistens durch Beispiele illustriert, gelernt, im Grunde also eine Mischung von Primär- und Metasprache, bevor die Lektüre begann und die sprachlichen Muster durch dauernde mündliche Wiederholung eingeprägt wurden. Daß dieser Unterricht für die noch recht jungen Schüler häufig genug zur Qual wurde, belegen vor allem die heftigen Attacken bedeutender Humanisten (wie Erasmus, Comenius und vieler anderer), die das Nachplappern von nicht Verstandenen als sinn- und erfolglose Mühe verurteilten und statt dessen forderten, daß nur das gelernt werden könnte und sollte, was zuvor in seiner Bedeutung verstanden worden war.

Wie wurde und wird in einsprachigen Konzepten die Morphologie der Fremdsprache gelehrt und gelernt? Da auf die Muttersprache als Vergleichsbasis und als Erklärssprache zu verzichten ist, bleiben als Möglichkeiten vor allem (a) die direkte zielsprachliche Präsentation morphologischer Lerninhalte in Form von primärsprachlichen Beispielsätzen und tabellarischen Übersichten (Deklinations- und Konjugationsparadigma), (b) die metasprachliche Formulierung der jeweiligen Regularitäten in der Zielsprache, (c) das Reproduzieren und Variieren der jeweiligen Formen in zum Teil monotonen Übungen im Stile der "pattern drills" der audio-lingualen Methode zwecks unbewußter Automatisierung dieser Formen, (d) das Hoffen darauf, daß die "eingedrillten" Formen in der "freien" Sprachproduktion automatisch richtig verwendet werden – eine Hoffnung freilich, die sich nicht erfüllt, wenn nicht vielfältige Übungen zum produktiven Sprachgebrauch hinzutreten. Was demgegenüber bei strikter Handhabung des einsprachigen Prinzips als Möglichkeit ausscheidet, ist die Zuhilfenahme der Muttersprache als Vergleichsbasis und Kommunikationsmittel.

### 2.2.2. Bilinguale Konzepte

**Bilinguale Konzepte** propagieren den Einsatz der Muttersprache im Fremdsprachenunterricht in vielerlei Hinsicht, (a) zur Vermittlung der Bedeutung von Wörtern und Wortgruppen, (b) zur Formulierung grammatischer Regeln, (c) als Basis für den Vergleich der Zielsprache mit der Muttersprache, (d) zur Herüber- und Hinüberübersetzung sowohl zu Übungszwecken als auch als übergeordnetes Lernziel, (e) als Unterrichtssprache. Sie versprechen sich davon ein schnelleres und genaueres Verstehen der Bedeutung von Lexik und Grammatik, die Vermeidung von Interferenzfehlern durch Herausarbeitung der Unterschiede zwischen Zielsprache und Muttersprache und einen schnelleren Lernfortschritt.

Beispiele aus dem 20. Jahrhundert sind: (a) die von Butzkamm (1989) u. a. propagierte bilinguale Methode, bei der in Abkehr von dem zu engen Korsett der audio-lingualen Methode ein maßvoller und jeweils didaktisch genau zu begründender Einsatz der Muttersprache angeraten wird, (b) Suggestopädie und Superlearning, wobei in strenger Dogmatik der Ausgang vom muttersprachlichen Wort, Satzteil und Satz vorgeschrieben wird, denen jeweils die zielsprachlichen Wör-

ter, Formen und Strukturen unmittelbar zugeordnet werden, und (c) der Unterricht in Latein und Griechisch, in dem das Herüberübersetzen authentischer antiker Texte sowie deren Analyse und Interpretation das komplexe, erst allmählich zu erreichende Ziel ist, auf das hin jedoch alle didaktischen Überlegungen und methodischen Konzepte von Anfang an ausgerichtet sind.

Dieses didaktische Konzept des Lateinunterrichts wurde bereits im 19. Jahrhundert entwickelt und als generelles Konzept auf den Unterricht in den modernen Sprachen übertragen – was dann von Vietor und anderen (wie bereits gezeigt) heftig kritisiert wurde. Gleichwohl wird dieses Konzept der sogenannten Grammatik-Übersetzungsmethode bis in die Gegenwart zumindest in Teilespekten (z. B. muttersprachliche Erklärungen, Übersetzungsübungen) noch praktiziert. Dies gilt insbesondere für homogene Lernergruppen im Land der jeweiligen Muttersprache, auch wenn die Zielsetzung nicht auf Lesen, Verstehen und Übersetzen reduziert bleibt, sondern daneben und darüber hinaus auch Hören und Sprechen entwickelt werden sollen – mit häufig unbefriedigendem Erfolg, weil der Unterricht zu sehr durch ausschließlich deduktive Grammatikvermittlung und durch Übersetzungsübungen dominiert wird.

Ansätze des bilingualen Konzepts zur Vermittlung der Fremdsprache Latein sind bereits im frühen Mittelalter, wenn auch in sehr bescheidener Form, faßbar und weiten sich erst langsam in dem Maße aus, wie die *lingua vernacula* sich mit und an dem lateinischen Vorbild lexikalisch und grammatisch entwickelt; das vollzieht sich im romanisch-sprachigen Raum (Italien, Spanien, Frankreich) wesentlich früher und schneller als beispielsweise im deutschsprachigen Raum, bis auch hier aufgrund großer und zum Teil überspannter Anstrengung das Deutsche aufgrund extensiver Nutzung der Möglichkeiten der Wort(neu)bildung etwa Mitte des 17. Jahrhunderts einen Zustand erreicht hat, der die Sprachwissenschaftler wie Schottel und die Poeten und Poetiker wie Harsdörffer und Zesen nicht nur die Gleichrangigkeit, sondern sogar die Überlegenheit des Deutschen gegenüber dem Lateinischen und aller zeitgenössischen europäischen Sprachen konstatieren läßt.

Wie wurde und wird in diesen bilingualen Konzepten die Morphologie der Zielsprache gelehrt und gelernt? In den der antiken Grammatik in Gestalt der Ars Minor des Do-

nat verpflichteten zweisprachigen Grammatiken des Lateinischen seit dem 15. Jahrhundert sind folgende Verfahren zu beobachten: (a) Zunächst und vor allem wird das grammatische Kategoriensystem der *octo partes orationis* in Frage und Antwort gelehrt, wobei den lateinischen Beispielwörtern für die einzelnen Kategorien Übersetzungen dieser Beispielwörter in die jeweilige Muttersprache folgen. (b) Die metasprachlichen Fragen nach den Kategorien und die Antworten und Definitionen werden in einem weiteren Schritt ebenfalls in die jeweilige Muttersprache übersetzt, wobei die muttersprachliche Formulierung der zielsprachlichen lateinischen nachfolgen oder vorangehen kann. (c) Die Formen des Nomens und des Verbs erscheinen in systematisch geordneter und übersichtlicher tabellarischer Form, manchmal in Form kurzer Sätze in der Zielsprache, wiederum gefolgt von der Übersetzung in die Muttersprache. (d) Das Erlernen des kompletten morphologischen Systems dient (in Verbindung mit dem Erlernen eines Grundwortschatzes anhand von zweisprachigen Vokabellisten oder Wörterbüchern) zunächst dem Übersetzen lateinischer Texte ins Deutsche, sodann in zunehmendem Maße auch dem Verfassen lateinischer Texte; dabei wird implizit und kontinuierlich das fremdsprachliche morphologische System geübt. (e) Der Einbezug der Muttersprache in den Sprachunterricht dient vorrangig dem Erwerb der Zielsprache Latein, darüber hinaus aber auch der Entwicklung und Ausbildung der muttersprachlichen Kompetenz. (f) Gelegentlich wird die Einführung in die Grammatik der Muttersprache auch dem Lateinunterricht vorgeschaltet und verstanden als Propädeutikum des Lateinlernens.

Im gegenwärtigen Lateinunterricht finden sich viele dieser Merkmale wieder; ein wesentlicher Unterschied besteht freilich darin, daß von Anfang an mit lateinischen Texten gearbeitet wird, die es zu verstehen und zu übersetzen gilt; anhand dieser Texte erfolgt die Herausarbeitung morphologischer und syntaktischer Regularitäten, die in Form von Tabellen und Regeln sowie anhand von Beispielsätzen in grammatischen Übersichten in den Lehrbüchern und in eigenen Grammatiken des Lateinischen, in denen die Meta- und Erklärsprache die Muttersprache ist, zusammengestellt sind.

Analoge Übersichten über die Morphologie und Syntax finden sich in Lehrbüchern und Grammatiken der modernen Fremdspra-

chen; diese Übersichten kommen entweder ganz ohne Regelformulierungen aus oder bieten solche Formulierungen in möglichst einfacher Form in der Zielsprache oder in der Muttersprache. Sofern sie zweisprachig sind, kontrastieren sie darüber hinaus die morphologischen Systeme der Muttersprache und der Zielsprache, um das Verstehen zu erleichtern und um mögliche Interferenzfehler zu verhindern.

### 2.3. Konzepte induktiven vs. deduktiven Lernens

#### 2.3.1. Konzepte induktiven Lernens

**Konzepte induktiven Lernens** im Sprachunterricht zielen auf einen Lernprozeß, in dessen Verlauf die Lernenden selbst sprachliche Regularitäten entdecken und internalisieren und dabei zugleich die kognitiven Fähigkeiten des Vergleichens, Abstrahierens und Generalisierens entwickeln. Diese Konzepte werden des Weiteren mit dem Hinweis darauf begründet, daß die selbst entdeckten Regularitäten besser verstanden und behalten werden als vorformulierte Regeln, die auswendig zu lernen sind. Erkenntnisse der Gehirnforschung, nach denen Behaltensleistungen nach Differenziertheit und Dauer von der Intensität und Tiefe der kognitiven Verarbeitung von Informationen abhängen, tragen zur Fundierung dieser Konzepte bei: Je mehr Gehirnregionen gleichzeitig und parallel intensiv arbeiten, desto wahrscheinlicher ist es, daß die jeweilig bearbeiteten Sachverhalte aufgrund stabiler molekularer Veränderungen im sog. Langzeitgedächtnis gespeichert werden können.

Dabei ist jedoch zu beachten, daß viele Regularitäten einer Sprache aufgrund ihrer Kompliziertheit, Komplexität und Anzahl der "Ausnahmen" auf diesem Wege von den Lernenden selbst nicht oder nicht in einem überschaubaren und vertretbaren Zeitraum zu entdecken sind. Beispiele solcher komplexen und komplizierten Regularitäten sind: Gebrauch des definiten, des indefiniten und des Null-Artikels im Deutschen, der von der Linguistik mittels 55 Regeln – die Ausnahmen nicht mitgerechnet – beschrieben worden ist; Deklination der Nominal-Gruppe im Deutschen. Daneben gibt es aber eine Vielzahl von Regularitäten, die aufgrund ihrer Reichweite (keine oder nur ganz wenige Ausnahmen) und internen, vergleichsweise einfachen Struktur von den Lernenden in einem methodischen Drei-Schritt selbst entdeckt

werden können: (a) Sammeln/Ordnen (b) Vergleichen/Systematisieren und (c) Beschreiben.

Die Propagierung und Realisierung dieser Konzepte induktiven Lernens stehen in einem unlösbaren Zusammenhang mit grundlegenden pädagogischen Konzepten, welche die Lernenden, ihre Lernprozesse und Lernstrategien konsequent fokussieren, denen erst in einem zweiten Schritt geeignete Lehrprozesse, welche die Lernprozesse ermöglichen, fördern, und sichern sollen, zuzuordnen sind.

Beispiele für solche Konzepte finden sich überwiegend erst im 20. Jahrhundert, sind aber ansatzweise und indirekt bereits in früheren Jahrhunderten nachweisbar, zum Beispiel in der von Comenius propagierten und praktizierten Trias *exempla – pracepta – exercitia*, bei der die Beispiele den Regeln immer vorangehen sollen:

“Per Exempla, Praecepta, Exercitia, docentur et discuntur omnia ... Exemplum semper praecedat, Praeceptum semper sequatur, Imitatio semper urgeatur ... Per Exempla facilius discitur, quam per Praecepta. Facilius tamen per utrumque junctim. Sed ut Exempla praecedant ...” (Comenius 1642: 102 ff.)

Der Prozeß der Ermittlung der Regularitäten (“pracepta”) auf der Basis konkreten sprachlichen Materials (“exempla”) wird in Konzepten induktiven Lernens also von jedem Lernenden selbst vollzogen. Diese Konzepte haben zusammen mit anderen Einflußfaktoren etwa seit den siebziger Jahren des 20. Jahrhunderts zur Entwicklung von Fremdsprachen-Lehrwerken und von pädagogischen Grammatiken geführt, in denen selbständiges und selbsttätiges Lernen im Mittelpunkt aller didaktischen Überlegungen und methodischen Konkretisierungen steht.

Wie wurde und wird in Konzepten induktiven Lernens die Morphologie der Zielsprache gelernt? Die Lernenden selbst analysieren, spontan oder durch entsprechende Aufgabenstellungen dazu aufgefordert, das präsentierte sprachliche Material mit dem Ziel, Regularitäten der Formenbildung und des Gebrauchs dieser Formen zu entdecken und in Paradigmata und Regeln (zunächst in der Muttersprache, dann zunehmend auch in der Zielsprache) abzubilden. Diese Analyse läßt sich in die drei bereits erwähnten Analysestufen gliedern: (a) Sammeln/Ordnen (b) Vergleichen/Systematisieren und (c) Beschreiben. Sie operiert auf und vor dem Hintergrund sowohl des muttersprachlichen Kön-

nens und des sich allmählich parallel herauskristallisierenden Wissens, als auch des jeweils erworbenen zielsprachlichen Wissens und Könnens. Der Analyse müssen sodann vielfältige Übungen im Erkennen und im Gebrauch der jeweiligen Formen folgen.

Zu beachten ist, daß die einzelnen morphologischen Subsysteme (z. B. das Tempusystem) weder in einem einzigen Zugriff noch *in toto* behandelt und internalisiert werden können, sondern in mehreren, aufeinander aufbauenden Zugriffen und in einem Grad von “Vollständigkeit”, der didaktisch (auf der Ebene der Lernzielermittlung und -beschreibung) und nicht primär linguistisch (im Sinne des Vollständigkeitspostulats) zu definieren ist.

Hochkomplexe Strukturen mit einem hohen Maß an Irregularitäten jedoch sind mit Konzepten induktiven Lernens allein nicht zu bewältigen.

### 2.3.2. Konzepte deduktiven Lernens

**Konzepte deduktiven Lernens** im Sprachunterricht zielen auf einen Lernprozeß, in dessen Verlauf die Lernenden die in z. T. komplexen und zudem kompliziert formulierten Regeln generalisierten Regularitäten einer Sprache lesen und auf ausgewählte, meist kontextlose Beispielwörter und -sätze anwenden. Die Lernenden werden dabei von Anfang an mit abstrakter linguistischer Metasprache in komprimierter Form konfrontiert, welche das Verstehen erschwert, wenn nicht gar verhindert, weil sie vor dem konkreten Gegenstand, der Sprache, die abstrakte und komprimierte Beschreibung dieses Gegenstands kennenzulernen und verstehen sollen. Ein solches Verfahren läßt sich pädagogisch und lernpsychologisch schwerlich begründen. Gleichwohl scheint es sich immer noch einer gewissen Beliebtheit zu erfreuen. Über die Gründe dafür läßt sich nur spekulieren: Sicherheit seitens der Lehrperson aufgrund ihres überlegenen Wissens, scheinbare Zeitersparnis, auch in anderen Fächern praktizierte Vermittlung von Fachwissen, Verankerung in der Tradition der Vermittlung des Lateinischen und Griechischen.

Wie wurde und wird in Konzepten deduktiven Lernens die Morphologie der Zielsprache gelehrt und gelernt? Lehrbücher und Lehrpersonen präsentieren die jeweiligen Formen der zu erlernenden Sprache in enger Anlehnung an die linguistische Beschreibung dieser Formen in linguistischen Grammatiken in Form von Paradigmata, Regeln und

Ausnahmen von den Regeln in der Muttersprache der Lernenden; bei Einbeziehung des kontrastiven Aspekts erfolgt darüber hinaus ein Vergleich mit den jeweiligen Formen der Muttersprache, insbesondere dann, wenn systematische Unterschiede negativen Transfer möglich oder wahrscheinlich erscheinen lassen. Als Beleg für die jeweiligen Regeln und Ausnahmen folgen sodann Beispielwörter und Beispielsätze. Die Lernenden müssen als erstes die schwierigen metasprachlichen Regelformulierungen verstehen, bevor sie sie auf primärsprachliche Wörter, Sätze und Texte anwenden. Während dieses Verfahren bei der Rezeption von Texten in schriftlicher Form sinnvoll sein kann, kann es bei der schriftlichen und allemal bei der mündlichen Produktion dazu (ver)führen, Sätze durch parallele Anwendung einer Vielzahl von Einzelregeln konstruieren zu wollen, was die Konzentration auf den Inhalt der Aussage erschwert und die Flüssigkeit der Äußerung erheblich beeinträchtigen kann. Deshalb kommen auch deduktive Konzepte ohne viele und vielfältige Übungen, die auf "Automatisierung" der zu erlernenden Formen zielen, nicht aus.

### 3. Konzepte pädagogischer Grammatiken für den Fremdsprachenunterricht

Konzepte pädagogischer Grammatiken für den Fremdsprachenunterricht basieren nicht alleine auf linguistischen Beschreibungen der jeweiligen Zielsprache, sondern darüber hinaus auf lernpsychologischen Erkenntnissen allgemein sowie Erkenntnissen der Kognitionswissenschaft (*Cognitive Sciences*) und

der Zweitsprachenerwerbsforschung (s. Art. 166) sowie zunehmend auch der Fremdsprachenlehr- und -lernforschung. Da dem Fremdsprachenunterricht aufgegeben ist, das Verstehen und den Gebrauch der Fremdsprache bei den Lernenden zu entwickeln, führt das zu Funktionsbestimmungen und Realisierungsformen von Grammatik, die sich von Funktionsbestimmungen und Realisierungsformen rein linguistischer Grammatiken zum Teil deutlich unterscheiden.

Autoren pädagogischer Grammatiken für den Fremdsprachenunterricht bedienen sich deshalb auch morphologischer Theorien und der auf diesen Theorien basierenden Darstellungen der Morphologie in eklektischer und souveräner Weise: Sie sichten den Formenbestand einer Sprache und die den Formen, ihren Funktionen und ihrem Gebrauch innewohnenden Regularitäten. Sie analysieren diese Regularitäten im Hinblick auf ihre Reichweite (den Grad der ihnen innewohnenden Irregularitäten) und ihren Komplexitätsgrad. Die Ergebnisse dieser Analysen sind eine wichtige Basis für die Auswahl, Progression und Präsentation unter lernpsychologischen Gesichtspunkten.

Der Wert einzelner morphologischer Theorien, wie beispielsweise des Strukturalismus, bestimmt sich danach, ob und gegebenenfalls bis zu welchem Grad die auf ihnen basierenden Beschreibungen den Anforderungen des Lehr- und Lernprozesses entsprechen. Abstrakte Darstellungen sind von weit geringerem Wert als Darstellungen, die anhand von kontextualisierten Beispielen die jeweiligen Regularitäten besser verstehbar und behaltbar machen. Metasprachlich möglichst einfache Regelformulierungen mit Fokussierung

Linguistische Grammatik	Lerner-Grammatik
Totalität (Ausnahmen von der "Regel" besonders wichtig)	Auswahl
Abstraktheit (der Beschreibung/Darstellung)	Konkretheit/Anschaulichkeit (der Abbildung/Darstellung)
Kürze (der Darstellung)	Ausführlichkeit (der Darstellung der als wichtig erkannten Elemente)
Keine lernpsychologischen Vorgaben/ Rücksichten	Lernpsychologische Kategorien (Verstehbarkeit, Behaltbarkeit, Anwendbarkeit)

Tab. 177.1: Wesentliche Unterschiede zwischen einer linguistischen und einer Lerner-Grammatik (Schmidt 1992: 163)

des Wesentlichen sind von weit größerem Wert als in zum Teil eigenwilliger Metasprache gefaßte Regelformulierungen mit Fokussierung aller nur denkbaren Ausnahmen und Ausnahmen von den Ausnahmen.

Pädagogische Grammatiken für den Fremdsprachenunterricht lassen sich deshalb auch nicht einfach aus linguistischen Grammatiken durch Kürzung und Vereinfachung deduzieren, sondern sind Sprachbeschreibungen *sui generis* (s. Art. 11).

Zentrale Funktionen solcher Grammatiken sind:

- (a) Sie sollen die Einsicht der Lernenden in die Regularitäten grammatischer Formen, Strukturen und Funktionen fördern.
- (b) Sie sollen das Einprägen, das Behalten und die Abrufbarkeit dieser Regularitäten unterstützen.
- (c) Sie sollen die möglichst fehlerlose Beherrschung der Fremdsprache entwickeln helfen.
- (d) Sie sind damit "nur" Instrument, nicht Selbstzweck.

#### 4. Grammatik im muttersprachlichen Unterricht

Grammatik im muttersprachlichen Unterricht unterscheidet sich prinzipiell ebenso von rein linguistischen Grammatiken wie Grammatik im Fremdsprachenunterricht, insofern auch bei dieser Grammatik lernpsychologische Erkenntnisse sowie pädagogische und didaktische Konzepte eine entscheidende Rolle spielen.

Grammatik im muttersprachlichen Unterricht setzt – im Unterschied zu Grammatik im Fremdsprachenunterricht – die je nach Altersstufe und individuellen Lernbiographien unterschiedlich weit fortgeschrittene Beherrschung der Muttersprache voraus. Vor diesem Hintergrund dient sie vor allem der kognitiven Auseinandersetzung mit den Formen und Strukturen der eigenen Sprache sowie deren Funktionen und Leistungsfähigkeit in Wort und Schrift. Damit lassen sich Zielsetzungen auf unterschiedlichen Ebenen verbinden, die zudem noch nach Altersstufen variieren können, z. B.: Unterstützung beim Erlernen der Orthographie (auf der Primarstufe) mittels spielerischem und entdeckendem Umgang mit der eigenen Sprache; Einsicht in grundlegende Regularitäten und Funktionsweisen der eigenen Sprache zwecks

Verbesserung der mündlichen und Entwicklung der schriftlichen Kompetenz sowie zwecks Förderung der Fähigkeit zur Textanalyse und -interpretation (auf der Sekundarstufe I); Entwicklung der Fähigkeit zu Analyse, Generalisierung und Abstraktion ("formale" Bildung); Kennenlernen und Verstehen linguistischer Kategorien und Terminologie(n) (und damit in gewisser Weise Vorbereitung und Entlastung des nachfolgenden oder parallel einsetzenden Unterrichts in einer ersten Fremdsprache).

Welchen Stellenwert hat Morphologie in diesen Zielhorizonten? Die Behandlung morphologischer Themen im muttersprachlichen Unterricht dient vor allem dazu, die Morphologie der eigenen Sprache zu entdecken und die metasprachliche Beschreibung morphologischer Sachverhalte zu verstehen. Das impliziert zunächst und vor allem das (Kennens-)Lernen grundlegender Kategorien, insbesondere der Wortarten und ihrer Akzidentien (z. B. Verb; die Tempora wie Präsens, Perfekt usw., die Genera wie Aktiv und Passiv, die Modi wie Indikativ, Konjunktiv usw.); unterschiedliche linguistische Verfahren, Modelle und Terminologien stellen dabei ein großes Problem dar, insofern sie zu erheblichen Konfusionen in den Köpfen der Lernenden führen können, wenn sie beispielsweise auf der Primarstufe mit anderen Begriffen konfrontiert werden als auf der Sekundarstufe I, oder wenn zeitlich parallel im muttersprachlichen Unterricht andere Begriffe für dieselbe Sache verwendet werden als im fremdsprachlichen Unterricht.

Des weiteren war und ist Grammatik im muttersprachlichen Unterricht immer beeinflußt von Entwicklungen in der Sprachwissenschaft: Während bis weit ins 20. Jahrhundert hinein Verfahren, Modelle und Kategorien der lateinischen Grammatik die Grundlage grammatischer Darstellungen in Sprachbüchern gewesen sind, haben etwa seit der Mitte des 20. Jahrhunderts Entdeckungsprozeduren, Modelle, Kategorien und Begrifflichkeiten des Strukturalismus verstärkt in Sprachbüchern und damit auch im Sprachunterricht Platz gegriffen. Exemplarisch verwiesen sei auf den "Sprachspiegel" von Hans Glinz (1969, Hrsg.), in dem Entdeckungs- und Analyseprozeduren des Strukturalismus zu von den Schülern handhabbaren operationalen Werkzeugen für den entdeckenden Umgang mit der eigenen Sprache gemacht werden: Der Permutationstest wird zur Umstellprobe, mit deren Hilfe Satzglieder ent-

deckt und abgegrenzt werden sollen; der Deletionstest wird zur Weglaßprobe, mit deren Hilfe Kernsätze entdeckt werden sollen; die Infinitivierung wird dazu verwendet, das Subjekt (oder die Nominalphrase des Knotens Satz im strukturalistischen Syntax-Modell) von dem Rest des Satzes (oder der Verbalphrase des strukturalistischen Modells) zu trennen, und so fort. Zugleich werden allerdings auch neue Begrifflichkeiten eingeführt (z. B. Grundgröße für Subjekt, Gleichgröße für Prädikatsnomen, Anteilgröße für Genitivobjekt, Zuwendgröße für Dativobjekt usw.), die sich weder im muttersprachlichen Deutschunterricht generell noch gar im Fremdsprachenunterricht durchsetzen konnten.

Neuere Entwicklungen innerhalb der Linguistik, insbesondere die Erweiterung des Analysegegenstands über Morphem, Syntagma und Satz hinaus auf Text, Kommunikation, sprachliches Handeln, Spracherwerb und die damit einhergehende Untergliederung der Linguistik in weitere Teildisziplinen (Textlinguistik, Pragmalinguistik, Psycholinguistik u. a.) haben sich ebenfalls auf den muttersprachlichen Unterricht und den Teilbereich "Reflexion über Sprache", innerhalb dessen Grammatikunterricht wiederum einen Teilbereich darstellt, ausgewirkt. In ihrem Buch "Der andere Grammatikunterricht" fragen Boettcher & Sitta "... nach Begründungen, Prinzipien und Realisierungsmöglichkeiten von Grammatikunterricht im Rahmen des Lernfelds 'Reflexion über (sprachliche) Kommunikation' im Kontext eines insgesamt schüler- und situationsbezogenen Deutschunterrichts" (Boettcher & Sitta 1978: 5).

Welche Bedeutung kommt in einem solchen Konzept noch der Vermittlung der Einsicht in die Morphem-, Phrasen- und Satzstrukturen der Muttersprache zu? Generell läßt sich feststellen, daß die Reflexion über diese Strukturen instrumentalisiert wird für die Lösung von sprachlichen und kommuni-

## XXI. Morphologie und Nachbardisziplinen

kativen Problemen in für die Schüler relevanten Situationen außerhalb der Schule, aber auch innerhalb der Schule und innerhalb einzelner Fächer. Es bleibt aber zu fragen, ob und in welcher Weise in diesem anderen Grammatikunterricht eine auch situationsunabhängige systematische Vermittlung der o. g. Strukturen erfolgen kann oder darf, welche die Schüler kennengelernt haben müssen, wenn sie mit ihnen arbeiten sollen.

## Verzeichnis der Abkürzungen / List of Abbreviations

### 1. Deutsch

Ø	Null	INCH	Inchoativ
1	1. Person	IND	Indikativ
2	2. Person	INDEF	indefinit
3	3. Person	INF	Infinitiv
ABL	Ablativ	INSTR	Instrumental
ABS	Absolutiv (Kasus/Funktion des ergativischen Systems)	INT	Interrogativ
ADJR	Adjektiv(alis)ator	INTS	Intensiv
ADVR	Adverbalisator	IO	indirektes Objekt
AG	Agens	IPFV	Imperfektiv
AKK	Akkusativ	IRR	Irrealis
AKT	Aktiv	KAUS	Kausativ
ALL	Allativ	KLN	Nominalklasse n
AOR	Aorist	KMPR	Komparativ
APPL	Applikativ	KOMIT	Komitativ
ART	Artikel	KOMP	Kompletiv
ASRT	Assertiv	KOND	Konditional
AUG	Augmentativ	KONJ	Konjunktiv
AUX	Auxiliar	KONN	Konnektor
DAT	Dativ	KONSEK	Konsekutiv
DEF	definit	KOP	Kopula
DEM	Demonstrativ	LIG	Ligatur
DIR	Direktional	LOK	Lokativ
DISTR	Distributiv	M	maskulinum
DO	direktes Objekt	MED	medial (nicht-finaler Satz)
DU	Dual	MEDPASS	Mediopassiv
DYN	dynamisch	N	neutrum
ERG	Ergativ	NEG	negativ
EXIST	Existential	NOM	Nominativ
F	femininum	NPRT	Nicht-Präteritum
FAKT	Faktitiv	NR	Nominalisator
FOK	Fokus	OBJ	Objekt
FUT	Futur	OBL	Oblik
GEN	Genitiv	OBLG	Obligativ
GER	Gerundium	OPT	Optativ
HABIT	Habitualis	PART	Partizip
IMP	Imperativ	PASS	Passiv
IMPF	Imperfekt	PAT	Patiens
INAKT	inaktiv	PF	Perfekt
		PFV	Perfektiv
		PL	Plural
		PLUP	Plusquamperfekt
		POSS	Possessiv (pronominales Element)

POT	Potentialis	ANIM	animate
PRÄS	Präsens	AOR	aorist
PRÄT	Präteritum	APASS	antipassive
PRIV	Privativ	APPL	applicative
PROG	Progressiv	ART	article
PROLAT	Prolativ	ASRT	assertive
PROZ	Prozessiv	ASS	(as)sociative
RDP	Reduplikation	AT	actor topic
REFL	reflexiv	AUG	augmentative
RELL	Relational(isator)	AUX	auxiliary
REZ	reziprok	AVERS	aversive (abessive)
S	intransitives Subjekt	BEN	benefactive
SG	Singular	CAUS	causative
STAT	Stativ	CL	classifier
SUP	Superlativ	CLN	noun class n
TOP	Topik	CMPR	comparative
VEN	Venitiv	COLL	collective
VOK	Vokativ	COMIT	comitative
VR	Verbalisator	COMPL	completive
ZIRK	Zirkumstantiell	COND	conditional
		CONJ	conjunctive
		CONN	connector
		CONSEC	consecutive
		CONSTR	construct
		CONT	continuous
		COP	copula
Ø	zero	D1	deictic of 1 <sup>st</sup> person
1	1 <sup>st</sup> person	D2	deictic of 2 <sup>nd</sup> person
2	2 <sup>nd</sup> person	D3	deictic of 3 <sup>rd</sup> person
3	3 <sup>rd</sup> person	DAT	dative
ABL	ablative (separative)	DECL	declarative
ABS	absolutive (case/function of ergative system)	DEF	definite
ABSL	absolute (free form of noun)	DEM	demonstrative
ABSTR	abstract	DES	desiderative
ACAUS	anticausative (deagentive)	DET	determiner
ACC	accusative	DETR	detransitivizer
ACNNR	action nominalizer	DIM	diminutive
ACR	actor	DIR	directional
ACT	active	DIST	distal (remote)
ADESS	adessive	DISTR	distributive
ADJR	adjectiv(al)izer	DON	donative
ADM	admonitive	DR	direct
ADVR	adverbializer	DS	different subject
AG	agentive	DU	dual
AGNR	agent nominalizer	DUB	dubitative
AGR	agreement	DUR	durative
AGT	agent	ELAT	elative
ALL	allative	EMPH	emphasizer/emphatic
ANA	anaphoric	EQT	equative
AND	andative	ERG	ergative
		EVID	evidential

## 2. English

Ø	zero	D1	deictic of 1 <sup>st</sup> person
1	1 <sup>st</sup> person	D2	deictic of 2 <sup>nd</sup> person
2	2 <sup>nd</sup> person	D3	deictic of 3 <sup>rd</sup> person
3	3 <sup>rd</sup> person	DAT	dative
ABL	ablative (separative)	DECL	declarative
ABS	absolutive (case/function of ergative system)	DEF	definite
ABSL	absolute (free form of noun)	DEM	demonstrative
ABSTR	abstract	DES	desiderative
ACAUS	anticausative (deagentive)	DET	determiner
ACC	accusative	DETR	detransitivizer
ACNNR	action nominalizer	DIM	diminutive
ACR	actor	DIR	directional
ACT	active	DIST	distal (remote)
ADESS	adessive	DISTR	distributive

AGR	agreement	DUR	durative
AGT	agent	ELAT	elative
ALL	allative	EMPH	emphasizer/emphatic
ANA	anaphoric	EQT	equative
AND	andative	ERG	ergative
		EVID	evidential

EXIST	exist(ential)	N	neuter
EXPER	experiential	NARR	narrative
F	feminine	NEG	negative
FACT	factitive	NFIN	non-finite
FIN	finite	NFUT	non-future
FOC	focus	NHUM	non-human
FUT	future	NOM	nominative
GEN	genitive	NPST	non-past
GER	gerund (conjunctive participle)	NR	nominalizer
GNR	generic	OBJ	object
HABIT	habitual (customary)	OBL	oblique
HEST	hesternal	OBLG	obligative
HODPST	hodiernal past	OBV	obviative
HON	honorific	OPT	optative
HORT	(ad-/co-)hortative	PART	participle
HUM	human	PASS	passive
ILL	illative	PAST	past
IMM	immediate	PAT	patient
IMP	imperative	PATNR	patient nominalizer
IMPF	imperfect	PE	plural exclusive
IMPR	impersonal	PF	perfect
INACT	inactive	PFV	perfective
INAN	inanimate	PI	plural inclusive
INCH	inchoative	PL	plural
INCOMPL	incomplete	PLUP	pluperfect
IND	indicative	PNCT	punctual
INDEF	indefinite	POSS	possessive (pronominal element)
INDEP	independent	POT	potential
INESS	inessive	PRES	present
INF	infinitive	PRET	preterite
INFR	inferential	PRIV	privative
INGR	ingressive (inceptive)	PROC	processive
INSTNR	instrument nominalizer	PROG	progressive
INSTR	instrumental	PROH	prohibitive
INT	interrogative	PROPR	proprietary
INTS	intensive (reinforcement marker)	PROX	proximal (local deixis)
INV	inversive	PRTV	partitive
INVIS	invisible	PRX	proximate (pronominal)
IO	indirect object	PT	patient topic
IPFV	imperfective	PURP	purposive
IPS	impersonal passive	QUOT	quotative
IRR	irrealis	REC	reciprocal
ITER	iterative	RECPST	recent past (immediate past)
JUSS	jussive	RDP	reduplication
LOC	locative	REFL	reflexive
LOG	logophoric	REL	relative
LT	locative topic	RELL	relational(izer)
M	masculine	REM	remote
MANNR	manner nominalizer	REMPST	remote past
MED	medial (non-final clause)	REP	repetitive
MID	middle (medio-passive)	RES	resultative
		RLS	realis

RPRT	reportative	SUP	superlative
S	intransitive subject	SUPESS	superessive
SBJ	subject	TOP	topic
SENS	sensory evidential	TRNSL	translative
SEQ	sequential	TRL	trial
SG	singular (restricted)	TRR	transitivizer
SPEC	specific	UGR	undergoer
SR	subordinator	VEN	venitive
SS	same subject	VOC	vocative
STAT	stative	VOL	volitive
SUBESS	subessive	VR	verbalizer
SUBJ	subjunctive	VIS	visible

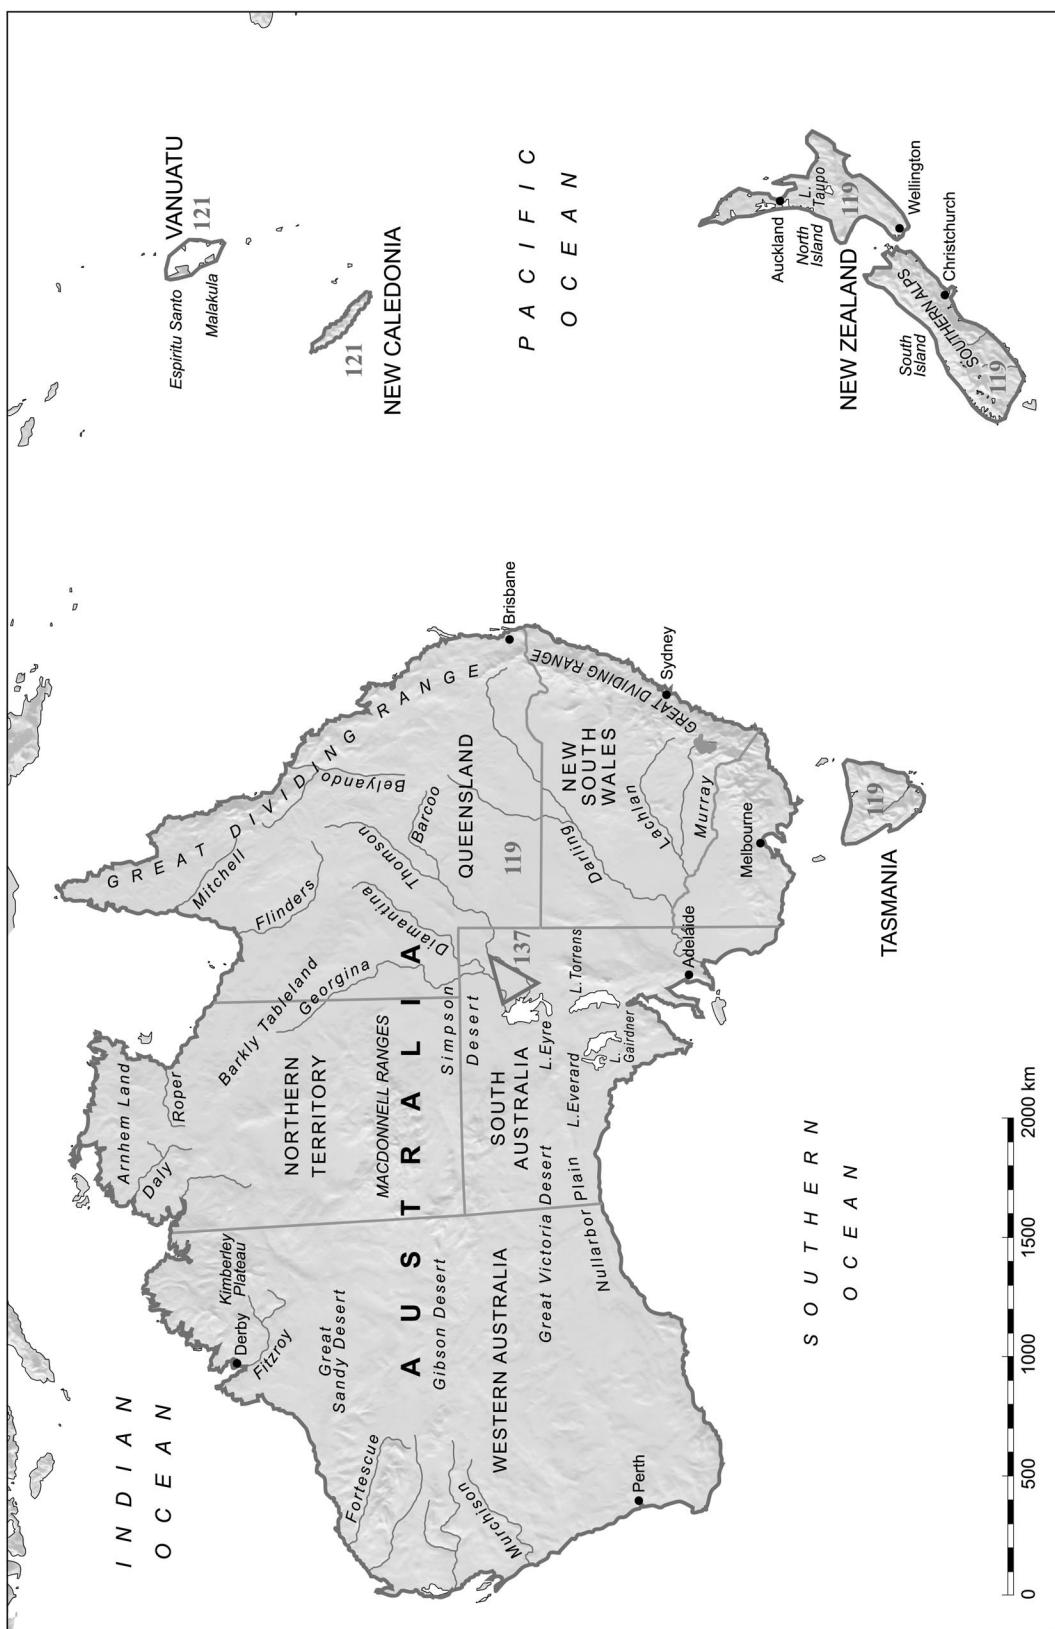

# Sprachenkarten/Language maps

## 1. Afrika/Africa

119. English (Indo-European: Germanic)  
121. Français (Indo-européen: Roman)  
139. Turkana (Nilo-Saharan)  
140. Twi (Kwa)  
141. Kinyarwanda (Bantu)

## 2. Australien/Australia

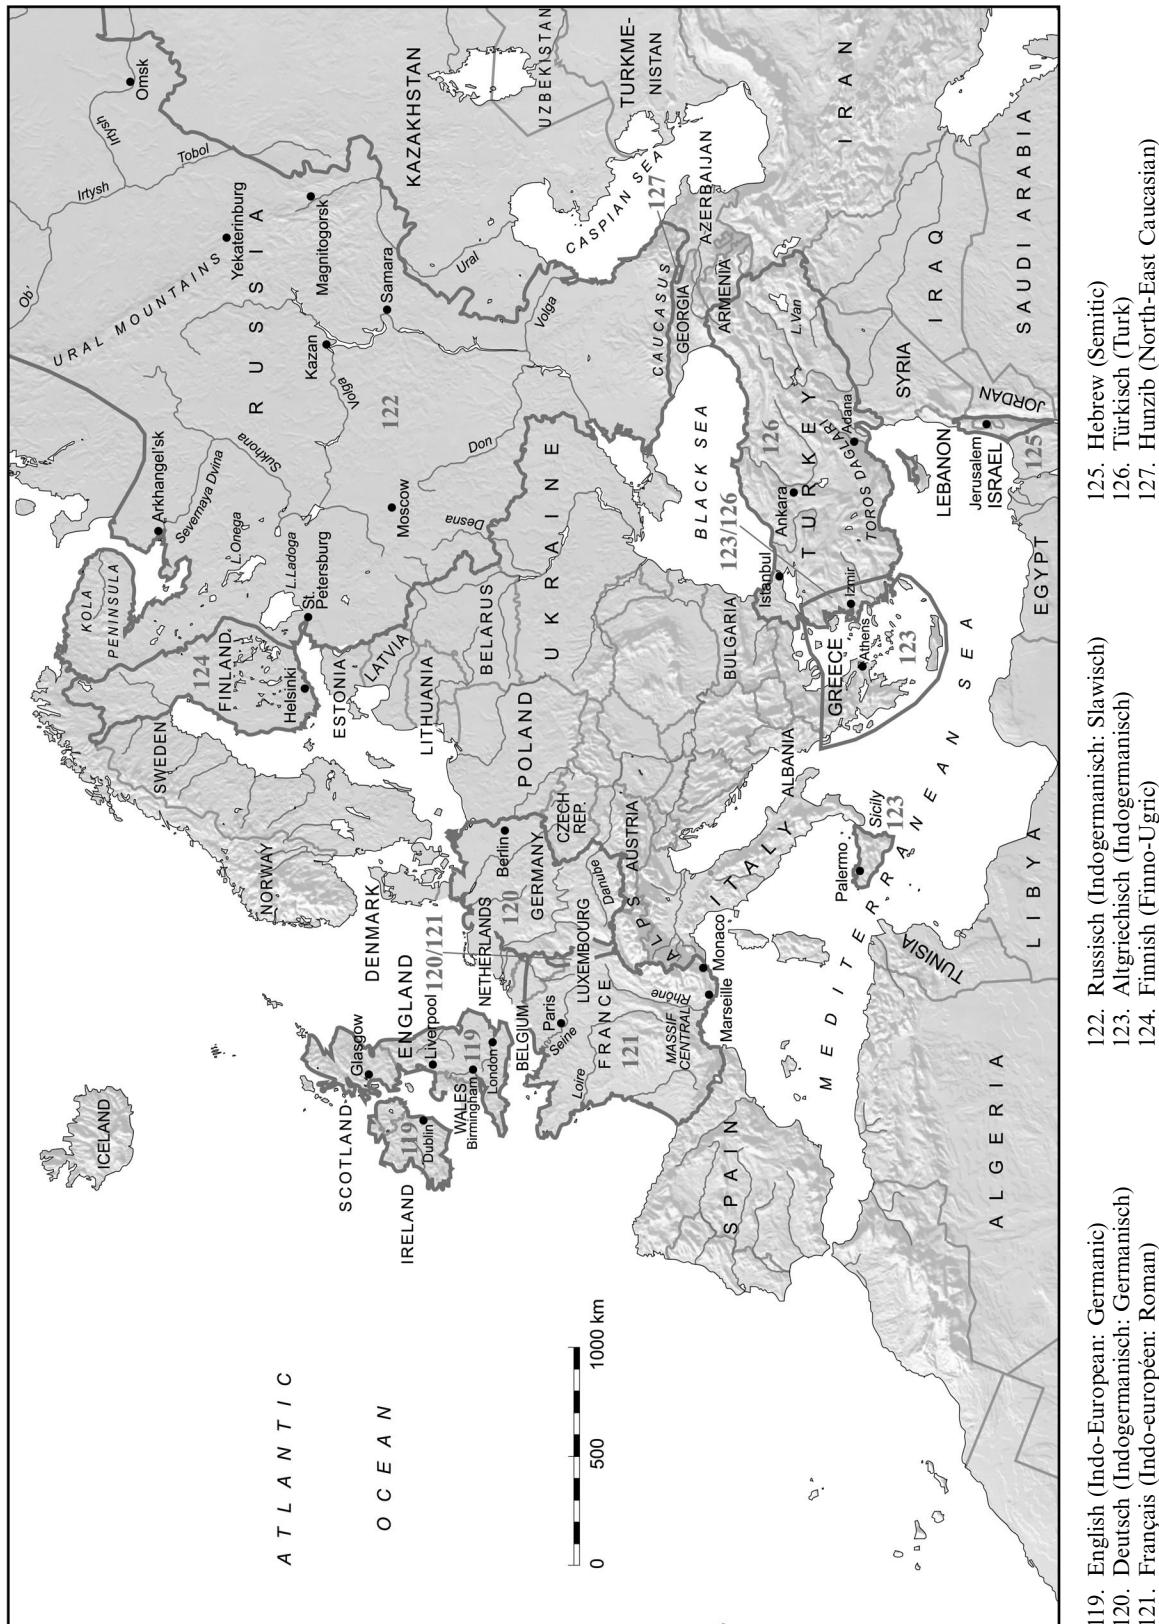

119. English (Indo-European: Germanic)

121. Français (Indo-européen: Roman)

137. Diyari (Pama-Nyungan)

## 3. Europa und Nahost/Europe and Near East

## 4. Nordasien/North Asia

122. Russisch (Indogermanisch: Slawisch)

128. Ketisch (Jenisieisch)

## 5. Nordamerika/North America

119. English (Indo-European: Germanic)  
 121. Français (Indo-européen: Roman)  
 129. West Greenlandic (Eskimo)

130. Koyukon (Athapaskan)  
 131. Montagnais/Innu-aimun (Algonquian)

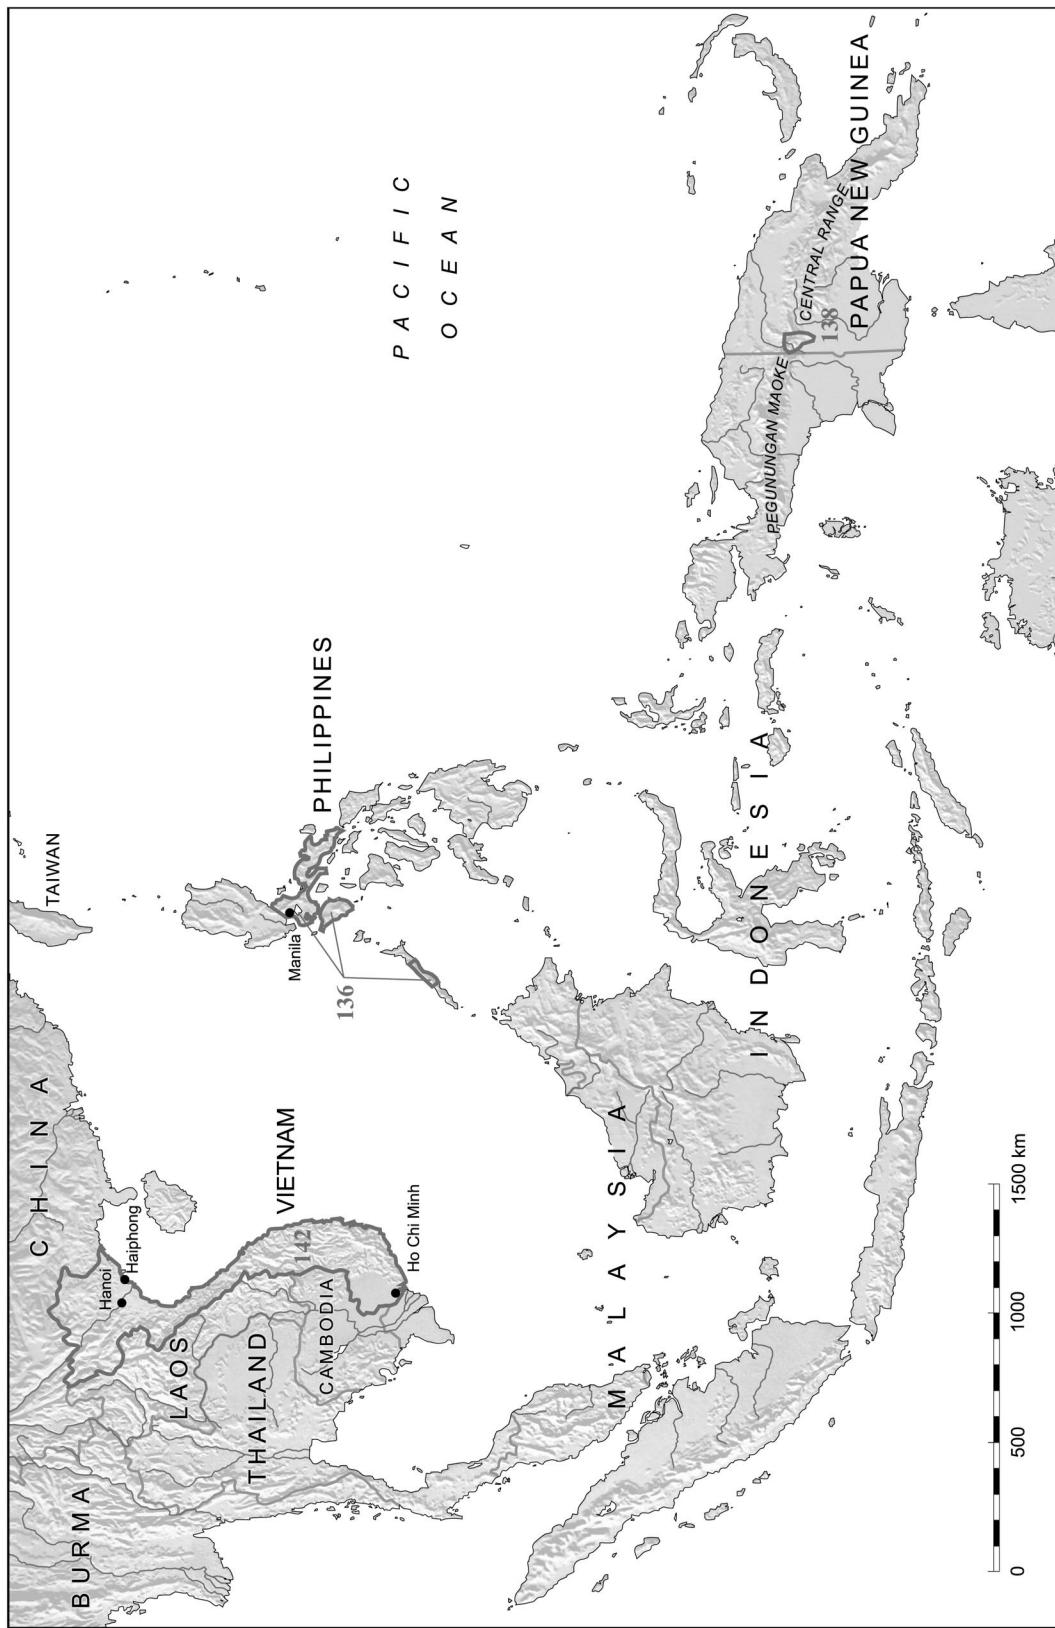

## 6. Südamerika/South America

119. English (Indo-European: Germanic)  
 121. Français (Indo-européen: Roman)  
 132. Guarani (Tupi-Guarani)

134. Quechua (Quechua)  
 135. Yagua (Peba-Yaguan)

## 7. Südostasien/South East Asia

136. Tagalog (Austronesian)

138. Wambon (Awyu)

142. Vietnamese (Viet-Muong)

 Kasus/case 1011, 1073, 1304, 1331, 1568, 1595, 1699, 1713, 1747, 1862  
 – abessive 1085  
 – ablative 1494, 1514  
 – accusative 1493 f.  
 – case form 1074  
 – case language 1074  
 – case marker 1074  
 – case marking 737  
 – case morphology 1812  
 – case relation 1074  
 – Dativ/dative 1092, 1494, 1862  
 – direct case 1076, 1080, 1723  
 – ergative 1081  
 – genitive 744, 1514, 1748  
 – independent case 604  
 – indirect case 1080  
 – instrumental 1085, 1514  
 – Kasusnivellierung 1691  
 – Kasussynkretismus 1766

- Kasussystem 1316
  - Lokalkasus 1092
  - nominative 1493 f., 1514
  - oblique case 738, 1076, 1080, 1086, 1723
  - obviative 1005
  - primary case 604
  - secondary derivative case 604
  - Trennbarkeit von Kasus- und Numerusflexion 1268
  - vocative 1086, 1444
  - Kayne's Generalization 398
  - Klammerform 894
  - Klasse/class
    - class-free suffix 1456
    - closed class 249, 1112
    - complementary class 634
    - default class 635
    - Deklinationsklasse/declension class 735 f., 1316
    - distributional class 733
    - form class 677
    - Klassenwechsel 1690
    - macroclass 632, 634
    - morphological class 1507
    - open class 249, 1112
    - unmarked class 635
  - Klassifikator/classifier 735, 1070, 1094, 1467
    - general classifier 1017
    - genitive classifier 1021
    - incorporated classifier 1022
    - mensural classifier 1020, 1070
    - noun classifier 1021
    - numeral classifier 1019
    - possessive classifier 1862
    - sortal classifier 1020, 1070
    - specific classifier 1017
    - typology of classifiers 1018
    - unique classifier 1017
    - verbal classifier 1022
  - klassifikatorischer Schlüssel 1243
  - Klassifizierung 1271
  - Kognitionswissenschaft 1766
  - koine 1741
  - Kombinationsfähigkeit 677
  - Komparation/comparison 1212, 1306, 1569
    - absolute comparative 1213
    - comparative construction 1212
    - comparee/topic of comparison 1212 f.
    - comparison of equality 1213
    - comparison of majority 1213
    - comparison of minority 1213
    - komparativ/comparative 1213, 1257, 1306 f., 1717
    - marker of comparison (s. comparison, pivot of)
    - pivot of comparison/marker of comparison, 1212
  - standard of comparison 1212 f.
  - Kompatibilität 1565
  - Kompositbildung 1307 f.
  - Komposition/composition/com-  
pounding 344, 370, 524, 527, 833, 1262, 1275, 1325, 1416, 1428, 1511, 1567, 1675 f., 1693, 1759, 1801, 1852
    - bahuvrihi compound 1631, 1675
    - composite word/complex word 405
    - compound lexeme 1627
    - compound phrase 889
    - denominales Kompositum 1566 f.
    - deverbales Kompositum 1566
    - Distanzkompositum 1277
    - eigentliches Kompositum 1683
    - endozentrisches Kompositum 444
    - exozentrisches Kompositum/exocentric compound 444, 1276, 1631
    - fossilized compound 1627
    - imperative compound 1631, 1677
    - Kompositum/compound 888, 1308, 1677, 1704, 1717, 1728, 1813, 1890, 1926
    - Konfixkompositum 895
    - Kopulativkompositum 887, 1276
    - phrasal compound 166, 1657
    - Possessivkompositum 1276
    - präpositionales Kompositum 889
    - Pseudokompositum 890
    - stub compound 1256
    - syntactic compound 1627
    - synthetic compound 166, 891
    - verbales Pseudokompositum 1277
    - Verbalkompositum 1277
    - Verb-Ergänzung-Kompositum 890
  - Kompositionalität, synchrone 1273
  - conditional/conditional 1204, 1458, 1569, 1703, 1715
  - Konditionierung 239
    - distributionelle phonologische Konditionierung 463
    - formale phonologische Konditionierung 463
    - grammatische Konditionierung 474
    - lexikalische Konditionierung 474
    - morphologische Konditionierung 474
  - phonologische Konditionie-  
rung 463
  - primäre phonologische Kon-  
ditionierung 465
  - reziproke Konditionierung 475
  - sekundäre phonologische Konditionierung 465
  - semantische Konditionierung 477
  - syntaktische Konditionierung 480
  - Konfix 893, 895, 1276
  - Konfixderivat 895
  - Konfixkompositum 895
  - Kongruenz/agreement 365, 1002, 1270, 1514, 1725, 1799, 1811
  - Konjugation 1569
  - Konjunktion 675
  - Konjunktiv 1274, 1303, 1569
  - Konnektionismus 1766
  - Konnektor 1093
  - konsekutiv 1521
  - Konsonant/consonant
    - appendix consonant 384
    - consonant gradation 568, 1337
    - consonant mutation (s. kon-  
sonantische Veränderung)
    - konsonantische Veränderung/  
consonant mutation 568, 1272
  - Kontamination 1819
  - Konversion/conversion 27, 165, 527, 932, 944, 1275, 1660, 1709, 1759, 1927
    - categorical conversion 530
    - paradigmatic conversion 530
    - principe d'orientation des conversions 871
    - rectional conversion 530
    - zero conversion 531
  - Kopiesprache (replica language) 1646
  - Kopulativkompositum 887, 1276
  - Körperteil 1557
  - Korrelationskoeffizient 1242
  - Kreolsprache 1646
  - Kunstsprache, internationale 1563
  - Kürzungssuffigierung 894
  - Kurzwort/truncation 529, 583, 958, 1286, 1289, 1295, 1390, 1537
